Re: Response to Requests for Clarification regarding Latham & Watkins, LLP letter dated August 13 regarding Monterey Peninsula Water Supply Project CDP Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034

Dear Mr. Luster:

With this letter, Monterey One Water ("M1W") hereby responds to your inquiry dated August 13, 2020 regarding the above-referenced letter from Latham and Watkins LLC.

Water Supply and Demand and Exhibit 2 (Hazen & Sawyer Letter)

Declining Wastewater Flows

The Latham and Watkins letter and Exhibit 2 appears to contain inaccurate analyses and conclusions regarding sources of supply and yields for the PWM Project and the possible PWM Expansion, as proposed by others. In Exhibit 2, Figure 3, Hazen & Sawyer showed a decline in influent wastewater flow volumes from 2000 to 2013, and using that historic and incomplete influent data, they project 2014 through 2020 volumes using a trend line (linear extrapolation). The incorrect resultant wastewater flows in 2020 of 17,016 acre-feet per year (AFY) permeates into analysis throughout the remainder of the report. Figures on pages 12, 14, and 20 and associated text in Exhibit 2 are based on multiple inaccuracies (see also Surface Water Limitation which further falsify these charts). Actual flows since 2013 are shown below.

Regional Treatment Plant Influent Wastewater Flows	
Year	**Volume (in AFY)**
2014	21,695
2015	19,739
2016	20,474
2017	19,860
2018	18,810
2019	18,875
Six-Year Average	**19,909**

The inaccurate trend line result is then incorrectly reduced further using an erroneous correlative relationship. Hazen and Sawyer apply a wastewater volume reduction factor of 15.3% based on a trend of CalAm service area water demands. Wastewater flows to the Regional Treatment Plant (RTP) do not correlate to CalAm water demands for the following reasons:

1) the Monterey Peninsula, including the Marina Coast Water District (MCWD) water supply service area, comprises only approximately 46% of the influent flow to the M1W RTP;

2) CalAm's service area contains Pebble Beach, Carmel and vicinity, Carmel Valley none of which are included in M1W's service area; and

3) a substantial portion of the decline in Monterey Peninsula/CalAm demands are due to reduced outdoor irrigation which have no effect on wastewater flows.

The combined errors underestimate wastewater flows at the RTP by approximately 3,000 AFY.

Source Waters for PWM Expansion

Notwithstanding the above, the future amount of additional Agricultural Wash Water, Blanco Drain, and Reclamation Ditch available to the Pure Water Monterey Project depends on the satisfaction of conditions precedent contained in Section 16.15 of the *Amended and Restated Water Recycling Agreement* ["Water Recycling Agreement"] that would enable M1W to use those waters for agricultural irrigation in Salinas Valley.

The source water discussion for the possible PWM Expansion is complex due to the number of variables in the system. However, the document "Approved Pure Water Monterey Project and Proposed Modifications to Expand the PWM Project – Source Water Operational Plan" in Appendix M - Supplemental Environmental Impact Report (SEIR) provides a detailed analysis of source water to meet the possible PWM Expansion yield in all scenarios using the following:

- secondary effluent otherwise discharged to the ocean,
- one half of wastewater from outside the 2001 service area,
- waters committed in the Water Recycling Agreement (section 4.01 1(d)), and
- operating reserve (in a drought year if conditions precedent in Water Recycling Agreement Section 16.15 are not met).

There is disagreement from the M1W Board regarding adequacy of source waters for the PWM Expansion.

PWM Project (Ian Crooks Letter)

Delays

For the last six months, the PWM Project has been producing purified recycled water and recharging the Seaside Basin. As originally intended, the PWM Project is delivering the first new drinking water supply for North Monterey County in over a decade.

The Latham and Watkins letter to the Coastal Commission criticizes M1W for having scheduling delays on the PWM Project, as if the Cal-Am Monterey Peninsula Water Supply Project has not experienced any delays. Implementing a $100+ million public works infrastructure projects in under seven years from conception to operation is a monumental success that should be celebrated by all local, regional, and State-level stakeholders, including Cal-Am.

Injection Well Operational Problems and Solutions to Meet Yield Requirements

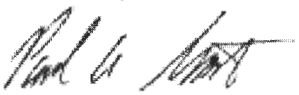
The PWM Project planning, CEQA certification, permitting, and the Water Purchase Agreement (WPA) consisted of four deep wells and four shallow wells. Currently, there are two deep wells and two shallow wells, which was intended as a potential cost-saving measure for rate payers. Unfortunately, Mother Nature and the uncertainties of the local hydrogeology did not cooperate, such that the shallow wells have underperformed. It is anticipated the two existing deep wells, currently going through final commissioning, will eventually approach and possibly exceed their planned injection capacity. To ensure adequate long-term recharge capacity, a third deep well is being designed and is scheduled for operation by the end of 2021.

The PWM Project will complete delivery of its first 1,000 acre-feet to the Seaside Basin this week to meet the WPA operational reserve. The PWM Project water deliveries will then be used by CalAm to reduce Carmel River diversions. The original objective of an average of 3,500 AFY of groundwater injections for water supply is achievable with current plans to complete the third deep injection well. Upon completion of the next injection well, the Project is expected to achieve the 3,700 AFY injection yield pursuant to the WPA. An implementation schedule detailing the timelines for existing well improvements and the third injection well is attached as **Exhibit A**.

Potential PWM Expansion Status

The SEIR for a possible PWM Expansion was not certified by the M1W Board on April 27, 2020. Staff was directed to suspend work on any aspect of the PWM Expansion.

Agricultural Source Water Issues



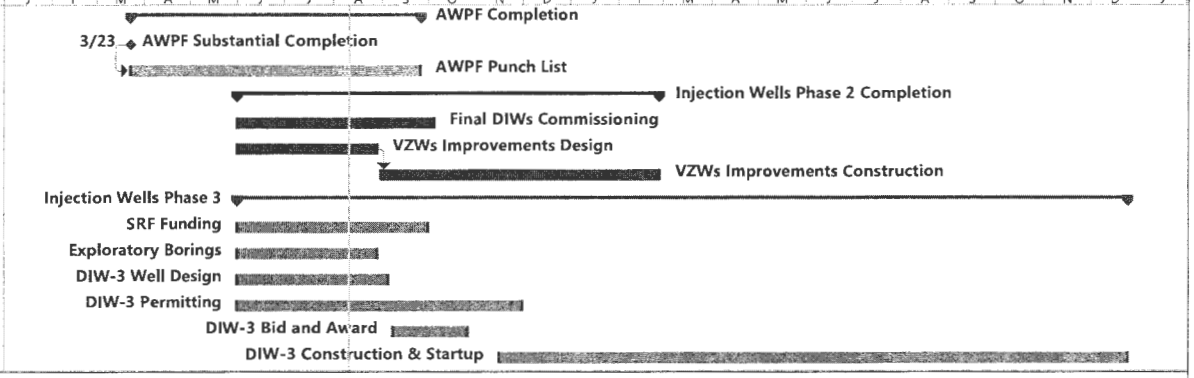
The comment regarding the treatability of the Salinas industrial wastewater (SIWW) or "Agricultural Wash Water" in Latham and Watkins letter (page 4, last bullet) is incorrect. The SIWW has been successfully treated at the RTP and advanced water purification demonstration facility since 2013 and recently through the Advanced Water Purification Facility. M1W has met all regulatory water quality standards while treating SIWW.

The SIWW is a safe source water for the PWM Project. The Division of Drinking Water approved the use of SIWW as additional RTP influent after extensive review of its water quality and PWM pilot testing results, and with independent expert input from a National Water Research Institute Independent Advisory Panel. The SIWW flows presently are not needed to meet the PWM Project production goals or agricultural irrigation recycled water demands. Source water diversion volumes are not included in the monthly and quarterly reports, but they will be reported in the annual reports.

There is nothing controversial about the safety of the SIWW; its treatment challenges are conventional and manageable. Typical constituents are total organic carbon, biological oxygen demand and phosphate. Should satisfaction of conditions precedent contained in Section 16.15 of the Water Recycling Agreement not occur, Monterey County Water Resources Agency shall retain the right to utilize 100% of the SIWW.

Please contact me if you have any further questions or require additional information.

Sincerely,



Paul A. Sciuto
General Manager

AWPF Milestones

Coastal Commission Testimony – Secretary for Environmental Protection, Jared Blumenfeld – August 12, 2020

Background

- Good morning, Chair Padilla and members of the Commission. Thank you for providing this opportunity to talk with you this morning.

- I asked for the time with you this morning in order to provide background and context related to the State Water Resources Control Board's efforts to protect the Carmel River and its threatened native fisheries from decades of unlawful diversions.

- Historically over 10,000 steelhead spawned in the Carmel River and over 1,700 returned to spawn in the 1970s.

- Due to development and unlawful diversions, only 129 steelhead were observed at Los Padres Dam in 2019.

- During the last drought, zero spawning steelhead were observed in the river for all of 2014, 2015, and 2016.

- The steelhead fishery in the Carmel River continues to be threatened.

- The lower 9.5 miles of river are seasonally dry in most years, in part due to the ongoing illegal diversions.

- While significant investments and improvements in habitat and removal of fish passage barriers (San Clemente Dam was removed in 2015) have helped create better conditions, there are still significant concerns for the fishery.

- In March of 2020, the Branch Chief for the National Marine Fisheries Science Central Coast Branch testified before this Commission that

overutilization of freshwater from the Carmel River continues to constrain steelhead habitat and migration.

- The main local water supplier, California American Water (Cal-Am) provides retail water supply to around 97,000 people in the Monterey Peninsula.

- Approximately 70% of Cal-Am's water supply comes from a series of wells drilled into the subterranean stream of the Carmel River.

- Cal-Am's water rights to Carmel River were approximately 3,400 acre-feet per year in 1995.

- At the time, Cal-Am was illegally diverting roughly 10,500 acre feet each year on top of their authorized diversions.

- Cal-Am has since obtained additional rights, but in 2019, Cal-Am still diverted about 2,700 acre feet a year without a valid right.

- The illegal diversions directly contribute to seasonal dewatering of more than 9 miles of river, which has contributed to the collapse of the native steelhead fishery on the river.

State Water Board Actions

- Over 25 years ago, in 1995, the State Water Board issued its first Water Right Order (WR 95-10) against Cal-Am for the illegal diversion of water from the Carmel River.

- Though Cal-Am and Monterey Peninsula communities have reduced per capita water consumption over time, significant unlawful diversion and use of water have continued, and continue today.

- When Cal-Am failed to stop its unlawful diversions, the Board issued a Cease and Desist Order in 2009 that provided a clear timeline to cease the illegal diversions.

- The Cease and Desist Order addresses the ongoing public trust impacts and lack of progress in finding an alternative source of water supply for the Monterey Peninsula sufficient to eliminate the illegal diversions from the Carmel River.

- The State Water Board's Order is focused on one goal: to cease the illegal diversions from the Carmel River for the protection of native fish, including steelhead, and other public trust resources.

- The Order called on Cal-Am, in coordination and cooperation with local stakeholders and agencies, to identify and develop a new alternative source of water supply.

- The Order also left the choice of what type of alternative supply project to Cal-Am and local stakeholders, recognizing that the local water supplier and community were best positioned to understand the needs, costs, and local conditions.

- The timelines in the 2009 Order (to cease all unlawful diversions by 2016) were not met.

- In 2016, the Board issued another order that extended the timeline for ceasing illegal diversions to the end of 2021.

- This provided Cal-Am and the local community another five years to develop a local solution and alternative source of water.

- In doing so, the Board recognized that clear milestones and targets were needed and that failure to meet those milestones could not forestall protection of the Carmel River and its public trust resources.

- The cease and desist order has also had the effect of limiting new housing development in the region as there is a moratorium on new water service connections.

- The Monterey Peninsula has maintained significant water conservation in light of ongoing unauthorized diversions.

- The terms and conditions of the cease and desist order will continue to apply until rescinded.

- The Water Board has signaled that future timeline extensions to cease the unlawful diversions from the River are unlikely to be granted.

- Cal-Am faces significant accrued and continuing penalties if it fails to comply.

The Water Supply Alternatives

- By 2015, stakeholders had focused on two water supply projects: a recycled water project and a desalination project.

- The recycled water project, or Pure Water Monterey, which recently started production, received significant support and resources from the state.

- The State Water Board provided the following funding (all values rounded):
    - $110 million from the Clean Water State Revolving Fund, at 1% interest.
    - $15 million from the water recycling funding program construction grant (no repayment).
    - $2.5 in Proposition 1 Stormwater Grant Funding (no repayment).
    - Pure Water Monterey has recently requested an additional $6 million for construction of an injection well, which is currently under review.

- Pure Water Monterey is expected to produce up to 3,500 acre feet per year of water for Cal-Am, depending on how the project operates and performs. There have been reported issues with the performance capacity of the existing injection wells that reduces the expected yield.

- As you know, a desalination project has also been proposed, and its components within the Coastal Zone will be the subject of your hearing in September.

- That project would ultimately produce approximately 6,200 acre feet per year.

- But essential facilities, including intake and desalination plant structures, have yet to proceed beyond the design and permitting stage.

- In part that is because the Coastal Commission has not yet acted on Cal-Am's Coastal Development Permit application and appeal, which are before you next month.

- To date, the desalination project has not received funding from the Board but a funding application is pending.

- Based on what appeared at the time to be both strong support and agreement among Cal-Am and most local stakeholders and a feasible path to lawful water supplies by the end of 2021, the State Water Board's 2016 order set annual milestones based on completion of both of these projects.

- The California Public Utilities Commission has also issued necessary analyses, findings, and authorizations for Cal-Am to proceed with and obtain water supplies from these projects.

Further Delay Will Have Significant Impacts

- Due to permitting delays, however, it is already clear that Cal-Am will not meet some future milestones laid out in the 2016 Cease and Desist Order.

- The 2016 Order requires drilling activity for at least one source well and construction of building foundations and 25% of transmission pipelines for the desalination project by September 30, 2020.

- Cal-Am will likely be able to manage to avoid severe restrictions even though it will miss the 2020 milestone.

- However, the final deadline of December 31, 2021, at which point **all** further illegal diversions from the Carmel River must stop, will be difficult or impossible to meet without the development of further alternative supplies.

- It is clear at this point that neither the proposed desalination project nor the proposed Pure Water Monterey expansion will be constructed and operating by then.

- The State Water Board and CalEPA continue to urge Cal-Am, the Monterey Peninsula community, and other water users and suppliers in the region, to consider how this final compliance deadline can still be met and sustained until a sustainable and long-term replacement water supply is developed.

- The Monterey Peninsula simply can no longer operate and grow by relying on unauthorized water supplies from the Carmel River.

- Further delay in securing alternative water supplies and ceasing unlawful diversions will only continue to add uncertainty, cost, and cause additional public trust impacts that threaten the existence of the Carmel steelhead fishery.

- By providing clarity in the Commission's actions next month, you will set a clear milestone of your own that is critical for resolving the ongoing supply challenges and disputes in the region.

- In summary, I urge you to commit to acting on the desalination project application in September for the benefit of local water users and the public trust resources that we all have an obligation to preserve, restore, and enhance.

- I would also like to offer each of you the chance to have briefings from State Water Board staff if you would like any additional background or information on their efforts over the last 25 years to protect the Carmel River.

- Thank you very much for your time.

Additional Background on State Water Board Water Right Actions and Alternative Supply Projects

The State Water Board has issued three orders against Cal-Am over the last 25 years for illegally diverting from the Carmel River:

1. Order WR 95-10
    - Found Cal-Am was illegally diverting 10,730 AFA from the Carmel River, and ordered Cal-Am to obtain legal rights or find alternative water sources.
2. Order WR 2009-0060
    - Found Cal-Am was still diverting over 7,500 AFA; ordered Cal-Am to cease illegal diversions by the end of 2016.
    - Imposed a moratorium on new service connections and on increased water delivery to existing service connections that undergo significant changes.
3. Order WR 2016-0016
    - Found Cal-Am was still illegally diverting approximately 3,800 AFA
    - Extended Cal-Am's compliance deadline to the end of 2021.
    - Added milestones for the development of alternative water supplies, which included both a recycled water and desalination facility. To ensure that the *final* compliance deadline is met even if the water supply projects are not timely developed, the Order requires Cal-Am reduce its interim diversions by up to 1,000 acre-feet per year if the annual milestones are not met.

In general, the Orders require that Cal-Am cease all illegal diversions by the end of 2021, regardless of whether new water supply projects are built.

New Water Projects

Cal-Am has focused on the development of a recycled water project and a desalination project to replace the illegal diversions.

1. Pure Water Monterey: an indirect potable reuse groundwater replenishment project. Expected to begin delivery in mid-2020, will supply approximately 3,500 AFA and create an approximately 1,000 acre-foot drought reserve (banked groundwater).
2. Proposed Monterey Peninsula Water Supply Project Desalination Facility: a desalination facility that would provide approximately 6,250 AFA to Cal-Am through use of slant well technology drilled below the ocean floor.

MONTEREY PENINSULA WATER MANAGEMENT DISTRICT

June 15, 2020

Mr. John Ainsworth
Executive Director
California Coastal Commission
45 Fremont Street, Suite 2000
San Francisco, CA 94105

Via Email

RE: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 (California American Water Company)

Dear Mr. Ainsworth:

On behalf of the Monterey Peninsula Water Management District, we are writing to encourage the California Coastal Commission to deny the Coastal Development Permit for California American Water Company's proposed desalination facility.

- Pure Water Monterey (PWM) expansion is a feasible alternative to the desalination facility. PWM is an advanced water purification facility that is already producing water for potable supply. The expansion could be constructed in approximately 20 months.

- PWM expansion has less adverse environmental impact than the proposed desalination facility, and no new construction in the coastal zone.

- PWM expansion is more than sufficient to lift the Cease and Desist Order in our community. Based on the most recent pumping and demand history, only approximately 800 acre-feet per year (afy) of new supply is required to do so – at 2,250 afy PWM expansion is more than sufficient.

- Based on the report titled "*Supply and Demand for Water on the Monterey Peninsula*" adopted by the District on May 18, 2020, PWM expansion provides a new water supply sufficient to meet the future needs of the Peninsula for the next 20 to 30 years.

- While both proposed water supply projects meet the current and future needs of the Peninsula, PWM expansion will save the ratepayers approximately $1 billion compared to desalination over a 30-year lifecycle.

Desalination can be looked at for providing the next increment of water needed on the Peninsula, and perhaps regionally, somewhere down the road when additional supplies appear to be required.

Thank you for your consideration of the District's position.

Sincerely,

The Board of Directors
Monterey Peninsula Water Management District

Letter from Monterey County Elected Leaders to the State Water Resources Control Board

June 11, 2020

Joaquin Esquivel, Chair
Board of Directors
State Water Resources Control Board

Dear Chair Esquivel and Board Members:

As elected leaders in Monterey County, it is our responsibility to advocate for the economic and environmental well-being of our citizens. We were concerned to read the letter from your Executive Directo Eileen Sobeck, to the California Coastal Commission that made several statements that need correction in regard to California American Water's proposed desalination plant.

We write to express our concerns about why this desalination plant is not the right solution for our region ar should be set aside in favor of our Pure Water Monterey facility.

We support timely compliance with the SWRCB's Cease and Desist Order (CDO) on the Carmel River. Expansion of the Pure Water Monterey (PWM) recycling plant is the fastest way to meet the CDO. Cal-Am's desalination plant is not needed to meet the Peninsula's water demand and is rife with legal and environmental complications that will only further delay compliance.

Our PWM plant has now been celebrated by both the Newsom Administration and the Environmental Protection Agency for its innovative treatment of agricultural and municipal wastewater and its use of on-sit landfill gas. PWM also comports with the SWRCB's policy to maximize water recycling in California.

The Pure Water Monterey is easily capable of meeting water demand on the Monterey Peninsula.

The CPUC's 2018 decision to approve Cal-Am's desalination plant was based on antiquated data from 2007 t 2016 that assumed a demand of 14,000 acre-feet per year for the Monterey Peninsula.

Yet three recent studies and reports by local public agencies show the Monterey Peninsula's real water demand over the last five years is 9,825 AFY. These reports confirm that expanding Pure Water Monterey's current yield of 3,500 AFY by 2,250 acre feet would provide ample water to eliminate illegal diversions from the Carmel River and meet demand for at least 30 years.

In order to justify building a desalination plant that would yield an additional 6,200 AFY and over $100 millio in corporate profits, Cal-Am has disputed the 9,825 AFY demand figure. Yet in Cal-Am's current General Rate Case before the CPUC, Cal-Am's David Mitchell testified that our demand would be 9,338 AF in 2021, 9,478 A in 2022, and 9,610 AF in 2023.

Despite the overwhelming evidence that the 14,000 AFY estimate is grossly inaccurate, Ms. Sobeck wrote,

"Even though actual water use within Cal-Am's Monterey District service area in recent years has been lowe

than the Public Utilities Commission's estimated current demand, State Water Board staff does not have a basis for concluding that the Public Utilities Commission's prior analysis and determinations regarding the water demand, sizing, reliability, or diversity of supply were unreasonable, invalid, or outdated."

Such a conclusion suggests an unfortunate bias in favor of a project that our constituents do not need and cannot afford. After the Coastal Commission staff recommended denial of Cal-Am's desalination permit last November, Cal-Am and its allies launched a sabotage campaign to derail the expansion of Pure Water Monterey.

Unfortunately, Ms. Sobeck's letter was recently used by Cal-Am and its allies on the Monterey One Water board as arguable rationale for their ongoing effort to deny approval of the final SEIR for the PWM expansion Despite their efforts, we remain confident that the PWM Expansion will be approved.

We urge the Board to seriously consider the devastating consequences that an unnecessary desalination plan would have on the people and the environment of the Monterey Peninsula.

Environmentally, Cal-Am's desal plant would destroy 7 acres of Marina's beautiful coastal dunes. This desal plant would use a massive 38,000-megawatt hours of power from PG&E and become the region's largest emitter of greenhouse gases on the coast at a time when climate change is getting worse. The plant also creates gross environmental injustice for the lower-income, predominantly minority communities of Marina and Seaside.

Groundwater rights issues have not been addressed. Cal-Am's desalination plant would draw up to 17,300 AF from the already overdrafted Salinas Valley Groundwater Basin. Under the SGMA definition of groundwater, most of the desal's source water is groundwater. Cal Am has no legal right to this water and the Agency Act prohibits exportation of groundwater from the Basin. Moreover, the project will - by design - exacerbate seawater intrusion, which endangers Marina's long-term water supply. It will also lower groundwater levels in the Dune Sand Aquifer, adversely impacting groundwater dependent ecosystems in the project area, including Coastal wetlands.

Economically, Cal-Am's desal would cost $1.2 billion over 30 years compared to $190 million for the Pure Water Monterey Expansion. Constructing and financing the desalination plant would double water bills when our constituents already pay some of the highest water bills in the nation. This increase would make the cost of living and doing business here unaffordable and would undoubtedly force residents and small businesses to leave our region. And this would make economic recovery from Covid-19 even more difficult.

Because of all these potential obstacles our local public agencies, despite Cal-Am, have worked together to solve our water supply problem with the Pure Water Monterey project and its proposed Expansion.

As it currently stands, Cal-Am only needs an additional 800 AFY to fully comply with the Cease and Desist order and the Seaside Basin overdraft payback. The additional 2,250 AFY from the Pure Water Monterey Expansion can easily provide this. Spending $1.2 billion for a desal plant is not warranted.

All that stands in the way of the Expansion of Pure Water Monterey is Cal Am's refusal to sign a Water Purchase Agreement. The CPUC has the power to move this solution forward by requiring Cal-Am to purchas the necessary replacement water from the Pure Water Monterey Expansion. Problem solved.

We urge your agency to support this solution.

Respectfully,

Senator Bill Monning, California State Senate, District 17

Re: NMFS' Comments on the Issuance of a Coastal Development Permit to California American Water Company to Construct and Operate a Desalination Facility Located Inland of the Coastal Zone (Application No. 9-19-0918, Appeal No. A-3-MRA-19-0034)

Dear Mr. Ainsworth:

This letter is in reference to the California Coastal Commission's (Commission) pending decision on the issuance of a Coastal Development Permit to California American Water Company (Cal-Am) for the construction and operation of the Monterey Peninsula Water Supply Project (MPWSP). NOAA's National Marine Fisheries Service (NMFS) is particularly concerned with the Commission's recent Staff Report that recommended denial of permits to Cal-Am for the MPWSP, and how the potential denial may affect streamflow and fisheries recovery in the Carmel River basin. NMFS is the federal agency responsible for managing, conserving, and protecting living marine resources in inland, coastal, and offshore waters of the United States. We derive our mandates from numerous statutes, including the Federal Endangered Species Act (ESA). The Carmel River supports a population of the federally threatened South-Central California Coast (S-CCC) steelhead (*Oncorhynchus mykiss*) Distinct Population Segment (DPS). NMFS identified the Carmel River as a Core 1 population (highest priority) for the recovery of the S-CCC DPS because of its size, location along the coast, and for its ability to serve as a source population for smaller, neighboring populations of the DPS (NMFS 2013).

For the past 100 years, the primary source of freshwater for the Monterey Peninsula region has been the Carmel River. Overutilization of freshwater in the Carmel River basin from groundwater extraction and surface water diversions contributed to the substantial decline of steelhead in the watershed and their listing under the ESA in 2006. Freshwater overutilization in the Carmel River Basin continues to be a very high threat to the recovery of the Carmel River steelhead population (NMFS 2013). This prompted the State Water Resources Control Board (SWRCB) to issue a Cease and Desist Order (CDO) to Cal-Am in 1995, which was updated in 2016 (SWRCB 2016). Currently, Cal-Am may withdraw up to 8,310-acre feet per year from the Carmel River with certain exceptions and adjustments as outlined in the CDO. By December 31, 2021, under full compliance of the CDO, Cal-Am's diversions from the Carmel River basin would be reduced to 3,376 acre-feet per year.

The overutilization of freshwater from the Carmel River constrains steelhead migration and suitable habitat in the Carmel River. In most years, as a result of freshwater extractions, up to 9.5 miles of the lower river dries by the summer/fall, thereby eliminating considerable portions of juvenile steelhead rearing habitat. Consequently, juvenile steelhead must be rescued from these drying reaches and reared at the Sleepy Hollow Rearing Facility until water conditions are suitable for steelhead to be relocated back to the river. Impaired groundwater elevations and drying of the lower river also curtails steelhead adult and smolt migrations by restricting their ability to transit through a critical migration corridor in late spring and early summer. Finally, reduced flow durations in the lower river have restricted access to and impaired habitat conditions within the lagoon. Reducing Cal-Am's diversions from the Carmel River to 3,376 acre-feet per year, per the CDO, is expected to alleviate these impacts and significantly aid in the recovery of the population.

Reducing water extractions from the basin through the development of a diverse and sustainable water supply portfolio is paramount to recovering steelhead in the Carmel River. To this end, NMFS has supported several regional projects aimed at meeting the terms of the CDO and improving instream flows of the Carmel River. These projects include Aquifer Storage and Recovery, the Pure Water Monterey, and Cal-Am's MPWSP (desalination project). We are concerned that the Commission's recommended denial of permits for Cal-Am's MPWSP and Commission staff's indicated desire for Cal-Am to withdraw its application fails to consider the implications to steelhead recovery if the project was not allowed to proceed at its projected timeline. The MPWSP was identified in the CDO as a critical step towards Cal-Am reliably reducing their extractions from the Carmel River, and thus a critical step in recovering steelhead in the watershed. We question whether the alternative supply options alone (i.e., without the MPWSP) could provide a reliable and sustainable water supply within a similar timeline as the MPWSP that will meet future municipal demands and protections for steelhead and their habitat.

In consideration of the dire consequences to steelhead recovery if a reliable and sustainable water supply alternative is not implemented in the near future, we request that the Commission rely on the best available information to make a final decision in August 2020.

We are available to meet with the Commission to discuss this important issue. If you have questions regarding this letter, please contact Mandy Ingham at (831) 460-7580 or at Mandy.Ingham@noaa.gov.

Sincerely,

Alecia Van Atta

California-American Water

CORRESPONDENCE

FROM AGENCIES

Packet II

Posted Sept. 16, 2020

M1W Staff Comments
California Coastal Commission Hearing Date September 17, 2020 (App. No, 9-19-0198) **[file name: "CCC Th3a&4a Staff Report"]**

SUMMARY OF STAFF RECOMMENDATION

Subheading: "Feasibility Concerns and Uncertainties" *[page 8, 1st paragraph]*

M1W notes a clarification to the number and status of the injection wells:

- 2 deep and 2 shallow (vadose) wells constructed (original design of 4 deep and 4 shallow wells)
- 2 shallow wells are scheduled to be stabilized
- 2 deep wells are completing commissioning which will increase injection rates
- A third deep well is scheduled to be added by end of 2021 (currently out for design)
- A fourth deep may also be added, which is consistent with the number of deep wells in the original design for Pure Water Monterey
- For PWM Expansion, an addition deep well may be built (totaling up to 5 deep wells)

II. FINDINGS AND DECLARATIONS

A. PROJECT DESCRIPTION, LOCATION, AND OBJECTIVES

Subheading: "Outfall Modifications"

- *[Page 17, 1st paragraph under bullet]* 129 open diffusers with duck-bill valves (plus, an open gate at the end of the outfall) out of 171 total ports. The technical analysis assumed M1W would keep the same number opened.

- *[page 17 last paragraph]* Although M1W has not yet committed to install liner; M1W and California American Water Company (Cal-Am) have begun negotiating a long-term lease agreement for such a project that would enable M1W to be reimbursed for costs associated with the liner project and other outfall improvements.

- *[page 18, 1st paragraph]* 95% design plans for the outfall lining project were completed and provided to Cal-Am in May 2019 (Note: 60% design plans were provided in November 2018). There is a very thorough description available.

C. JURISDICTION AND CONSOLIDATED PERMIT REVIEW

Subheading "Other Agency Approvals & Consultation":

- *[page 26, 1st bullet]* Please note that M1W will need to issue approvals of discharge permits for brine and plant wastewater, entering into a long-term lease agreement for use of the outfall, and potentially a potable water agreement for use of desalinated water supply to SVRP pond.

F. ENVIRONMENTALLY SENSITIVE HABITAT AREAS – TERRESTRIAL

Subheading "Additional Project Impacts":

- *[Page 44, 2nd paragraph]* Although M1W has not committed to install the liner to date, M1W and Cal-Am have started to negotiate the long-term lease agreement that would provide for mechanisms for Cal-Am to pay M1W to implement the project. The collaborative design process has progressed to 95% design as of May 2019; however, no permit applications to

implement the project have been submitted to resource agencies. The receipt of permits would enable bid documents to be finalized.

- *[Page 44, 3rd paragraph]* Although it appears that Cal-Am submitted the outfall lining info to the Coastal Commission, M1W does not know what information was submitted to confirm that those reflect the results of the collaborative design process.

- *[Page 45, 1st paragraph]* A spray on liner with internal bypass may not be feasible based on information provided by Cal-Am to Tom Luster. See M1W Technical Memorandum 9/10/2020 for more information.

I. PROTECTION OF COASTAL WATERS AND MARINE RESOURCES

Subheading "Effects of discharge on coastal water quality and marine biology,":

- *[Page 64, 2nd paragraph, 1st sentence]* The Brine Mixing Facility design progressed to 60% as of February 2019; however, it is currently on hold and at the time was proposed to undergo value engineering.

- *[Page 64, 2nd paragraph, 2nd- 4th sentences]* Technical analysis performed by M1W and their consultants, in collaboration with Cal-Am staff, found that brine flows will need to be ~13 MGD for compliance with the California Ocean Plan (COP), assuming diffuser port angles will be modified to extend upward from existing horizontal arrangement to 60 degrees upward.

- *[Page 64, 2nd para. (last sent.)]* MPWSP desalination brine would be less than ½ the daily volume in the wet seasons but may constitute more than ½ the volume during short periods (1-4 hrs.) of 13 MGD brine flow each day if the AWPF is operating at 5 MGD. Brine volumes will rarely, if ever, constitute 100% of the daily volume due to reverse osmosis concentrate discharge from PWM advanced water purification facility.

- *[Page 64, 3rd para. (1st sentence)]* M1W has not submitted a Report of Waste Discharge for accepting the brine into its outfall to the Regional Water Quality Control Board (RWQCB). The only document that has been submitted is the offshore monitoring and reporting plan (MRP).

- *[Page 64, 3rd para. (2nd to last sentence)]* The need for diffuser modifications is primarily related to the potential exceedances of COP limits for ammonia, not for salinity alone; to reiterate, brine would rarely, if ever, constitute 100% of the discharge.

- *[Page 65, 3rd para. (last sentence)]* Without diffuser modifications and intermittent high brine discharges of ~13 MGD or more, current information suggests that brine discharge to the M1W outfall may not comply with the COP.

- *[Page 65, 2nd para. (last sentence)]* The draft offshore MRP prepared to date and submitted to the RWQCB is only related to offshore monitoring of salinity and biological resources; it does not address other COP water quality limits.

O. ASSESSMENT OF ALTERNATIVES

1. Within this section, we have the following comments:
   - *[Page 107, 3rd paragraph, last sentence]* The sentence, "Additionally, the proposed retrofit of …" should be updated to 129 diffuser ports and that the end gate would need to be retrofitted with nozzles at a 60-degree angle from horizontal.

   - *[Page 131, 3rd paragraph]* Regarding the second sentence of 3rd paragraph: "*The Project Final EIR/EIS described concerns about whether even the first phase of the Pure Water project would provide sufficient water during multiple drought years, and it based the approved size and volume of the desalination facility, in part, with this concern in mind.*[135]" The text in the Final EIR/EIS referenced is not related to the Pure Water Monterey Project, but the MPWMD and Cal-Am's Aquifer Storage and Recovery Project.

   - *[Page 134, item 8]* It is not certain that if M1W does not use electricity from landfill gas, that the landfill gas would be released to the atmosphere. It is feasible that the Monterey Regional Waste Management District would generate electricity for contributing to the PG&E grid (albeit with additional transmission losses and costs to the public).

     M1W staff does not agree that the Expansion may use more energy per unit of water.

   - *[Page 138, criterion 8]* M1W staff does not agree with the last sentence, that stakeholders could be litigious toward M1W or others that might pursue a project involving increased purified recycled water production and delivery.

   - *[Page 141, 1st bullet, 2nd sentence]* M1W, with its partner agency MPWMD, is currently conducting final commissioning (referred to as "swabbing") of *both* deep injection wells.

   - *[Page 141, 1st bullet, 5th sentence]* M1W will exceed 1,000 AFY during its first year of injection. The first 1,000 AF of injection occurred in approximately 5 months.

   - *[Page 141, 1st bullet, last sentence]* M1W staff understands that Cal-Am must comply with the terms of the Cease and Desist Order related to Carmel River diversions this water year (ending Sept. 30th) and next water year Oct. 1 – Sept. 30) and is able to do so, as evidenced elsewhere in the staff report.

   - *[Page 141, 2nd bullet, 1st sentence]* M1W has successfully treated agricultural runoff water. Because it is lower in total organic carbon, biological oxygen demand, and during most times of the year suspended and dissolved solids, it is <u>less</u> difficult to treat than typical wastewater. Constituents of concern, such as pesticides, in comments from members of the public are effectively removed by the M1W's multiple treatment processes. Out treatment process meets all water quality standards and permit limits for subsurface groundwater application, irrigation with tertiary treated water, and discharge to the ocean.

- *[Page 145, first partial paragraph]* As previously discussed, M1W collaborated with Cal-Am and has 95% design plans for the outfall sliplining project. The project description for that component of the MPWSP is very well defined.

- *[Page 145, first full paragraph]* M1W staff prepared a technical memorandum that provides comments on the Cal-Am proposal to do their spray in place lining of M1W's outfall that was sent to the Coastal Commission in August 2020. M1W received that proposal on August 18, 2020 from Mr. Tom Luster, but not directly receive it from Cal-Am. With information presented to date, M1W cannot confirm the proposal is feasible, environmentally benign, and safe for M1W staff and work crews.

RE: Response to Email dated 8/18/2020 from Tom Luster, California Coastal Commission and the attached Latham and Watkins letter, dated 8/1/2020, and Exhibit A, letter from Spray in Place

---

In response to your request, we offer the following comments, information, and/or clarification related to the above-referenced correspondences. M1W had not previously received the Latham and Watkins letter, dated August 1, 2020 nor Exhibit A, the proposal submitted from "Spray in Place", prior to the above-referenced email.

BACKGROUND

The land portion of Monterey One Water's (M1W) 60-inch outfall pipeline does not require preventative or routine maintenance and has an expected 48-year life. This would change after high salinity, brine resulting from seawater desalination operations is introduced into the outfall. High salinity brine is anticipated to reduce the life of the outfall by approximately 85% due to severe corrosion. Acceleration of corrosion could lead to the requirement for replacement of the outfall pipeline, the construction of which would have significant costs and environmental impact. Therefore, the California Public Utilities Commission required MPWSP to complete an outfall protection solution prior to discharge desalination brine into M1W's outfall.

The intentions were that improvement(s) to the outfall would be the responsibility of M1W with CalAm consulting, approving and reimbursing associated costs. M1W and CalAm collaborated for five years to design an "Outfall Protection Project", which included evaluating several alternatives to identify the optimal, feasible, and cost-effective lining method. Based on our consensus, 95% design plans and specifications were developed for the Outfall Protection Project. There were two options for sliplining; 1) spiral wound, and 2) HDPE pipe insertion, to prevent the reduction of the outfall lifespan. Note: Neither option required shutdown of RTP flows to the outfall, except for several, short-duration project activities.

CalAm requested information on flows during a virtual meeting in May of 2020. Specifically, if and how long the flows could be held back while they were considering a spray on lining option. M1W shared that RTP flows are infrequently stopped and only for a short duration for critical maintenance operation(s).

This is completed during low flows from approximately 1:00 a.m. to 7:30 a.m., with 6 hours being the maximum time frame. If multiple shutdowns are required, a "recovery period" of three days between shutdowns is necessary for the RTP operational processes to return to steady-state conditions. Prior discharge shutdowns required 2 to 3 hours for the flow to slow down within the western portions of the outfall likely due to vertical profile low points in the outfall. Therefore, this would need to be considered for a "dry" pipe.

COMMENTS ON THE LATHAM & WATKINS LETTER AND EXHIBIT A

1. Latham & Watkins claims their proposed spray lining option would be as effective as the previously developed (95% design) liner projects. Exhibit A describes a single excavation pit located 100 feet east of Del Monte Boulevard with a bypass that would capture and divert flows from this point into a bypass "discharge" pipeline. The proposed bypass pipeline from that point to "the tidal zone" (see Latham & Watkins letter, page 2) would extend over 6,500 linear feet to the west and would be attached to the interior crown (top) of the outfall.

   M1W is unable to confirm whether this option will be structurally stable and/or provide adequate longevity for corrosion protection, for the following reasons:

   - Exhibit A provides a conceptual description, without details of the proposed spray liner solution, which are normally included in plans and specifications and which outline materials, means, methods, and schedules.
   - Attaching and detaching the bypass pipeline to the crown of the outfall pipe is unclear; more information is needed for M1W to determine whether it could safely occur with flow in the outfall (prior to operation of the bypass) or if an M1W shutdown is required.
   - With an 8 to 12-week duration, this project would need to be performed during the summer. There are many reasons (e.g. power failures, rain, and other) that cause the AWPF and SVRP to be inoperable during the summer. The proposed bypass system should be capable of pumping and conveying 15 to 20 MGD over the length of the lining project. Actual bypass pipe diameter should be 20 to 24-inches which may not fit in the outfall with the required lining bundle.
   - The method of attaching the bypass pipeline could potentially compromise the integrity of the outfall during installation, lining activity, and/or upon or after removal. Exposing the reinforcing members in concrete can accelerate corrosion. See also liner "bundle" comment below.

2. The M1W Beach Junction Structure provides a drop of 30-feet from the invert of the land portion of the outfall to the invert of the ocean portion of the outfall and is located outside the tidal zone. It is unclear whether the bypass would discharge into the Beach Junction Structure or be routed through that structure to the ocean portion of the outfall, which is within the tidal zone.

3. The Outfall Protection Project includes WEKO seals being replaced in the portion of the outfall to the west, not east of the Beach Junction Structure, as described in Exhibit A.

4. The letter does not address the remainder of the lining project (i.e., areas outside the Coastal Zone). Additional information is needed to describe how the spray-lined portion of the outfall

would transition to the slip-lined portion as M1W assumes the portions of the outfall outside the Coastal Zone would be built consistent with the previous design(s).

5. A separate mitigation for California Ocean Plan compliance requires the diffuser ports, along the last 1,350 feet of the outfall, be modified to extend at 60-degree angle from horizontal. The letter and associated exhibit do not address this work, located west of the outfall Beach Junction Structure.

6. Exhibit A assumes that all work can occur within the M1W existing 20-ft wide easement; however, a detailed site plan would need to confirm adequate space to accommodate referenced activities, including those items mentioned:
    - excavating for the bypass and access (Top of Outfall pipe is approximately 8 feet deep),
    - staging and movement of worker vehicles, safety, and communication equipment,
    - providing related pumps and generator,
    - ensuring a spill guard system,
    - providing sound entry enclosure,
    - vacuuming and storing debris waste and,
    - providing plural component pumping station (delivery of resin, resin hardener, hot water, air and vacuuming debris and water).

7. Exhibit A states that the spray on liner would require a custom-built "lining bundle" which includes five conduit lines (resin, resin hardener, hot water supply, hot water return line, and air) pulled into the outfall. The lining bundle needs to be over 6,500 feet long to reach the access point where the plural component pumping station would be located. The lining bundle would need to be pliable and well-protected to be pulled through the outfall without flow.

    There are various vertical and horizontal bends and potential debris in the outfall that may compromise the lining bundle as it is fed into the outfall or removed from the outfall. The process may result in collision with the bypass discharge pipe attached to the interior crown of the outfall. It is unknown whether the bundle can remain in the outfall between work shifts and/or overnight to avoid removing the bundle daily. Frequent movement would increase risks of damaging the lining bundle, bypass discharge pipe, and/or outfall.

8. The distance from the proposed access point to the farthest portion of the outfall exceeds 6,500 feet. This distance raises significant safety concerns for the work crew. M1W's highest priority is personnel safety; therefore, a thorough and complete safety plan must be developed and implemented. Continuous air flow and/or self-contained breathing apparatus may be required to ensure worker safety.

Subject: CalAm: Hazen response to M1W Letter from Friday
Attachments: CalAm - Hazen Response to M1W and CalAm - 08242020 Final.pdf

Importance: High

Good morning, Tom.

Attached for your review is a response from Hazen & Sawyer to the letter you received on Friday from M1W concerning source waters for the Pure Water Monterey Expansion Project. Hazen's analysis has been updated to include the new wastewater flow data that M1W released for the first time on Friday. Even accounting for this newly released data, Hazen's analysis demonstrates that the conclusions from Hazen's August 11, 2020 memorandum previously submitted to you remain accurate. Specifically, there are significant concerns with available source waters for both the Pure Water Monterey Phase One project and for the Expansion project, particularly during drought years, given flow data and existing commitments for those source waters. Hazen continues to conclude that based on its analysis it does not appear that the Expansion project can treat and deliver the amount of water it has promised.

Please let us know if you have any questions.

Thanks,
DJ

California American Water

Peer Review of August 20, 2020 Letter from M1W to CCC

Prepared By: Kevin Alexander, P.E.
Hazen and Sawyer - August 23, 2020

This memorandum addresses Monterey One Water's (M1W) August 20, 2020 letter to Tom Luster of the California Coastal Commission, which responds to Hazen and Sawyer's August 11, 2020 Peer Review of Supply and Demand for the Monterey Peninsula. Hazen has reviewed M1W's response and offers the following comments:

- As an initial matter, Hazen notes its concern with M1W's tone and use of terms like "inaccuracies" and "falsify" to describe Hazen's analysis. All of the assumptions that are used in Hazen's analysis are explained clearly and directly. While M1W may dispute the basis for those assumptions, none of them amount to either inaccuracies or falsification of information.

- M1W and the Monterey Peninsula Water Management District (MPWMD), as the proponents of the Pure Water Monterey Expansion project (PWM Expansion), have the burden to demonstrate the PWM Expansion will have sufficient water supply to meet demand. We do not agree that they have provided adequate information regarding the availability and reliability of source waters for the PWM Expansion to be considered a resilient sustainable supply source for the Peninsula.

- M1W misrepresents that the August 11 Hazen and Sawyer Memorandum contains inaccurate analyses and conclusions. Hazen's analysis was based on the information provided in the SEIR for the PWM Expansion by M1W and MPMWD. To the extent that information is inaccurate, such inaccuracies are that of M1W and MPMWD. For example, Hazen's memorandum did not (and could not) include the new wastewater flow information provided by M1W in its August 20 letter because M1W has not made these numbers publicly available until now. Despite providing wastewater flow information for 2014 to 2019 for the first time, M1W still has not provided evidence supporting these numbers and instead requests that the Coastal Commission take the numbers at face value.

    - Nevertheless, the new wastewater flow numbers support Hazen's analysis and further demonstrate that there are insufficient source waters for the PWM Expansion.

    - Further, if this flow information was readily available to M1W, why did M1W not evaluate it in the SEIR for the PWM Expansion? The flow information represents significant new information that should have been made available to the public, subject to review and analyzed by M1W in the SEIR.

- By M1W's own admission, M1W states that the wastewater influent data in the SEIR was incomplete. Hazen did a thorough review and found multiple discrepancies and

inaccuracies in the wastewater flows used throughout the SEIR. Hazen's review and analysis clearly shows that the accurate wastewater flows were either not provided or updated in a transparent manner to the community.

- Wastewater flow data after 2013 was not used in M1W's analysis of the PWM Expansion and was never considered in the SEIR, despite the apparent availability of this information to M1W. Rather than rely solely on old data, Hazen's peer review of M1W's analysis utilized data for 2018 from Appendix E of the PWM Expansion Draft SEIR that demonstrated flows had been reduced to 18,810 AF, and additional data presented by M1W to its Ad-Hoc JPA Revision Committee on July 20, 2020, which indicated that since the beginning of 2020 wastewater flows have been reduced to 17,980 AF (which is a decrease of 2,110 AF from the 2013 drought year flow of 20,090 AF utilized in the SEIR). The reduction of wastewater flows to 17,980 AF is not disputed by M1W. Absent additional information from M1W, the 17,980 AF number presented to M1W's Ad-Hoc JPA Revision Committee is the most current flow information available.

    - Hazen's analysis utilized the 17,980 AF number for non-drought conditions, and the 17,016 AF number for drought conditions. Hazen did not solely rely on the 17,016 AF number as M1W claims. Nonetheless, the consideration of flow at 17,016 AF is important because, as explained in Hazen's prior memo, prolonged drought conditions are likely if not certain to occur.

    - The SEIR for the PWM Expansion has never been updated to account for either the 2018 flow of 18,810 AF, or the 2020 flow of 17,980 AF, much less the new flow data that M1W has just provided. When accounting for the new flow information, the slope of the decreased flows since 2013 is very similar to the declining trend that Hazen previously projected (see Updated Figure 3). In fact, M1W's new flow information is confirmation of the trend that Hazen presented and further demonstrates that source water for the PWM Expansion is inadequate.

- When M1W's wastewater flow information for 2018 to 2020 is evaluated on a three year basis, the three year average is 18,555 AF, which is only 500 AF above Hazen's prior projection of 17,980 AF for 2020, rather than the 3,000 AF difference that M1W claims.

- Even using M1W's own numbers and ignoring the 17,980 AF number that M1W previously presented, Hazen's conclusions remain accurate. Hazen's approach throughout used actual information provided to the public by M1W in the SEIR for the PWM Expansion and did not use assumptions as was done by MPMWD and M1W.

    - Any extrapolations, interpretations, calculations and projections made by Hazen are based upon similar mathematical approaches used throughout the SEIR to be consistent. Figures 3, 4 and 5 and Tables 1 and 2 from Hazen and

Sawyer's August 11 Memorandum have been updated below to account for the revised average flow of 18,555 AFY using the last 3 years of data. Even based on this updated information, Hazen's prior conclusions remain valid and it is evident that there is not enough wastewater flow to support the PWM Phase One and the PWM Expansion as a reliable source of water supply for the Peninsula. In particular, there will be deficits over the summer months – particularly in dry years – given the existing commitments of source waters that are proposed for PWM Phase One and PWM Expansion. M1W has not provided any evidence to counter these real deficits or explain how they can be avoided.

- The deficits that Hazen has demonstrated – using M1W's own updated numbers – show that there is not sufficient source water for PWM Phase One and PWM Expansion to produce their promised product water to CalAm's customers of 3,500 AFY and 2,250 AFY, respectively.

- In addition, M1W has provided no evidence that Hazen's projections of reduced Reclamation Ditch flows are incorrect. Even though Hazen has serious concerns with the amount of other surface water flows from other sources purportedly available to the PWM Expansion, Hazen conservatively only made reductions as to Reclamation Ditch flows because there was publicly available evidence from USGS that Reclamation Ditch flows were lower than presented in the SEIR.

Re: Monterey Peninsula Water Supply Project, CDP Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 – Outfall Lining Proposal

Dear Mr. Luster:

On behalf of California-American Water Company ("Cal-Am"), we write regarding proposed future maintenance work to Monterey One Water's ("M1W") ocean outfall pipeline. Mitigation Measure 4.13-5b in the Final Environmental Impact Report/Environmental Impact Statement ("EIR/EIS") for the Monterey Peninsula Water Supply Project ("Project"), previously certified by the California Public Utilities Commission, requires Cal-Am to excavate, open, and install a new physical liner in the pipeline at ten locations along the M1W right-of-way. (See EIR/EIS, p. 4.13-29.) To comply with Mitigation Measure 4.13-5b and in response to concerns from Commission staff and others, Cal-Am proposes an alternative approach that is both as effective and far less impactful to coastal resources and environmentally sensitive habitat areas than the approach for the outfall pipeline evaluated in the EIR/EIS. Specifically, Cal-Am proposes to maintain the existing M1W outfall pipeline by excavating a single access point to the pipeline outside of the Coastal Zone and manually applying a protective spray liner throughout the pipeline's interior from the access point to the beach junction box.

Enclosed as **Exhibit A** is the proposal for the lining work, which Cal-Am would undertake in coordination with M1W. As detailed in Exhibit A and discussed below, because this minor work would maintain the functionality of M1W's existing outfall pipeline, it does not constitute "development"—or at a minimum is exempt from Coastal Development Permit ("CDP") requirements—under the Coastal Act, the City of Marina's Local Coastal Program ("LCP"), and the County of Monterey's North County LCP.

As the proposal describes, the contractor would enter the pipeline from an access point outside the Coastal Zone—100 feet east of Del Monte Blvd. on the RAMCO Property—and within M1W's existing sewer utility easement. (See Attachment 1 to **Exhibit A**; see also Grant Deed to Monterey Regional Water Pollution Control Agency for a 20-Foot Wide Sanitary Sewer Easement, attached hereto as **Exhibit B**.) This would be the only location of aboveground

disturbance, as limited excavation is needed to access the pipe through that entry point. All other lining work would be undertaken by workers physically inside the pipeline and with no groundbreaking activities.

Once the contractor has accessed the pipe, the contractor would install a bypass system to allow M1W to operate the outfall while providing the workers a safe environment to clean and line the pipeline. This bypass system includes fitting the existing pipe with two ports with discharge pumps—one which would serve as a backup. A hose would then be connected to the operating pump that allows discharges to bypass the pipeline and flow into the tidal zone temporarily while work is performed.

Before spray-lining the pipe, the contractor would remove the existing WEKO seals[1] located along the pipeline from the access point to the beach junction box. The contractor would then clean the joint areas and fill them with high-strength concrete. Once the joints are sealed, the contractor would use high-pressure water to remove calcium and brine deposits in the pipe's interior that could affect the consistent application of the lining. Any debris would be vacuumed from the pipe. Then, the contractor would spray a resin and resin hardener along the pipeline's interior from the access point to the beach junction box. Once the resin cures, the result is a solid liner equivalent to PVC that is impervious to moisture. No residue or waste would result. The lining process is anticipated to take approximately 8 to 12 weeks, as the workers expect to line about 200 feet of pipeline per day.

Because Cal-Am must line the entire length of the pipeline from the M1W wastewater treatment plant to the ocean outfall, crewmembers will pass through the Coastal Zone in unincorporated Monterey County and Marina on their way west to the beach junction box. However, the proposed work is not "development" as contemplated by the Coastal Act or the County's and Marina's LCPs. The Coastal Act defines "development" as including

> [T]he placement or erection of any solid material or structure; discharge or disposal of any dredged material or of any gaseous, liquid, solid, or thermal waste; grading, removing, dredging, mining, or extraction of any materials; change in the density or intensity of use of land . . . ; change in the intensity of use of water, or of access thereto; construction, reconstruction, demolition, or alteration of the size of any structure . . . ; and the removal or harvesting of major vegetation other than for agricultural purposes, kelp harvesting, and timber operations . . .

(Pub. Resources Code, § 30106.)

---

[1] The replacement of the existing WEKO seals located at joints west of the beach junction box in the nearshore portion of the outfall pipeline with corrosion-resistant clamps is part of Cal-Am's local CDP application, which is currently pending before the Commission in Appeal No. A-3-MRA-19-0034.

Here, Cal-Am would not build or expand any existing structure related to the outfall pipeline, but simply would apply a coating to the outfall pipeline's interior to protect against future corrosion. Any groundbreaking activities would occur in the unincorporated County, outside of the Coastal Zone. Further, the work would not involve the discharge or disposal of waste through the outfall. Indeed, spray lining is much less disruptive than installing a physical liner throughout the pipe, which would require a series of excavations along the pipeline route approximately every 500 feet. For the spray lining work, the contractor need only excavate one entry point outside of the Coastal Zone and within the existing M1W sewer utility easement; all other work would be performed belowground and inside the existing pipeline. The proposed work is no different from painting the interior of a house, which too would be exempt from CDP requirements.

Even if this work constituted "development" under the Coastal Act, the work is exempt from CDP requirements as a repair or maintenance activity. Coastal Act Section 30610 exempts "[r]epair or maintenance activities that do not result in an addition to, or enlargement or expansion of, the object of those repair or maintenance activities," so long as there is no risk of substantial adverse environmental impact. (See Pub. Resources Code, § 30610, subd. (d).) The Coastal Act also exempts work for "any necessary utility connection." (Pub. Resources Code, § 30610, subd. (f).) Similarly, both Marina's Coastal Zoning Ordinance and the County Code exempt "[r]epair or maintenance activities," including for "any necessary utility connection." (See Marina LCP Implementation Plan, pp. 27-28; Marina Municipal Code, § 17.43.070(D), (F); Monterey County Code, § 20.70.120(E), (G).) Together, these exemptions allow utilities to perform work and make repairs on existing, permitted infrastructure without the need to obtain a separate CDP for the maintenance. (See Coastal Commission, Repair, Maintenance and Utility Hook-Up Exclusions from Permit Requirements, adopted Sept. 5, 1978.)[2] "No permit is required for repair or maintenance of existing facilities that do not alter the service capacity." (*Ibid.*)

Since the outfall pipeline belongs to M1W, Cal-Am still will need to coordinate with M1W to move forward with the proposed alternative maintenance activities for the pipeline, including obtaining local approvals for the work as necessary. However, because this approach is feasible and minimizes impacts to Coastal resources in compliance with Coastal Act Section 30001.5 and the policies of Chapter 3, Cal-Am proposes the following updated special condition to cover the proposed outfall pipeline maintenance work:[3]

1. **Outfall Lining.** PRIOR TO THE COMMENCEMENT OF PROJECT OPERATION, Permittee shall demonstrate that it has obtained all approvals authorizing Project-related repair and maintenance work on the Monterey One Water outfall, including, but not limited to, excavation permits from the County

---

[2] This guidance is available online at: https://documents.coastal.ca.gov/assets/legal/exclusions-1978.pdf.

[3] In its June 30, 2020, submittal to Coastal Commission staff, Cal-Am proposed a Special Condition that would require approval of the outfall work prior to the commencement of Project operations. The proposed Special Condition in this letter supersedes the proposed Special Condition included with the June 30 letter.

of Monterey, if necessary, and has performed such repair and maintenance work pursuant to the approvals.

We appreciate staff's ongoing efforts and request that staff review the enclosed proposal and alert us to any remaining questions. Thank you for your consideration in this matter.

Very truly yours,

Duncan Joseph Moore
of LATHAM & WATKINS LLP

Mr. Tim O'Halloran
Engineering Manager
California American Water

Re: Monterey Bay Outfall Pipe Restoration 8/7/20

Dear Tim:

We are proposing the following restoration solution for the Monterey Bay Outfall Pipe, which includes consideration of concerns regarding isolation time periods for the discharge of the outfall system.

Considerable engineering has been undertaken related to designing a solution for this restoration project.

A succinct snapshot of our proposed bypass pumping system is as follows. A comprehensive detailed plan would follow if our conceptual estimates and plans are approved by California American Water and Monterey One Water to move forward.

We would first mobilize at the Access Point approximately 100 feet east of Del Monte Blvd. In this work zone, the work necessary for installation of a bypass pipeline would be undertaken so that the restoration work and installation of the spray liner can be performed in the existing Outfall Pipe. The work would be performed throughout the Outfall Pipe, from the Access Point to the beach junction box.

The subject 60" Reinforced Concrete Pipe (Outfall Pipe) will be fitted in this location with a custom internal sealer with a 36" threaded pipe fitting. A section of 36" pipe then would be installed with 2 - 6" suction ports with gate valves as well as a 36" gate valve. The two 6" ports would be fitted to discharge pumps; only one would be required to operate the bypass system, the second would be a backup. The 36" gate valve opening would be fitted with a hose to allow for the outfall system to operate without any pumps running. While we are working, this hose would be deflated thus would not interfere with our work zone access.

Related pumps and generator would be staged on a spill guard system, which would be designed to contain all the fluids in related machines. A sound sentry enclosure would be erected to control noise levels. The installation of this bypass system provides our team a safe work environment to expedite the cleaning and lining restoration of the subject Outfall Pipe.

A preliminary submittal package is attached which provides details on tools we would intend on using to expedite the bypass system required for the restoration of the subject Outfall Pipe. **Attachment 1** includes diagrams of the proposed internal bypass and Outfall Pipe restoration, and **Attachment 2** provides the Outfall Pipe specifications. We have the technology, methods, and materials to complete the restoration of the Outfall Pipe from the Access Point to the beach junction box.

SPRAY IN PLACE

45-1 KNICKERBOCKER AVE.
BOHEMIA, NY 11716

(631) 256-6046

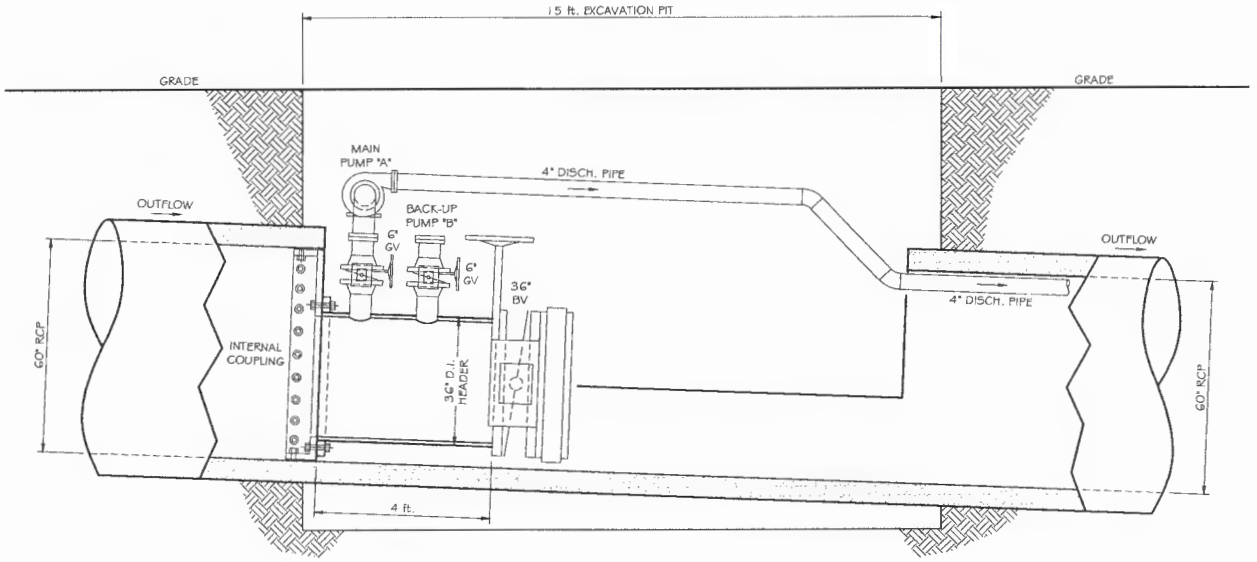
A succinct summary of the Outfall Pipe restoration after the bypass system is installed is as follows:

1) Our crew would physically enter the Outfall Pipe and remove the existing Weko seals located along the Outfall Pipe from the Access Point to the beach junction box. The joint area would be cleaned and filled with high tensile concrete, which we will line over. While inside the Pipe, our crew will utilize self-contained breathing apparatuses and follow all confined space entry protocols.

2) Our crew would manually clean the Outfall Pipe with high-pressure water to remove the calcium and brine deposits. Our crew would vacuum up any resulting debris from the deposit removal, such that no debris would be discharged from the Outfall Pipe.

3) Our lining process would proceed as follows. A plural component pumping station with a computerized control system will be staged in the Access Point work area. From this station, a custom-built lining bundle would be pulled into the subject pipe. This lining bundle has 5 internal lines: #1 for resin, #2 for resin hardener, #3 a hot water supply line, #4 a hot water return line, and #5 an airline. We will attach a hand spray gun to this bundle and spray the pipe surface with the resin and resin hardener. We would spray around the 4" aluminum Victaulic discharge pipe. When the project is 95% complete, we would start to remove sections of the Victaulic pipe and epoxy grout and seal the pipe hanger locations. At this time, high-pressure hoses would be fitted onto the mounted pipe and placed on the lined bottom of the subject Outfall Pipe.

   Throughout this process, our crew would travel along the inside of the Outfall Pipe using electric carts, which would allow consistent application of the liner throughout the pipeline interior. We anticipate lining approximately 200 feet/day, for a total construction timeline of approximately 8 to 12 weeks. The process leaves no residue behind after the material has cured. After this process, the final product would be equivalent to a PVC liner and would be impervious to moisture. Our lining process is also much less invasive than installing a physical liner, which could require physical excavations of the Outfall Pipeline every 500 feet.



4) Video inspections and recordings are included in our scope of work.

Our team has a combined 100 year plus project history designing and completing complex infrastructure restoration projects. For this project full time certified safety and environmental experts would be on site. We take great pride in our professional work ethics and project solutions.

While there are additional submittals and issues to discuss further, we are confident in our team's ability to attend to your restoration requirements and that our proposal is feasible to ensure restoration of the existing Outfall Pipe consistent with California Public Utilities Commission requirements. We look forward to moving forward to working with your team on this restoration solution.

Mark F. Boylan
Director of Infrastructure Rehabilitation

NO SCALE

PROCEDURE NOTES:

We would mobilize at the proposed excavation site adjacent to Del Monte Blvd. In this work zone, the subject 60" RCP would be fitted with a custom high-pressure internal clamping system with a 36" threaded pipe fitting. A section of 36" pipe would be installed with 2 - 6" suction ports with gate valves as well as a 36" gate valve. The two 6" ports would be fitted to discharge pumps, only one would be required to operate the bypass system, the second would be a backup. The 36" gate valve opening would be fitted for a hose to allow for the outfall system to operate with out any pumps running.
The installation of this bypass system provides our team a safe work environment to expedite the cleaning and lining restoration of the subject pipe.

AECOM

Date: August 19, 2020

To: Tom Luster, California Coastal Commission

cc: Ian Crooks, California-American Water Company

From: George Strnad, J , RLA, RA, CERP; John Chamberlain, Sr. Planner, AECOM Technical Services

Subject: Monterey Peninsula Water Supply Project: CEMEX North Dunes - Agricultural Runoff Drainage System Observations and Options

AECOM prepared a Habitat Mitigation and Monitoring Plan for the Monterey Peninsula Water Supply Project Part One – Coastal Zone dated June 2020 (HMMP). The HMMP proposes to mitigate for permanent impacts from the Monterey Peninsula Water Supply Project (MPWSP) through restoration and conservation of selected areas within an approximately 190-acre region of coastal dune habitat located in the northern portion of the CEMEX property (CNMA). In identifying locations at the CNMA for restoration, AECOM identified a sizeable area of upland dune and scrub habitat severely degraded by pumping of agricultural runoff and drainage containing substantial amounts of clayey sediment. The resulting thick layer of highly conductive fine soils serves as a supporting reservoir for numerous invasive exotic vegetation species (including significant amounts of iceplant). The HMMP proposes that the agricultural runoff drainage into the dunes be discontinued, that all the invasive vegetation associated with the agricultural runoff be removed, and the entire dune area impacted by the agricultural runoff be restored with coastal dune habitat.[1] Discontinuation or alternative management strategies for the agricultural runoff would occur as part of implementation of the HMMP. Additional details regarding the existing conditions of the agricultural runoff drainage system are provided below.

Figure 1 shows the location of an existing farm field drainage system that has been constructed in the past partially on the CNMA and partially in the large adjacent agricultural field. The system is pumping substantial amounts of water containing clayey sediment into a drainage pond much higher up in the sand dunes on the east side of the CNMA. This water then sometimes continues to flow into a much larger 'overflow' valley to the west of the drainage pond where it percolates into the sand leaving clay sediment behind on the surface.

[1] The HMMP also proposes restoration activities on two other adjacent areas degraded by historic sand mining and excessive iceplant infestation. These other areas are not discussed herein.

Figure 1: A vicinity map showing the location of the CEMEX Lapis Plant, Highway 1, the Monterey Bay shore, the pump, pond and overflow valley. The pump is near a larger white spot (arrow) adjacent to the farm road in the top portion of the aerial photograph at the boundary between the agricultural fields and the dunes. The drainage pond is the green spot to the northwest of the pump.

Figure 2 shows an enlarged aerial photo of the pump, the pond and the eastern portion of the overflow valley. It appears that the main source of the drainage water is irrigation runoff from the agricultural fields (that are irrigated daily) and possibly sub-drainage from the entire agricultural field between Highway 1 and the dunes.

Figure 2: Close-up aerial of the pump (lower right corner, short orange arrow), the drainage pond (long orange arrow) with bright green, invasive vegetation around it and the east tip of a large overflow valley (black arrow) covered with iceplant mat to the west of the drainage pond. The ephemeral stream (blue arrow) bed directing water to the west of the overflow pond is visible despite the dense iceplant cover. The entire impacted area is included in the proposed 6.6-acre ESHA restoration depicted in Appendix C (Restoration Plans) of the HMMP.

The pump (Figure 3) has been installed over a shallow well at a low point at the edge of the agricultural field drainage system. Even during the dry summer weather, the pump turns on and pushes water into the drainage pond approximately every 10 minutes for a duration of about 3-5 minutes.

Figure 3: Agricultural field drainage system pump on the farm side of the fence viewed from the top of the adjacent dune on the CEMEX property. The power pole to the north of the pump supplies electric power.

Figure 4 shows the drainage pond where the agricultural runoff is being pumped viewed from the same high dune as the pump (that is much lower). The agricultural fields are behind the photographer, Monterey Bay can be seen in the background to the west.

Figure 4: Agricultural runoff drainage pond in CEMEX dunes.

When the pump (that is triggered by the rising water level in the well below the pump) turns on water gushes out from a perforated corrugated plastic pipe that was placed in the middle of the drainage pond (Figure 5).

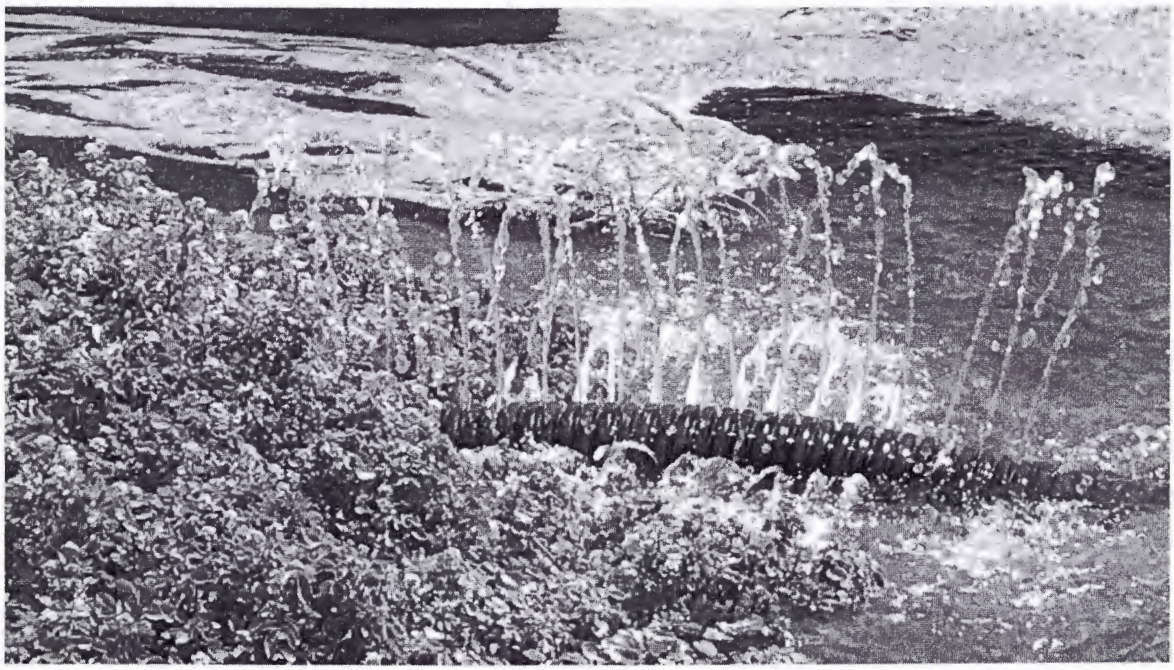

Figure 5: Drainage pond water discharge pipe.

It appears that either initially when the agricultural fields were drained or during heavy winter storms, large amounts of pumped clayey sediment laden water have been overflowing for extended periods (perhaps decades) from the small drainage pond and spilled through a narrow ephemeral streambed into a large landlocked valley further west of and lower than the drainage pond (Figures 6-8).

Figure 6: East end of the overflow valley. The drainage pond can be seen in the upper right part of the photo. The ephemeral streambed mostly covered up by iceplant mat is the faint line in the vegetation from the middle to the lower left of the photo.

Based on the presence of the power line and the look of the pump, the drainage system has been set up permanently and may continue pumping agricultural runoff into the dunes for years. The HMMP proposes that the agricultural runoff drainage into the dunes be discontinued, that the invasive vegetation be removed, and the dune area be restored with coastal dune habitat to mitigate for any permanent losses of ESHA resulting from the MPWSP implementation.

Figure 7: The narrow connection between the drainage pond and the overflow valley. The ephemeral streambed can be distinguished under a very dense layer of iceplant mat. The right side of this photo directly ties into the left side of Figure 6 photo and the left side into the right side of Figure 8 photo.

Figure 8: The west side of the overflow valley continues all the way to the oceanfront foredune that closes it off and prevents drainage to flow out.

The original sandy subsoil in this entire valley is covered by about 6-9" of very dark clayey soil that is in turn colonized by a dense layer of iceplant mat (Figure 9) and other invasive species such as ripgut brome (*Bromus diandrus*) and brome fescue (*Festuca bromoides*). A compound sample of the topsoil was taken and send to a soil laboratory (Figure 10).

It was determined that the soil texture is clay. It contains 0.9% sand, 9.2% silt and 89.9% clay. Gravel is not present. Phosphorus, potassium, iron, manganese, zinc, copper, nickel and magnesium are high. Magnesium is higher than desired. Since native plant dune species are adapted to coarse, alkaline, sandy soils with very low conductivity that are typically present in the coastal dune habitats and would not be able to survive in the clayey, nutrient rich sediment, as part of the HMMP proposed mitigation, this soil layer would be either removed, or buried under several feet of sand in order to restore the edaphic conditions suitable for native dune species.

Figure 9: Dark clayey soil layer has been deposited by agricultural runoff on top of sand in the overflow valley at CNMA.

Attachments: 2020.08.13 Cal-Am ltr to CCC.pdf

Good morning, Tom.

In advance of our call this morning, please see the attached response to various technical issues involving the MPWSP, including supply and demand, environmental justice, Pure Water Monterey, and sea level rise. We'll briefly explain these documents when we speak.

Best regards,
DJ

Re: Monterey Peninsula Water Supply Project, CDP Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 – Supplemental Technical Reports

Dear Mr. Luster:

On behalf of California-American Water Company ("Cal-Am"), this letter supplements Cal-Am's June 30, 2020, Response to the Coastal Commission's ("Commission") October 28, 2019, Staff Report ("2019 Staff Report") regarding the coastal development permit ("CDP") application for and appeal regarding the Monterey Peninsula Water Supply Project ("Project"). The enclosed technical reports provide additional responses to Staff's concerns regarding environmental justice (**Exhibit 1**), water supply and demand (**Exhibit 2**), the Pure Water Monterey Groundwater Replenishment Project ("Phase 1 PWM") and proposed expansion ("PWM Expansion") (**Exhibit 3**), and the recently adopted State of California sea level rise principle setting a minimum target for planning of 3.5 feet of sea level rise by 2050 (**Exhibit 4**).

Environmental Justice (Exhibit 1)

With respect to environmental justice, attached as Exhibit 1 is a memorandum from Dudek that evaluates the Project's potential environmental justice impacts, including Project benefits, and clarifies the Project's potential impacts to water costs. Exhibit 1 also analyzes the PWM Expansion's environmental justice impacts, which staff did not consider in its 2019 Staff Report. The following is a summary of Dudek's principal conclusions:

- **Water Costs.** Based on currently available information, the average monthly water bill for single-family residences following Project implementation would increase only an estimated $37 to $40, for a total yearly cost between $1,536 and $1,572—not $2,400 as the 2019 Staff Report asserts. Further, Cal-Am has a robust Low Income Ratepayer Assistance Program that provides a 30% discount to qualified customers that must be considered when evaluating the economic effects of Project implementation on individuals residing in Cal-Am's service territory.

- For comparison, just last year, the Commission approved the Morro Bay Water Reclamation Facility, which would result in a $41 monthly increase in Morro Bay residents' water bills. (See Staff Report for Agenda Item #13a, CDP App. No. 3-19-0463 (July 11, 2019), pp. 63-64.) The Commission determined that the increase was necessary to provide a secure and sufficient water supply to Morro Bay residents.

- **Benefits to Castroville.** The Project will benefit the severely disadvantaged community of Castroville, which critically needs—and would receive from the Project—a reliable source of potable water at a reduced rate. Castroville's primary source of water, the Salinas Valley Groundwater Basin, has become contaminated from seawater intrusion. The Project would reduce Castroville's need to pump water from the Basin and would prevent further seawater intrusion inland.

- **Public Access.** The Project will have a limited footprint and minimal impacts on public access. Once built, the Project's slant well network and associated aboveground infrastructure would occupy less than one-acre of the 400-acre CEMEX site and would be located behind an existing dune system. As a result, the Project would not impact public access to or along the beach.

- **Procedural Concerns.** Marina residents, ratepayers, and other members of the public have had ample and meaningful opportunities to participate in the Project's development since Cal-Am first proposed the Project in 2012. The CPUC held multiple hearings at which Marina and its residents actively participated, including by submitting hundreds of pages of comments and briefing on the Project.

- **Pure Water Monterey Expansion.** The 2019 Staff Report asserted that the PWM Expansion would be a feasible alternative to the Project, but did not consider the PWM Expansion's own environmental justice impacts. Not only is the PWM Expansion infeasible, but that project also would not provide sufficient water to lift the existing moratorium on new service connections or promote existing and future growth on the Monterey Peninsula. This would prevent the development of new affordable housing on the Peninsula, and would continue to force individuals working in the Peninsula's service industry to live further inland and commute far distances to their Peninsula jobs. Further, the PWM Expansion would not provide a sufficient and reliable water supply to support the Monterey Peninsula's agricultural activities—one of the region's economic pillars.

Water Supply and Demand (Exhibit 2)

Regarding water supply and demand on the Monterey Peninsula, Exhibit 2 to this letter is a memorandum from Hazen and Sawyer that provides a peer review of water supply and demand as evaluated in the Final Supplemental EIR for the PWM Expansion and in separate reports prepared by David J. Stoldt, General Manager of Monterey Peninsula Water Management District ("MPWMD"), and WaterDM on behalf of Marina Coast Water District. As explained in Exhibit 2, the technical analyses provided by proponents of the PWM Expansion fail to

demonstrate that the PWM Expansion has reliable sources of water necessary to meet demand on the Monterey Peninsula under multiple probable adverse scenarios, including reasonably foreseeable drought conditions. The following is a summary of Hazen and Sawyer's conclusions:

- **Adequate Water Supply to Meet Demand.** The Project is the only proposed water supply solution capable of providing the Peninsula with reliable water supplies across reasonable and probable scenarios such as prolonged drought conditions, limited wastewater flows, limited Phase 1 PWM injection, limited agricultural drain flows, flows from the Sand City Desal and possible limited flows from Aquifer Storage and Recovery ("ASR").

- **Declining Wastewater Flows Are Inadequate to Provide Necessary Source Waters for the Phase 1 PWM and PWM Expansion.** There are significant limitations on wastewater flows and data gaps within the analyses in the Supplemental EIR and offered by Stoldt and WaterDM that do not account for the continuing decrease in wastewater flows in the region over the past decade. When data and wastewater trends are taken into account, the Phase 1 PWM and PWM Expansion would not have sufficient source water to provide the Peninsula with an adequate water supply in both normal and dry years.

- **Surface Water Limitations.** The Supplemental EIR for the PWM Expansion overstates the availability of surface water flows, such as the Reclamation Ditch, as source water available for the Phase 1 PWM and the PWM Expansion. Analysis of current flow data available from United States Geological Survey for the Reclamation Ditch reveals that the Supplemental EIR significantly overstated the availability of Reclamation Ditch flows in critical summer months by up to 67 percent. As a result, the reliability of the Phase 1 PWM and the PWM Expansion, which rely on these flows, are in serious doubt.

- **Supply Deficits.** When updated wastewater flow and Reclamation Ditch flow data is accounted for, demand on the Peninsula exceeds supplies in both normal and dry year scenarios. Without an adequate supply of source water, the Peninsula would be forced to choose—either supply source water to the PWM Expansion or the Castroville Seawater Intrusion Project ("CSIP"). Moreover, potential adverse impacts of a CSIP deficit, including additional seawater intrusion, have not been evaluated.

- **Compliance with Governor Newsom's 2020 Water Resilience Portfolio.** Governor Newsom's 2020 Water Resilience Portfolio specifies that water suppliers need to plan for prolonged droughts and "[d]evelop strategies to protect communities and fish and wildlife in the event of a drought lasting at least six

years."[1] The PWM Expansion will have inadequate source waters during a drought, and that project does not achieve Governor's goal. Only Cal-Am's Project proposes a drought-proof water supply for the region.

Phase 1 PWM and PWM Expansion Status Update (Exhibit 3)

Exhibit 3 to this letter is a memorandum from Cal-Am, which provides a detailed report regarding the status of the Phase 1 PWM and PWM Expansion. As detailed in Exhibit 3, the status of the Phase 1 PWM and PWM Expansion raise significant concerns regarding Monterey One Water's ("M1W") ability to provide sufficient water for both the Phase 1 PWM and PWM Expansion further supporting that without the Project the Peninsula will not have an adequate, reliable, drought-proof, and permanent water supply that would be sufficient to allow the State Water Resources Control Board to lift its Cease and Desist Order and moratorium on new service connections. The following is a summary of Cal-Am's memorandum:

- **Delays and Cost Overruns**. The Phase 1 PWM has been plagued by delays and significant cost overruns. The Phase 1 PWM is currently eight months behind schedule. It is expected that the PWM Expansion would face similar timing and cost challenges.

- **Injection Well Operational Problems**. The Phase 1 PWM is experiencing substantial operational problems related to the injection capability of the shallow and deep injection wells. As a result, M1W estimates that the current annual injection volume for the Phase 1 PWM is only 2,030 afy—this equates to less than 58% of the 3,500 afy allocated to Cal-Am. It is unclear whether such delivery amount will ever be achieved. The PWM Expansion would utilize the same injection technology, calling into question whether the PWM Expansion could ever provide the claimed 2,250 afy.

- **PWM Expansion Status.** M1W denied certification of the Supplemental EIR for the PWM Expansion and did not approve the PWM Expansion. M1W does not have the funds to address the significant deficiencies identified in the Supplemental EIR. Thus, PWM Expansion is infeasible.

- **PWM Expansion Source Water Concerns.** There are significant questions regarding whether the PWM Expansion has adequate and sufficient source water because many of the water rights claimed for the PWM Expansion are in dispute.

- **Agricultural Source Water Issues.** There are also significant questions regarding whether agricultural wash water, one of the source waters for the Phase 1 PWM and the PWM Expansion, is capable of being treated. If the water is not

[1] 2020 Water Resilience Portfolio (July 2020), p. 26, available at https://waterresilience.ca.gov/wp-content/uploads/2020/07/Final_California-Water-Resilience-Portfolio-2020_ADA3_v2_ay11-opt.pdf.

treatable it would impact the Phase 1 PWM and the PWM Expansion's ability to meet water deliverables.

Sea Level Rise (Exhibit 4)

Regarding sea level rise, attached as Exhibit 4 is a memorandum from AECOM which confirms that the prior AECOM sea level rise analysis that was submitted to the Commission is consistent with the recently adopted State of California document, *Making California's Coast Resilient to Sea Level Rise: Principles for Aligned State Action*. Specifically, the previously completely sea level rise analysis is consistent with Principle 1, which directs state agencies to use a minimum target for planning of 3.5 feet of sea level rise by 2050. AECOM's previous sea level rise analysis evaluated the H++ scenario for 2060, which considered 3.8 feet of sea level rise. This prior analysis satisfies Principle 1 and no adverse impacts to the test slant well or the proposed slant well field would occur based on 3.5 feet of sea level rise at 2050. Therefore, no new analysis or revisions to AECOM's previous analysis is required.

****

Cal-Am appreciates staff's ongoing efforts in review of the Project, and hopes that the information provided in these supplemental technical memorandums will assist in staff's preparation of a new Staff Report for the upcoming September 17 hearing. We request that staff review the enclosed technical reports and alert us to any remaining questions. Thank you for your consideration in this matter.

Very truly yours,

Duncan Joseph Moore
of LATHAM & WATKINS LLP

MEMORANDUM

To:	Ian Crooks, California American Water Company
From:	Carolyn Groves and Sarah Richmond, Dudek
Subject:	Environmental Justice Analysis for the Monterey Peninsula Water Supply Project
Date:	August 10, 2020

Background and Summary

Environmental justice is defined by state law as "the fair treatment and meaningful involvement of all people regardless of race, culture, national origin, or income with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations and policies."[1] In 2016, AB 2616 amended the California Coastal Act and provided the California Coastal Commission (CCC) with new authority to consider environmental justice when making permit decisions.

On March 8, 2019, the CCC adopted its Environmental Justice Policy (Policy), implementing its authority under AB 2616. The Policy is intended to integrate the principles of environmental justice, equality, and social equity into the CCC's decision-making and operations. The Policy includes a statement of principles emphasizing the importance of issues such as meaningful engagement with environmental justice groups and underserved communities, coastal access, procedural participation, and climate change.

As part of Appeal No. A-3-MRA-19-0034 and CDP No. 9-19-0918 related to the California-American Water Company (Cal-Am) Monterey Peninsula Water Supply Project (MPWSP), CCC staff released a staff report on October 28, 2019 that includes an analysis of potential environmental justice impacts associated with the MPWSP.[2] However, the staff report's evaluation of the MPWSP's potential environmental justice-related impacts does not provide a comprehensive view of the MPWSP, including its potential benefits. The purpose of this memo is to identify and expound upon several of the assertions included in staff's environmental justice analysis, namely concerning water costs, public access, water

[1] Government Code, § 65040.12(e).

[2] Staff Report: Recommendation on Appeal Substantial Issue & De Novo Hearing and Consolidated Coastal Development Permit. Appeal No. A-3-MRA-19-0034, Application No. 9-19-0918. California Coastal Commission, Oct. 28, 2019. https://documents.coastal.ca.gov/reports/2019/11/Th8a_9a/Th8a_9a-11-2019 staff report.pdf. Accessed May 20, 2020.

supply impacts, procedural concerns, and feasible alternatives, and also to demonstrate that revised findings are needed to reflect a more accurate environmental justice discussion.

First, the increases in water rates resulting from implementation of the MPWSP are not as severe as portrayed in the staff report, and the report failed to mention several measures that Cal-Am has implemented to address water costs for communities of concern. Second, regarding public access in the City of Marina, the MPWSP's impacts are limited to a very small area, and are not significant when viewed in context. Third, the MPWSP will benefit the region's water supplies, and this reliable water source will allow for continued economic growth and much-needed residential development, including the provision of affordable housing. Fourth, in pursuit of meaningful engagement with communities of concern, Cal-Am followed all the permitting procedures required by local and state government agencies, and conducted extensive public outreach throughout development of the MPWSP. Finally, the proposed expansion of the Pure Water Monterey Groundwater Replenishment project (PWME) that staff relies on as a less-damaging alternative is currently not feasible and would not be able to meet the region's water supply demand within the necessary timeframe. The PWME project also presents a number of its own environmental justice concerns, including that it would not provide sufficient water to meet Regional Housing Needs Assessment (RHNA) housing or affordable housing goals. Thus, staff's continued claim that the PWME project would provide sufficient water for the region is incorrect; the PWME project will further burden disadvantaged communities that need a reliable water supply to not only support their existing community needs, but also to grow their regional economies and housing markets.

Water Costs

The CCC staff report claims that the increase in water rates resulting from the MPWSP could potentially affect the cost of living in the Monterey Peninsula region so much as to push low-income ratepayers out of the area completely. This claim is theoretical and based on anecdotal evidence rather than actual data or scientifically-defensible studies.

The California Public Utilities Commission (CPUC), the state agency charged with ensuring that all public utility water rates are just and reasonable, performed an extensive, six-year-long analysis of the MPWSP, including its costs and feasibility, its potential socioeconomic and environmental justice impacts, and the current and future water supply and demand for the region. As part of the CPUC's proceedings, the CPUC received evidence and testimony submitted under oath from various members of stakeholder groups. This process resulted in a proposed Comprehensive Settlement Agreement submitted to the CPUC by a diverse group of ratepayer advocates, environmental groups, public water agencies, and the applicant. After conducting this exhaustive evaluation, the CPUC adopted the rate-setting framework set out in the Comprehensive Settlement Agreement with additional ratepayer

protections.[3] Therefore, the interests of the State of California regarding fairness and equity in rate setting have been properly discharged, and there is no basis for the CCC to now contradict the CPUC's determination, especially on an issue which is not within the CCC's jurisdictional purview, and for which it has not undertaken the same rigorous fact-finding effort.

Moreover, in implementing its Environmental Justice Policy, the CCC has not previously extended its analysis to issues such as water costs or overall cost of living in coastal communities, which go beyond the realm of coastal resource protection. Coastal Act § 30213, which encourages the development of lower cost visitor and recreational facilities, previously included language that allowed the CCC to consider "housing opportunities for persons of low and moderate income." However, that housing provision was repealed by the California State Legislature in 1981 when it adopted the current version of § 30213. Therefore, Coastal Act § 30213, as currently enacted, provides that "[l]ower cost visitor and recreational facilities shall be protected, encouraged, and, where feasible, provided," but does not include consideration of housing opportunities. Additionally, Coastal Act § 30500.1 specifically prohibits the CCC from requiring housing policies or programs within Local Coastal Programs, and an effort to reinstate this authority (SB 663) failed in the Legislature in February 2018. Given these considerations, it is inappropriate for the CCC to use its Environmental Justice Policy to attempt to assert jurisdiction over cost of living considerations such as water rates.

The CCC staff report also incorrectly indicates that Cal-Am's water prices are among the highest in the country based on the flawed assumption that the average single-family residence in the region uses approximately 60,000 gallons per year and pays approximately $1,202 annually. In reality, the average single-family residence in the region currently uses about 45,600 gallons per year and pays approximately $1,092 annually. Based on current information, the average yearly cost for water for a single-family residence would increase after MPWSP implementation to between approximately $1,536 and $1,572 – not to over $2,400 as the CCC staff report incorrectly states. This amounts to an average monthly water bill increase of approximately $37 - $40 once the MPWSP comes online and begins producing desalinated water.[4] A final determination of rates will be made by the CPUC when the MPWSP goes into service.

---

[3] CPUC Decision D.18-09-017, Decision Approving a Modified Monterey Peninsula Water Supply Project, Adopting Settlement Agreements, Issuing Certificate of Public Convenience and Necessity and Certifying Combined Environmental Report, issued September 20, 2018, at pp. 124-125, available at: https://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M229/K424/229424336.PDF.

[4] See Attachment C-1 to Advice Letter No. 1220-A from California-American Water Company to CPUC, dated September 10, 2019, attached hereto as Exhibit A (rate increase is WSP Base Bill plus SRF Surcharge). The complete advice letter is available on the CPUC's website. This $37 to $40 per month increase in water bills is no different from the Morro Bay Water Reclamation Facility project that the CCC approved in July 2019. The CCC acknowledged that although the Morro Bay project would result in a $41 increase in water bills for Morro Bay residents, the project was necessary to provide sufficient water to Morro Bay residents. See Staff Report, CDP App. No. 3-19-0463, at pp. 63-64, available at: https://documents.coastal.ca.gov/reports/2019/7/Th13a/TH13a-7-2019-report.pdf.

Further, the staff report does not mention the fact that Cal-Am has a tiered water rate structure, with higher prices for customers using above-average levels of water and lower prices for customers who conserve water.[5] While the tiered rate structure is intended to promote water conservation by placing the highest costs on the largest users of water, the structure nonetheless helps keep utility bills affordable for lower-income residents by reallocating costs between users. This tiered rate structure allows residents who use less water to pay less than they otherwise would under a flat rate structure. Based on Cal-Am's water consumption estimates, the average single-family and multi-family residences would fall in Tier 2 of the five-tiered rate structure, with estimated monthly bills of $93 and $67, respectively.[6]

In addition, in its analysis of potential water costs, the CCC staff report does not consider the discounted rates provided through Cal-Am's Low Income Ratepayer Assistance (LIRA) Program[7]. Under the LIRA Program, Cal-Am offers a 30% discount to any customers who meet specified income guidelines or are enrolled in a qualified public assistance program.[8] Under this Program, the current cost for water for an average single-family residence comes down to approximately $764 annually – approximately $63 a month. After implementation of the MPWSP, that average cost would be between approximately $1,075 and $1,100 annually, representing a monthly increase of about $26 - $28. Again, this is a far lower increase than the inaccurate projection in the staff report, which assumes without evidentiary support that implementation of the MPWSP would cause average residential ratepayers' annual water bill to double. The discounted rates used in the LIRA Program are reviewed by the CPUC annually, so they can be adaptively managed in future years to respond to changing conditions in the service area.

As of June 30, 2020, Cal-Am reported to us that the LIRA Program is currently used by approximately 18% of residential customers in the City of Seaside and 6% of all customers in its overall service area. Based on demographic information from CalEnviroScreen and EPA EJSCREEN, the numbers of residents who are currently eligible for the LIRA Program are higher: approximately 43% of residential customers in Seaside, 16% in Carmel-by-the-Sea, 20% in Del Monte, 16% in Pacific Grove, 20% in Monterey, and 60% in Castroville. Thus there exists an opportunity to expand participation in the Program and provide assistance to a greater number of residents. However, many units within Cal-Am's service district are multi-family dwellings, which are typically master-metered for water by the entire building, as opposed to by individual units. In these situations, water service is often included as a component of rent, and the landlord makes the payment to the water utility. Thus, individual customers

[5] https://amwater.com/caaw/customer-service-billing/billing-payment-info/water-rates/monterey-district/rate-design.

[6] *Ibid.*

[7] https://amwater.com/caaw/customer-service-billing/customer-assistance-programs.

[8] See Cal-Am's LIRA Rate Schedule (January 1, 2020) attached as Exhibit 15 to Cal-Am's June 30, 2020, response to the CCC staff report. The total combined annual incomes eligible for the LIRA Program range from $34,480 (1-2 person household) to $88,240 (8 person household). (*Ibid.*)

or households that otherwise would be eligible for a LIRA Program discount on an individual basis cannot utilize the Program because their multifamily residential units are not separately metered.[9]

Cal-Am publicizes the LIRA Program by sending physical mailers, bill inserts, and email notices to all of its customers. Cal-Am also reported to us that the program is advertised on Cal-Am's website and customer web portal "myWater."[10] Additionally, notice of the program is provided to customers who have bill payments 30 days or more outstanding. Customers can opt into the LIRA Program by filling out an application, and enrollment lasts for two years. Prior to expiration, customers receive a renewal letter informing them that they need to reenroll if they are still eligible for participation.

In addition, a CPUC order requires that Pacific Gas & Electric (PG&E) share data with Cal-Am every six months regarding customers enrolled in PG&E's corresponding LIRA program for electrical service.[11] Cal-Am uses this data to determine whether customers within its service district would qualify for Cal-Am's LIRA Program. Cal-Am automatically enrolls customers who match or likely match the PG&E data in Cal-Am's LIRA Program, sending those customers opt-out letters. For matches that are not complete, Cal-Am provides the customers the ability to opt-in to the LIRA Program.

Thus, Cal-Am already conducts extensive outreach efforts to inform customers of the LIRA Program. Participation in this program by eligible customers could greatly offset any increased water rates of the MPWSP. In fact, if an average family that is eligible but not already enrolled in the LIRA Program were to enroll after the MPWSP is implemented, their annual bill could potentially *decrease* (e.g., from $1,092 to $1,075, assuming the same amount of water used). In other words, after MPWSP implementation, enrolled families could pay $461 less per year than projected regular rates and nearly $1,400 less per year than the costs relied upon by staff. In addition to the LIRA Program, Cal-Am also offers Payment Arrangements and Hardship Benefit Program, both of which help customers who are facing difficulties in paying their water bills.[12] The Hardship Benefit Program is a partnership between Cal-Am and United Way Monterey County that helps qualifying customers cover outstanding water balances on their water bills. Moreover, the LIRA Program is extended to Migrant Farm Worker Housing Centers and Nonprofit Group Living Centers (such as shelters and group living facilities).

---

[9] As part of the CPUC evaluation of climate resiliency in low-income and disadvantaged communities, the CPUC is exploring the issue of low-income programs for multi-family buildings. (See CPUC Proposed Decision and Order Instituting Rulemaking Evaluating the Commission's 2010 Water Action Plan Objective, Rulemaking 17-06-024, issued July 3, 2020, at pp. 2, 64-65, 86, 88, available at: https://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M342/K153/342153142.PDF.) Specifically, the CPUC may consider the development of pilot programs by water utilities that provide discounts for water users in low-income multifamily dwelling units that do not pay water bills directly to the utilities. (See *ibid.*)

[10] See www.amwater.com/caaw.

[11] See CPUC Decision D.09-12-017 (issued May 10, 2011).

[12] https://amwater.com/caaw/customer-service-billing/customer-assistance-programs.

Finally, the CCC staff report does not take into account the substantial benefits the MPWSP would create for residents of the Castroville community that are already facing serious water shortages and increasing water costs that threaten their ability to continue the agricultural operations that are vital to the region's economy. In fact, the staff report erroneously claims that communities of concern in Castroville would be adversely affected by the proposed MPWSP, despite a contradictory statement that states, "Castroville would not be burdened by Cal-Am's project, but would benefit from Cal-Am providing water to it at a reduced rate."[13] The Castroville community, much like the Cities of Seaside and Marina, has a large proportion of non-white (94%), low-income (60%), and linguistically isolated populations (45%). According to data from the US Census Bureau, approximately 29.4% of employed residents in Castroville work in the agriculture industry, which is much higher than both the state average (2.3%) and the national average (1.8%).[14] This large community investment in agriculture means that water supply reliability and cost are incredibly important to the overall economic health of Castroville and its residents. The MPWSP will provide Castroville residents with a reliable water supply at a greatly discounted rate of $110 per acre-foot.

Specifically, the Castroville Community Services District (CCSD) serves nearly 2,000 water connections in Castroville. CCSD relies on approximately 780 acre-feet per year (afy) of groundwater from the Salinas Valley Groundwater Basin (SVGB) to meet its water demands.[15] Because CCSD pumps groundwater from aquifers directly in the path of existing seawater intrusion, CCSD's water supply has become contaminated and CCSD has experienced increasing water supply challenges as a result.[16] The MPWSP would reduce CCSD's need to pump water from the SVGB and also would provide a regional benefit by reducing seawater intrusion into the SVGB and further contamination of the Basin's aquifers by creating a barrier that prevents seawater from migrating inland. Moreover, by an agreement between Cal-Am and CCSD approved by the CPUC, Cal-Am would replace any non-contaminated groundwater extracted by the MPWSP by delivering up to 800 afy of desalinated water.[17] "This water would be piped to the CCSD and . . . provided to water customers instead of their pumping an equal amount from the ground."[18] Therefore, the MPWSP will help to prevent further seawater intrusion in the SVGB and alleviate CCSD's water supply challenges.

[18] *Id.*, at p. 4.4-56.

To that end, in September 2019, J. Eric Tynan, the General Manager of the CCSD, testified in a declaration taken under oath to the much-needed benefits that Castroville will receive from the MPWSP:

> CCSD … increasingly has experienced water supply challenges due to water quality degradation of its water supplies. This is because groundwater wells in the 400-Foot Aquifer in and around the Castroville and Marina area, including CCSD's wells, are becoming intruded with seawater. If the groundwater in the vicinity of these wells becomes further degraded due to seawater intrusion, CCSD will lose most of its water supply and will be forced to drill an expensive new well in the 900-Foot (or "Deep") Aquifer and begin additional pumping from that aquifer, which is 99 degrees (e.g., a hot well), requires expensive cooling and treatment for arsenic, and is a non-renewable water supply.
>
> Long-term reliance on the Deep Aquifer would permanently ruin this supply and CCSD is very worried about depending on this aquifer as a last resort if the Monterey Peninsula Water Supply Project ("MPWSP") desalination plant does not move forward and CCSD's current wells become further intruded with seawater.
>
> CCSD is a party to a Return Water Purchase Agreement ("Agreement") with California-American Water Company ("Cal-Am"), which is incorporated into the MPWSP and the California Public Utilities Commission's Decision to approve the MPWSP. The Agreement was a collaborative effort from multiple entities that gives the community of Castroville access to a sustainable source of potable water, while protecting the SVGB.
>
> Pursuant to the Agreement, as part of the MPWSP Cal-Am will return desalinated product water into the SVGB in the amount of freshwater that originated in the SVGB that is included in the withdrawn brackish water. Such return of SVGB freshwater would be accomplished by supplying return water to CCSD for municipal water supply (in lieu of groundwater pumping from the SVGB). CCSD anticipates receiving at least 690 afy of return water under the Agreement.
>
> The Agreement provides significant benefits to CCSD, its customers, and the SVGB. Through the Agreement, groundwater currently being pumped by CCSD from wells in the 400-Foot Aquifer, which are directly in the path of seawater intrusion, would be replaced by desalinated water from the MPWSP. Thus, the MPWSP would provide much-needed recharge benefits to the SVGB while helping to slow further contamination of the 400-Foot Aquifer in and around Marina and Castroville. The return water would also prevent CCSD from needing to pump water from the Deep Aquifer.

> The MPWSP is an essential element of CCSD's long-term water supply. Halting construction of the MPWSP will severely prejudice CCSD and the disadvantaged community of Castroville that desperately needs a new, reliable long-term water supply.[19]

Thus, the MPWSP is crucial for providing a much-needed water source for residents and agricultural operations in Castroville. Having a water source that is both reliable and provided at a reduced cost will increase the long-term sustainability of this community of concern.

In sum, while the MPWSP will result in slightly increased water costs for some ratepayers, those increases are not as severe as stated in the CCC staff report. Not only will Castroville residents greatly benefit from receiving water at a reduced rate, Cal-Am has also implemented programs such as the LIRA Program and a tiered rate structure to address water costs for low-income and disadvantaged customers in the region.

Public Access

The CCC staff report raised concerns that the MPWSP could negatively impact public access to the shoreline in the area near the proposed well field. Specifically, the CCC staff report states that the MPWSP will have significant impacts to "up to several dozen" acres of beach and dune habitat, which is misleading.

The slant well field for the MPWSP will have an extremely small aboveground footprint within an easement held by Cal-Am on part of the approximately 400-acre CEMEX property, which is within the City of Marina and has historically been used for sand mining. As part of CEMEX's agreement to close the existing sand mining facility by 2022, a Consent Settlement was approved by the CCC, California State Lands Commission, and the City of Marina that directed the 400-acre property be used for both the future development of public access, as well as for use by Cal-Am within their existing easement.[20] Cal-Am currently maintains one test slant well on the CEMEX property, and the proposed MPWSP involves constructing six new slant wells in an already disturbed area that is separated from the shore by dunes (see maps attached hereto as Exhibit C).

The CCC staff report acknowledges that construction-related impacts to coastal access would be minimal: (p. 63):

> Coastal access at the site is primarily available as lateral access along the beach from access points to the north and south. During construction, work the develop the well field

[19] See Declaration of Eric Tynan, *Marina Coast Water District v. County of Monterey*, Superior Court Case No. 19CV003305 (Sept. 2019), attached hereto as Exhibit B.

[20] Consent Settlement Agreement and Cease and Desist Order CCC-17-CD-02.

> and the project's Source Water Pipeline would occur several hundred feet from the shoreline and would not be expected to affect access to or along the beach and would have little, if any, effect on public access or recreational use.[21]

Once constructed, the slant wells and all associated above-ground infrastructure would occupy a total area of less than one acre.[22] Cal-Am would also need to perform routine maintenance to these facilities, which would involve using heavy equipment over an area totaling 0.25 acres during maintenance activities. However, this maintenance would only be scheduled in the late fall/winter to avoid impacts to nesting birds and public access during the peak summer season. Mitigation measures applicable to MPWSP construction would also be required during maintenance.[23] Thus, out of the 400-acre CEMEX property and Cal-Am's easement within it, less than one acre of potential public access space would be permanently impacted by the MPWSP.

Moreover, this combined one-acre area would be located behind an existing dune system and would not affect access to the shoreline at all. Unrestricted public access is currently available along the shore at the CEMEX property, and would continue to be available after MPWSP construction. In other words, the MPWSP will have no impact whatsoever on lateral beach access. There are also no existing vertical access points on the property, and CEMEX is not required to provide any new public access within the property upon the closure of its mine on December 31, 2020. Further, before a new public access area could be created on the CEMEX property, a government agency or non-profit entity must purchase the land at 80% of fair market value, which has not yet occurred.[24] If the land is purchased in the future, the existence of the MPWSP would not preclude the development of a vertical public accessway. It is entirely feasible to dedicate the majority of the CEMEX property to public access, habitat restoration, and passive recreational use, while still allowing the operation of Cal-Am's slant wells within their minimal physical footprint.

The CCC staff report also cites concerns from nearby residents that Cal-Am may impose limitations around its well field that would impede public access. There is no basis for these concerns other than speculation on the part of nearby residents, because Cal-Am has never proposed any such limitations. In addition, Cal-Am cannot and does not control access, including public access, to or from the CEMEX site. As noted above, the fenced, aboveground MPWSP footprint that would be controlled by Cal-Am would be less than one acre. In fact, it is stated in the CCC staff report (p. 64): "While Cal-Am's limited

---

[21] Staff Report: Recommendation on Appeal Substantial Issue & De Novo Hearing and Consolidated Coastal Development Permit. Appeal No. A-3-MRA-19-0034, Application No. 9-19-0918. California Coastal Commission, Oct. 28, 2019.

[22] See Proposed Fence Perimeters, (January 25, 2019) attached as Exhibit 6 to Cal-Am's application for local CDP to City of Marina.

[23] Final EIR/EIS, pp. 3-59; see also *id.*, pp. 4.6-249, 4.6-254 to 4.6-257 (listing twelve mitigation measures for maintenance related impacts).

[24] Consent Settlement Agreement and Cease and Desist Order CCC-17-CD-02, § 6.1.

project footprint would represent some diminishment of the potential recreational use, there are other recreational opportunities that are provided and/or would be provided elsewhere on the CEMEX site and along this stretch of shoreline."

In summary, the slant well field associated with the MPWSP would not preclude use of the CEMEX property for public access, habitat restoration, and passive recreational use, and would not affect lateral access along the shoreline. Any impacts to public access and recreation from the MPWSP would be minimal, and could easily be mitigated by imposing special conditions on the permit. Indeed, the CCC staff report raised the possibility that "the Commission could require special conditions requiring Cal-Am to implement measures needed to ensure its proposed project would be consistent with the . . . Coastal Act and LCP provisions related to public access and recreation." Accordingly, Cal-Am submitted a proposed special condition with its response to the CCC staff report, requiring preparation and submittal of a Public Access Plan that would resolve any perceived impacts to public access or recreation.

Procedural Concerns

The CCC staff report alleges that there was a lack of transparency during the decision-making process surrounding the MPWSP, and that Cal-Am did not engage adequately with communities of concern near the project site. According to the U.S. Environmental Protection Agency's (EPA) definition of environmental justice, "meaningful involvement" means: people have an opportunity to participate in decisions about activities that may affect their environment and/or health; the public's contribution can influence the regulatory agency's decision; community concerns will be considered in the decision making process; and decision makers will seek out and facilitate the involvement of those potentially affected.[25] All of these criteria were met during the development and permitting process of the MPWSP.

The CPUC's evaluation of the MPWSP included a robust public process in which the City of Marina and its residents, as well as many other organizations and individuals, participated – including ratepayer advocacy groups. The CPUC issued a public Notice of Preparation (NOP) for the MPWSP on October 10, 2012, at which point Marina and its residents began participating in the CPUC's administrative process.[26]

Marina and its residents, including as members of the organizations Citizens for Just Water, Water Plus, and Public Water Now, submitted hundreds of pages of comment letters on the Draft EIR/EIS,[27] and actively participated in CPUC hearings on the MPWSP. The CPUC's hearings were accessible to Marina residents, as the CPUC held public meetings in a variety of locations to hear concerns from the

[25] https://www.epa.gov/environmentaljustice/learn-about-environmental-justice

[26] See CPUC Decision, D.18-09-017, pp. 72-74, and Appendix C, Exhibit A, for a detailed chronology of the level of public involvement, including Marina's in the CPUC's review of the MPWSP.

[27] See Final EIR/EIS, §§ 8.6-8.8.

public on topics such as the "needs of low income ratepayers, . . . [the] role of the [CPUC] in protecting ratepayers, . . . high rates" and other matters.[28] After the CPUC released the Final EIR/EIS, the City of Marina, Citizens for Just Water, Water Plus, Public Water Now, and others submitted hundreds of pages of briefing, comments, and other materials to the CPUC before the CPUC issued its decision approving the MPWSP. The City of Marina then petitioned for review of the CPUC's decision before the California Supreme Court, which denied the petition after extensive briefing on the adequacy of the CPUC's review and decision. Therefore, although Marina residents are not ratepayers, Cal-Am and the CPUC conducted significant outreach to Marina residents throughout the CPUC's administrative process, and Marina was a party to the CPUC's ratemaking process. Far from ignoring Marina residents, the CPUC gave "great weight to the City of Marina's community values."[29]

The CPUC also considered the community values expressed by other interested parties and groups, such as The Latino Water Coalition, Latino Seaside Merchants, and Comunidad en Acción, Coalition for Peninsula Businesses, Cal-Am ratepayers, Salinas Valley Water Coalition, the County of Monterey, and others.[30] In addition to the CPUC hearing process, public meetings and hearings concerning the MPWSP have been held before a variety of public agencies, including the City of Monterey, the Monterey Peninsula Water Management District, Monterey Regional Water Pollution Control Agency, and the Monterey County Board of Supervisors, among others, thereby increasing opportunities for public involvement.

In addition, as part of the CPUC's review process, a settlement agreement was reached in 2013 between key stakeholders including California American Water, Monterey Peninsula Regional Water Authority, Monterey Peninsula Water Management District, Monterey Regional Water Pollution Control Agency, Monterey County Board of Supervisors, Monterey County Water Resources Agency, City of Pacific Grove, CPUC Division of Ratepayer Advocates, Salinas Valley Water Coalition, Monterey County Farm Bureau, Coalition of Peninsula Businesses, LandWatch Monterey County, Sierra Club, Surfrider Foundation, and the Planning and Conservation League. The settlement concerns issues such as intake technology, project financing and governance and was used as the central framework for CPUC's ratemaking determination.

During the CPUC's environmental review process, Cal-Am and the CPUC also conducted extensive engagement with ratepayers and local groups and organizations who would be directly affected by the MPWSP, and maintained a dedicated project website with information and updates for the public.[31] For instance, Cal-Am sent bill inserts and direct mail pieces to customers regarding the MPWSP and its

[31] www.watersupplyproject.com; see also www.mpwsp.com (directing to same project website).

progress and engaged in a social media awareness campaign to increase the project's public visibility. In addition, since 2013, a quarterly newsletter has been published which discusses the project status and need, permitting process, financing, and schedule. The newsletter, which is archived on the updates page of the MPWSP website, is advertised in local print media and sent via email to interested stakeholders.[32] The MPWSP also receives regular local media coverage from print and broadcast media outlets, and Cal-Am has contributed guest editorials to help inform the public on issues of concern and interest.

Further, two local agencies have been formed to increase public participation in the future of the Monterey Peninsula's water supply and, specifically, in the execution of planning and construction for the MPWSP desalination component. The first – the Monterey Peninsula Regional Water Authority – is a joint-powers authority made up of the six cities within Cal-Am's service territory, which holds monthly public meetings for its Board of Directors and its Technical Advisory Committee, represented by various community stakeholders, to discuss issues concerning the project and the area's future water supply. The second – a Governance Committee – was formed with representatives from the Monterey County Board of Supervisors, Monterey Peninsula Water Management District and Monterey Peninsula Regional Water Authority, specifically to review contracts and bidding related to project construction.[33] The Governance Committee meetings are also open to the public.

In sum, there is a substantial record demonstrating that Cal-Am and the CPUC took public input into account in designing the Project. The CCC staff report ignores the extensive outreach that Cal-Am and the CPUC performed during the CPUC's administrative process. Nor does staff identify any specific outreach measures that could have been taken but were not.

Pure Water Monterey Expansion

Cal-Am partnered with Monterey One Water in developing Phase 1 of Pure Water Monterey as a way to satisfy some of the Monterey Peninsula's water supply needs. In 2019, Monterey One Water proposed expanding the Pure Water Monterey project (PWME) to provide an additional 2,250 acre-feet per year of water as a back-up to the MPWSP. The CCC staff report relies heavily on the PWME as a feasible alternative that staff claims is preferable to the MPWSP. However, the staff report does not address the serious flaws associated with assumptions regarding the PWME's performance capabilities. Throughout the development of both Phase 1 of Pure Water Monterey and the PWME, there have been numerous uncertainties about these projects' ability to perform at cost and meet water supply goals. These uncertainties have not been resolved, and at this time the PWME is not feasible. Moreover, Monterey One Water does not possess the rights to many of the water sources that are critical to the PWME's operation. The unreliable quantity of water coming from the PWME would eliminate the community's

[32] https://www.watersupplyproject.org/update

[33] https://www.watersupplyproject.org/governance-committee

potential to expand affordable housing in the area, and the staff report does not address the numerous environmental justice impacts that would result if the PWME is implemented instead of the MPWSP.

Infeasibility of PWM

Phase 1 of PWM was originally scheduled to start on January 1, 2020, but was pushed back to August 10, 2020, with a possibility for more delays. There have also been serious operational issues associated with Phase 1, including sinkholes and subsidence near shallow wells, and injection refusal at deeper wells. As of June 2020, the total injection volume for the Phase 1 facility was 169 acre-feet per month, which equates to an annual injection volume of 2,030 acre-feet. This is approximately 58% of the 3,500 acre-feet per year that was promised to Cal-Am as part of their approved Water Purchase Agreement.

Given these various serious performance issues with Phase 1, it is extremely unlikely that the PWME will be completed successfully in the near future or will provide the volume or cost of water that was initially promised. This sentiment has been echoed by the State Water Board:

> The proposed schedule for implementing a 2,250 acre-foot-per-year Pure Water Monterey expansion has itself already been delayed well beyond December 31, 2021, and requires approvals and funding for which the details are uncertain and the timeline is indefinite. In practice, Pure Water Monterey expansion appears to be viewed by the Coastal Commission and others not merely as a "back-up" to, but rather as a potential full substitute for, the Project. It is uncertain whether or when the proposed Pure Water Monterey expansion project may proceed beyond its currently pending environmental review, but significant additional progress appears unlikely while the Project is still pending.[34]

Further, in April 2020, Monterey One Water denied certification of the PWME's Supplemental Environmental Impact Report, citing significant flaws in the environmental document. The chief concerns cited in denying the certification by members of the Monterey One Water Board included inadequate support for source water assumptions and water rights. Included among these concerns were potential impacts on available water for the agricultural industry in the Salinas Valley, due to overdraft conditions in the groundwater basin supporting agriculture.

In fact, the CPUC considered the PWME as an alternative to MPWSP, among others, and found that:

> No alternative presented would replenish the water that Cal-Am previously pumped from the Seaside Basin in excess of Cal-Am's adjudicated right, none would establish water

[34] Sobeck, Eileen. "Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 (California American Water Company)." Received by John Ainsworth, Executive Director of California Coastal Commission, May 8, 2020.

> supply reliability and enable the development of vacant legal lots of record or provide supply to meet demand resulting from economic recovery and rebound of the hospitality industry. The alternatives would not provide the same diversity in the sources of supply as would the desalination plant. The alternatives would not contribute to providing a portfolio of supply options in the same was as would the desalination plant. The alternatives would not provide the same drought-resistant or drought-proof supply source as would the desalination plant.[35]

Nothing presented in the staff report alters the CPUC's findings. Accordingly, the MPWSP is likely to alleviate environmental justice issues by providing much needed water supply reliability.

Environmental Justice Concerns Connected to PWME

If the MPWSP is not developed, and assuming the PWME were somehow to be approved in the future despite the identified issues with its EIR, the PWME would result in significant environmental justice impacts and severe consequences for the Monterey Peninsula. Most significantly, the failure to permit the MPWSP would result in substantial hardship faced by communities served by the MPWSP resulting from insufficient and unreliable water supplies. There is no doubt that the burden of consequences from insufficient and unreliable water supplies would be disproportionately borne by disadvantaged communities within Cal-Am's service area.

For instance, there would be direct effects in terms of a lack of supply of and access to a clean, reliable and affordable drinking water. Without the MPWSP and an adequate water supply, Monterey Peninsula residents could face potential severe rationing of and restrictions on water usage.[36] The State Water Resources Control Board also has imposed a moratorium on new service connections and certain increases in use until Cal-Am obtains sufficient alternative water supplies.[37]

These "extreme conservation and moratorium measures"[38] – which would persist if only the PWME is pursued instead of the MPWSP – prevent cities on the Monterey Peninsula from promoting and expanding their local economies and from building the affordable housing needed to meet State mandates. The Monterey Peninsula Waste Management District (MPWMD) estimates that, with the PWME, the Monterey Peninsula will have 9,994 afy of water supply for a water demand that MPWMD estimates to be 9,825 afy.[39] Using MPWMD's estimates, this leaves only 169 afy to meet the

---

[35] CPUC Decision D.18-09-017, pp. 40-41.

[36] Final EIR/EIS, pp. 5.4-10 to 5.4-11.

[37] See State Water Resources Control Board Order WR 2016-0015, pp. 27, 59.

[38] CPUC Decision D.18-09-017, pp. 52-53.

[39] Cal-Am disputes these estimates, which conflict with the CPUC's supply and demand determinations. However, for purposes of this memorandum, Dudek provides MPWMD's assumptions as provided in the PWME's supplemental environmental impact report.

Peninsula's RHNA goals. However, this is less than the 190 afy that MPWMD has estimated is necessary to achieve those goals.

In fact, even 190 afy vastly understates the water needed to meet future State-mandated housing requirements. The City of Monterey recently estimated that its housing projection through 2030 requires an additional 1,700 housing units, which conservatively equates to 255 afy of water needed. This one city housing projection alone exceeds what MPWMD has projected for the future housing needs of the entire Peninsula.[40]

Further, a sufficient and reliable water supply is critical in supporting agricultural activities in Cal-Am's service area. Agriculture in the region is not only an important component of the job base for disadvantaged communities, but also serves as an important economic pillar in the region. Agricultural production requires investments that depend on water supply reliability. As reliability of water supplies becomes threatened, a diminishment in agricultural production will result, and will affect the overall economy. Those effects again will be disproportionately borne by disadvantaged communities. The worsening effects of climate change will only exacerbate these effects and pose additional threats to disadvantaged populations.

Local groups representing farmers and communities of concern have voiced significant concerns about the environmental justice issues related to the PWME, including its water sources and the intended uses for the water it would supply.

- The Monterey County Farm Bureau (MCFB), which represents farmers and agricultural operations in the Salinas Valley, expressed concern that the PWME would capture water that was originally discharged inside the Salinas Valley basin and reuse it outside the basin for the benefit of Monterey Peninsula water users.[41] This could seriously undermine the Castroville Seawater Intrusion Project (CSIP), in turn exacerbating Salinas Valley water issues. CSIP is a recycled water project which delivers recycled water to agricultural operations near Castroville and allows farmers to "safely irrigate their crops and reduce pumping of seawater-tainted groundwater."[42] The MCFB later noted that the project's EIR did not analyze the cumulative

[40] New RHNA figures for the Monterey Peninsula will be released in December 2023. It is expected that the new RHNA numbers substantially increase the required housing given the State's ongoing housing crisis. For example, the San Francisco Bay area's updated RHNA represents an increase of 135% from the previous period. (See Department of Housing and Community Development Letter to Association of Bay Area Governments (June 9, 2020), attached hereto as Exhibit D.)

[41] Groot, Norman C. "Pure Water Monterey Expansion Project." Received by Monterey One Water Board of Directors, Jan. 10, 2020.

[42] See, e.g., http://montereycfb.com/index.php?page=csip

effects of the project related to other water resource projects, such as CSIP, and reiterated that there were significant disputes about the water rights for many of the project's source waters.[43]

- The City of Salinas raised concerns that the PWME intended to utilize the City's agricultural produce wash water as a water source, which was not authorized as part of the City's 2015 Conveyance and Treatment Agreement with Monterey One Water.[44] The City took serious issue with the potential outcome that the PWME would provide water to Monterey Peninsula residents at the expense of the Salinas Valley agricultural community.[45] The City of Salinas qualifies as a community of concern – 87% of residents are non-white, 44% have less than a high school education, 49% are low income, and 23% are linguistically isolated.[46]

- The Monterey County Water Resources Agency (MCWRA) also voiced concern that Monterey One Water does not hold permanent water rights for many of the water sources identified for the PWME, and thus there were substantial discrepancies in the true amount of water available to the project as described in the EIR.[47,48] MCWRA also noted that the EIR stated that the PWME would result in approximately 700-800 afy less water available for agricultural irrigation in the Salinas Valley, thereby impairing the CSIP and depleting groundwater levels and groundwater quality in the SVGB.

- Castroville Community Services District took issue with the PWME's proposal to claim water originating within the over-drafted Salinas Valley Groundwater Basin for use in the Monterey Peninsula, with no benefit to the Basin.[49] Importantly, the CCSD noted, "While the MPWSP helps address regional water needs both in the Monterey Peninsula and the Salinas Valley, the PWME only benefits the Peninsula, and does so at the expense of the Salinas Valley Ground Water Basin."

[48] Buche, Brent. Untitled. Received by Monterey One Water Board of Directors, April 27, 2020.

[49] Tynan, J. Eric. "Pure Water Monterey Expansion Project Certification of SEIR – OPPOSE." Received by Monterey One Water Board of Directors, April 23, 2020.

The PWME has serious environmental justice issues that have not been addressed by Monterey One Water or CCC staff. Monterey One Water does not own the water rights for many of the proposed source waters and has not been able to confirm a certain quantity of product water. Thus, staff's assumption that the PWME will avoid environmental justice impacts does not consider the totality of circumstances surrounding the project and should be reevaluated.

Conclusion

The CCC staff analysis of the MPWSP raises environmental justice issues that are important to consider regarding the potential effects of the MPWSP on nearby communities of concern. However, the analysis does not accurately capture the many benefits that the MPWSP would provide for communities of concern in the region. Residents of the disadvantaged community of Castroville will receive water at a substantially reduced rate, while the MPWSP will actually improve local groundwater resources. The MPWSP will not significantly impact City of Marina residents, as any potential public access impacts are minimal. Further, relevant stakeholders and members of the public were engaged throughout the CPUC's review of the MPWSP. Finally, the Pure Water Monterey Expansion is not a reliable or viable alternative to the MPWSP and raises its own significant environmental justice concerns. The MPWSP is the most feasible option for securing a critically important water supply for a vulnerable area with extremely limited water supply options. As a critical public utility project that could provide a reliable water supply to thousands of coastal residents, we recommend that CCC staff evaluate environmental justice issues associated with the MPWSP as comprehensively as possible.

Respondents and Defendants.

CALIFORNIA-AMERICAN WATER COMPANY, a California water corporation, and DOES 111-120,

Real Party in Interest.

CASE NO. 19CV003305

Assigned to: Hon. Lydia Villarreal

DECLARATION OF J. ERIC TYNAN IN SUPPORT OF REAL PARTY IN INTEREST CALIFORNIA-AMERICAN WATER COMPANY'S OPPOSITION TO PETITIONER MARINA COAST WATER DISTRICT'S REQUEST FOR STAY AND MOTION FOR PRELIMINARY INJUNCTION

Hearing re: Motion for Preliminary Injunction:
Date: October 4, 2019
Time: 10:00 a.m.
Dept.: 1

Action Filed: August 15, 2019

DECLARATION OF J. ERIC TYNAN

I, J. Eric Tynan, declare:

1. I am the General Manager of the Castroville Community Services District ("CCSD"). I have served in this role for 19 years. I have personal knowledge of the facts set forth in this Declaration and, if called as a witness, could and would testify competently to such facts under oath.

2. In my capacity as General Manager at CCSD, I am charged with the responsibility of running the day-to-day operations of CCSD. CCSD provides municipal and domestic water service to approximately 8,000 customers in Castroville, a 100% severely disadvantaged community in the north end of the Salinas Valley Groundwater Basin ("SVGB"), just north of the City of Marina.

3. As of 2015, Castroville had an unemployment rate of 13.4 percent. More than 96 percent its residents identify as minority populations. More than 21 percent of individuals have family incomes below the poverty threshold.

4. CCSD currently exclusively relies on approximately 780 acre-feet per year ("afy") of groundwater from one well in the Deep Aquifer and three wells in the SVGB's 400-Foot Aquifer to meet Castroville's water demand, and increasingly has experienced water supply challenges due to water quality degradation of its water supplies. This is because groundwater wells in the 400-Foot Aquifer in and around the Castroville and Marina area, including CCSD's wells, are becoming intruded with seawater. If the groundwater in the vicinity of these wells becomes further degraded due to seawater intrusion, CCSD will lose most of its water supply and will be forced to drill an expensive new well in the 900-Foot (or "Deep") Aquifer and begin additional pumping from that aquifer, which is 99 degrees (e.g., a hot well), requires expensive cooling and treatment for arsenic, and is a non-renewable water supply.

5. CCSD requires a reliable, long-term, drought-proof source of water to serve its customers. Recent years have seen a steady increase in pumping from the Deep Aquifer, diminishing its long-term capacity. The Deep Aquifer provides approximately seventy-percent (70%) of Marina Coast Water District's current water supply (up from thirty-percent (30%) in

2011) and recently multiple new wells have been drilled into the Deep Aquifer to accommodate new demand from farming uses north of Marina. These new Deep Aquifer wells, which are located on the border of Marina, are less than two miles from CCSD's wells, are pumping the equivalent of seven times the average annual demand of CCSD, and represent approximately two times MCWD's previous annual pumping.

6. Long-term reliance on the Deep Aquifer would permanently ruin this supply and CCSD is very worried about depending on this aquifer as a last resort if the Monterey Peninsula Water Supply Project ("MPWSP") desalination plant does not move forward and CCSD's current wells become further intruded with seawater.

7. CCSD is a party to a Return Water Purchase Agreement ("Agreement") with California-American Water Company ("Cal-Am"), which is incorporated into the MPWSP and the California Public Utilities Commission's Decision to approve the MPWSP. The Agreement was a collaborative effort from multiple entities that gives the community of Castroville access to a sustainable source of potable water, while protecting the SVGB.

8. Pursuant to the Agreement, as part of the MPWSP Cal-Am will return desalinated product water into the SVGB in the amount of freshwater that originated in the SVGB that is included in the withdrawn brackish water. Such return of SVGB freshwater would be accomplished by supplying return water to CCSD for municipal water supply (in lieu of groundwater pumping from the SVGB). CCSD anticipates receiving at least 690 afy of return water under the Agreement.

9. The Agreement provides significant benefits to CCSD, its customers, and the SVGB. Through the Agreement, groundwater currently being pumped by CCSD from wells in the 400-Foot Aquifer, which are directly in the path of seawater intrusion, would be replaced by desalinated water from the MPWSP. Thus, the MPWSP would provide much-needed recharge benefits to the SVGB while helping to slow further contamination of the 400-Foot Aquifer in and around Marina and Castroville. The return water would also prevent CCSD from needing to pump water from the Deep Aquifer.

10. Despite being a small, severely disadvantaged community with limited funding,

CCSD has committed $2.8 million to pay for a pipeline to connect the MPWSP into CCSD's system.

11. The MPWSP is an essential element of CCSD's long-term water supply. Halting construction of the MPWSP will severely prejudice CCSD and the disadvantaged community of Castroville that desperately needs a new, reliable long-term water supply.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Executed this 17th day of September, 2019, at 11499 Geil St Castroville CA.

J. Eric Tynan

Therese W. McMillan, Executive Director
Association of Bay Area Governments
375 Beale Street. Suite 700
San Francisco, CA 94105

Dear Therese W. McMillan,

RE: Final Regional Housing Need Determination

This letter provides the Association of Bay Area Governments (ABAG) its final Regional Housing Need Determination. Pursuant to state housing element law (Government Code section 65584, et seq.), the Department of Housing and Community Development (HCD) is required to provide the determination of ABAG's existing and projected housing need.

In assessing ABAG's regional housing need, HCD and ABAG staff completed an extensive consultation process from March 2019 through May 2020 covering the methodology, data sources, and timeline for HCD's determination of the Regional Housing Need. HCD also consulted with Walter Schwarm with the California Department of Finance (DOF) Demographic Research Unit.

Attachment 1 displays the minimum regional housing need determination of **441,176** total units among four income categories for ABAG to distribute among its local governments. Attachment 2 explains the methodology applied pursuant to Gov. Code section 65584.01. In determining ABAG's housing need, HCD considered all the information specified in state housing law (Gov. Code section 65584.01(c)).

As you know, ABAG is responsible for adopting a methodology for RHNA allocation and RHNA Plan for the projection period beginning June 30, 2022 and ending December 31, 2030. Pursuant to Gov. Code section 65584(d), the methodology to prepare ABAG's RHNA plan must further the following objectives:

(1) Increasing the housing supply and mix of housing types, tenure, and affordability
(2) Promoting infill development and socioeconomic equity, protecting environmental and agricultural resources, and encouraging efficient development patters
(3) Promoting an improved intraregional relationship between jobs and housing
(4) Balancing disproportionate household income distributions
(5) Affirmatively furthering fair housing

Pursuant to Gov. Code section 65584.04(d), to the extent data is available, ABAG shall include the factors listed in Gov. Code section 65584.04(d)(1-13) to develop its RHNA

plan, and pursuant to Gov. Code section 65584.04(f), ABAG must explain in writing how each of these factors was incorporated into the RHNA plan methodology and how the methodology furthers the statutory objectives described above. Pursuant to Gov. Code section 65584.04(h), ABAG must submit its draft methodology to HCD for review.

Increasing the availability of affordable homes, ending homelessness, and meeting other housing goals continues to be a priority for the State of California. To support these goals the 2019-20 Budget Act allocated $250 million for all regions and jurisdictions for planning activities through the Regional Early Action Planning (REAP) and Local Early Action Planning (LEAP) Grant programs. ABAG has $ 23,966,861 available through the REAP program and HCD applauds ABAG's efforts to engage early on how best to utilize these funds and HCD looks forward to continuing this collaboration. All ABAG jurisdictions are also eligible for LEAP grants and are encouraged to apply to support meeting and exceeding sixth cycle housing element goals. While the SB 2 Planning Grant deadline has passed, ongoing regionally tailored technical assistance is still available through that program.

In addition to these planning resources HCD encourages local governments to consider the many other affordable housing and community development resources available to local governments that can be found at *https://www.hcd.ca.gov/grants-funding/nofas.shtml*

HCD commends ABAG and its leadership in fulfilling its important role in advancing the state's housing, transportation, and environmental goals. ABAG is also recognized for its actions in proactively educating and engaging its board and committees on the RHNA process and the regional housing need, as well as creating tools to aid the public understanding in the process. HCD especially thanks Paul Fassinger, Gillian Adams, Aksel Olsen, Dave Vautin, Bobby Lu, Matt Maloney, and Elizabeth Bulgarin for their significant efforts and assistance. HCD looks forward to its continued partnership with ABAG and its member jurisdictions and assisting ABAG in its planning efforts to accommodate the region's share of housing need.

If HCD can provide any additional assistance, or if you, or your staff, have any questions, please contact Megan Kirkeby, Acting Deputy Director, at *megan.kirkeby@hcd.ca.gov* or Tom Brinkhuis, Housing Policy Specialist at (916) 263-6651 or *tom.brinkhuis@hcd.ca.gov*.

Sincerely,

Megan Kirkeby
Acting Deputy Director

HCD REGIONAL HOUSING NEED DETERMINATION
ABAG: June 30, 2022 through December 31, 2030

Income Category	Percent	Housing Unit Need
Very-Low*	25.9%	114,442
Low	14.9%	65,892
Moderate	16.5%	72,712
Above-Moderate	42.6%	188,130
Total	**100.0%**	**441,176**
* Extremely-Low	15.5%	Included in Very-Low Category

Notes:

Income Distribution:

Income categories are prescribed by California Health and Safety Code (Section 50093, et. seq.). Percents are derived based on Census/ACS reported household income brackets and county median income, then adjusted based on the percent of cost-burdened households in the region compared with the percent of cost burdened households nationally.

ATTACHMENT 2

HCD REGIONAL HOUSING NEED DETERMINATION:
ABAG June 30, 2021 through December 31, 2030

Methodology

ABAG: PROJECTION PERIOD (8.5 years) HCD Determined Population, Households, & Housing Unit Need		
Reference No.	Step Taken to Calculate Regional Housing Need	Amount
1.	**Population: December 31 2030 (DOF June 30 2030 projection adjusted + 6 months to December 31 2030)**	8,273,975
2.	*- Group Quarters Population: December 31 2030 (DOF June 30 2030 projection adjusted + 6 months to December 31 2030)*	-169,755
3.	**Household (HH) Population**	8,159,280
4.	**Projected Households**	**3,023,735**
5.	+ Vacancy Adjustment (3.27%)	+98,799
6.	+ Overcrowding Adjustment (3.13%)	+94,605
7.	+ Replacement Adjustment (.50%)	+15,120
8.	*- Occupied Units (HHs) estimated June 30, 2022*	-2,800,185
9.	+ Cost-burden Adjustment	+9,102
Total	**6th Cycle Regional Housing Need Assessment (RHNA)**	**441,176**

Detailed background data for this chart is available upon request.

Explanation and Data Sources

1-4. Population, Group Quarters, Household Population, & Projected Households: Pursuant to Gov. Code Section 65584.01, projections were extrapolated from DOF projections. Population reflects total persons. Group Quarter Population reflects persons in a dormitory, group home, institute, military, etc. that do not require residential housing. Household Population reflects persons requiring residential housing. Projected Households reflect the propensity of persons within the Household Population to form households at different rates based on American Community Survey (ACS) trends.

5. Vacancy Adjustment: HCD applies a vacancy adjustment (standard 5% maximum to total projected housing stock) and adjusts the percentage based on the region's current vacancy percentage to provide healthy market vacancies to facilitate housing availability and resident mobility. The adjustment is the difference between standard 5% vacancy rate and regions current vacancy rate based **(1.73%)** on the 2014-2018 ACS data. For ABAG that difference is **3.27%**.

6. Overcrowding Adjustment: In regions where overcrowding is greater than the comparable region's overcrowding rate, or in the absence of comparable region the national overcrowding rate. HCD applies an adjustment based on the amount the regions overcrowding rate **(6.73%)** exceeds the comparable region's rate **(3.60%)**. For ABAG that difference is **3.13%**. Data is from the 2014-2018 ACS.

7. Replacement Adjustment: HCD applies a replacement adjustment between .5% and 5% to the total housing stock based on the current 10-year annual average percent of demolitions the region's local government annual reports to Department of Finance (DOF). For ABAG the 10-year annual average multiplied by the length of the projection period is .40%, and the minimum **.50%** adjustment is applied.

8. Occupied Units: This figure reflects DOF's estimate of occupied units at the start of the projection period (June 30, 2022).

9. Cost Burden Adjustment: HCD applies an adjustment to the projected need by comparing the difference in cost-burden by income group for the region to the cost-burden by income group for the comparable regions, as determined by ABAG. The very-low and low income RHNA is increased by the percent difference (66.64%-66.00%=.**64%**) between the region and the comparable region cost burden rate for households earning 80% of area median income and below, then this difference is applied to very low- and low-income RHNA proportionate to the share of the population these groups currently represent. The moderate and above-moderate income RHNA is increased by the percent difference (16.25%-13.10%=**3.15%**) between the region and the comparable region cost burden rate for households earning above 80% Area Median Income, then this difference is applied to moderate and above moderate income RHNA proportionate to the share of the population these groups currently represent. Data is from 2012-2016 CHAS.

REGIONAL HOUSING NEEDS ALLOCATION

Association of Bay Area Governments

TO: ABAG Executive Board DATE: June 18, 2020

FR: Executive Director

RE: Update on Regional Housing Need Determination (RHND)

Overview

On June 10, 2020, the California Department of Housing and Community Development (HCD) transmitted its proposed Regional Housing Needs Determination for the Bay Area's Cycle 6 RHNA process to the ABAG Executive Director. As shown in **Attachment B**, the determination is the state's estimation of the total housing need for the nine-county San Francisco Bay Area between 2022 and 2030. As discussed below, the needs determination followed a consultation process between ABAG/MTC staff and HCD staff on technical inputs. ABAG is required to use it as the "big number" to distribute to local jurisdictions through the allocation process in 2021.

Consultation Process

As part of the consultation process outlined in Government Code Section 65584.01(c), ABAG was required to provide a variety of information to HCD, which was submitted as a consultation letter on May 29, 2020. ABAG/MTC staff and HCD staff also held several meetings prior to the submission to discuss the data and mechanics of the RHND calculation. The meetings focused on the appropriate forecast to use as the basis of the calculation, as well as vacancy rates, the rates of over-crowding and cost-burden, and comparable regions to the Bay Area.

ABAG/MTC staff recommended that the DOF population forecast be used as the "baseline forecast" of the RHND. The Regional Growth Forecast used in Plan Bay Area 2050 integrates strategies and policies that cause it to be significantly higher than the DOF forecast. Use of the DOF forecast is also appropriate for the RHND as HCD is required to adjust (i.e., increase) the DOF forecast using a variety of calculation factors, which would result in double-counting if overlaid with Plan Bay Area 2050 strategy impacts.

In addition, ABAG/MTC staff provided the following input to HCD:

- **Target Vacancy Rate.** HCD interprets the government code to say that the minimum target vacancy rate for the overall housing stock, rental and ownership, is 5 percent. While the law is less clear on this point, staff did not dispute the issue given that 5 percent is a reasonable vacancy rate.
- **Comparable Regions.** The adjustments made for overcrowded and cost burdened households depend on the region to which the Bay Area is compared, and the statistical data source that is used. ABAG/MTC staff identified a group of seven large regions for comparison with the Bay Area:
    1. Washington-Baltimore-Arlington, DC-MD-VA-WV-PA
    2. Seattle-Tacoma, WA
    3. Boston-Worcester-Providence, MA-RI-NH-CT

4. Denver-Aurora, CO
5. Minneapolis-St. Paul, MN-WI
6. New York-Newark, NY-NJ-CT-PA
7. Chicago-Naperville, IL-IN-WI

The government code allows the Bay Area to identify comparable regions for calculating the adjustments for overcrowded and cost burdened households. Using comparable regions instead of national averages is more accurate and tends to reduce the size of the adjustment for these two problems. HCD agreed to accept this group of regions for the comparison.

- **Appropriate Federal Data Source.** ABAG/MTC staff asked HCD to only use data from the U.S. Census PUMS 2014-2018 dataset because it is the most recent source. In this case, HCD decided to use another census tabulation, known as the 2011-2015 CHAS dataset. While this data is not as recent, HCD prefers it because it has been able to use it consistently for all of the different regions in the state. Ultimately, the selection of data source and vintage had relatively minor impacts to the RHND calculation.

Needs Determination

The calculation of the RHND follows specific rules laid out in the government code. The baseline population growth during the RHND period is multiplied by factors known as headship rates to produce the number of housing units needed. Adjustment factors for vacancy rates, overpayment and overcrowding are added to calculate the number of housing units necessary for the end of the period. This number is subtracted from the estimated housing units at the beginning of the period, to produce the RHND.

HCD has determined that the total number of housing need, as measured in housing units, for the Cycle 6 RHNA period should be **441,176 units**. The total need is further divided by income level[1] in proportions generally consistent with Cycle 5:

- **114,442 units** affordable to very-low income households (25.9%)
- **65,892 units** affordable to low-income households (14.9%)
- **72,712 units** of moderate-income households (16.5%)
- **188,130 units** of above moderate households (42.6%)

While the total number of units assigned in this RHND cycle is 135% more than in Cycle 5, it is consistent with the low rates of construction in the Bay Area since 2011. It is still well below the number of units assigned to Southern California. SCAG was assigned 1,344,740 units in Cycle 6, a 229% increase from the 409,060 units it was assigned in Cycle 5.

[1] Income categories are determined by the Area Median Income (AMI) set by the Federal Government. Very low-income households make 50% of less of AMI. Low income households make between 80% and 50% of AMI. Moderate income households make between 120% and 80% of AMI, and above moderate or market rate households make over 120% of AMI.

Next Steps

The Executive Board can object to the determination within 30 days of receipt, in accordance with Government Code Section 65584.01(c). Under the statutory deadline, this would mean that HCD would have to receive an appeal prior to July 10, 2020. The objection can only be filed if the region disagrees with HCD population projection, or it believes that HCD has misapplied the RHND methodology.

As HCD have accepted most of the information provided as part of the RHND calculation, including the use of DOF forecast as the baseline population input, and no technical inaccuracies in the RHND calculation have been identified, staff recommends accepting the notice of determination.

The HMC will continue to work to identify a proposed RHNA methodology to distribute the RHND to individual jurisdictions by the fall of this year. The RHND will also play a role in assigning final subregion shares by December 2020. The RHNA process is anticipated to wrap up in late 2021, following the completion of an appeals process next year.

California American Water

Peer Review of Supply and Demand for Water on the Monterey Peninsula

Prepared By: Kevin Alexander, P.E.
Reviewed By: Cindy L. Miller, P.E.; Jack Kiefer, PhD, Greg Gates, P.E., Luke Wang, P.E.
Hazen and Sawyer - August 11, 2020

This memorandum is in response to the following:

- Monterey Peninsula Water Management District (MPWMD), Exhibit 4-A Supply and Demand for Water on the Monterey Peninsula dated March 13, 2020 prepared by David J. Stoldt, General Manager;
- Exhibit 4-B Marina Coast Water District Demand (MCWD) Study by WaterDM dated April 21, 2020;
- Final Supplemental EIR for the PWM Expansion dated April 2020; and
- WaterDM Supplemental Study dated June 24, 2020.

California American Water Company (CalAm) is responsible for ensuring the Monterey Peninsula's available water supply is adequate to meet demand not just under ideal circumstances, but particularly under any number of adverse conditions that have some probability of occurrence.

There is no dispute that the Monterey Peninsula Water Supply Project (MPWSP) will provide a supply required to meet the demand of the Monterey Peninsula. The MPWSP is the only solution that meets the stated goals of Governor Newsom's 2020 Water Resilience Portfolio of: diverse water supplies, protect and enhance natural ecosystems, build connections and be prepared[1].

PHOTOS: USGS (TOP), HAZEN AND SAWYER (ABOVE)

MPWMD's General Manager is asking CalAm to utilize recycled water with sources that are vulnerable to drought, climate change, and water quality challenges. CalAm is asking for consideration of the MPWSP as a means to address those concerns and to address vulnerable supply issues for the entire region.

Considering the Ocean as a safe, secure, reliable, and resilient source as part of the Monterey Peninsula water supply portfolio is critical to solving the region's water supply.

- Since 2001, 13 dry years and 4 critically dry years have affected the Peninsula's water supplies.
- Agricultural flows are diminished by a third when compared to past years.[2]
- Water demands are down and that is reducing municipal wastewater flows available for water recycling.[3]

The Pure Water Monterey(PWM) Expansion project as proposed by Monterey One Water (M1W) is intended to provide additional water supply, but fails to provide the reliability, resiliency and supply diversity needed to meet demand on the Monterey Peninsula under multiple probable adverse scenarios including demand variability, wastewater flow variability, and surface water supply limitations as discussed further in this memorandum.

In contrast, the resiliency and certainty of the MPWSP facility provides the ability to meet uncertain demands across multiple probable adverse scenarios, flexibility to manage supply to protect the environment, and enough water to support stated goals of safe, secure, reliable and resilient water for the Peninsula at all times.

Phase One of the Pure Water Monterey Groundwater Replenishment Project (PWM Phase One) is intended to provide up to 3,500 acre-feet per year of recycled water as a valuable part of the Peninsula's supply portfolio, but expanding the facility with the PWM Expansion means more reliance on an uncertain water source and creates an imbalance in the Peninsula's supply portfolio. Such heavy reliance on one source means more scrutiny must be placed on assessing the risks of the supply.

> **Only the Monterey Peninsula Water Supply Project provides a source that can meet the objectives of a reliable and adequate potable water supply for the Monterey Peninsula.**

Water Resource Management

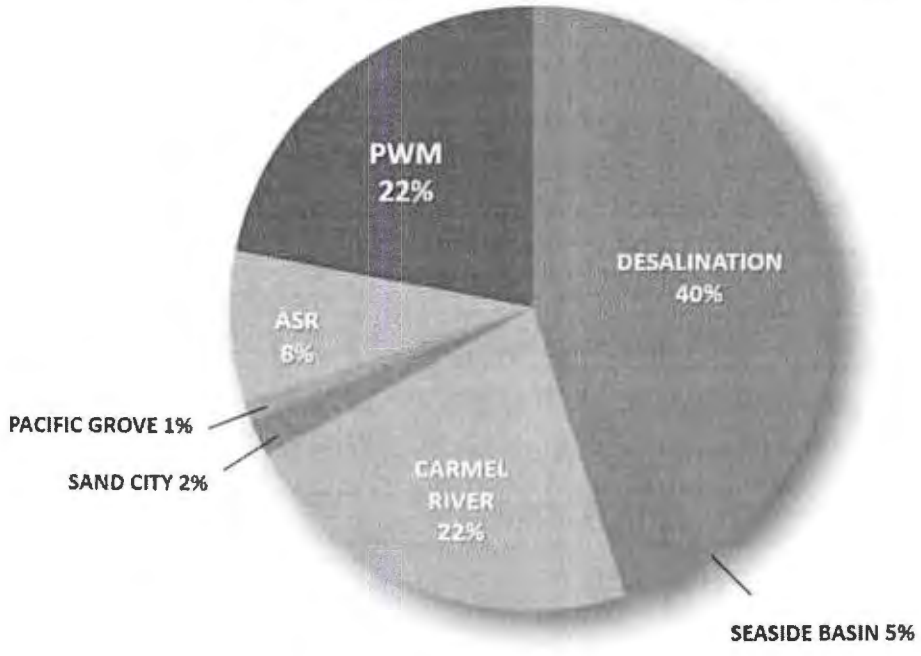
CalAm is responsible for assessing the ability of water supplies to meet the demands of the community and the environment in Monterey. With that responsibility comes a need to identify potential risks to its customers' water supplies and the need to develop plans and supplies resilient to those risks. CalAm has developed the MPWSP to accomplish these objectives, ensuring the ability to protect public health and the environment on the Peninsula for the foreseeable future.

CalAm Considers Water Supplies Through Supply Reliability, Diversification, Data, and Dry Year Resiliency.

Supply Reliability – Water agencies throughout the world consider water supply reliability when developing water supply plans to account for known and unknown risks. California Water Code 10635(a) requires water suppliers to assess the reliability of supplies. Of the proposed supply projects for the Peninsula, only the MPWSP fully accounts for water supply reliability to protect the Peninsula from adverse supply conditions.

Diversification – Diversification is a foundational strategy for minimizing the risks to any kind of water supply portfolio. Even California Water Code section 10608(c) declares that diverse supply portfolios will increase supply reliability. Governor Newsom's 2020 Water Resilience Portfolio includes diversification as the first approach to address climate change in the state's water supply systems and explains that diversification "will strengthen water security and reduce pressure on river systems across the state." (Portfolio, at p. 5.) The Governor explains that local and regional entities "must reduce reliance on any one source and diversify supplies to enable flexibility as conditions change." (Portfolio, p. 17.) The MPWSP increases the diversity of the Peninsula's water portfolio by introducing a new source of raw water and reduces risk, as opposed to the PWM Phase One and the PWM Expansion, which rely on the availability of effluent treated at a centralized recycling facility to generate 51% of total supply available to CalAm's Customers.

Data – Analysis of proposed water sources and demands over the same time period is important to account for impacts such as financial downturns, drought, water restrictions, tiered rates, regulatory changes and population considerations. The MPWMD Supply and Demand Report fails to fully account for historical data and thus fails to tell a complete story by using only the past 3 or 5 years of demand data, while simultaneously using a different time range (2009-2013) for other sources. Informed decisions based on a complete picture of supply and demand and concrete data from the historic and available record can and should be made together and in the best Interest of the Peninsula.



Dry Year Resiliency – Throughout an increasing percentage of the world, the western United States, and certainly California, planning for a very dry year (and a succession of dry years) is a key element to water supply planning as required by the California Water Code. The source water for the MPWSP, the Pacific Ocean, is not vulnerable to drought – and the regulatory conservation that often accompanies it – unlike the source water for PWM Phase One and the PWM Expansion. Governor Newsom's 2020 Water Resilience Portfolio specifically notes that water suppliers need to plan for deeper droughts and "develop strategies to protect communities and fish and wildlife in the event of a drought lasting at least six years. (p. 25) Only the MPWSP provides for such dry year resiliency. (Portfolio, pp. 25-26.)

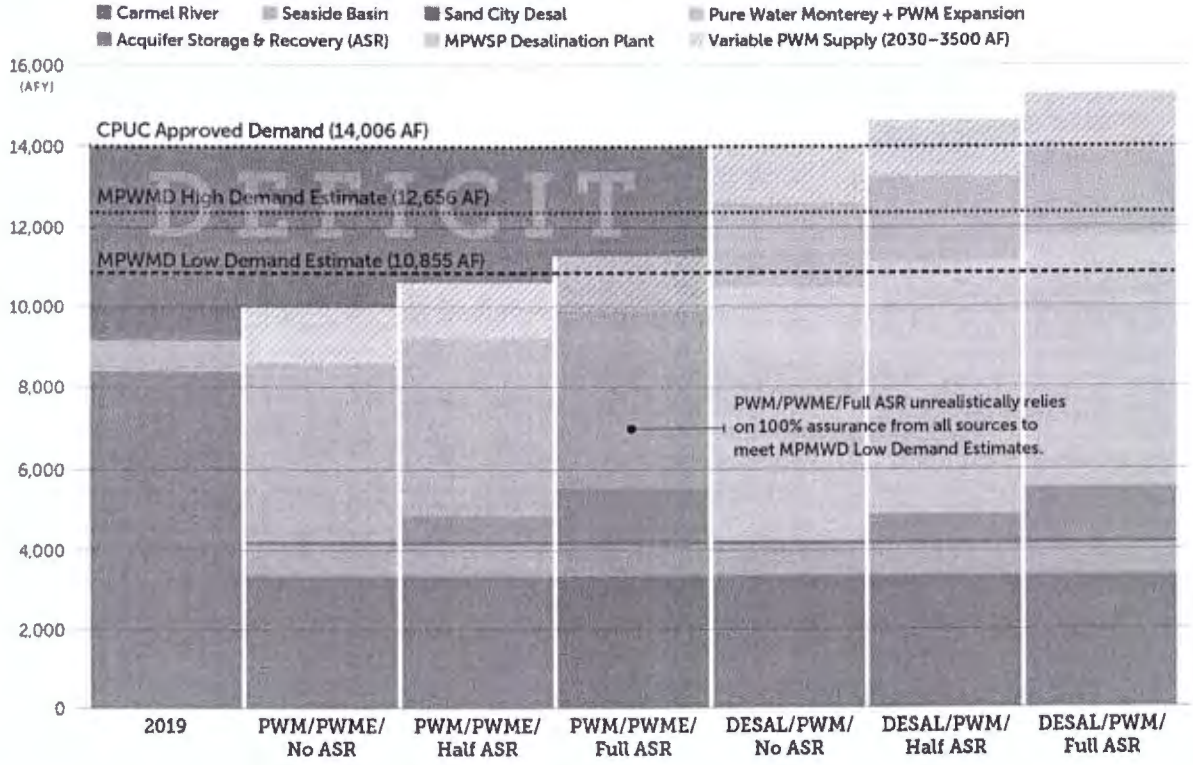
Water Supply to Meet Demand

CalAm is responsible for meeting the requirements of the California Water Code for Urban Water Management Planning, which requires the assessment of the reliability of water service under multiple scenarios (normal, dry, and multiple dry years, including a repeat of the 5 consecutive historic driest years) and consideration of the reliability of water service given the combination of supplies available to it. (See Water Code §10635.) If PWM Phase One and the PWM Expansion are considered key sources of supply for the Peninsula, then the Peninsula is required to rely on production from PWM Phase One and PWM Expansion and ASR at all times to barely achieve normal year demands. Accepting the PWM Expansion as a key supply does not line up with informed and thorough engineering practices for water supply planning required by the California Water Code. (Water Code §§ 10610 *et seq.*) Figure 1 below illustrates why a diverse and balanced portfolio of water supplies is required for the Peninsula to meet the range of water demands including low optimistic demand values to the higher and more conservative demand values.

The only solution that addresses the water supply issue in a way that provides appropriate supply reliability on the Peninsula is the MPWSP. As depicted in Figure 1 below, coupled with the existing PWM Phase One and other existing sources, the MPWSP provides a robust and diversified portfolio of water supplies to address known and probable challenges such as prolonged drought conditions, limited wastewater flows, limited PWM Phase One injection, limited agricultural drain flows, flows from the Sand City Desal and possible limited flows from Aquifer Storage and Recovery (ASR).

Figure 1: Monterey Peninsula Water Supply Portfolio Diversification

ASR build-up in particular has not been successfully demonstrated throughout the development and use of the ASR system over a 15-year period. As shown in Figure 6, included in the Appendix hereto, only once in the past 15 years has ASR achieved 1,300 AFY. As explained in Hazen's prior memo, ASR water availability is reduced to 63% in a single dry year, and even further reduced to 4% following three dry years. Therefore, ASR does not meet Water Code reliability standards (5 consecutive historic driest years) or Governor Newsom's 2020 Water Resilience Portfolio that requires consideration of a drought lasting six years.



Further, over the past 15 years, the average availability of ASR is approximately 138 AFY, far less than the 1,300 AFY assumed by MPWMD General Manager David Stoldt and WaterDM as available to meet water demand on the Peninsula. Even over the last five years, the average availability of ASR is 352 AFY, which again is far less than the 1,300 AFY assumed available by Stoldt and WaterDM. Analysis offered by Stoldt in September 2019 to the Coastal Commission and WaterDM relied on the full availability of ASR in order for the PWM Expansion to meet existing demand on the Peninsula, however, such analysis is based on the unrealistic assumption that no drought will take place between now and 2034. Such an assumption is contradicted by plain history—there has been a multi-year drought in California in virtually every decade since 1917—and as discussed above is inconsistent with applicable water planning regulations and guidance.

In addition, counting on ASR storage at 100% with limited knowledge of losses to the ocean and other basins imparts uncertainty in that supply as a continuous resource and drought mitigation strategy. In Figure 2 below, ASR volume is shown under three distinct scenarios to account for the limited volume stored over the past 15 years and these other uncertainties—No ASR, Half ASR and Full ASR. Notably, even the Half ASR scenario requires 650 AFY, which is almost double the average ASR availability over the past five years, and over five times the 15-year ASR average. When the variability of ASR is considered, the PWM Phase One and PWM Expansion do not meet the Peninsula's minimum water demands. This is one of the reasons that the California Public Utilities Commission concluded that "only in conjunction with construction of a desalination plant of some size within five to fifteen years" would the PWM Expansion be capable of providing a "sufficient and reliable water supply" for the Peninsula. (See CPUC Decision D.18-09-017, Appx. C, p. C-71.)

Figure 2: Monterey Peninsula Water Supplies to Meet Demands

Comparison of PWM Expansion and MPWSP with Variable ASR

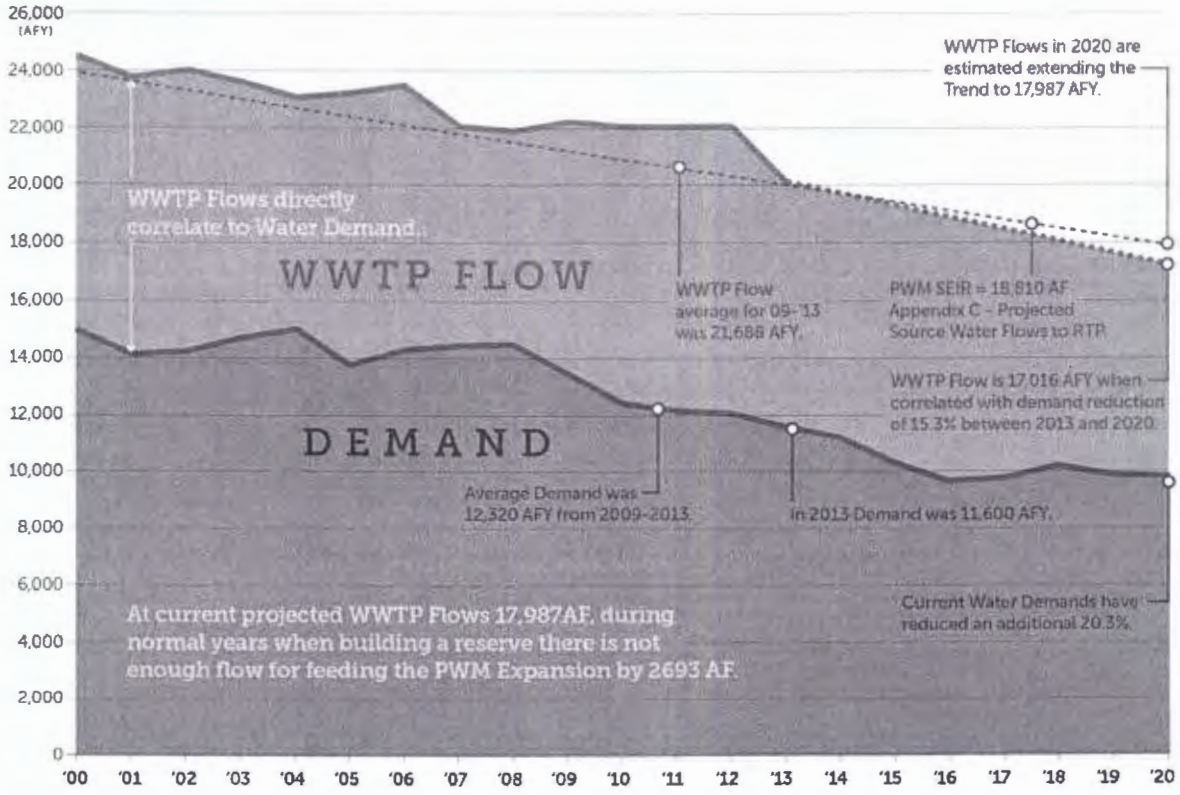
MPWSP opponents claim that the MPWSP is not currently needed to meet existing demand projections. However, meeting even the lowest demand projections without the MPWSP requires full capacity operation of two other supplies that have yet to prove reliable and are vulnerable to high-probability risks.

Wastewater as a Source for PWM Phase One and PWM Expansion

Stoldt's characterization of the PWM Expansion as a project that can replace CalAm's existing water supplies and meet the long-term needs of the Peninsula also does not accurately and transparently account for the risks of having wastewater as a primary water supply that varies with demand and drought.[4,5] As discussed below, publicly available evidence demonstrates that wastewater cannot be relied upon as a primary water source for the PWM Expansion, and additional reliable supplies would be needed to ensure that the PWM Phase One and PWM Expansion can supply water in the amounts those projects have promised/projected.

The MPMWD Supply and Demand Report and the Supplemental EIR for the PWM Expansion focus on demands being low and use the last 3, 5 and 10 years as the basis for revised demand assumptions in CalAm's service territory. (See MPWMD Supply and Demand Report page 8, Table 3 .) MPMWD had WaterDM evaluate demands with recent data in an attempt to explain the differences in demands between estimates by CalAm and what has been observed on the Peninsula in the past 5 years.[6]

In contrast to MPMWD's and WaterDM's attempt to focus only on the most recent years to support their positions, Appendix I to the Supplemental EIR for the PWM Expansion asserts that the average wastewater treatment plant (WWTP) flows should be based on the period from 2009 to 2013 where WWTP flows were 21,764 AF, or a worse case flow of 20,090 AF based on the 2013 drought year.[7] By failing to account for the most recent years since 2013, Appendix I substantially overstates the available wastewater flows that could potentially be used as source water for recycled water projects on the Peninsula.



The approach taken in Appendix I ignores that WWTP flows correlate to water demand/use, which has continued to decrease on the Peninsula due to conservation and other factors. Based on available data, Figure 3 below depicts an overall downward trend in WWTP flows that is consistent with the observed decline in water demand on the Peninsula. The EIR from 2016 for PWM Phase One shows WWTP flows trending downward from approximately 25,000 AF in 2000 to approximately 20,000 AF in 2013.[8] A separate appendix to the Supplemental EIR (Appendix E) shows further reduced WWTP flows to 18,810 AF (16.79 MGD) .[9] However, this number was not utilized in the Supplemental EIR to calculate available WWTP flows as source water for either PWM Phase One or PWM Expansion, which is a significant error.

Moreover, additional data collected by M1W and presented to its Ad-Hoc JPA Revision Committee on July 20, 2020, indicates that since the beginning of 2020 WWTP flows are yet again further reduced to 17,980 AF or 16.05 mgd, as specified in Exhibit 5.[10]

Figure 3 shows that the WWTP Flows correlate with demand reductions on the Peninsula. For example, as shown in Figure 3, since 2013 demand has declined 20.3% when compared to the average demand from 2009 to 2013. Additionally, 2013 drought year demand compared to current demand, represents a 15.3% reduction.[11] Calculating the WWTP flows over these same time periods using these respective reduction percentages (20.3% and 15.3%), a conservative estimate of current average WWTP flows is 17,296 AF to as low as 17,016 AF, respectively. An alternative method of determining todays WWTP flows based on a linear trend of the existing flow data indicates that current flows are 17,987 AF, as shown in Figure 3. All of these WWTP flow estimates, which are based on a more complete picture of recent data, are much lower than those used in the SEIR Appendix I -Tables 8 to 11. As result the SEIR substantially overstates the availability of WWTP flows available as source water available to PWM Phase One and the PWM Expansion.

Figure 3: Reduced Demand = Reduced WWTP Flow (=Reduced Recycled Water Supply)

Monterey Wastewater Flows shown in the SEIR Appendix I-Table 8,9,10 (Normal Yr) and Table 11(Dry Yr) use data from 2009-2013 which does not represent the current WWTP Flows. The graph below estimates current WWTP flows in 2020 based on demand correlation from MPWMD Supply and Demand Report-Fig 1.

SEIR Appendix I -Tables 8 to 11 have been updated in Table 1 below to reflect more realistic estimates of WWTP flows, along with minor reductions to Reclamation Ditch flows in the Surface Waters category based on the analysis provided in the next section of this memorandum demonstrating these flows also are expected to be reduced compared to amounts claimed in the SEIR. When realistic estimates of WWTP flows are utilized, it becomes clear, the MPMWD Supply and Demand Study and the SEIR failed to assess how reduced WWTP flows would adversely affect production of the PWM Phase One or the PWM Expansion. The following Table 1 provides a comparison of Supply and Demand from SEIR Appendix I - Tables 8 to 11 with updated WWTP flows and Reclamation Ditch flows to show the impact of these expected reductions on the water available to use for the CSIP, PWM Phase One, PWM Expansion, and the Regional Urban Water Augmentation Project (RUWAP). In all conditions there is a supply deficit.

TABLE 1 – IMPACTS OF REDUCED WWTP FLOW ON TABLES 8 – 11 FROM SEIR APPX. I

Notes:

a Updated WWTP Flows based on Figure 2 Trends and calculated Dry Year from Demand Correlation

B New sources from Table 8-11

c Surface water updated by reducing Reclamation Ditch Values from USGS 10yr average.

d Annual supply excess calculated from Supply minus Demand. A negative value means a supply deficit.

Table 2 represents a flow balance to compare SEIR Appendix I Tables 8 to 11 compared to updated Table 8 to 11 with updated WWTP flow and Reclamation Ditch waters from Figure 3. Based on the flow balance for the updated Normal/Wet Year when building a reserve "Table 9 Updated column" would allow for 84 Acre-Ft to be fed to the PWM Expansion. The available supply for the Dry Year, as shown in the "Table 11 Updated" column, demonstrates that there is no flow available for PWM Phase One and PWM Expansion during a dry year, and flow for RUWAP would have to be taken as a water right to serve those flows. All scenarios analyzed demonstrate that there is little to no WWTP flow available to PWM Expansion. As a result, PWM Expansion would not have sufficient source water to produce the promised supply of 2,250 AFY.

TABLE 2 – IMPACTS OF REDUCED WWTP FLOW ON SUPPLY FLOW BALANCE

Flow Balance – *in Acre-Ft*	**Table 8**	**Table 9**	**Table 10**	**Table 11**	**Table 8** Update	**Table 9** Update	**Table 10** Update	**Table 11** Update

Notes:

e CSIP and CSIP Well Flows from Table 8-11 Demand. Reduced CSIP in "Table 11 Updated" by taking Water Right
f Revised flow to PWM down for Table 11 to match actual Use to supply
g Flow available to PWME is calculated based on maintaining flow to PWM and RUWAP and to Concentrate
h Actual Use is calculated to confirm balance with Supply
i ASR Flow is from the AWT product water flow without RUWAP
j Concentrate flow is 19% of Flow for PWM, PWM Drought, PWME, and RUWAP
k Deficit to ASR based on Flow to ASR minus the PWM AND PWME DEMAND from Table 1

The above analysis of the WWTP flows demonstrates the need for a very thorough and transparent analysis of the current WWTP flows and the impact to the reliability of PWM Phase One and PWM Expansion. At present, there appear to be significant limitations on the availability of source water from WWTP Flows for the PWM Expansion.

Surface Water Flow Analysis

As discussed above, another area that requires consideration is the flow available to the PWM Phase One and PWM Expansion from the proposed Surface Water supplies. The Reclamation Ditch flows were analyzed originally in the Schaaf & Wheeler Agricultural Ditch Yield Study, March 2015 based on 2006-2014 data, and were updated in the SEIR Appendix I Tables 8-11. A detailed analysis of the Reclamation Ditch flows using the most recent USGS data reveals that average flows are lower than indicated in Schaaf & Wheeler and the SEIR Appendix I. The following Table 3 below shows the average monthly flow according to USGS for the last 5 years, 10 years and 2013 as compared to the values in the SEIR Appendix I Tables 8 to 11.

Table 3: Reclamation Ditch Flows[12]

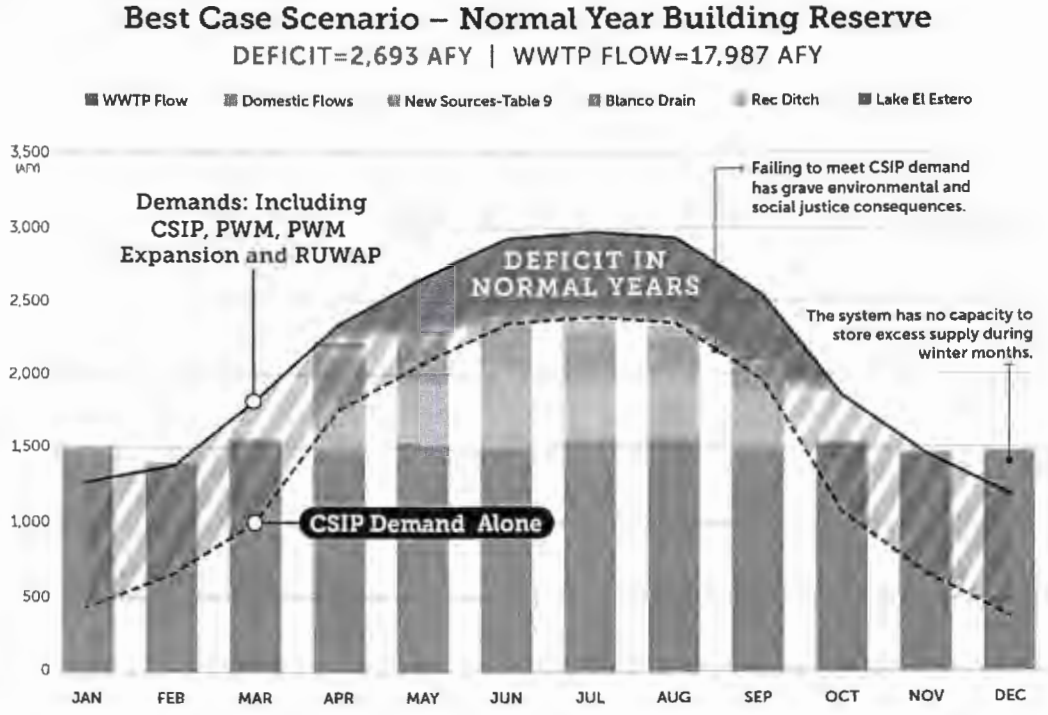
	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Normal Years (Ac-ft)												
USGS 5 yr Avg minus Instream	>360	>360	>360	340	123	74	83	77	35	108	>360	>360
USGS 10 yr Avg minus Instream	>360	>360	>360	356	59	93	98	96	45	129	>360	>360
Table 8	70	66	70	106	79	99	113	109	72	65	89	76
Table 9	0	0	0	106	79	99	113	109	72	11	0	0
Table 10	0	0	0	106	79	99	113	109	72	0	0	0
Dry Years (Ac-ft)												
USGS 2013(Same Jan/Feb as Tbl11)	0	0	42	4	0	28	53	57	23	16	43	0
Table 11	0	0	70	106	79	99	113	109	72	65	89	0

Note: >360 is when diversion flows above 6 cubic feet per second (CFS) after subtraction of the instream of 2 CFS.

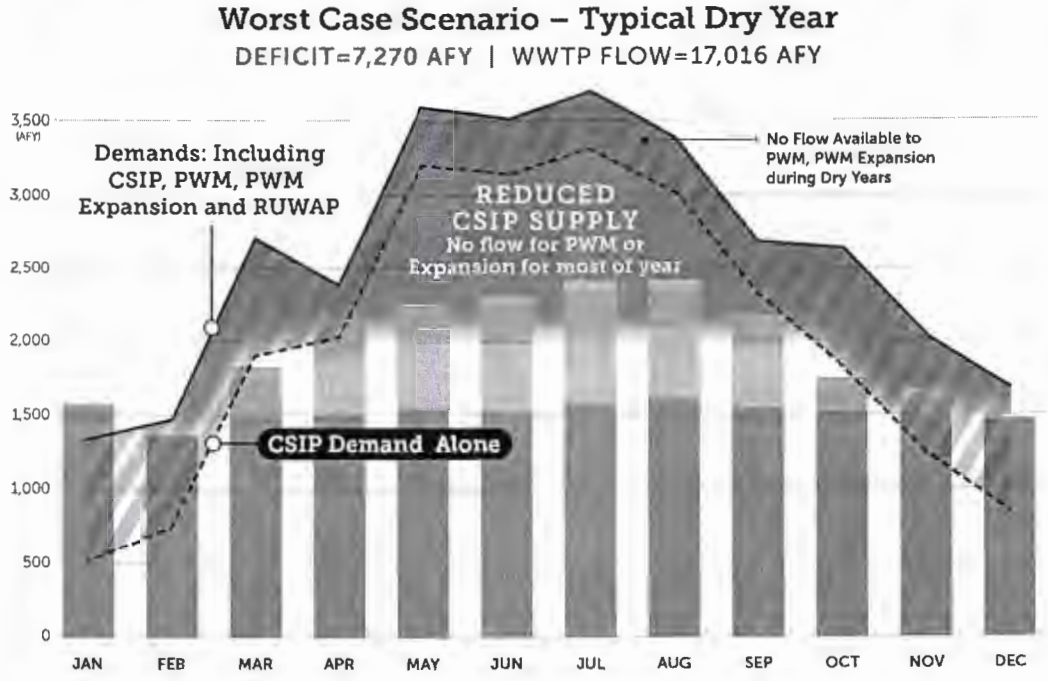
Table 3 shows that for the months of May through September there is a reduction of average flow per month of 16% between the Table 8, 9 and 10 compared to the USGS flows for a 10 year comparison. Table 3 also shows that for the months of June through September there is a reduction of average flow per month of 16% between the Table 8, 9 and 10 compared to the USGS flows for a 5 year comparison. In addition, using the USGS flows for 2013 with similar assumptions for December-February, there is a 67% reduction

in flow as compared to the predicted dry year in SEIR Table 11. As a result, the SEIR overstates the availability of Reclamation Ditch flow potentially available as source water for PWM Phase One and the PWM Expansion. Again, in this case the available flow to the PWM Phase One and the PWM Expansion should be reconsidered and revised accordingly.

The Schaaf & Wheeler report for the Reclamation Ditch indicates that agricultural flows are continuing to drop, and have dropped 1/3 in recent years. This would likely mean there are reductions in the monthly flows from Blanco Drain as well as the Agricultural Wash Water below what is projected in the SEIR. The flows for these two proposed sources were not updated beyond what was provided in the original Draft EIR for the PWM Phase One in 2016 in Appendix B – Source Water Assumptions Memorandum dated March 26, 2015. Both of those data sources in the SEIR Appendix I Tables 8 through 11 are based on similar dated information from 2014. If the flows from the Blanco Drain and Agricultural Wash Water are considered to have similar percentage reductions during the April to October period as Reclamation Ditch flows, then there are likely conditions where the actual flows available may not be able to supply the PWM Phase One let alone the PMW Expansion.



Supplies and Demands



The combined analysis of supplies and demand illustrated in Figure 4 below (Normal/ Wet Year Building ASR) and (Dry Year) are based on monthly supply and demand from SEIR Appendix I-Tables 9 and 11 with data updated as noted in Table 1 above. Figure 4 shows that when lower WWTP Flow from Figure 3 and lower Reclamation Ditch flows from Table 3 and all other available sources are accounted for, that demand for those specific source waters far exceeds available supplies in Normal/Wet Years and in Dry Years.

Table 2 above shows that in Normal Years Building a Reserve (Table 9 Updated Column), there is potentially only 84 AF available from all of the available supplies for the PWM Expansion. Then in Dry Years, Table 2 shows there is actually no flow available from all of the supplies for the PWM Phase One or the PWM Expansion assuming water is still supplied to the CSIP with some flow taken from CSIP as a water right (as described in the Final Supplemental EIR-3.3 Master Response #3: Comments on Water Supply and Source Water Availability) to serve the Regional Urban Water Augmentation Project (RUWAP). Based on this analysis, PWM Phase One and PWM Expansion would not be able to provide their promised product water to the Peninsula during dry years, which are 3,500 AFY and 2,250 AFY, respectively.

Figure 4: Impacts of Demands Exceeding Limited Supplies

Best Case Scenario based upon SEIR Appendix I-Table 9 with revised WWTP Flows (Updated Table 9) shows a supply deficit such that 84 Acre-Ft is available to PWM Expansion. The Worst Case Scenario based upon SEIR Appendix I – Table 11 Dry Year with revised WWTP Flows (Updated Table 11) shows a deficit with Zero flow available to PWM, PWM Expansion and reduced flow to CSIP.

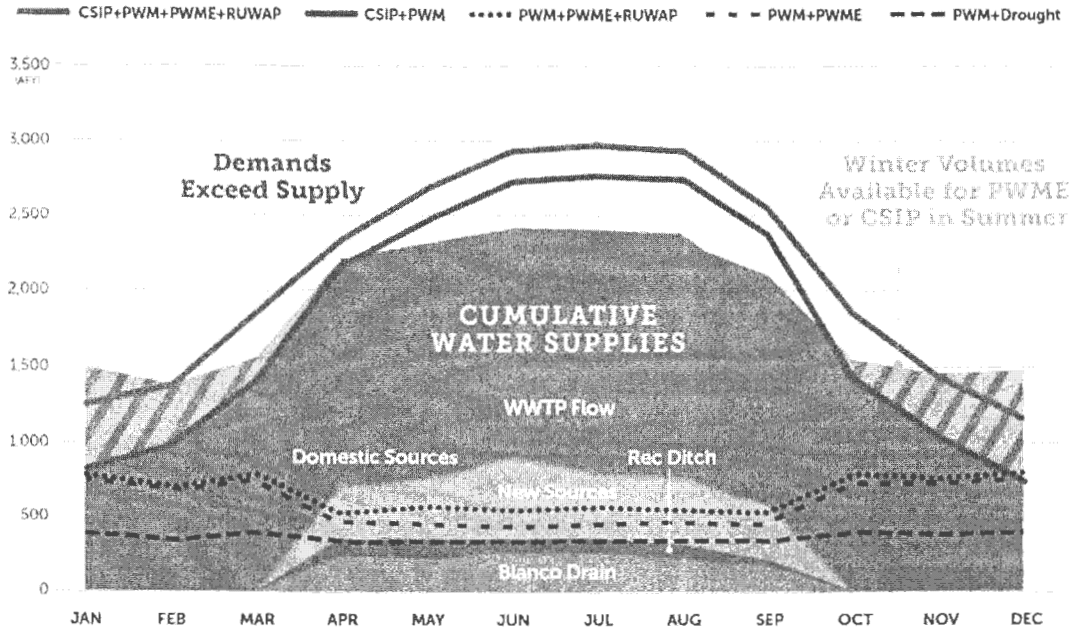
The demand assumptions in Figure 4 use the same values in SEIR Appendix I Tables 9 and 11 for CSIP, PWM Phase One, PWM Expansion and RUWAP which are the same values used in Table 1 above.

As shown in Figure 4 above there is a demonstrable water deficit. Monthly supply of water as compared to demand even when the additional proposed supplies of Agricultural Wash Water, Urban Runoff, Blanco Drain, and Reclamation Ditch are included does not satisfy the demand during a significant portion of the year – particularly during the summer months.

Water Supply Deficit for either PWM Expansion or CSIP

Without an adequate supply of source water, the Peninsula is placed in a difficult position of whether to supply water to the PWM Expansion or the CSIP system, which will impact the environment long term. Although there are water rights for the water that MWMWD proposes to use to supply the PWM Expansion, there are overstatements of the actual flows that need to be addressed. Protecting public health and the environment requires determining the true volumes available for the project and whether those flows can be counted on day in and day out for supply of water to the Peninsula.

Figure 5 closely correlates the cumulative water supplies to the respective cumulative demands. The water supplies are shown in the order of use with the PWM Phase One using Blanco Drain and Rec Ditch. Based on agreements, such as the Amended and Restated Water Recycling Agreement between the M1W and the Monterey County Water Resources Agency, those flows are unavailable to the PWM Expansion. Then New Sources are added to serve as the supplies for the PWM Expansion according to the priorities and water rights as defined in SEIR Appendix M. The supplies are cumulative by month. The graphs are based on SEIR Appendix I -Table 9 and 11 with the WWTP and Reclamation Ditch flows updated. These graphs include Lake El Estero and AWW, which are now not included in the water supply as noted in SEIR Appendix M as a best-case supply scenario (SEIR Appendix M-Page 5).



The demands in Figure 5 are each shown cumulatively for PWM, then PWM+PWME, then PWM+PWME+RUWAP, and ultimately PWM+PWM+RUWAP and CSIP. There is a separate blue line of PWM+CSIP to show a normal year today without the PWM Expansion. That line is necessary to determine available volume in the winter.

Figure 5: Supply Available for PWM Expansion or CSIP (Not Both)

Best Case Scenario based upon SEIR Appendix I-Table 9 with revised WWTP Flows (Updated Table 9) shows winter volume available for PWM Expansion or if injected could be used for CSIP in the summer. The Worst Case Scenario is based upon SEIR Appendix I – Table 11 Dry Year with revised WWTP Flows (Updated Table 11) shows there is near Zero flow available for the PWM Expansion in winter and significant reduced flow to CSIP.

Best Case Scenario – Normal Year Building Reserve

DEFICIT=2,693 AFY | WWTP FLOW=17,987 AFY

Worst Case Scenario – Typical Dry Year

DEFICIT=7,270 AFY | WWTP FLOW=17,016 AFY

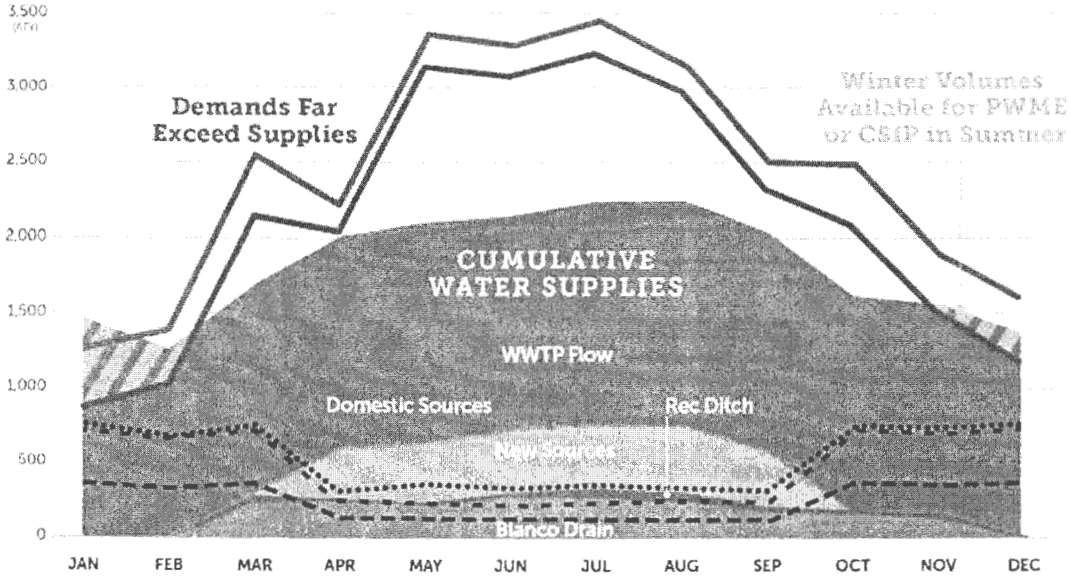


Figure 5 demonstrates that in normal years, excess winter effluent that would ultimately go to the Ocean can be used or it is otherwise wasted. However, with current CSIP demand the system will always be in a deficit. If CSIP could capture winter flow (such as the proposed but not implemented improvements to the Salinas Valley Reclamation Project (SVRP) (SEIR Master Response #3 p. 3-20, SEIR Appendix M- Page 5)) to run SVRP and CSIP at lower flows without using wells in conjunction with water storage or groundwater infiltration, then excess winter water could be available for use in the summer for CSIP. Implementing such a storage program would be a sizable new development project and would require a significant investment to secure and develop the necessary property where the storage program could be implemented (such as a reservoir). Further, for CSIP and CSIP well demands in SEIR Appendix I Tables 9-11 to be met, this would require all of the other New Water sources, Blanco Drain and Reclamation Ditch as well to meet the combined CSIP and CSIP well flows now and especially in dry years.

CSIP flows are shown in Figure 5 based on the SEIR Tables 8-11 including the CSIP well pumping. It should be noted that the improvements to SVRP have not been completed and therefore, the CSIP must rely on well pumping.

It should be highlighted that the flows shown in SEIR Appendix I for Tables 8-11 were not updated to match the assumptions in Final SEIR Appendix M. If the flows shown in Tables 8 to 11 were updated to account for the assumptions made in Final SEIR Appendix M, then the water supply deficit depicted in Figures 4 and 5 above would be even greater. For example, the Agricultural Wash Water and Lake El Estero were assumed to be unavailable in Final SEIR Appendix M. Moreover, Reclamation Ditch Flows were not reduced as noted in Table 3-B in the Final SEIR Master Response #3.

In addition, the SEIR Master Response #3 Table 3-A and SEIR Appendix M Table 2 both support the reduced flow of wastewater highlighted in Figure 3 above. One example is the use of 5,811 AFY as the Secondary Effluent available from the Outfall which is 3,000 AFY less than the estimated amount in Table 8, 9 and 10 of the SEIR Appendix I of 8,809 AFY. Assuming this is the updated Outfall flow, this would correlate to roughly 18,810 AFY of WWTP flow in 2018. Again, this was not highlighted in Source Water Availability, Use and Yield in SEIR Appendix I and as discussed earlier in this memorandum the regional wastewater flows have reduced since then. When these reductions are accounted for, the supply deficit will only increase. As a result, the technical analysis of the PWM Expansion has greatly overstated the reliability and availability of the source water. It is not feasible to achieve the PWM Expansion's projected water deliveries of 2,250 AFY based on the proposed water sources.

Responding to MPMWD and Water Demand Analysis

CalAm is responsible for assessing water demand on the Peninsula and continues to evaluate the impacts from climate change, regulatory drivers, growth in residential and commercial demands, impacts from water rates and restrictions imposed, and considers a future when the MPWSP is in place and how available water will shift demands. CalAm is contributing to conservation programs, participating in cutting edge research on leakage to apply the latest approaches to loss to their system.

All of this is done to ensure their customer demands are met, the environment is protected, and that water is not wasted. In performance of these duties, CalAm is continuing to assess the risks associated with meeting average demands, maximum day demand and peak hour demands. Hazen has participated in the studies with CalAm on system loss and is providing water resources planning services.

Hazen and Sawyer response to comments from MPMWD and WaterDM regarding prior memorandum:

Hazen and Sawyer is a national consulting engineering firm with a focus on all aspects of water supplies, planning, treatment and demands. We have local and national experts working on evaluation of water supplies and demands. It should be noted that WaterDM is a firm that collaborates with Hazen and Sawyer on large water supply projects and is currently a team partner for projects on the East Coast.

MPWMD and WaterDM reviewed Hazen's prior memorandum dated January 2020 and point to many areas that they consider deficient, in error or misleading. Hazen disagrees with this claim. The Hazen memorandum as written highlights the substantial concern with assuming lower water demands on the Peninsula with no discussion of range of uncertainty. We feel the higher demands are warranted to provide a buffer for uncertainty. WaterDM and MPMWD have been unwilling to address the risk of the potential demand increases on supply. For supply to the PWM Expansion, these entities have avoided updating the flow data with transparent information on the proposed supplies.

WaterDM does not address variability or uncertainty of supplies in their report to a level to assess the risk of the supplies to meeting the lowest projected demands that they developed.

Hazen asserts that supply and demand planning in an area like the Monterey Peninsula that is dependent on new sources of water must look at the risk and must apply an appropriate level of reliability and resiliency as good engineering principles. MPMWD has not addressed the current supply as required by the California CWC Section 10635 for normal, dry and multiple dry years to prove the resilience of that supply. Our analysis highlights the need for more analysis with recent data including consideration of historical impacts to supply. This also gets to the heart of our prior memorandum.

Current codes and regulations as well as their interpretation are important to establishing a reliable and resilient water supply across a range of likely supply and demand conditions. MPMWD focused on the interpretation of Maximum Day Demand and Peak Day Demand versus annual demand which is well understood, but avoided the topic of assessing the long-term historical data in determining future demands and not just picking data to fit a narrative.

In addition, interpreting the latest revisions to American Waterworks Association (AWWA) M50 Manual to say that MPWMD can use 3 or 5 years of data when there is over 20 years of data available is not in line with the intent and spirit of the latest version of that document which Hazen participated in developing.

Hazen and Sawyer had the MPMWD Supply and Demand Report reviewed independently by Hazen's nationally recognized demand expert, Dr. Jack Kiefer. He noted: *"There is not a standard or minimum amount of empirical rigor formally promulgated, which leads many to focus on simple averaging and story-telling instead of modeling cause and effect and then using official economic forecasts for evaluating and predicting growth. In addition, it is seldom when you see uncertainty explicitly accounted for or at least addressed which detracts from a higher-level objective of identifying, reducing and mitigating risks."*

Hazen's intentions with our comments on MPWMD's analysis are consistent with that objective – a desire to see the Water Supply Solutions for the Monterey Peninsula truly evaluated and the risks of the water supply mitigated.

(Continued next page)

The demand analysis performed by WaterDM assumes that existing water conservation measures will result in increased conservation without implementing more stringent measures, such as use moratoriums and water rationing. CalAm has invested heavily in Conservation Programs as well as paying for research into water loss and loss detection and mitigation strategies in an assertive effort to minimize the impact to the area in the absence of a water supply solution meeting the basic requirements noted herein. WaterDM and MPMWD do not acknowledge that the MPWSP was designed to avoid the need for further implementation of stringent measures, like moratoriums and water rationing. Those types of measures may be necessary to achieve the demands that WaterDM and MPWMD are projecting.

MPMWD's response to the Hazen memorandum regarding ASR, states that there is "no immediate present-day demands" for the PWM Expansion flow. If the PWM Expansion is the backup project to satisfy the CDO, as noted in the SEIR (Final SEIR Page 1-1), to supply water if MPWSP is not available then the water demand today would require all of that flow and flow from ASR that is not available.

MPMWD references multiple times the SEIR Appendix I-Tables 9 through 11 and states "the annual use of the new sources exceeds the annual AWPF demands." The SEIR documents however do not provide recent flow data as a basis for the claim that the multiple sources of water in the Appendix M of the SEIR actually available to the PWM Expansion. It highlights those flows are from assumptions and flow balance calculations. As noted herein, there is a need to assess the current water supplies with recent data from the water sources to fully validate that statement.

To assume that paper water is presently available without evaluating actual flow data is a significant error.

The WaterDM Supplemental Study maintains the same errors at the first WaterDM Study. The water projections in the WaterDM Supplemental Study remain unreasonable, including an over estimation of the availability of ASR and PWM Phase One. Likewise, the WaterDM Supplemental Study understates demand on the Peninsula and overlooks M1W's July 20, 2020 report that indicates since the beginning of 2020 WWTP flows were reduced to 17,980 AF or 16.05 mgd. Nonetheless, meeting even the lowest demand projection in the Supplemental Study is unrealistic without the MPWSP and would require full capacity operation of the PWM Phase One and the PWM Expansion, supplies that have yet to prove reliable and are vulnerable to high-probability risks.

Recommendations and Conclusions

This memorandum is based on extensive analysis and a thorough review of the MPWMD Supply and Demand Report, the WaterDM Study, the Supplemental EIR for the PWM Expansion as well as other supporting documents. The following recommendations and conclusions are offered to the California Coastal Commission to consider as it evaluates the MPWSP and considers the feasibility of the PWM Expansion:

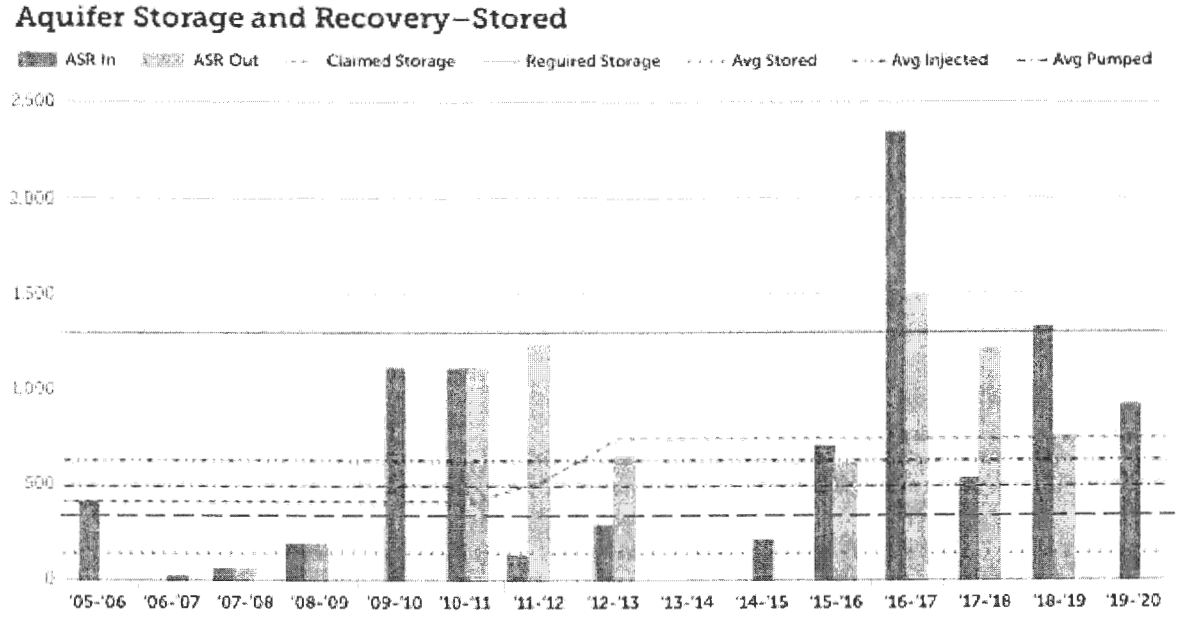
1. MPWMD Supply and Demand Report and SEIR for the PWM Expansion put the Peninsula in jeopardy of not having water available for meeting current demands with no recognition and accommodation for future uncertainty within the supplies proposed. (Refer to Figure 2).

2. MPWSP is the only currently proposed and feasible solution that provides safe secure reliable and resilient supply for a diversified portfolio for the Peninsula. (Refer to Figure 2).

3. The water supplies proposed for the PWM Expansion need further analysis with recent flow data to assess that water is actually available. Even if it is assumed that MPWMD has sufficient water rights to the source water for the PWM Expansion, which we understand it does not, holding adequate water rights will not actually secure water for the PWM Expansion if there is not actual water available to treat. (Refer to Figure 3).

4. The complex water supply management strategy to prioritize water supplies with limited historical flow information is a risk that must be considered in evaluating flows used for ensuring potable water supplies.

5. There is a deficit in water that will be available to the PWM Expansion when considering todays wastewater flows and Reclamation Ditch flows based on the most recent available data. Figure 4 highlights the deficit in supplies available to meet demands of PWM Phase One , CSIP, RUWAP and PWM Expansion.



6. Assuming that there are adequate water rights for the water supplies that MPMWD proposes to supply the PWM Expansion, the SEIR and supporting studies overstate the actual flows available for the PWM Expansion. The true flow available to the PWM Expansion needs to be addressed to determine the true volumes available and to determine if those flows can be counted on day in and day out to supply the Peninsula. Based on the proposed supplies as studied to date, PWM Expansion appears infeasible.

7. The PWM Expansion should be reevaluated based on updated and accurate flow data and demands such as CSIP and PWM. Current flows even in best of water supply cases shows that CSIP will always be in a deficit. The impact of the CSIP deficit should be evaluated to avoid unintended environmental impacts if seawater intrusion is not mitigated by CSIP flows.

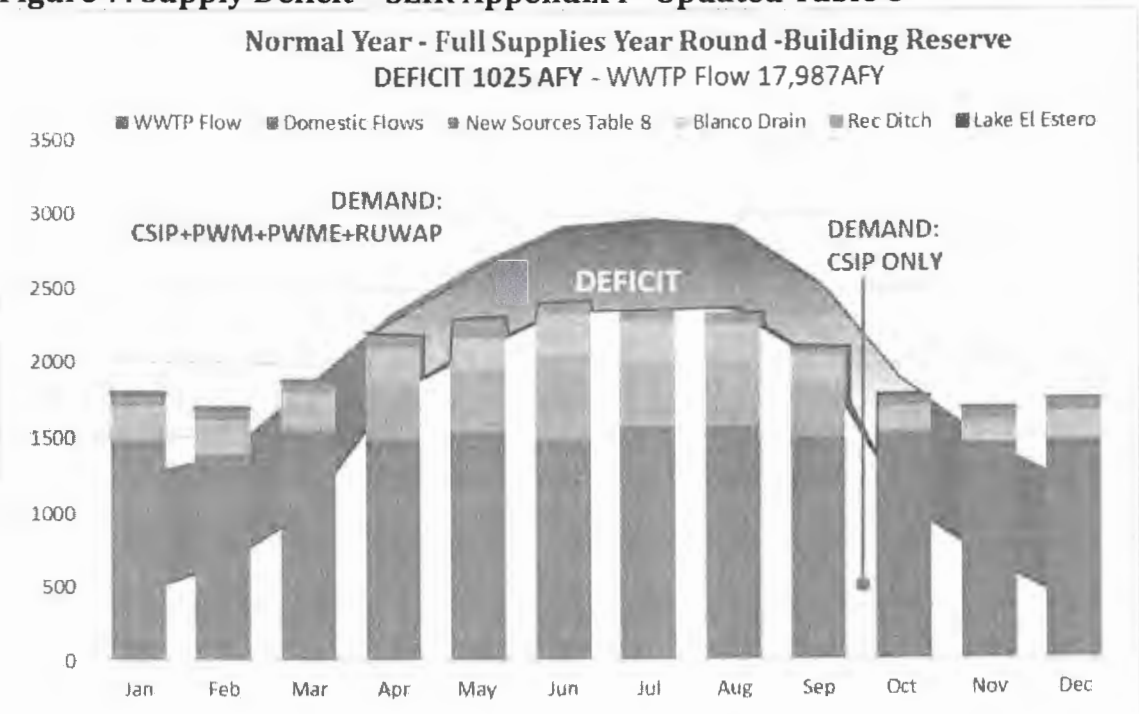
Appendix

Figure 6 represents the current Aquifer Storage and Recovery program over the past 15 years in operation. Figure 4 shows the average annual injected and annual average pumped volume. The average stored volume annually over 15 years is 138 acre-ft. Over 15 years there is only 700 acre-ft claimed as storage yet the MPMWD Supply and Demand Report indicates they can store 1,300 acre-ft per year. There are only two years the system has achieved more than 1,300 acre-ft into the aquifer. The limited average storage coupled with the injection limitations being experienced at PWM Phase One means these supplies are not yet reliable to be considered as a source that CalAm or any other public agency.

Figure 6: Aquifer Storage and Recovery

Figures 7 and 8 are provided as further information for Updated Tables 8 and 10 to highlight that in all conditions, there is a flow deficit with updated WWTP and Reclamation Ditch Flows. In the above document, Best Case and Worst Case were used to keep the discussion simple and direct. There is a flow deficit in all conditions and there is a need to update the relevant calculations with recent flow data to give an accurate assessment of supply and demand in a clear and transparent way.

Figure 7: Supply Deficit – SEIR Appendix I - Updated Table 8



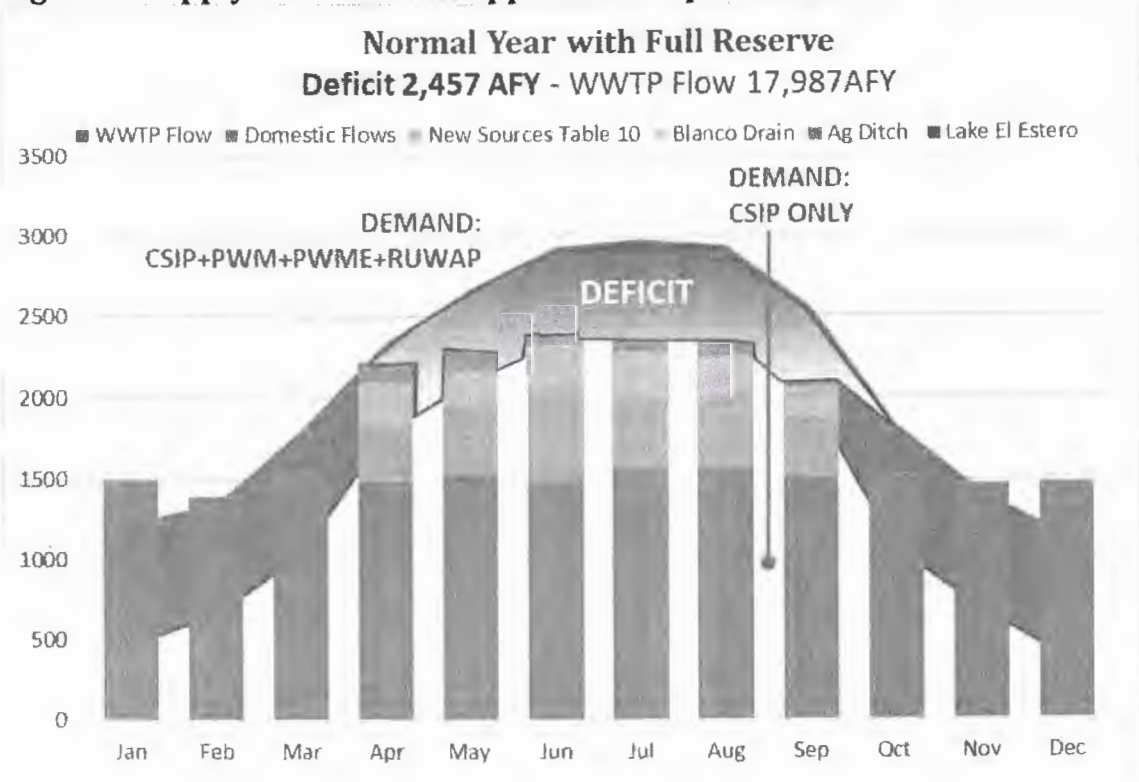


Figure 8: Supply Deficit – SEIR Appendix I – Updated Table 10

Jack Kiefer, PhD Resume

Hazen and Sawyer

Water Resources Expert

Jack C. Kiefer, PhD

Senior Associate

Dr. Kiefer is an economist and geographer specializing in multiple consulting areas of water resource economics and planning, econometrics, and integrated water demand and supply planning and management.

Education

PhD, Geography, Southern Illinois University

MA, Monetary and Development Economics, Southern Illinois University

BA, Economics, Southern Illinois University

Areas of Expertise

- Water Resources Planning
- Economic Analysis
- Econometrics
- Water Demand Forecasting
- Impact and Process Evaluation
- Risk and Uncertainty Analysis
- Water Supply Reliability Planning

Experience

- 30 total years
- 13 years with Hazen

Professional Activities

American Water Works Association

American Water Resources Association

Prior to joining Hazen and Sawyer, Dr. Kiefer led CDM's Water Economics group and was a Lead Practitioner in the area of Water Resources. Before joining CDM, Dr. Kiefer directed Planning and Management Consultants, Ltd.'s Water Resources Research program and its five business service lines of Integrated Water Demand and Supply Planning, Resource Economics and Quantitative Analysis, Navigation Analysis, Military Resources Planning and Environmental Planning.

Dr. Kiefer is an expert in forecasting the demand for potable water. He has performed numerous analyses of water demand, including the development of long term water demand forecasts for some of the largest water utilities in the United States, including the Metropolitan Water District of Southern California, Tampa Bay Water, and San Diego County Water Authority. Dr. Kiefer is also an expert in conducting empirical evaluations of demand management programs. He has led water conservation studies for large utilities in the Southwest and demand management plans for Tampa Bay Water, the City of Phoenix, and New York City. He has also served as principal investigator on several Water Research Foundation (WaterRF), projects where he has led evaluations of urban water demands as part of WaterRF's Strategic Climate Change initiative and Water Demand Forecasting focus area.

Dr. Kiefer has more than 15 years of consulting experience with the U.S. Army Corps of Engineers (Corps) for whom he directed economic and water resources planning studies. He has addressed the Corps' major Civil Works program functions, including Water Supply, Hydropower, Navigation, Recreation, Ecosystem Restoration, and Flood Damage Reduction. Dr. Kiefer has considerable expertise in the areas of risk analysis, multipurpose planning, and multi-criteria decision support techniques.

In 1997, he received the Commander's Award for Public Service from the Department of the Army for outstanding performance in support of the U.S. Army Corps of Engineers Cost Savings Task Force, which helped to identify and automate cost savings measures and to facilitate the analysis of those same measures nationwide.

Long-Term Demand Forecasting System (LTDFS) Update, Tampa Bay Water, Tampa Bay, FL

Technical Director leading a team to redevelop all elements of LTDFS, including estimation of econometric and end use water efficiency models, focusing on exploratory data analysis of an expanded time-series and cross-sectional database of water demands in the Tampa Bay region.

Long-term Water Demand Forecasts, San Diego County Water Authority, San Diego, CA

Project Manager of development of five consecutive water demand forecasts and forecast updates for the San Diego County Water Authority, in support of the Agency's periodic development of its Urban Water Management Plan. Original efforts involved the development of econometric models of M&I water demands, which were followed by development of predictive models for agricultural demands. More recent support to the Authority has included the analysis of climate change impacts on water demand and the development and application of risk-based simulation procedures to support long-term supply reliability and capital improvement planning.

Modeler/Analyst, Water Research Foundation Project 4309, Residential End Uses of Water Update

Dr. Kiefer was responsible for developing models of key indoor and outdoor residential end uses of water, using end use logging data for a large sample of households across the US and Canada, relating end use water consumption to household demographic and economic characteristics, as well as the price for water and sewer services.

Technical Director, Water Conservation Planning Support, NYC-DEP, NY

Technical Director, of the development of NYC DEP's Water Demand Management Plan (WDMP) through a series of investigations involving pilot efficiency projects, water reuse at specific facilities, spatial demand profiling, and assessment of large users, drought management, and water pricing strategies. The objective of this project was to assist NYC DEP in the development of its WDMP through a series of investigations involving pilot efficiency projects, water reuse at specific facilities, spatial demand profiling, assessment of large users, drought management, and water pricing strategies.

Enhancements to New York City's Long-Term Water Demand Forecasting Model, NYCDEP, NY

Technical Director for this project. The objective was to make incremental improvements to NYCDEP's long-term water demand forecasting model to incorporate key future trends and uncertainties related to water efficiency and climate. The updated model included a water efficiency index, climatic variables, and residual variance factors at both annual and monthly time steps, which supports development of multiple forecast scenarios.

Notes

1 Presumes all facilities associated with diversions are completed, including SVRP modifications.

2 Table 2-1, p. 5, Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler Consulting Engineers, August 2015.

3 Volume of effluent from City of Salinas agricultural wash water to be directed into ponds 1,2,3, and the aeration pond for storage.

4 Average monthly flow from Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler, August 2015.

5 Rainfall from Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler, August 2015. Pond area presumed to be Ponds 1,2, 3 + Aeration lagoon. No rainfall/evaporation or storage assigned to drying beds.

6 Table 3, Todd Groundwater, Memorandum, Pure Water Monterey Groundwater Replenishment Project: Impacts of Changes in Percolation at the Salinas Industrial Wastewater Treatment Facility on Groundwater and the Salinas River, February 11, 2015.

7 Table 4, Ibid.

8 Ponds 1,2,3 and aeration basin hold up to 1,065 acre-feet (one foot of freeboard). If flow to ponds would exceed the maximum volume, it is presumed that excess flow can be diverted to the RIBs or drying beds or flow can be diverted to the RTP. Presume that pond storage goes to zero sometime during the year (shown here starting in July).

9 Water right application 32263A. Max diversion = 6 cfs diversion. If SRDF is not operating (drought year), 2 cfs is bypassed to the Salians River. See final water right permit 21376

10 Water right application 32263B. Max. diversion = 6 cfs. See final water right permit 21377. Assumes 2 cfs instream bypass requirement Dec-May, 1 cfs bypass in June and 0.7 cfs instream bypass requirement for July-Nov. Also assumes diversion stopped when flows reach 30 cfs (migration window) and restart when flow declines to 20 cfs. See final water right permit 21377

11 Water right application 32263C. Max. diversion = 3 cfs. Removed from project portfolio during water rights process. See RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015.

12 Includes secondary effluent wastewater currently used to produce recycled water at the Salinas Valley Reclamation Project (SVRP), and additional amounts which may be used during periods of low demand (<5 mgd) with the proposed improvements to the SVRP.

13 New source waters not used by AWPF will be available to SVRP for CSIP.

14 A drought reserve of up to 1,000 AF would be created over five years by producing 200 AFY additional product water from the GWR Project AWTF during winter months and storing the water in the Seaside Basin. This would establish a "water bank" that the CSIP can draw on in droughts. The drought reserve would allow flow at the RTP for the GWR Project to be temporarily reduced during critically dry periods, thus freeing up more of the newly available inflows to the RTP to be sent to the CSIP area. Extraction from the Seaside Basin would continue at the average rate to supply the Monterey Peninsula.

15 Average monthly RTP discharge, 2009-2013 (reported by M1W).

16 Secondary treated municipal effluent not used for SVRP or the AWPF.

17 Excess is calculated as Line 13 minus Lines 15 & 16

18 RUWAP supply comes from existing RTP inflows of municipal wastewater. Demands reflect existing urban irrigation customers along trunk main.

Notes

1 Presumes all facilities associated with diversions are completed, including SVRP modifications.

2 Table 2-1, p. 5, Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler Consulting Engineers, August 2015.

3 Volume of effluent from City of Salinas agricultural wash water to be directed into ponds 1,2,3, and the aeration pond for storage.

4 Average monthly flow from Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler, August 2015.

5 Rainfall from Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler, August 2015. Pond area presumed to be Ponds 1,2, 3 + Aeration lagoon. No rainfall/evaporation or storage assigned to drying beds.

6 Table 3, Todd Groundwater, Memorandum, Pure Water Monterey Groundwater Replenishment Project: Impacts of Changes in Percolation at the Salinas Industrial Wastewater Treatment Facility on Groundwater and the Salinas River, February 11, 2015.

7 Table 4, Ibid.

8 Ponds 1,2,3 and aeration basin hold up to 1,065 acre-feet (one foot of freeboard). If flow to ponds would exceed the maximum volume, it is presumed that excess flow can be diverted to the RIBs or drying beds or flow can be diverted to the RTP. Presume that pond storage goes to zero sometime during the year (shown here starting in July).

9 Water right application 32263A. Max diversion = 6 cfs diversion. If SRDF is not operating (drought year), 2 cfs is bypassed to the Salians River. See final water right permit 21376

10 Water right application 32263B. Max. diversion = 6 cfs. See final water right permit 21377. Assumes 2 cfs instream bypass requirement Dec-May, 1 cfs bypass in June and 0.7 cfs instream bypass requirement for July-Nov. Also assumes diversion stopped when flows reach 30 cfs (migration window) and restart when flow declines to 20 cfs. See final water right permit 21377

11 Water right application 32263C. Max. diversion = 3 cfs. Removed from project portfolio during water rights process. See RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015.

12 Includes secondary effluent wastewater currently used to produce recycled water at the Salinas Valley Reclamation Project (SVRP), and additional amounts which may be used during periods of low demand (<5 mgd) with the proposed improvements to the SVRP.

13 New source waters not used by AWPF will be available to SVRP for CSIP.

14 A drought reserve of up to 1,000 AF would be created over five years by producing 200 AFY additional product water from the GWR Project AWTF during winter months and storing the water in the Seaside Basin. This would establish a "water bank" that the CSIP can draw on in droughts. The drought reserve would allow flow at the RTP for the GWR Project to be temporarily reduced during critically dry periods, thus freeing up more of the newly available inflows to the RTP to be sent to the CSIP area. Extraction from the Seaside Basin would continue at the average rate to supply the Monterey Peninsula.

15 Average monthly RTP discharge, 2009-2013 (reported by M1W).

16 Secondary treated municipal effluent not used for SVRP or the AWPF.

17 Excess is calculated as Line 13 minus Lines 15 & 16

18 RUWAP supply comes from existing RTP inflows of municipal wastewater. Demands reflect existing urban irrigation customers along trunk main.

Notes

1 Presumes all facilities associated with diversions are completed, including SVRP modifications.

2 Table 2-1, p. 5, Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler Consulting Engineers, August 2015.

3 Volume of effluent from City of Salinas agricultural wash water to be directed into ponds 1,2,3, and the aeration pond for storage.

4 Average monthly flow from Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler, August 2015.

5 Rainfall from Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler, August 2015. Pond area presumed to be Ponds 1,2, 3 + Aeration lagoon. No rainfall/evaporation or storage assigned to drying beds.

6 Table 3, Todd Groundwater, Memorandum, Pure Water Monterey Groundwater Replenishment Project: Impacts of Changes in Percolation at the Salinas Industrial Wastewater Treatment Facility on Groundwater and the Salinas River, February 11, 2015.

7 Table 4, ibid.

8 Ponds 1,2,3 and aeration basin hold up to 1,065 acre-feet (one foot of freeboard). If flow to ponds would exceed the maximum volume, it is presumed that excess flow can be diverted to the RIBs or drying beds or flow can be diverted to the RTP. Presume that pond storage goes to zero sometime during the year (shown here starting in July).

9 Water right application 32263A. Max diversion = 6 cfs diversion. If SRDF is not operating (drought year), 2 cfs is bypassed to the Salians River. See final water right permit 21376

10 Water right application 32263B. Max. diversion = 6 cfs. See final water right permit 21377. Assumes 2 cfs instream bypass requirement Dec-May, 1 cfs bypass in June and 0.7 cfs instream bypass requirement for July-Nov. Also assumes diversion stopped when flows reach 30 cfs (migration window) and restart when flow declines to 20 cfs. See final water right permit 21377

11 Water right application 32263C. Max. diversion = 3 cfs. Removed from project portfolio during water rights process. See RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015.

12 Includes secondary effluent wastewater currently used to produce recycled water at the Salinas Valley Reclamation Project (SVRP), and additional amounts which may be used during periods of low demand (<5 mgd) with the proposed improvements to the SVRP.

13 New source waters not used by AWPF will be available to SVRP for CSIP.

14 A drought reserve of up to 1,000 AF would be created over five years by producing 200 AFY additional product water from the GWR Project AWTF during winter months and storing the water in the Seaside Basin. This would establish a "water bank" that the CSIP can draw on in droughts. The drought reserve would allow flow at the RTP for the GWR Project to be temporarily reduced during critically dry periods, thus freeing up more of the newly available inflows to the RTP to be sent to the CSIP area. Extraction from the Seaside Basin would continue at the average rate to supply the Monterey Peninsula.

15 Average monthly RTP discharge, 2009-2013 (reported by M1W).

16 Secondary treated municipal effluent not used for SVRP or the AWPF.

17 Excess is calculated as Line 13 minus Lines 15 & 16

18 RUWAP supply comes from existing RTP inflows of municipal wastewater. Demands reflect existing urban irrigation customers along trunk main.

Notes

1 Presumes all facilities associated with diversions are completed, including SVRP modifications.

2 Table 2-1, p. 5, Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler Consulting Engineers, August 2015.

3 Volume of effluent from City of Salinas agricultural wash water to be directed into ponds 1,2,3, and the aeration pond for storage.

4 Average monthly flow from Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler, August 2015.

5 Rainfall from Groundwater Replenishment Project, Salinas River Inflow Impacts, Schaaf & Wheeler, August 2015. Pond area presumed to be Ponds 1,2, 3 + Aeration lagoon. No rainfall/evaporation or storage assigned to drying beds.

6 Table 3, Todd Groundwater, Memorandum, Pure Water Monterey Groundwater Replenishment Project: Impacts of Changes in Percolation at the Salinas Industrial Wastewater Treatment Facility on Groundwater and the Salinas River, February 11, 2015.

7 Table 4, Ibid.

8 Ponds 1,2,3 and aeration basin hold up to 1,065 acre-feet (one foot of freeboard). If flow to ponds would exceed the maximum volume, it is presumed that excess flow can be diverted to the RIBs or drying beds or flow can be diverted to the RTP. Presume that pond storage goes to zero sometime during the year (shown here starting in July).

9 Water right application 32263A. Max diversion = 6 cfs diversion. If SRDF is not operating (drought year), 2 cfs is bypassed to the Salians River. See final water right permit 21376

10 Water right application 32263B. Max. diversion = 6 cfs. See final water right permit 21377. Assumes 2 cfs instream bypass requirement Dec-May, 1 cfs bypass in June and 0.7 cfs instream bypass requirement for July-Nov. Also assumes diversion stopped when flows reach 30 cfs (migration window) and restart when flow declines to 20 cfs. See final water right permit 21377

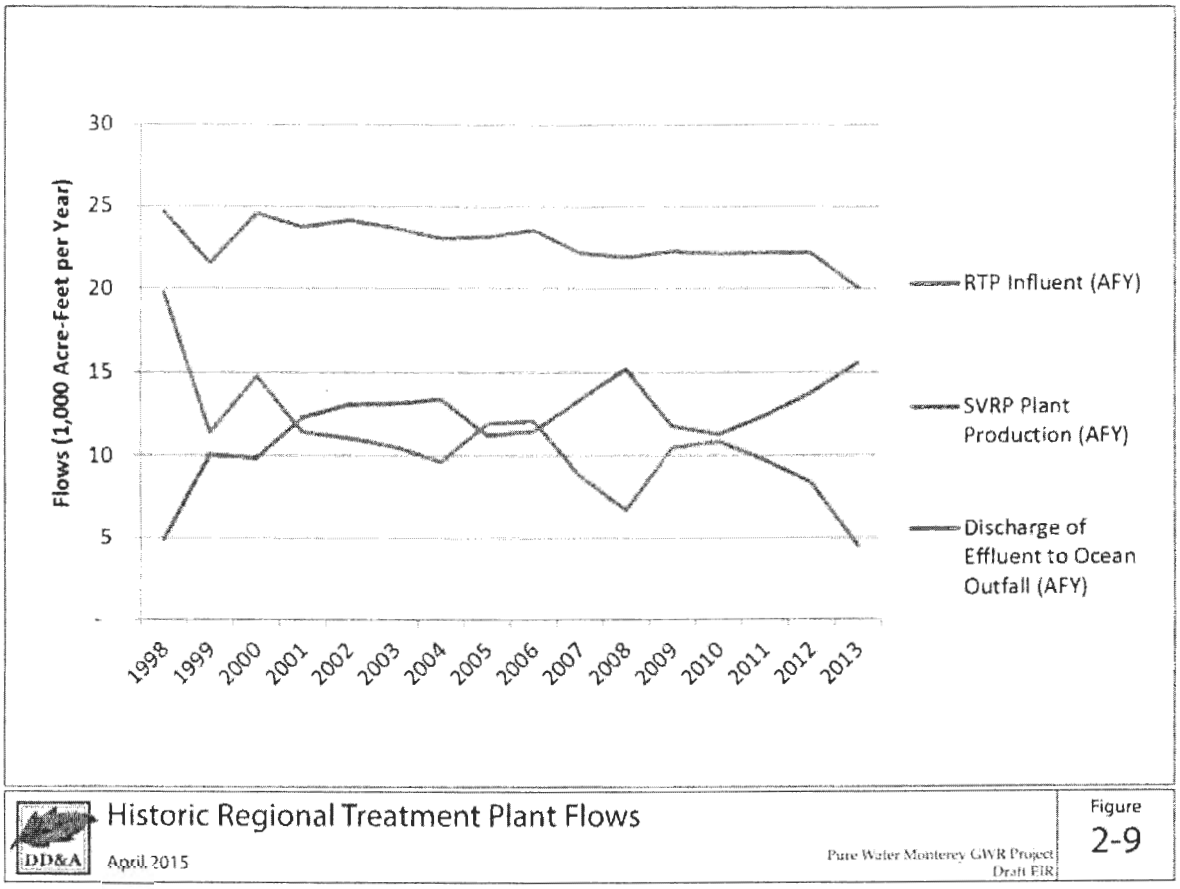
11 Water right application 32263C. Max. diversion = 3 cfs. Removed from project portfolio during water rights process. See RECLAMATION DITCH YIELD STUDY, Schaaf and Wheeler, March 2015.

12 Includes secondary effluent wastewater currently used to produce recycled water at the Salinas Valley Reclamation Project (SVRP), and additional amounts which may be used during periods of low demand (<5 mgd) with the proposed improvements to the SVRP.

13 New source waters not used by AWPF will be available to SVRP for CSIP.

14 A drought reserve of up to 1,000 AF would be created over five years by producing 200 AFY additional product water from the GWR Project AWTF during winter months and storing the water in the Seaside Basin. This would establish a "water bank" that the CSIP can draw on in droughts. The drought reserve would allow flow at the RTP for the GWR Project to be temporarily reduced during critically dry periods, thus freeing up more of the newly available inflows to the RTP to be sent to the CSIP area. Extraction from the Seaside Basin would continue at the average rate to supply the Monterey Peninsula.

15 Average monthly RTP discharge, 2009-2013 (reported by M1W).



16 Secondary treated municipal effluent not used for SVRP or the AWPF.

17 Excess is calculated as Line 13 minus Lines 15 & 16

18 RUWAP supply comes from existing RTP inflows of municipal wastewater. Demands reflect existing urban irrigation customers along trunk main.

CALIFORNIA
AMERICAN WATER

MEMORANDUM

August 12, 2020

To: Tom Luster, California Coastal Commission

From: Ian Crooks, California American Water Company

Subject: Pure Water Monterey Project Status—Delays, Operational Issues, and Cost Overruns

This memorandum provides a status update on Monterey One Water's Pure Water Monterey Project, both the initial phase of the Project (Phase I) and the proposed expansion of the Project (Expansion). The current status of Phase I and the Expansion raise significant concerns regarding Monterey One Water's (M1W) ability to provide sufficient water for both Phase I and the Expansion. Based on the performance of Phase I and the substantial issues with the environmental review and proposed water sources for the Expansion, Cal-Am is concerned that without the Monterey Peninsula Water Supply Project's (MPWSP) desalination plant the Peninsula will not have an adequate, reliable, drought-proof, and permanent water supply that would be sufficient to allow the State Water Resources Control Board to lift its Cease and Desist Order and moratorium on new service connections.

I. PHASE I

Phase I of the Pure Water Monterey Project is intended to provide 3,500 afy of recycled water as part of Cal-Am's MPWSP portfolio. By way of background, Phase I includes two shallow (vadose zone) injection wells and two deep injection wells whereby the water treated would be injected into the Seaside Groundwater Basin. Once injected into the Seaside Basin, the treated water would mix with the groundwater present in the aquifers and be stored for future use. Cal-Am would use existing wells and distribution facilities to extract and distribute the water.

Phase I has been plagued by delays, operational issues, and cost overruns, all of which raise doubts regarding M1W's ability to be able to provide Cal-Am with 3,500 afy. Provided below is additional detail on each of the Phase I issues.

A. Phase 1 Delays

Under the Water Purchase Agreement (WPA) by and between Cal-Am, M1W, and the Monterey Peninsula Water Management District (MPWMD), significant Events of Default have occurred with respect the Delivery Start Date and the Performance Start Date for Phase I. As of April 29, 2020, M1W anticipated a Performance Start Date of August 10, 2020, a nearly eight-month delay from the WPA's Performance Start Date of January 1, 2020. (See April 29, 2020 Pure Water Monterey Letter, attached hereto as Exhibit 1.) As of July 30, 2020, MPWMD pushed the Phase 1 Performance State Date further to September 1, 2020. (See July 30, 2020 MPWMD

Letter, attached hereto as Exhibit 2.) Under the WPA, M1W must inject 1,000 af into the Basin for operational flexibility prior to any water being allocated to Cal-Am. As of July 22, 2020, only 828 af had been stored and M1W estimated that the full 1,000 af would not be stored until mid-September 2020.

B. Operational Issues

Substantial operational problems could jeopardize Phase I's ability to provide the 3,500 afy allocated to Cal-Am under the WPA.

With respect to the two shallow injection wells, sinkholes and/or subsidence are affecting those wells that may not be repairable. (See June 18, 2020 M1W Pure Water Monterey Presentation, attached hereto as Exhibit 3.) In fact, in March 2020, and due to the sinkholes and/or subsidence, M1W shut off the shallow wells as a safety precaution. The wells are not currently injecting any water. (*Ibid.*) Even with costly repairs that are planned for this fall and winter, M1W does not anticipate that the shallow wells will achieve anywhere near their 1,000 gallons per minute (gpm) planned capacity (the two shallow wells had a planned capacity of 500 gpm each). (*Ibid.*) Under a best case scenario it is anticipated that the shallow wells would only ever operate at 25% of planned capacity. (*Ibid.*) Specifically, M1W is anticipating that one of the shallow wells would operate at 50 gpm and the other would operate at 100-200 gpm, for a total range of 150-250 gpm significantly less than the planned capacity of 1,000 gpm. (*Ibid.*)

Further, the two Phase I deep injection wells have also been plagued with problems and are experiencing injection refusal. (*Ibid.*) As of June 2020, the two deep injection wells were only functioning at rates of 70% or less. (*Ibid.*) One deep injection well was operating at 775 gpm and the other was operating at 625 gpm for a total injection rate of 1,400 gpm, 600 gpm less than the planned capacity of 2,000 gpm. (*Ibid.*) Even after additional work on the deep injection wells, M1W is anticipating that the total injection rates for the deep injection wells would only reach 1,600-1,800 despite a planned capacity of 2,000 gpm. (*Ibid.*)

Based on these problems, M1W estimates that the current annual injection volume for Phase I is only 2,030 afy—this equates to less than 58% of the 3,500 afy allocated for Cal-Am under the WPA. Accordingly, Phase I is currently not on track to be able to deliver the full 3,500 afy to Cal-Am and it is unclear whether such delivery amount will ever be achieved given the issues Phase I is facing.

In an attempt to remedy these issues M1W has proposed costly repairs to the shallow wells, final commissioning (inclusive of swabbing) of the deep injection wells, and the addition of a new deep injection well. (*Ibid.*) The increases in costs associated with this work will significantly increase costs of Phase I, possibly by more than $13 million, resulting in an additional increase in product water prices. (*Ibid.*) M1W's consultants estimate that construction on the additional deep well will not begin until November, further delaying Phase I. (*Ibid.*)

Finally, some of the source waters identified and intended for treatment as part of Phase I have not been utilized since startup. Notably, agricultural wash water has not been used at all. While Phase I was heralded as a pioneer in its proposal to recycle agricultural wash water, the reality is that treating agricultural wash water has proven to be a technological challenge as there are chemical issues with the source water. The treatment technologies in use for Phase I may be incapable of treating agricultural wash waters to safe levels. Treating agricultural wash water is an emerging area without substantial precedent. There is a range of water quality generated from different agricultural wash waters making the treatment of agricultural wash water

challenging for any water recycling project. It remains to be seen whether Phase I will ever be able to treat such water, which would further impact Phase I's ability to meet its design capacity.

C. Cost Overruns

As Phase I has run significantly behind schedule and faced operational issues, the costs of Phase I have increased substantially. For Phase I, the CPUC approved a rate of $1,720 or less per-acre-foot and Cal-Am is required to include with its Tier 1 advice letter support for a rate of at least $1,720 per-acre-foot. At this time the final costs of Phase I are unknown but each time M1W provides an update the costs increase further. In early March 2020, M1W and MPWMD staff presented to Cal Am a new cost summary for water years 2019-20, 2020-21 and 2021-22, projecting annual costs per acre-foot of $2,198, $2,398 and $2,599 respectively.

Then, in a letter dated April 29, 2020, Cal-Am was advised of a further increase to $2,442 for FY 2020-21, and $2,639 for 2021-2022. (See Ex. 1, April 29, 2020 Letter from Pure Water Monterey.) The April 29, 2020 letter also noted that construction costs are just now being calculated, and other costs that have a bearing on the rate are still being estimated. During M1W's June 18, 2020 status update on Phase I, M1W shared that at the current projected delivery of 2,030 afy the costs will increase to $3,678 per acre foot, which is more than twice the rate that was approved by the CPUC. (See Ex. 3, June 18, 2020 M1W Pure Water Monterey Presentation.) Even under M1W's best case scenario after repairs to the shallow wells, commissioning of the deep wells, and the addition of another deep well the costs would be $2,508, which represents a nearly 50 percent increase from the rate approved by the CPUC. (*Ibid.*)

II. PWM EXPANSION

Phase I and the Expansion would utilize the same technology. The Phase I issues therefore call into question the Expansion's timeline, water rates, and ability to produce the 2,250 afy M1W and MPWMD claim it would produce for Cal-Am's service area. Besides facing the same challenges as Phase I, the Expansion also faces additional issues because M1W denied certification of the Expansion's Final Supplemental EIR (SEIR) and the Expansion has additional source water concerns.

A. Status of Expansion SEIR

On April 27, 2020, the M1W Board of Directors denied certification of the SEIR for the Expansion and did not approve the Expansion. M1W does not have the funds to address the SEIR deficiencies and has suspended the remaining contracts on the Expansion. (See May 21, 2020 M1W Board of Directors Staff Report, attached hereto as Exhibit 4.) Notably, the following deficiencies were found in the Expansion's SEIR:

1. Source Water. The SEIR does not adequately address the number of comments and concerns expressed that it cannot document the quantity and reliability of the source water available to the Expansion Project.

2. Water Supply and Demand. The SEIR fails to support its conclusion about long-term water supply and demand, and that conclusion is contrary to the CPUC demand determination and the estimates from the individual cities involved.

3. Agricultural Water Supplies. It fails to properly evaluate potential impacts to agricultural water supplies due to a significant reduction in available agricultural irrigation water because of the Expansion.

4. Cumulative Impact. The SEIR fails to evaluate the Expansion either as an alternative to or a cumulative project with the MPWSP desalination facility.

(*Ibid.*)

Accordingly, because of the deficiencies in the Expansion's environmental analysis no water from the Expansion should be assumed to be available to satisfy the Peninsula's water needs.

B. Expansion Source Water Concerns

In failing to certify the SEIR one of the noted issues was source water concerns. The water rights claimed for the Expansion are merely interruptible use entitlements, not permanent water rights and many of those claimed entitlements are disputed by the holders of the water rights, as set forth in comment letters submitted to M1W by the City of Salinas, Monterey County Water Resources Agency, Castroville Community Services District, and Monterey County Farm Bureau, among others. Accordingly, there remain significant questions regarding whether the Expansion has adequate and sufficient source water and whether it would ever be able to provide the claimed 2,250 afy. Issues with claimed source waters are discussed in further detail below.

- **ARWRA Source Waters**. The Amended and Restated Water Recycling Agreement ("ARWRA") between M1W and MCWRA sets forth the responsibilities for construction, operation, and financing of new source water for Phase I. M1W claims that such source waters would also be available for the Expansion, however the ARWRA does not contemplate such a use. In fact, on July 7, 2020, the MCWRA sent a letter to the M1W Board specifically stating that "[t]he ARWRA and Amendments do not contemplate M1W's use of the New Source Waters [defined as waters from the Blanco Drain and Reclamation Ditch] in any other capacity, including any proposed expansion to the Pure Water Monterey Project." (See July 7, 2020 MCWRA Letter, attached hereto as Exhibit 5.) Accordingly, the Expansion does not have the water rights to ARWRA Source Waters and their use cannot be assumed for the Expansion.

- **Questionable Modifications of Source Waters**. Source waters identified for the Expansion were modified throughout the environmental review process without adequate analysis or justification, raising doubts as to their reliability and ultimately the feasibility of the Expansion. For instance, the Draft SEIR identified Tembladero Slough as a reliable water source but M1W later conceded that the source was unreliable and it was removed from the Final SEIR's source water analysis. Instead, the Final SEIR increasingly relied upon the availability of certain municipal wastewater flows even though the SEIR also acknowledges that such flows have not been previously metered and that the estimates are based in part upon assumptions. When confronted with comments regarding the reliability of water from agricultural produce wash, Lake El Estero, or the Salinas Storm Water Collection System, M1W elected to evaluate source water scenarios where such sources are not used by the Expansion, rather than demonstrate their reliability. M1W's inability to establish a consistent list of source waters for the Expansion suggests the project lacks an adequate source water supply

and raises serious questions about the Expansion's ability to meet its stated water projections.

- **Disputed Agricultural Source Waters**. The City of Salinas has disputed M1W's rights to use the City's agricultural produce wash water for the Expansion and asserts that the ARWRA only permits M1W to use agricultural produce wash water for Phase I, and not for the Expansion. (See January 29, 2020 City of Salinas Letter, attached hereto as Exhibit 6.) The City also explains that these water sources will not be available for the Expansion because "the City fully intends to use available Agricultural Wash Water for its own purposes, including to support farmers, ranchers and the City's agriculture industry, as determined by the City in its sole and absolute discretion." (*Id.*, p. 2.) Therefore, agricultural produce wash water from the City of Salinas cannot be considered a reliable water source for the Expansion.

- **Source Water Quality Issues**. As noted above, agricultural wash water, upon which both Phase I and the Expansion heavily rely, does not appear to be a reliable source water as the feasibility of treatment has yet to be established. Like Phase I, agricultural wash water cannot be assumed for the Expansion.

- **Overestimation of Water Supplies During Drought Years**. Source water availability for the Expansion was not analyzed during multi-year drought conditions. Therefore, the amount of water that could be produced by the Expansion during drought conditions is unknown.

III. CONCLUSION

While Cal-Am views Phase I as a critical component to providing water to the Peninsula the difficulties that Phase I has encountered make clear that Phase I and the Expansion, without desalination, are inadequate to solve the Peninsula's water supply shortage.

San Diego, CA 92101

RE: Expected Payment of Company Water Rate for Pure Water Monterey

Dear Mr. Svindland,

This letter serves as a response to your letter dated April 20, 2020 regarding the Company Water Rate under the Water Purchase Agreement (WPA) approved in CPUC Decision 16-09-021.

Tier 1 Advice Letter Filing

At the March 4, 2020 meeting in which representatives from Cal Am, M1W and MPWMD reviewed detailed supporting documentation for the capital costs and O&M costs for the Pure Water Monterey Project[1], a three-year summary of the estimated cost of water was shared. The attachment to this letter updates that analysis for the Company Water Rate beginning FY 2020-21. Because that analysis shows a cost of water in excess of the soft cap, your Tier 1 advice letter can support a Company Water Rate of at least $1,720 per acre-foot.

Please also be advised that the project's hydrogeologist estimates the Performance Start Date to be on or about August 10, but may vary due to injection rates and well performance.

Tier 2 Advice Letter Filing

The Company Water Rate for FY 2020-21 is $2,442 as shown in the attachment. Final construction costs are just now being calculated. Other costs, such as operations and rate of consumables will have a bearing on the FY 2020-21 cost of water and are estimated here based on a limited operation to date. Also, receipt of a federal Title 16 grant will potentially reduce the cost of water during the fiscal year. Pursuant to Section

[1] 9 pages of material were shared on current project costs and the cost of water. Also reviewed were the estimates used in the CPUC joint testimony in the Phase II decision that supported the soft cap of $1,720 per AF.

16 of the WPA a "true-up" will be made in next year's Company Water Rate to reflect this year's over- or under-collection of expenses. Please refer to the March 4th materials for greater detail.

Ongoing Annual Review of Costs

We are sending you this update from our March 4th meeting prior to May 1, and pursuant to Section 15 of the WPA, we expect to do so each year. The Company Water Rate will be adopted by our respective boards with the annual fiscal year budget, typically in June, hence your 15-day review will be met. That being said, we had not heard anything back from you or the other three Cal-Am representatives who attended the March 4th meeting and received the detailed materials, hence assumed there was consent.

We will continue to update you on the status of the Performance Start Date, after which billing for the amounts injected into the Basin will be sent by the Water Management District directly to California American for review and payment.

We look forward to working with you in providing a safe and affordable water supply for the residents, businesses, and visitors of the beautiful Monterey Peninsula.

Sincerely,

Paul A. Sciuto
General Manager
M1W

Pure Water Monterey
Company Water Rate Calculation
FY 2020-21 and Estimated 2021-22

	2020-21	2021-22
Projected Revenues from Recycled Water Sales	9,402,600	11,014,000
Projected Expenses		
Power	1,583,000	1,925,000
Chemicals	1,445,000	1,749,000
Labor	1,025,600	1,077,000
Lease / Insurance	82,000	87,000
Parts/Material/Other	318,000	385,000
Capital Outlay		200,000
Interest on loans for fronting of PWM reserves / electrical hookups		210,000
Funding of Replacement Fund Reserve	431,000	463,000
Wastewater Charges	120,000	320,000
Overhead Allocation from Wastewater Fund	120,000	320,000
Allocable Debt Service - MCWD	366,000	366,000
Allocable Debt Service - MPWMD	3,912,000	3,912,000
Total Projected Costs	9,402,600	11,014,000
Less Costs Attributable to MCWD	366,000	1,249,671
Net Costs Attributable to MPWMD	9,036,600	9,764,329
Cost Per Acre Foot for MPWMD	$ 2,442	$ 2,639
Based on Acre Feet	3,700	3,700
% Change in Cost / Acre Foot	11.1%	8.1%
Rate if Winn Grant is received	$ 2,271	$ 2,418
	3.3%	6.5%
Bond Coverage (110% required)	110.1%	110.8%
Overhead %	2.4%	5.0%

Note:

1. SRF Loan - Assumes 1st payment is interest only and balance deferred until FY 20-21
2. Internal/External Loans - Assumes interest expense are deferred until FY 21-22
3. Overhead/Wastewater Charges - Assumes phase in over a multi year period
4. Electrical Hookup - Assumes funding (estimated at $1.5 million) in FY 20-21 to be funded 50% through MCWD/MPWMD/M1W contributions and a $400K loan from MPWMD over 10 years 0% interest
5. MCWD - Assumes starts purchasing water in FY 21-22
6. Replacement Reserve - Assumes that funding will increase by $300K per year for 46 years beginning in match expected useful life of 50 years, estimated replacement cost $375 million.
7. MCWD not paying wastewater charges, but are paying overhead charges and replacement reserve
8. Winn Grant - Assumes Winn Grant proceeds are used to reduce rates over a five year period. Total Net Funding $3.7 million.

VIA EMAIL

Mr. Ian C. Crooks
Vice President, Engineering
California American Water
655 West Broadway, Suite 1410
San Diego, CA 92101

Re: Pure Water Monterey "Performance Start Date"

Dear Mr. Crooks:

Pursuant to the "Water Purchase Agreement for Pure Water Monterey Project" (WPA) the Monterey Peninsula Water Management District (District) is providing this notification under Section 2 of the WPA and the definition of "Performance Start Date."

We are hereby notifying California American Water (Company) that the Performance Start Date for the project will be September 1, 2020. That is the date prior to which we expect the Operating Reserve of 1,000 acre-feet will have been satisfied. Upon that date, water delivered will be available to the Company for customer service.

While the initial Delivery Start Date was delayed due to unfortunate construction issues, pursuant to this section of the WPA the Performance Start Date will, in fact, occur within six months following the Delivery Start Date.

By separate correspondence on or about August 18, 2020 Monterey One Water (M1W) and our District will suggest a Company Allotment for this first partial Fiscal Year, that pursuant to Section 2 of the WPA's definition of Company Allotment requires written agreement of all three of our entities.

We think the commitment to this project by all three entities, and the cooperative nature in how our respective staffs have worked toward a successful launch of this important water supply project, should be lauded and is often overlooked by the community. We appreciate the partnership.

Sincerely,

David Stoldt
General Manager
Monterey Peninsula Water Management District

Subject: Cal-Am Responses to Staff

Good Afternoon, Commissioners:

On June 30, 2020, California-American Water Company (Cal-Am) submitted a response to staff's November 2019 Staff Report on the Monterey Peninsula Water Supply Project. As part of that submittal, Cal-Am prepared specific responses to the individual questions about the Project that each of you raised at the end of the November 14, 2019, informational item on the project. Those responses are attached.

Cal-Am's full submittal to staff, including the exhibits referenced in the attachment, can be accessed at the following link:

Link: Cal-Am 06.30.2020 Submittal to Coastal Commission Staff (check box and click "Download")

If you have any questions or would like to discuss the materials provided, please let us know. The Cal-Am team is available to meet anytime and want to make sure all of your questions have been answered.

Thanks very much,
Anne

ATTACHMENT B

RESPONSES TO COMMISSIONER QUESTIONS FROM NOVEMBER 14, 2019, HEARING

A. Scope of Commission's Authority

Questions from Commissioner Rice: We know there are other agencies involved in permitting the Project who have authority that is different from the Commission's. What is the scope of the Commission's authority for this Project? For instance, which issues (particularly those raised in public comment) are irrelevant or outside the scope of the Commission's evaluation of the Project? (Transcript of Nov. 14, 2019, Commission Hearing,[41] pp. 325:24-327:1.)

Cal-Am Response: The Commission's jurisdiction is limited to the Project components located in the Coastal Zone, which are specifically identified in the Staff Report.[42] Further, the Commission is only responsible for assessing the Project's consistency with the Coastal Act and applicable LCPs in determining whether to approve or deny Cal-Am's CDP application. (See Pub. Resources Code, § 30200; see also *Charles A. Pratt Construction Co. v. Cal. Coastal Com.* (2008) 162 Cal.App.4th 1068, 1075.) Thus, the Commission's review is limited to Project components within the Coastal Zone and potential impacts to Coastal Zone resources.

The Commission does not have jurisdiction to consider the reasonableness of Cal-Am's water rates or the public need for the Project—both of which fall squarely within the CPUC's statutory jurisdiction to regulate public utilities. (See Pub. Util. Code, § 701 ["The [CPUC] may supervise and regulate every public utility in the State and may do all things . . . which are necessary and convenient in the exercise of such power and jurisdiction."].) The CPUC evaluated the Project's potential impacts on Cal-Am's water rates and the appropriate water supply and demand figures for Cal-Am's Monterey District service area over a six-year administrative process, during which it received evidence and testimony submitted under oath. (See also Attachment A, Sections H, I.)

Moreover, the issue of water rights is not for the Commission to decide. Cal-Am's water rights for the Project are wholly separate from the Project's potential impacts to groundwater resources and, thus are not relevant to the Project's consistency with the Coastal Act's groundwater protection policies. The State Water Board—not the Commission—is the state agency with primary responsibility for the regulatory and adjudicatory functions of the state regarding water resources. (Water Code, § 174; Pub. Resources Code, § 30412.) The State Water Board determined that Cal-Am could

---

[41] The transcript is attached hereto as **Exhibit 51**.)

[42] Specifically, the Commission has jurisdiction over those Project components in the Coastal Zones of the City of Seaside, County of Monterey, and the Commission's retained jurisdiction in an area of deferred certification within the County. (Staff Report, p. 4.) Further, the Commission has appellate jurisdiction over the City of Marina's decision to deny a local coastal development permit for those Project components in the Marina Coastal Zone. (*Ibid.*)

develop the necessary water rights to operate the Project. (See CPUC Decision D.18-09-017, p. 80.)

The Commission also should defer to the State Water Board on matters of water quality, consistent with Coastal Act section 30412. (See Pub. Resources Code, § 30412 ["The commission shall not . . . take any action in conflict with any determination by the State Water Resources Control Board or any California regional water quality control board in matters relating to water quality or the administration of water rights."].) The State Water Board has reviewed the existing groundwater record for the Project, and concluded that the modeling "already conducted, revised, and relied upon by the Public Utilities Commission . . . provides a conservative overprediction of the volume of shallow, inland water that the Project would capture during full operation." (See Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), p. 3.) As a result, "State Water Board staff's opinion remains that the groundwater impacts of the Project will not be any greater than those stated, analyzed, and mitigated under the Public Utilities Commission's certified Final EIR," even if additional modeling is conducted. (*Id.*, p. 3.)

Finally, because the Commission's jurisdiction does not extend outside of the Coastal Zone, the Commission is limited to considering alternatives within its jurisdiction. (See Pub. Resources Code, §§ 21002.1, subd. (d), 30260; see also Attachment A, Section I.) Under Coastal Act section 30260, the Commission has the authority to consider only "alternative ***locations***" for coastal-dependent facilities, not alternative projects. (See Pub. Resources Code, § 30260 [emphasis added].) The PWM Expansion project is not located within the Coastal Zone, and thus, is outside of the Commission's jurisdiction. (See, e.g., Pub. Resources Code, § 21002.1, subd. (d); CEQA Guidelines, §§ 15042, 15096, subd. (g)(1) ["When considering alternatives and mitigation measures, a responsible agency is more limited than a lead agency. A responsible agency has responsibility for mitigating or avoiding only the direct or indirect environmental effects of those parts of the project which it decides to carry out, finance, or approve."]; *RiverWatch v. Olivenhain Mun. Water Dist.* (2009) 170 Cal.App.4th 1186, 1207 ["If the responsible agency finds that any alternatives or mitigation measures within its powers are feasible and would substantially lessen or avoid a significant effect of the project, the responsible agency may not approve the project as proposed, but must adopt the feasible mitigation measures or alternatives."] [emphasis added]; *Sierra Club v. Cal. Coastal Com.* (2005) 35 Cal.4th 839, 860 [holding that neither the Coastal Act nor CEQA allow the Commission to consider impacts of projects located outside the Coastal Zone]; *Schneider v. Cal. Coastal. Com.* (2006) 140 Cal.App.4th 1339, 1347 [concluding that the Coastal Act did not permit the Commission to consider ocean boaters' right to view coastline from the ocean].)

In sum, the scope of the Commission's authority in determining whether to approve or deny the coastal development permits extends to evaluating those Project components located within the Coastal Zone and whether they will impact Coastal Zone resources.

B. Role of Other Agencies

Questions from Commissioners Rice and Groom: What role is the CPUC playing? What is the status of the CPUC's approval? (Transcript, pp. 325:24-327:1, 329:24-330:19.)

Cal-Am Response: The CPUC is the constitutionally established state agency charged with regulating investor-owned utilities, like Cal-Am, and reviewed the Project as the lead agency under CEQA for over six years. (See Final EIR/EIS, p. 1-3.) The CPUC, in conjunction with the Monterey Bay National Marine Sanctuary, prepared the EIR/EIS to evaluate the Project's environmental impacts and potential Project alternatives. Based on the EIR/EIS' analysis and conclusions, the CPUC approved a Certificate of Public Convenience and Necessity ("CPCN") for the Project and certified the EIR/EIS in September 2018. Following its approval of the Project, as the lead agency the CPUC oversees Cal-Am's compliance with the MMRP. (CPUC Decision D.18-09-017, p. 161.)

Further, the CPUC is charged by statute with exclusive jurisdiction to oversee Cal-Am's ratesetting and determine utility supply and demand. "[T]he jurisdiction to determine the adequacy of service actually being rendered by a public utility under its franchise is vested exclusively in the [CPUC] when it has elected to determine whether the service is inadequate." (See *Citizens Utilities Company of California v. Super. Ct.* (1976) 56 Cal.App.3d 399, 408; see also *City of Oakland v. Key System* (1944) 64 Cal.App.2d 427, 435 [exclusive jurisdiction vested in CPUC to determine adequacy of service rendered by public utility].) Therefore, only the CPUC has the authority to make binding determinations as to the levels of supply and demand within Cal-Am's service area. (See CPUC Decision D.18-09-017, pp. 167-171, 194-195.)

See Section C below for a discussion of the CPUC's role vis-à-vis the PWM Expansion.

Questions from Commissioners Rice and Groom: What role is the State Water Board playing? (Transcript, pp. 325:24-327:1, 329:24-330:19.)

Cal-Am Response: The State Water Board regulates Cal-Am's water withdrawals from the Carmel River. In 1995, the State Water Board issued an order finding that Cal-Am was diverting more water from the Carmel River than it was legally allowed. (See Ex. 52, State Water Board, Order WR 2009-0060, pp. 1-2.) Recognizing Cal-Am's obligation to provide water to the people and businesses on the Monterey Peninsula to protect public health and safety, the State Water Board ordered Cal-Am to immediately limit its diversions of water from the Carmel River system, and to diligently implement various actions to address the situation and develop water from other sources of supply. (See *id.*, pp. 36-37.)

In 2009, the State Water Board adopted a CDO in which it set a compliance schedule requiring Cal-Am to take actions necessary to reduce its diversions from the Carmel River and ultimately terminate the withdrawals by December 31, 2016. (See *id.*, p. 57.) The CDO also imposed a moratorium on new service connections and certain increases in use until Cal-Am obtained sufficient alternative water supplies. (See *id.*, p. 59.) In 2016, the State Water Board approved an amended CDO that would maintain Cal-Am's effective

diversion limit from the Carmel River from the start of water year 2015-2016 until December 31, 2021, as long as Cal-Am meets defined Project approval and construction milestones. (See Ex. 47, State Water Board, Order WR 2016-0016, p. 19.)

Currently, the State Water Board oversees Cal-Am's compliance with the CDO's milestones. (*Id.*, pp. 20-21.) Indeed, the State Water Board has the power to lift the current moratorium on new water service connections and increases in use provided that Cal-Am certifies that it has secured sufficient permanent water supplies for its Monterey service district. (See *id.*, p. 27.)

Further, the State Water Board oversees issues of water quality and preservation of water resources. (See Section A *supra.*)

See Section C below for a discussion of the State Water Board's role vis-à-vis the PWM Expansion.

C. Alternatives

Questions from Commissioner Mann: What alternative locations were evaluated for the Project's slant wells? Why are alternative locations of the slant wells infeasible? Why is the CEMEX site the environmentally superior alternative location? (Transcript, p. 322:14 – 322:19.)

Cal-Am Response: In analyzing the Project as proposed, the Final EIR/EIS assessed the feasibility of a series of alternatives at two different locations, each of which would avoid the need to construct the slant well system at the CEMEX site. These two alternatives involved the construction of intake systems at a site on Potrero Road site and a site at Moss Landing. (See Final EIR/EIS, pp. 5.4-2 to 5.4-3.)

First, the Potrero Road alternative, as evaluated in the Final EIR/EIS, involved construction of the same type of slant well system as proposed for the CEMEX site, but located instead at a site at the western end of Potrero Road in northern Monterey County. (See Final EIR/EIS, pp. 5.3-13, 5.4-12, 5.4-59.) Under this alternative, the desalination plant, brine discharge, product water pipelines, and ASR components would be identical to the proposed Project. (*Id.*, p. 5.4-12.)

The Final EIR/EIS found that a Project utilizing a slant well system located at Potrero Road would be infeasible because it would draw a greater volume of water from the SVGB than the proposed Project, given the unique hydrology of the Potrero Road area. (Final EIR/EIS, pp. 5.4-14, 5.4-59.) Under the Return Water Settlement Agreement Cal-Am is required to return product water to the SVGB based on the amount of water drawn from the SVGB. Given the increased draw from the SVGB that would result from slant wells at Potrero Road, the amount of water that Cal-Am would be obligated to return to the SVGB would result in a remaining water supply that would be insufficient to meet recovered tourism demand or serve vacant legal lots of record, as required by the Project objectives set forth by the CPUC. (*Ibid.*) Moreover, slant wells at Potrero Road would capture groundwater that would otherwise flow into Elkhorn Slough—resulting in

significant and unavoidable impacts on marine and terrestrial biological resources. (*Id.*, p. 5.6-6.)

Second, the Final EIR/EIS analyzed a series of alternatives involving construction of open ocean intake systems at a site located to the southwest of the Moss Landing Harbor, including: (1) an alternative that would retain most Project components but would utilize open ocean intakes that would be located at the Moss Landing site; (2) the Monterey Bay Regional Water Project, a desalination facility proposed by DeepWater Desal, LLC that would produce over three times more product water than the Project; and (3) the People's Moss Landing Water Desalination Project, a desalination project proposed by Moss Landing Green Commercial Park, LLC. (See Final EIR/EIS, pp. 5.4-17, 5.4-21, 5.4-40.)

The Final EIR/EIS found that a proposed intake alternative at Moss Landing would involve "additional permitting complexity associated with the construction and operation of an open-water intake due to entrainment and impingement of marine organisms," which would hinder Cal-Am's ability to implement the alternative before the CDO deadline. (Final EIR/EIS, pp. 5.4-21, 5.4-39, 5.4-50.) The Final EIR/EIS also concluded that open ocean intakes at the Moss Landing Site would involve the following increased impacts as compared to the Project: (1) significant and unavoidable impacts to marine habitat and biological resources associated with construction and operation of the intakes; (2) potentially significant impacts related to the open ocean intakes' potential to cause underwater landslides and interfere with oceanic processes; and (3) significant and unavoidable impacts to marine biological resources caused by intake and entrainment of marine life. (*Id.*, p. 5.6-4.)

In comparing the above alternative locations to the proposed Project, the Final EIR/EIS concluded that siting intake systems at either Potrero Road or the Moss Landing site would not "offer an overall environmental advantage over the proposed project," due to the impacts described above. (See Final EIR/EIS, p. 5.6-6.) The Final EIR/EIS noted that siting the slant well system at the CEMEX site would avoid the groundwater impacts associated with siting a similar intake system at the Potrero Road site. (*Ibid.*) Specifically, unlike the aquifers underlying the Potrero Road site, the 180-FTE and 400-Foot Aquifers below the CEMEX site are heavily intruded by seawater (*Id.*, p. 4.4-34.) Siting the slant wells at the CEMEX site therefore ensures that the Project slant wells will extract seawater-intruded groundwater that is otherwise unusable. As such, the Final EIR/EIS selected the Project, with slant wells located at the CEMEX site, as the environmentally superior alternative. (*Id.*, p. 5.6-8.) The CPUC later affirmed this decision, concluding that no other alternatives are feasible, capable of meeting Project objectives, or reducing significant impacts of the Project. (See CPUC Decision D.18-09-017, pp. 79-80.)

Finally, as explained in Attachment A *supra*, the CEMEX site is the least environmentally damaging location feasible for the Project, as siting the slant wells at the CEMEX site enables Cal-Am to obtain Project source water using subsurface intakes, thereby preventing impingement or entrainment of marine life, and also allows Cal-Am to construct the slant wells in areas previously disturbed by sand mining operations,

rather than in undeveloped locations on the coast. (See Attachment A, Sections A, B, J; see also Staff Report, p. 104.)

Questions from Commissioner O'Malley: Is staff's finding regarding the feasibility of the PWM Expansion driven by the CDO deadline? (Transcript, p. 325:10-325:16.)

Cal-Am Response: The Staff Report claims that the PWM Expansion can be operational in sufficient time to meet the CDO's December 2021 deadline and used that conclusion to support a finding that the PWM Expansion is a feasible project alternative. (See Staff Report, p. 80.) However, the PWM Expansion is not feasible because the M1W Board has since denied certification of the project's Final SEIR and did not approve the project, and M1W has confirmed that it does not have the funds to remedy the faults in the SEIR. (See Ex. 17, M1W Letter to Cal-Am re: Pure Water Monterey Project – Cost, Operational Performance and Status (June 8, 2020), p. 1; Ex. 18, M1W Board of Directors Staff Report (May 20, 2020).) Moreover, M1W currently estimates a roughly eight month delay in implementation of the first phase of the PWM (the "Original PWM Project"), which both imposes additional delays on the PWM Expansion and indicates it likely will face similar delays. (See Ex. 21, Cal-Am Comments on Cost, Operational Performance and Status of PWM Expansion (May 9, 2020), p. 1.) Indeed, the Original PWM Project is currently plagued by a number of technical issues, including sinkholes or subsidence around the shallow injection wells, injection wells running at less than half of their planned capacity, and an inability to utilize planned source waters, all of which are resulting in significant increases in projected PWM water rates. (See Attachment A, Section I.2.a.) It is likely that the PWM Expansion could experience even greater delays than the Original PWM Project, given the additional permits and source water agreements needed for the Expansion. The State Water Board recently expressed concern in a letter to the Commission that the timeline for implementation of the PWM Expansion has been delayed well beyond the CDO deadline. (See Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), at pp. 4-5.) Therefore, staff's conclusion that the PWM Expansion can be completed by the CDO is not substantiated by the available evidence and cannot support a finding of feasibility. (See Attachment A, Section I.2.b.)

Questions from Commissioner Rice: What are the next steps with respect to the PWM Expansion SEIR and what is the timeline for finalization of that document? Does it impact the CPUC's decision going forward? Does it impact the State Water Board's role going forward? (Transcript, pp. 326:17-327:1.)

Cal-Am Response: The PWM Expansion is no longer moving forward, as the M1W Board has denied certification of the Final SEIR. (See Ex. 18, M1W Board of Directors Staff Report (May 20, 2020).) The M1W Board rejected certification of the Final SEIR due to deficiencies in the environmental analysis of: source water for the PWM Expansion; water supply and demand; impacts to agricultural water supplies; and because the SEIR failed to evaluate the PWM Expansion either as an alternative to or a cumulative project with the Project. (*Ibid.*) The M1W Board has stated that these deficiencies will need to be corrected before the Board decides to move forward with the Project. However, M1W "[s]taff has noted that the [M1W] does not have additional

budget funds at this time for dealing with any additional deficiencies that have been identified . . . or could be identified in the future. [M1W] has suspended all of the remaining contracts on these matters to prevent further consultant expenditures." (*Ibid.*; see also Attachment A, Section I.2.) Moreover, there remains significant doubt regarding the availability of source waters for the PWM Expansion—so long as M1W fails to obtain secure and adequate source waters, the PWM Expansion remains infeasible. (See Attachment A, Section I.2.a.)

Should the M1W Board ever secure the funds needed to correct the substantial inadequacies in the PWM Expansion SEIR, and obtain all necessary source water rights, the Expansion would require the implementation of a Water Purchase Agreement between Cal-Am and M1W. (See Attachment A, Section I.2.) As with purchase of Original PWM Project water, this Water Purchase Agreement would require CPUC approval. (*Ibid.*) Moreover, to account for the numerous uncertainties surrounding the proposed PWM Expansion, the Water Purchase Agreement would need to include additional terms beyond those included in the Original PWM Project agreement, including more stringent performance guarantees to provide greater assurances to Cal-Am and its customers that the recycled water would be produced in specified amounts, and greater protections in the event that recycled water is not or cannot be produced. (*Ibid.*) Again, these terms would all be subject to CPUC approval, assuming the M1W Board ever decides to move forward with the PWM Expansion after correcting the Final SEIR. Such protections are even more critical given that the Original PWM Project is on track to produce only 2,030 afy, or only 58% of the 3,500 afy that was planned and allocated for Cal-Am's customers. (See Ex. 25, Pure Water Monterey: Injection Wells Facilities Status Presentation, M1W Recycled Water Committee Meeting (June 18, 2020).) There are no additional water supplies that can make up for that shortfall, apart from the Project.

Further, unlike the PWM Expansion, the CPUC has already certified the Final EIR/EIS and issued a CPCN for the Project. In issuing that decision, the CPUC explicitly determined that the PWM Expansion "would satisfy the basic and key purposes of Project (i.e., sufficient and reliable water supply) ***only in conjunction with construction of a desalination plant of some size within five to fifteen years***," and therefore ordered that the PWM Expansion be considered as an ***addition***, to the Project, not as an alternative. (See CPUC Decision D.18-09-017, Appx. C, p. C-71 [emphasis added].) The CPUC's decision has been upheld by the California Supreme Court and is now final. Neither the Commission's decisions with respect to the Project, nor any decision on the part of M1W to move forward with the PWM Expansion, has ***any*** impact on the Project's approval status before the CPUC.

With respect to the State Water Board—should the PWM Expansion move forward instead of the Project, the PWM Expansion would need to satisfy the requirements of the 2016 State Water Board CDO for a new permanent water supply before Cal-Am may be deemed to have satisfied the CDO. (See Attachment A, Section I.4.) Specifically, the 2016 State Water Board CDO states that the conditions thereto, as well as conditions set forth in previous iterations of the CDO, "shall remain in effect until (a) Cal-Am certifies, with supporting documentation, that it has obtained a permanent supply of water that has

been substituted for the water illegally diverted from the Carmel River and (b) the Deputy Director for Water Rights concurs, in writing, with the certification." (See Ex. 47, State Water Resources Control Board, Order WR 2016-0016 (July 19, 2016), p. 27; see also Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), at p. 2.)

As discussed above, there are significant uncertainties regarding the feasibility of the PWM Expansion and its ability to serve as an adequate water supply for Cal-Am's service area. Indeed, the PWM Expansion is not capable of providing a sufficient water supply to meet Monterey Peninsula water demand. Even assuming the depressed demand figures utilized by the Staff Report, Peninsula water supplies with the PWM Expansion, but without the Project, would only be able to meet Peninsula demand for a maximum of five years before falling short. (See Attachment A, Section I.3.c; see also Ex. 28, Hazen Memo, pp. 10-11.) That analysis also assumes that the Original PWM Project would provide a full 3,500 afy. As demonstrated in M1W staff's June 18, 2020 presentation to the M1W Recycled Water Committee, the Original PWM Project is only providing 2,030 afy, which means even existing demand cannot be met without desalination. Moreover, neither the Staff Report nor M1W has demonstrated that existing Peninsula water supplies plus PWM Expansion can meet maximum month demand (MMD) as required by the California Waterworks Standards (Cal. Code Regs., tit. 22, § 64554, subds. (a), (b)(2)). (See Attachment A, Section I.3.e.) Given these substantial issues, it is highly unlikely that Cal-Am could obtain the required certifications from the State Water Board needed to lift the CDO without the Project. (See Attachment A, Section I.4.)

Questions from Commissioner Brownsey: What is going to be the source of the water recycling? Are there drought conditions that could stress the system? How would that impact the Salinas Aquifer? (Transcript, p. 328:9-328:15.)

Cal-Am Response: The sources of water available for the PWM Expansion are discussed in more detail in Attachment A, Section I.2.a. As discussed therein, there remains significant uncertainty surrounding the availability of source waters for the PWM Expansion, which raises serious doubts that the PWM Expansion can be accomplished in a successful manner. First, M1W has failed to commit to a consistent list of source waters for the PWM Expansion, so the certainty of source waters is very difficult to ascertain. (Ex. 20, Cal-Am Letter to Monterey One Water re: PWM Expansion Final SEIR (Apr. 24, 2020), pp. A-16, A-21.) These issues were raised by multiple commenters on the PWM Expansion's SEIR, including from the City of Salinas, which controls the use of the City's agriculture produce wash water. (PWM Expansion Final SEIR, Comments F1-1 to F-3.) The City of Salinas has publicly confirmed it has not granted M1W the rights or approvals necessary for the PWM Expansion to utilize the City's agriculture produce wash water beyond the scope of the Original PWM Project and "the City intends to use available agriculture wash water for its own purposes[.]" (*Id.* at F1.) Other significant concerns surround the availability of source waters for the PWM Expansion, including the reliability of certain source waters under an existing agreement between M1W and the MCWRA referred to as the ARWRA. This agreement sets forth the responsibilities for construction, operation, and financing of new source water for the Original PWM Project. (PWM Expansion Final SEIR, Comment H-3.)

However, M1W has yet to satisfy several conditions required to utilize ARWRA source waters and its ability to do so is uncertain. (Ex. 20, pp. A-16 to A-17.) Thus, M1W's reliance on disputed rights to agricultural produce wash waters and ARWRA source waters results in an overestimation of available water supplies.

Though each of these issues is individually important, Commissioner Brownsey's concern regarding water supply availability during drought years is particularly critical because multiple dry years are very common in California. It is certain that California will experience another drought in the coming years, but the PWM Expansion's SEIR does not analyze that project during multi-year drought conditions, as required by the CEQA Guidelines, and has not established that the PWM Expansion is drought resilient. (CEQA Guidelines, Appx. G, § XIX(b); Ex. 20, Cal-Am Letter to Monterey One Water re: PWM Expansion Final SEIR (Apr. 24, 2020), p. A-20.) Therefore, serious questions remain as to the feasibility of the PWM Expansion as a viable alternative to the Project during extended drought conditions and the extent to which PWM Expansion would impact the SVGB under such constraints. The M1W Board acknowledged the substantial deficiencies with the SEIR's analysis of source waters and included this issue as one of its reasons for denying certification of the Final SEIR. (Ex. 19, M1W Board of Directors Agenda (May 21, 2020); see Ex. 18, M1W Board of Directors Staff Report (May 20, 2020).)

The PWM Expansion also has the potential to result in seawater intrusion in the SVGB, however these impacts have not been fully evaluated by M1W in the Final EIR for the PWM Expansion. (January 30, 2020 Cal-Am Comments on PWM Expansion Draft SEIR , p. 17; Ex. 20, Cal-Am Letter to Monterey One Water re: PWM Expansion Final SEIR (Apr. 24, 2020), p. A-9.) The EIR for the PWM Expansion evaluated impacts to groundwater resources without considering the impact the PWM Expansion would have if the Project is not built. The Project would benefit the SVGB by reducing existing and preventing additional seawater intrusion. If the PWM Expansion Project is seen as a replacement for the Project—and the Project is not built—then the Project's benefits to the SVGB will not occur and further seawater intrusion of the coastal aquifers can be expected.

Questions from Commissioner Hart: Will the PWM Expansion be able to provide the water that staff assumes will be available? (Transcript, pp. 331:4-332:2.)

Cal-Am Response: Based on the available evidence, the PWM Expansion is not capable of producing the 2,250 afy that staff has assumed. As discussed in detail below, there have been significant complications in development of the Original PWM Project that have resulted in a much lower water production than initially estimated, which raise substantial questions regarding the technology to be used by the PWM Expansion. In addition, there are substantial concerns about the availability of PWM Expansion source waters as discussed above. These issues raise significant doubt as to the PWM Expansion's ability to provide 2,250 afy. (See Attachment A, Section I.2.)

For example, while PWM Expansion will utilize the same technologies that are currently being implemented in the Original PWM Project, there are serious concerns with that

project's ability to produce the water it has agreed to provide. (See Attachment A, Section I.2.a.) Indeed, sinkholes or subsidence are affecting the Original PWM Project's shallow injection wells, which may not be repairable, certain deep wells are experiencing injection refusal and are functioning at rates of 60% or less, and some of the source waters identified and intended for treatment by the Original PWM Project have not been utilized since startup. (See Ex. 21, Cal-Am Comments on Cost, Operational Performance and Status of PWM Expansion (May 9, 2020), pp. 3-4; Ex. 22 Staff Report for May 14, 2020 M1W Recycled Water Committee Meeting, Agenda Item #5; Ex. 23 Staff Report for April 16, 2020 M1W Recycled Water Committee Meeting, Agenda Item #5; Ex. 24, Final Minutes from March 16, 2020 MPWMD Regular Board Meeting, p. 3.) Moreover, M1W recently confirmed that current injection rates for the Original PWM Project are only half of the planned capacity rate for the Original PWM Project injection wells. As a result, M1W may propose to add a new deep injection well to the project, further delaying implementation of the Original PWM Project and causing additional increases to water rates. (See Ex. 25, Pure Water Monterey: Injection Wells Facilities Status Presentation, M1W Recycled Water Committee Meeting (June 18, 2020).) Given these significant obstacles, the Original PWM Project is currently capable of producing only 2,030 afy of the planned 3,500 afy allocated for Cal-Am's customers. (*Ibid.*) These issues raise significant uncertainties regarding the use of this same technological approaches for the PWM Expansion.

Further, as discussed above, there is significant uncertainty regarding the availability of source water for the PWM Expansion—without such source waters, the PWM Expansion cannot, by definition, provide a sufficient water supply. (See Attachment A, Section I.2.a.) Moreover, even if the PWM Expansion could produce the water supplies discussed in the Staff Report, such supplies are inadequate to meet demand on the Monterey Peninsula, as assessed by the CPUC. (See *id.*, Section I.3-4.) Only the Project, not the PWM Expansion, has been proven capable of providing a reliable, drought-proof water supply. (See CPUC Decision D.18-09-017, Appx. C, p. C-71 [concluding that the PWM Expansion would only satisfy Project objectives "in conjunction with construction of a desalination plant of some size within five to fifteen years."].)

Questions from Commissioner Gold: What is the reliability of the PWM Expansion source water? How is the region's wastewater accounted for? Does it all go to M1W? Or is some additional wastewater available as source water for the Expansion? (Transcript at 335:7-335:16.)

Cal-Am Response: Source water reliability for the PWM Expansion is discussed in detail in Attachment A, Section I.2.a. As discussed above, there is significant uncertainty surrounding the availability of source waters for the PWM Expansion, including the reliability of certain source waters under the ARWRA between M1W and MCWRA, M1W's inability to commit to a consistent list of source waters for the PWM Expansion, disputed rights to agricultural produce wash waters and overestimation of water supplies during drought years. The extent that wastewater flows are available for the PWM Expansion is not readily apparent or proven. For instance, as discussed in Attachment A, Section I.2.a, M1W's ability to use a portion of such water is governed by the ARWRA, under which M1W previously contractually granted certain rights to municipal

wastewater to MCWRA. Under the ARWRA, certain wastewater flows from outside of M1W's 2001 service area boundary are to be evenly divided between M1W and MCWRA. (PWM Expansion Final Supplemental EIR/EIS, Appendix M, p. 3-10.) Though the PWM Expansion relies on the use of such water for recycling, M1W has admitted that "[t]hese flows have not previously been individually metered" and therefore the associated quantities cannot be reasonably relied upon for a specific quantity. (*Id.* at p. 3-10.) Moreover, multiple outstanding conditions are required to be completed before the ARWRA can become effective. (Draft SEIR, p. 4.18-5.) Therefore, the reliability of certain ARWRA source waters is speculative due to the significant conditions precedent that must be met for the sources of water to become fully secured. (Ex. 20, Cal-Am Letter to Monterey One Water re: PWM Expansion Final SEIR (Apr. 24, 2020) , pp. A-16 to A-17.)

Further, the source waters identified for the PWM Expansion remain uncertain since they have been modified by MIW throughout the environmental review process without adequate analysis or justification, raising doubts as to their reliability and ultimately the feasibility of the PWM Expansion. For instance, the Final SEIR for the PWM Expansion increasingly relies upon the availability of certain municipal wastewater flows even though it acknowledges that such flows have not been previously metered and that the estimates are based in part upon assumptions. (Final Supplemental EIR for the PWM Expansion, pp. 3-11 to 3-12.) When questioned about the reliability of such water supplies, M1W elected to evaluate source water scenarios where such sources are not used by the PWM Expansion, rather than demonstrate their reliability. (*Id.*, Responses to Comments VV-93 to VV-94 and VV-96 to VV-99.) M1W's inability to establish and rely on a stable, consistent set of source waters confirms that the project lacks a definite source water supply and raises serious questions about the PWM Expansion's feasibility and M1W's ability to accomplish the project in a successful manner. In part because of concerns associated with the reliability and availability of source waters, the M1W Board denied certification of the SEIR for the PWM Expansion. (See Ex. 18, M1W Board of Directors Staff Report (May 20, 2020); Ex. 17, M1W Letter to Cal-Am re: Pure Water Monterey Project – Cost, Operational Performance and Status (June 8, 2020), p. 1.)

Regarding how the region's wastewater is accounted for, according to the Final SEIR for the PWM Expansion, "[r]elative contributions of municipal wastewaters from M1W's geographic areas that enters the M1W headworks and is metered there include: 51% from the Salinas urban area, 3% from Moss Landing and Castroville, 45% from the Monterey Peninsula, Marina, and Fort Ord areas." (PWM Expansion Final Supplemental EIR/EIS, Appendix M, p. 2.) While the majority of these municipal flows are from areas within M1W's service area, some are received from beyond that boundary.

In response to the question concerning the availability of "some additional wastewater" for the PWM Expansion, M1W has not demonstrated the availability of additional sources of wastewater for the PWM Expansion, much less the availability and reliability of the water sources evaluated in the SEIR for the PWM Expansion.

D. Environmental Justice

Question from Commissioner Mann: What would Cal-Am's water rates be if the Project is not operated at full capacity? (See Transcript, pp. 322:10-323:7; also see Staff Report, p. 92.)

Cal-Am Response: As approved by the CPUC, the Project is intended to function at 86% capacity, producing 6,252 afy of water per year in normal years. (See Ex. 42, Direct Testimony of Ian Crooks to the CPUC Errata Version (Sept. 27, 2017).) This "provides a reasonable 14% operational reserve capacity to meet maximum day/month demands, dry weather reserves, variable water return percent, and additional supply for other system supply constraints in availability" to ensure water supply reliability. (*Ibid.*) During dry years, a "water supply shortfall can be covered by increasing desalination plant output to 100% and peaking other system supplies . . . depending on operational variables and regulatory availability." (*Ibid.*) Accordingly, the CPUC's ratesetting determination already considers that the Project will run at 86% capacity.

Further, as described in Attachment A, Section H, *supra*, staff's assumption that Project water would cost $6,100 per acre foot is incorrect. The CPUC decision expressly states that the "cost per acre-foot (AF) for the 6.4 mgd plant 'under the Tier 2 and PTM caps (inclusive of the 3,500 of GWR water) is $4,265 per AF and $4,472 per AF respectively." (CPUC Decision D.18-09-017, p. 123, fn. 332; see also Ex. 14, Rebuttal Testimony of Jeffrey T. Linam (Oct. 13, 2017).) These costs assume the Project is operating at 86% capacity. There is no reasonable basis for staff's reliance on a projected per acre foot cost of $6,100 per year.

Questions from Commissioner Brownsey: Why are Cal-Am's water rates, as included in a 2017 study, among the highest out of a survey of 500 public and private companies? How do water conservation and reduction of use have the unintended consequence of increasing water prices? (See Transcript, pp. 328:16-329:4.)

Cal-Am Response: The numbers provided in Food & Water Watch's 2017 study are misleading and do not reflect actual average water use in Monterey. As discussed in Attachment A, Section H, *supra*, the study wrongly assumed that the average water use of a single-family residential household in Monterey is 60,000 gallons per year. (Staff Report, p. 73.) The correct average use is 44,000 gallons per year. (Ex. 12, p. 1.) Conservation pricing generally charges higher tiered rates for higher than average levels of water use to discourage excessive use of water. Therefore, under conservation pricing, assuming a baseline of 60,000 gallons per year—16,000 gallons per year above the actual average water use in Monterey—artificially skews the average cost of water above actual costs. (*Ibid.*) Applying the correct usage model into a monthly estimate utilizing a 5/8-inch meter, the average monthly water bill is about $78 (or $936 annually), rather than the approximately $100 per month cited in the Food & Water Watch study for 2017. (*Ibid.*) Additionally, Food & Water Watch relies on sources that explicitly warn against the sort of rate comparison employed by the study. (See Attachment A, Section H, *supra*.) As such, the Commission should not rely on the Food & Water Watch study and instead should credit the CPUC's thorough ratesetting determination for the Project as

reasonable and just. (See CPUC Decision, D.18-09-017, pp. 19-20, 123-24; Pub. Util. Code, §§ 451, 454.)

In addition, water conservation and reduction in water use can have the unintended consequence of increasing water prices because water utilities generally have high fixed costs associated with infrastructure, improvements, staff, and maintenance. This situation is not unique to Cal-Am; on average, about 70 percent of a water utility's revenue is devoted to fixed costs. When sales are reduced as a result of water conservation, the variable costs go down, but the fixed costs remain, so the cost of each unit of water must increase to support the fixed costs and keep the water utility's finances stable. While customers who conserve will always pay less than those who do not, they may not see substantial reductions in monthly bills due to conservation because the fixed costs remain.

Question from Commissioner Groom: Is there a water rate chart or analysis available for the Commission to review? (See Transcript, pp. 329:24-330:19.)

Cal-Am Response: The ratemaking framework approved by the CPUC was developed through a lengthy briefing process and included input from ratepayers and community organizations. (See CPUC Decision, D.18-09-017, pp. 19-20, 123-124; see also Section H, *supra*.) The rates ultimately approved by the CPUC were based on extensive collaboration: "Sixteen parties (a sub-set of parties, including the applicant, ratepayer advocates, environmental groups, and public water agencies)" contributed to the process. A description of the ratemaking framework and the process is provided in the CPUC decision. (CPUC Decision, D.19-09-017, pp. 77, 88-99; see also *id.*, Appendix F.) As stated above, the CPUC found that costs per acre foot would be between $4,265 and $4,472. (*Id.*, p. 123, fn. 332.)

In addition, Cal-Am's rate schedule for Monterey County is based on use: single family; multi-family; and non-residential.[43] For each use, the rates feature pricing tiers with price in the first tier being the lowest. Each tier has a certain amount of water allocated to it and if the user uses more water than is allocated to a particular tier, the user moves to the next higher priced tier associated with a greater consumption of water. Cal-Am's water rate schedule in Monterey County for single-family residences effective January 2020 is as follows:

[43] Cal-Am's Monterey Rate Schedules are available at: https://amwater.com/caaw/customer-service-billing/billing-payment-info/water-rates/monterey-district

Residential Customers:	Base Rate Per 100 gal (CGL)	
For the first 29.9 CGL	$1.0078	(I)
For the next 29.9 CGL	$1.5117	
For the next 44.9 CGL	$3.5274	
For the next 67.3 CGL	$6.5508	
For all water over 172.0 CGL	$8.0625	(I)

(See Regular and LIRA Rates, Ex. 15.) Cal-Am also offers a low income ratepayer assistance ("LIRA") program that discounts rates for qualifying households by up to 30%.[44] The water rate schedule in Monterey County for the LIRA program effective January 2020 is as follows:

Residential Customers:	Base Rate Per 100 gal (CGL)	
For the first 29.9 CGL	$0.7055	(I)
For the next 29.9 CGL	$1.0582	
For the next 44.9 CGL	$2.4692	
For the next 67.3 CGL	$4.5856	
For all water over 172.0 CGL	$8.0625	(I)

(*Ibid.*)

E. Coastal Waters

Questions from Commissioner O'Malley: Is there sufficient wastewater available for mixing with the Project's brine discharges? What impact would highly concentrated brine discharges have on the receiving marine environment? What is the process for the Project's brine discharge? Will it comingle with wastewater? Where will the water for brine dilution come from? (See Transcript, p. 324:4-18.)

Cal-Am Response: The Project's potential environmental impacts from brine discharges were analyzed in detail in the Final EIR/EIS. The Final EIR/EIS incorporates mitigation measures developed jointly by various parties as part of the "Brine Discharge Settlement," including *inter alia*, Surfrider Foundation ("Surfrider"), Monterey Peninsula Regional Water Authority ("MPRWA"), Monterey Regional Water Pollution Control Agency, and Cal-Am. (CPUC Decision 18-09-017, p. 116.) Due largely to the leadership and direction of Surfrider in the settlement process, the Brine Discharge Settlement creates standards and conditions for the collection of relevant, long-term water quality data to determine and ensure compliance with defined water quality standards. (Brine Discharge Settlement at Section 3.) It also requires implementation of specific corrective actions if salinity standards are exceeded, before Cal-Am can continue to

[44] For example, for a household of 4 persons to qualify for LIRA rates, the total gross income from all sources must be less than $52,400. Exhibit 15 provides further detail on qualifying households.

discharge brine. (*Id.* at Sections 4.4-4.6.) Accordingly, the Project's brine discharges and associated mitigation measures, which are described below, were thoroughly evaluated by and reflect the interests of multiple stakeholders.

As discussed in the Final EIR/EIS, the Project will generate approximately 9 mgd of brine that will be discharged through M1W's existing ocean outfall. (Final EIR/EIS, p. 5.5-61.) Depending on the season, the Project will utilize treated wastewater flowing from the M1W Regional Wastewater Treatment Plant for mixing with brine discharges. (*Ibid.*) During the non-irrigation season (November through March), when the highest wastewater flows occur, brine would be combined and discharged with varying amounts of secondary wastewater. (*Ibid.*) During the irrigation season (April through October), when the secondary treated wastewater may be treated and distributed to irrigators, it is possible that only brine would be discharged from the Project. (*Ibid.*) Nevertheless, as described below, the Project would ensure that applicable water quality and salinity standards are met year-round. (*Id.* at p. 5.5-64.)

Due to the varying amount of wastewater available for mixing throughout the year, the Final EIR/EIS evaluated four discharge scenarios for water quality impact: brine only, brine with wastewater, high brine only, and high brine with wastewater. (*Id.* p. 5.5-61.) As expected, the worst case condition for dilution would be when only brine is discharged during the irrigation season. (*Id.* at p. 5.5-64.) In all scenarios modeled, the applicable Ocean Plan salinity limit would be met. (*Ibid.*) As discussed in detail in Section 4.3 of the Final EIR/EIS, brine generated at the desalination plant would flow through a 1,100-foot-long diffuser resting above the ocean floor at approximately 90 to 110 feet below sea level. (*Id.* at p. 4.3-70.) The diffuser would be equipped with 172 2-inch diameter ports through which the brine stream discharge. (*Ibid.*) As a result of this process, the diffuser would disperse the brine stream, "thereby minimizing differences in salinity and other water quality parameters between the discharged brine and the surrounding water." (*Id.* pp. 4.3-70 to 71.) Moreover, Project discharges, "would not violate water quality standards, waste discharge requirements, or otherwise degrade the water quality (including hypoxia) of receiving waters in Monterey Bay by increasing salinity levels." (*Ibid.*)

Furthermore, in order to comply with applicable monitoring and reporting requirements for operation of new desalination facilities, the project would implement Mitigation Measure ("MM") 4.3-5 (Implement Protocols to Avoid Exceeding Water Quality Objectives). (Final EIR/EIS, p. 4.3-104; see also Attachment A, Section C.) In addition to implementing routine monitoring and reporting, MM 4.3-4 also includes corrective actions that would be required to be implemented if data indicates deleterious effects to receiving water quality or marine biological resources. (*Id.* at 4.3-93.) Accordingly, any Project impacts relating to brine discharges have been thoroughly studied in the Final EIR/EIS and mitigated, where necessary, to the extent feasible.

Questions from Commissioner Escalante: Have the state agencies vested with authority over marine protected areas expressed any concerns about marine protected areas in the vicinity of the Project? What are the Project's impacts to marine protected areas, such as the Elkhorn Slough and the Pacific Grove? (See Transcript p. 333:16-23.)

Cal-Am Response: Aside from the Coastal Commission, state agencies vested with authority over the marine protected areas within the Project's footprint include the California Department of Fish and Wildlife (CDFW), the California Fish and Game Commission, the State Water Board and the California State Lands Commission (CSLC). (See Final EIR/EIS, pp. 4.5-37, 4.5-39, 4.5-42.) The CDFW, State Water Board, and CSLC each commented on the Draft EIR/EIS for the Project. (Final EIR/EIS, Ch. 8.4.)

In its comments on the Draft EIR/EIS, CDFW requested that "special status biological resources should be evaluated and addressed prior to Project implementation, in order to comply with State law[]." (*Id.* at p. 8.4-6.) As discussed in further detail below, the Final EIR/EIS evaluated such potential impacts in detail and concluded that the Project would not result in a significant impact on marine biological resources with implementation of the mitigation measures identified. (Final EIR/EIS, pp. 4.5-47, 5.5-134.) With respect to Project impacts on marine species, the State Water Board confirmed that "[s]lant wells are… the preferred intake technology in the Ocean Plan because they minimize or eliminate intake and mortality of marine life." (*Id.* at p. 8.4-22.) As such, State Water Board concluded that "CalAm's construction and maintenance plan for the slant wells appears to avoid impacts to marine life" and "[o]verall, it appears that the MPWSP has been sited and designed in a manner that would result in minimal impacts to marine life and is consistent with the intent of the Ocean Plan to protect marine life and water quality." (*Ibid.*) CSLC's comments did not concern Project impacts on marine resources. (*Id.*, pp. 8.4-17 to 8.4-20.)

As noted above, the Final EIR/EIS evaluated potential impacts to marine protected areas. (See Final EIR/EIS, Ch. 4.3, 4.5.) Significantly, the Final EIR/EIS was prepared jointly with the Monterey Bay National Marine Sanctuary ("MBNMS"), which served as the NEPA lead agency for the Project. (*Id.* at ES-2.) The MBNMS is the federal agency charged with overseeing specified marine area offshore of California's central coast, including areas impacted by the Project. As such, the Final EIR/EIS reflects the analysis and conclusions of MBNMS staff. The Final EIR/EIS concluded that the Project would not result in a significant impact on marine biological resources. (Final EIR/EIS, p. 4.5-47, 5.5-134.) For instance, with respect to special status marine species in these areas, Section 4.5.1.3 identified certain mammals, birds, turtles and fish that may be impacted by the Project. (*Id.*, pp. 4.5-10 to 4.5-25.) Impact 4.5-1 determined that the Project would not result in a substantial impact upon any such species or on any natural community or habitat identified in any applicable local or regional plans, policies or regulations. (*Id.*, pp. 4.5-47, 5.5-135.) Additionally, the Final EIR/EIS confirmed that there are no known marine species in Monterey Bay with population numbers suspected of dropping below self-sustaining levels (except for the California Sea otter). (*Id.*, p. 5.5-135.) Accordingly, Final EIR/EIS determined that the Project "would not cause a fish or marine wildlife population to drop below self-sustaining levels and would not interfere

with the movement of any native marine resident or migratory fish or marine wildlife species in MBNMS." (*Ibid.*)

F. Groundwater

Questions from Commissioner Brownsey: Is groundwater data missing that could impact how the Salinas Valley Groundwater Basin aquifers have been characterized? If so, does that impact the Project? (Transcript, pp. 327:23-329:13.)

Cal-Am Response: As explained above in Attachment A, Section D, the Commission has sufficient information regarding the Project's potential impacts to groundwater supplies in the SGVB to determine that the Project conforms to the groundwater protection provision of Coastal Act Section 30231. The EIR/EIS consultant team performed over six years of fieldwork, data analysis, and groundwater modeling, and the modeling and its results were subject to substantial peer review and public comment. (See, e.g., Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), at p. 3.) Based on the extensive data and peer-reviewed modeling, the Final EIR/EIS conservatively analyzed the Project's potential impacts to groundwater supplies in the SVGB, finding that such impacts would be less than significant. (See Final EIR/EIS, pp. 8.2-86, 8.2-97, 4.4-64, 4.4-90 to 4.492.) Any additional, non-peer reviewed modeling is unnecessary and would not change the Final EIR/EIS's conclusions. (See Staff Report Addendum, Ex. 7, pp. 19-20 [Weiss Associates confirmed the Final EIR/EIS's modeling was conservative].) Nonetheless, Cal-Am has consented to additional modeling work by Weiss Associates for purposes of moving the Project forward through the Commission process.

Questions from Commissioner Brownsey: How do the slant wells work? When the slant wells withdraw water, do they extract fresh water? What basin is that water coming from? What is the impact on Marina's water? (Transcript, pp. 327:23-329:13.)

Cal-Am Response: The Project's slant wells would extend from the wellheads (the surface components) located on the CEMEX site to beneath Monterey Bay at a fourteen-degree angle. (See Final EIR/EIS, pp. 3-9, 3-18.) The slant wells would withdraw water from the groundwater aquifers that extend beneath the ocean floor. (*Id.*, pp. 3-9, 3-20.)

As explained in detail in Attachment A, Section D, the Project will withdraw primarily seawater from the Salinas Valley Groundwater Basin. (See *id.*, pp. 4.4-4.4-92, 8.5-561.) This "feedwater" would be "a combination of brackish groundwater representing the ambient conditions in the water bearing sediments of the Dune Sand and 180-FTE Aquifers at the coast, and the seawater that is drawn in through the aquifer sediments to recharge the capture zone."[45] (*Id.*, p. 8.2-3.) As shown in Final EIR/EIS, Table 8.2.8-1, copied below, TDS and chloride concentrations in the Project's monitoring wells show

[45] "The capture zone is the localized region that would contribute source water to the slant wells." (Final EIR/EIS, p. 8.2-3; see also *id.*, p. 4.4-52.)

that the water within the capture zone is substantially exceeds applicable standards for human consumption or irrigation without treatment. (See Final EIR/EIS, p. 8.2-48.)

TABLE 8.2.8-1
TOTAL DISSOLVED SOLIDS CONCENTRATIONS IN MPWSP MONITORING WELLS LOCATED WITHIN THE SLANT WELL CAPTURE ZONE

Well Number	Sample Date	Aquifer	Total Dissolved Solids (TDS) (mg/L)	Chloride (mg/L)
			California Drinking Water Standard: 500 mg/L[a]	California Drinking Water Standard: 250 mg/L[a]
MW-1S	2/13/15	Dune Sand	26,600	14,504
MW-1M	2/14/15	180-FTE	30,900	16,037
MW-3S	2/25/15	Dune Sand	23,400	11,680
MW-3M	2/24/15	180-FTE	28,500	14,686
MW-4S	3/7/15	Dune Sand	11,900	5,497
MW-4M	3/6/15	180 FTE	17,900	9,751

NOTES:
[a] California Secondary Maximum Contaminant Level (Cal. Code Regs., tit. 22, § 64449)
SOURCE: Geoscience, 2015

As Project pumping continues, the ocean water percentage of the Project's feedwater will reach 96 to 99%. (*Id.*, p. 4.4-56.) Any fresh water (i.e., water with less than 500 mg/L TDS (Final EIR/EIS, p. 4.4-31)) will be returned to the Basin as part of Cal-Am's obligations under the Return Water Settlement Agreement and Monterey County Water Resources Agency Act. (See CPUC Decision D.18-09-017, pp. 104-105, 110; see also Attachment A, Section D.)

Further, Project pumping will not impact the City of Marina's water supplies. Marina's municipal wells are over 2 miles outside of the Project's capture zone. (See Final EIR/EIS, p. 4.4-75.) Further, Marina's municipal wells are screened in the Deeper Aquifer, but the Project will extract contaminated groundwater from the Dune Sands Aquifer and the 180-Foot Aquifer of the SVGB. (*Ibid.*) There are no known potable groundwater supply wells currently operating in the 180-Foot and 400-Foot Aquifers within the area of potential impacts of the Project's slant wells. (Final EIR/EIS, p. 8.5-633.) Therefore, the Project will not adversely impact Marina's municipal water supply.

G. Water Supply and Demand

Questions from Commissioners Brownsey and Gold: Why is there a divergence of views on water demand? (Transcript, p. 329:6-329:13.) How do we reconcile the differences in the water demand estimates put forth by various parties? (Transcript, pp. 334:21-335:6.)

Cal-Am Response: The estimates of supply and demand that diverge from the CPUC's conclusive supply and demand determination are being put forward by Project opponents in an attempt to derail the Project. These alternative supply and demand estimates all

suffer from significant flaws. Importantly, the CPUC is the agency charged by statute with exclusive jurisdiction to determine utility supply and demand and its determinations reflect a six year process. (See Attachment A, Section I.3; see also *Citizens Utilities Company of California v. Super. Ct.* (1976) 56 Cal.App.3d 399, 408; see also *City of Oakland v. Key System* (1944) 64 Cal.App.2d 427, 435.) Indeed, many of the entities now claiming to have re-calculated Peninsula supply and demand were parties to the CPUC's proceedings on the Project, and made substantially the same arguments in support of their positions then that they are now advancing before the Commission. (See Attachment A, Section I.3.a.) The CPUC considered the testimony of those parties and the evidence presented, and nevertheless determined that Cal-Am's future customer demand is 14,000 afy. *(Ibid.*; see also CPUC Decision D.18-09-017, p. 171.) Following the CPUC's decision, Project opponents, including MCWD, challenged that decision, including its findings on supply and demand, before the California Supreme Court—the Supreme Court wholly rejected those challenges and affirmed the CPUC's decision. Commission staff, MPWMD, and the various Project opponents lack authority to second-guess the binding supply and demand determinations handed down by the CPUC. (See CPUC Decision D.18-09-017, pp. 167-171, 194-195.) Moreover, many of the positions taken in the Stoldt Memo, upon which the Staff Report relies, directly contradict arguments put forward during earlier proceedings related to the Project before the State Water Board. (See Attachment A, Section I.3.d.) Accordingly, there is no need to reconcile the disparate estimates of supply and demand—rather, staff must utilize the supply and demand levels calculated by the CPUC.

As described in detail in Attachment A, each of the supply and demand estimates put forward by various entities and Project opponents is deeply flawed, and do not constitute substantial evidence to conclude that Peninsula supply and demand should be reassessed from the levels set by the CPUC. (See Attachment A, Section I.3.)

Question from Commissioner Escalante: Is there more room for water conservation in Cal-Am's service area? (Transcript, p. 333:3-333:15.)

Cal-Am Response: As a result of both the State Water Board CDO and long-standing drought conditions, water users in Cal-Am's service area are already burdened by "extreme conservation and moratorium measures." (See CPUC Decision D.18-09-017, pp. 52-53.) Indeed, the MPRWA has stated that "the Monterey Peninsula is already one of the most efficient water use communities in the state," and that the Cal-Am service area is already "drought hardened," a fact that the CPUC recognized in its decision on the Project. (*Id.*, p. 28.) Moreover, multiple entities, including MPWMD and the Monterey County Hospitality Association, have argued that additional conservation measures "would force economic stagnation upon the region, and can result in harm to the health and safety of the community." (See Final EIR/EIS, p. 5.5-358.) As such, "meaningful additional conservation will not be a reasonable option" to address the Monterey Peninsula's ongoing water crisis. (CPUC Decision D.18-09-017, p. 28 [quoting testimony provided by MPRWA].)

H. Agriculture

Question from Commissioner Groom: What are the Project's potential impacts to agriculture? (See Transcript, pp. 329:24-330:19.)

Cal-Am Response: The CPUC determined that the Project would boost the economic vitality of the agricultural industry in the region by improving long-term water supply reliability and water infrastructure. (CPUC Decision, D.18-09-017, Appx. C, pp. C-74 to C-75; see also *id.*, pp. 159 [Project "reflects community values . . . by supporting agriculture"].) Rather, without the Project, "the lack of water supply would adversely affect the region's economic vitality, including the County's 'four pillars' – agriculture, tourism, education, and research – by substantially reducing the reliability of water resources and water infrastructure" in the region. (*Id.*, p. 67.)

The Project specifically will provide desalinated product water to the Castroville Community Services Department ("CCSD") and Castroville Seawater Intrusion Project ("CSIP") as part of the CPUC-approved "Return Water Settlement Agreement." (See Attachment A, Section D, *supra.*) CCSD provides municipal and domestic water service to customers in the disadvantaged agricultural community of Castroville. (See, e.g., Ex. 11, Declaration of Eric Tynan, *MCWD v. County of Monterey*, Case No. 19CV003305.) CSIP similarly serves agricultural operations in the region to allow farmers to "safely irrigate their crops and reduce pumping of seawater-tainted groundwater."[46] Project water supplied to CCSD and CSIP will support and improve regional agricultural operations that are currently threatened by saltwater intrusion and a lack of reliable water supplies. (See, e.g., Final EIR/EIS, p. 8.6-414 [letter from Salinas Valley Water Coalition and Monterey County Farm Bureau stating that the Project, with implementation of the Return Water Settlement Agreement, would not cause agricultural impacts]; Ex. 11, p. 4 [describing CCSD's dire need for Project water].) The CCSD Manager has stated that "halting construction of the MPWSP will severely prejudice CCSD and the disadvantaged community of Castroville that despretately needs a new, reliable long-term water supply." (Ex. 11, p. 4.) The Monterey County Farm Bureau, which represents farmers and agricultural operations in the Salinas Valley, has explicitly supported the Project with implementation of the Return Water Settlement Agreement. In contrast, the Monterey County Farm Bureau has raised concerns that the PWM Expansion could capture water discharged in the Salinas Valley that could be used for agriculture and instead reuse it elsewhere, and has recommended that the PWM Expansion be put on hold. (SEIR for PWM Expansion, p. 4-593.) The City of Salinas, MCWRA, and private agricultural operators have raised similar concerns that the PWM Expansion would come at the expense of the Salinas Valley agricultural community. (See, e.g., *id.*, pp. 4-4 to 4-5; 4-42 to 4-44; 4-195.) Cal-Am will provide additional detail on potential impacts to the agricultural community from the PWM Expansion in an

[46] Monterey County Water Resources Agency, Monterey County Water Recycling Projects (CSIP/SVRP), https://www.co.monterey.ca.us/government/government-links/water-resources-agency/projects-facilities/castroville-seawater-intrusion-project-salinas-valley-reclamation-project-csip-svip.

Environmental Justice technical analysis that will be submitted separately to the Commission.

As for direct impacts, the EIR/EIS found that there would be no impacts to agriculture from construction of the slant wells. (See Final EIR/EIS, § 4.16.) The agriculture related concern raised by Project opponents is that alleged saltwater intrusion resulting from the Project's operations may impact regional agriculture. These concerns are not based in fact. All available evidence indicates that seawater intrusion will not occur. If anything, the CPUC concluded that the Project will work to prevent further saltwater intrusion. (See Final EIR/EIS, pp. 4.4-92, 8.5-561; HWG Response to Coastal Commission (Feb. 20, 2020), at p. 2; see also Section I.D, supra.)

Further, the Project will neither extract nor impact water that could otherwise be used for agricultural purposes. As fully discussed in Attachment A, Section D, the State Water Board has reviewed the existing groundwater record and the Weiss Report, and in its May 8, 2020 letter, concluded that the modeling "already conducted, revised, and relied upon by the [CPUC] . . . provide a conservative overprediction of the volume of shallow, inland water the Project would capture during operation." (See Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), p. 3.) The State Water Board further stated that the Project's groundwater impacts "have already been resolved by the Public Utilities Commission, after extensive environmental review and consideration of evidence and testimony over a multi-year adjudicative proceeding." Although MCWD and others have claimed that pockets of "fresh water" exist that may be impacted by the project, these pockets are either hydraulically disconnected from the Project's capture zone or are composed of water unfit for agricultural irrigation. (Final EIR/EIS, p. 8.2-61; CPUC Decision D.18-09-017, Appx. J, pp. 15, 19-21; see also Attachment A, Section D.) As determined by the CPUC, the enhanced water supply reliability provided by the Project will benefit agricultural operations in the region and there is no evidence that regional agriculture will be negatively impacted.

I. Coastal Act Section 30260 Override

Questions from Commissioner O'Malley: If the Commission finds that the Project is inconsistent with Coastal Act or LCP policies, but that the Project satisfies the tests of Section 30260, is approval of the Project mandatory or discretionary? Similarly, if the Commission finds that the PWM Expansion is feasible, does the Commission still have discretion to approve the Project under Section 30260? (See Transcript, pp. 324:21-325:19.)

Cal-Am Response: Section 30260 is discretionary. Section 30260 provides that "[c]oastal-dependent industrial facilities shall be encouraged to locate or expand within existing sites and shall be permitted reasonable long-term growth where consistent with [the Coastal Act]." (Pub. Resources Code, § 30260.) If a proposed coastal-dependent industrial facility is inconsistent with a Coastal Act or LCP policy, Section 30260 provides that the facility "***may nonetheless be permitted***" if three criteria are met: "(1) alternative locations are infeasible or more environmentally damaging; (2) to do otherwise would adversely affect the public welfare; and (3) adverse environmental

effects are mitigated to the maximum extent feasible." (Ibid. [emphasis added].) In MCWD's lawsuit challenging the Commission's approval of the test slant well under section 30260, the Sixth District Court of Appeal upheld the Commission's exercise of discretion to approve the test slant well notwithstanding potential impacts to ESHA. (See *MCWD v. Cal. Coastal Com.* (2016) 2016 Cal.App.Unpub.LEXIS 8028.)

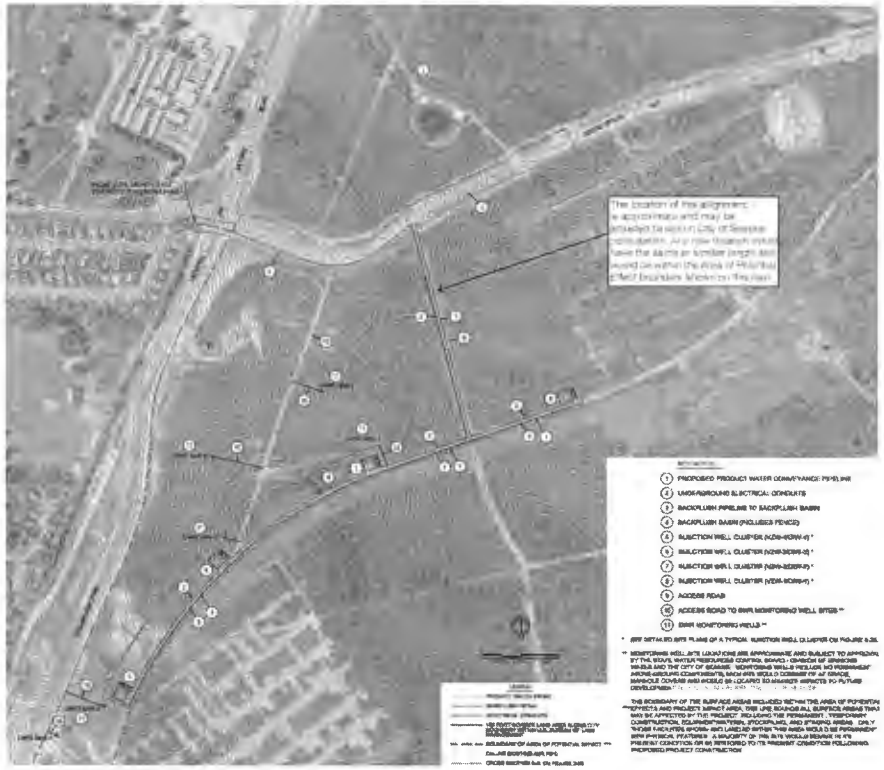
Further, the Commission does not have the authority to consider the PWM Expansion as an alternative to the Project under Section 30260. As explained in Attachment A, Section J, the first test of section 30260 is whether "alternative ***locations*** are infeasible or more environmentally damaging." (Pub. Resources Code, § 30260 [emphasis added].) The PWM Expansion is not an alternative location to the Project components located within the Coastal Zone, but rather a wholly separate proposed project. The Final EIR/EIS evaluated alternative locations to the Project components located within the Coastal Zone and concluded, based on substantial evidence, that the proposed location of Project infrastructure, including the slant wells on the CEMEX site, is the environmentally superior alternative. (See Section C *supra*; see also Final EIR/EIS, Ch. 5.)

Acting as lead agency under CEQA, the CPUC also considered certain project alternatives outside of the Coastal Zone, like the PWM Expansion. The CPUC specifically rejected the PWM Expansion as infeasible for "myriad independent reasons." (CPUC Decision D.18-09-017, Appx. C, p. C-17.) The CPUC noted that by September 2018, the PWM Expansion was already far behind schedule and there was not "sufficient certainty concerning short- and long-term availability of source water supplies for the PWM Expansion." (*Id.*, p. C-71; see also Attachment A, Section I.2, for a discussion of the infeasibility of the PWM Expansion.) Further uncertainty has arisen since the CPUC's decision about the Original PWM Project's ability to deliver the amount of water it is obligated to provide, along with related technical issues, which substantially call into question the PWM Expansion's feasibility. Coupled with the fact that the M1W Board has denied certification of the PWM Expansion's Final SEIR, these issues further support the CPUC's conclusion that the PWM Expansion is not a feasible alternative to the Project.

Exhibit 3

Monterey One Water

PURE WATER MONTEREY



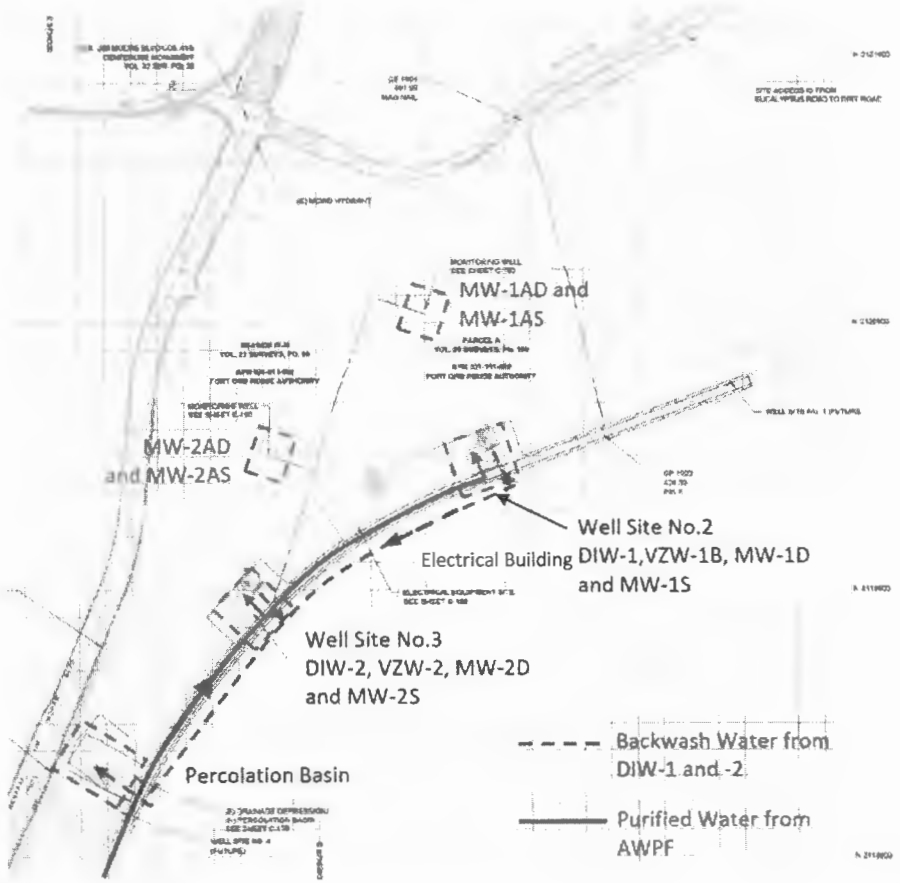
Injection Wells Facilities Status
RWC Meeting - June 18, 2020

Kennedy Jenks Consultants Todd Groundwater

Overview

- Review IWF and Objectives
- Review of Current Status of Injection Wells Facilities (IWF)
- Discussion of Third Deep Injection Well
- Discuss Potential Next Steps

Original Plan: "Delivery Point" defined Under WPA in September 2016



Delivery Point

"AWT Water will be injected into the Seaside Groundwater Basin using new injection wells. The proposed new Injection Well Facilities will be located east of General Jim Moore Boulevard, south of Eucalyptus Road in the City of Seaside, including up to eight injection wells (four deep injection wells, four vadose zone wells, in pairs identified as #5, #6, #7, and #8 in the figure below), six monitoring wells, and back-flush facilities."

Injection Wells Facilities Site

Monterey One Water

PWM System Injection Objectives

	Initial Commissioning Period	1st Year of Operations	2nd Year of Operations	3rd Year of Operations	4th Year of Operations
Initial 6 months Operating Reserve, AF	1,000	-	-	-	-
Annual Production Amount, AFY		3,500	3,500	3,500	3,500
Drought Reserve, AFY		200	200	200	200
First 3-years Annual Operating Reserve, AFY		250	250	250	-
Total for Period, AF	1,000	3,950	3,950	3,950	3,700
AF/Month	167	329	329	329	308

IWF Injection Rates: Recharge up to 3,950 AFY to Meet Objectives

Injection Objectives	Average Month	Maximum Month	Minimum Month
AF/Month	308	338	288
AF/Day	10.3	11.3	9.6
MGD	3.35	3.67	3.13
Average, gpm	2,325	2,550	2,175
System Downtime	10%	10%	10%
Required Injection Rate, gpm	2,560	2,800	2,490

Planned & Current Injection Rates

Wells		Planned Capacity, gpm	Early Injection Rates, gpm	Current Injection Rates, gpm
	VZW-1B	500	50	0
	VZW-2	500	350	0
Vadose Zone Wells	Subtotal	1,000	400	0
	DIW-1	1,000	950	775
	DIW-2	1,000	950	625
Deep Injection Wells	Subtotal	2,000	1,900	1,400
	Total IWF	**3,000**	**2,400**	**1,400**
Required Injection Rate		**2,800**	**2,800**	**2,800**

Estimated Annual Recharge at Current Rates: 2,030 AFY

Recommended Commissioning and Repair

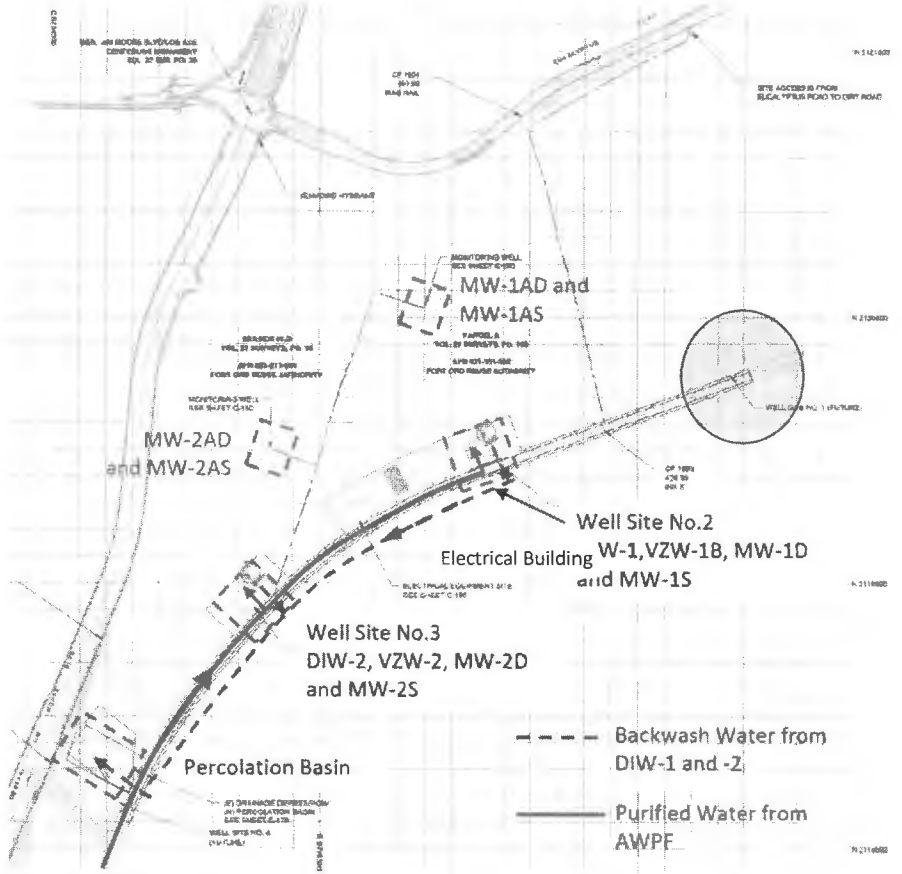
Final Commissioning (swabbing) of Deep Injection Wells

Est. $300K; Plan for Fall 2020

Well Pad Stabilization at Vadose Zone Wells

Est. $350K; Plan for Winter 2020

Potential Improved Injection Rates (after DIW commissioning & VZW restart)



Wells		Low-End Potential Injection Rates, gpm	High-End Potential Injection Rates, gpm
	VZW-1B	50	50
	VZW-2	100	200
Vadose Zone Wells	Subtotal	150	250
	DIW-1	850	950
	DIW-2	750	850
Deep Injection Wells	Subtotal	1,600	1,800
	Total IWF	**1,750**	**2,050**
Required Injection Rate		**2,800**	**2,800**

Estimated Annual Recharge at Mid-Potential Rates: 2,760 AFY

DIW-3 at Well Site 1

Well Site #1 – Farther to East

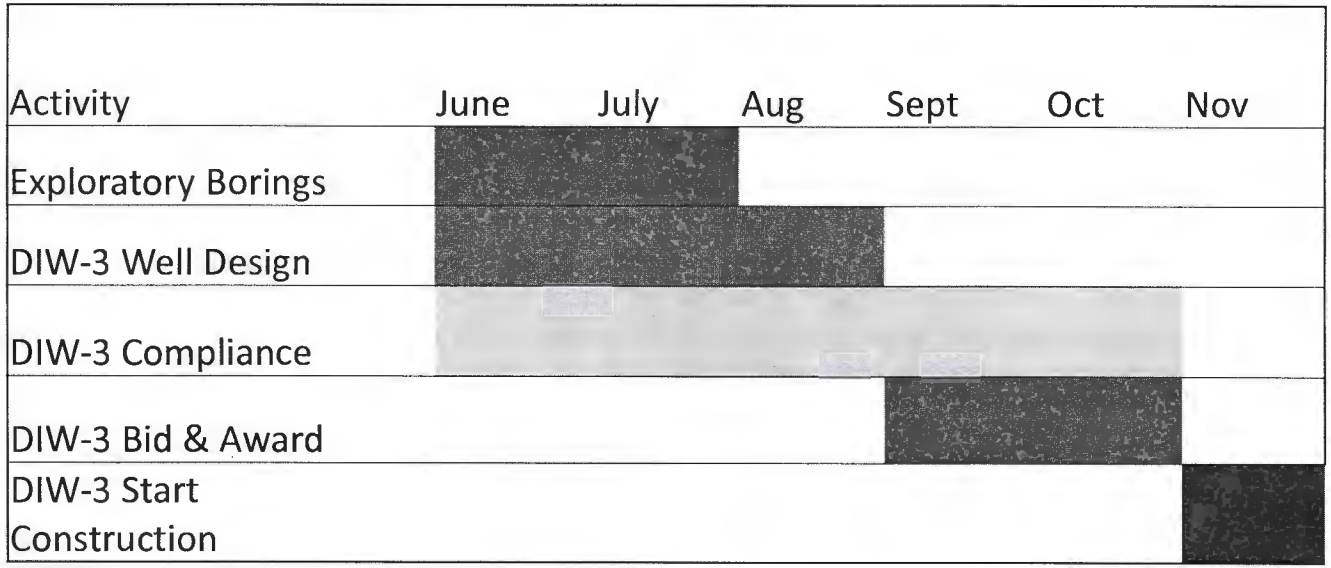
- Santa Margarita geology expected to be much better than Well Site 4
- Doesn't require Booster PS and probably doesn't require another MW

Potential Injection Rates (after DIW-3, DIW commissioning & VZW restart)

Wells		Low-End Potential Injection Rates, gpm	High-End Potential Injection Rates, gpm
	VZW-1B	50	50
	VZW-2	100	200
Vadose Zone Wells	Subtotal	150	250
	DIW-1	850	950
	DIW-2	750	850
	DIW-3	850	950
Deep Injection Wells	Subtotal	2,450	2,750
	Total IWF	**2,600**	**3,000**
Required Injection Rate		**2,800**	**2,800**

Estimated Annual Recharge at Mid-Potential Rates: 3,960 AFY

Proposed Change in SRF Loan



$6.1 Million:	↑ 5% increase on $110 million loan
Increase in Debt Service:	↑ $245,000 Annually
Increase in Cost/Acre Foot:	↑ $66

Note: Loan amount above does not account for a reimbursement of $4.1 million from a WIIN grant.

Cost of PWM Water

Estimated Recharge	Planned 1st Year	Current Status	After Final DIW Commissioning/VZW Restart	Add DIW-3
AFY	3,750	2,030	2,760	3,750
$/AF	$2,442	$3,678	$2,993	$2,508

DIW-3 Implementation Schedule

Board of Directors Meeting
Staff Report

TO: Board of Directors

FROM: Paul A. Sciuto, General Manager

MEETING DATE: May 21, 2020

AGENDA ITEM NO: 7 - B

SUBJECT: **Discuss and Consider Issues and any Options Relative to the PWM Expansion Project and the SEIR (not certified)**

BACKGROUND

On April 27, 2020, the M1W Board did not act to certify the Supplemental Environmental Impact Report (SEIR) for the Pure Water Monterey Expansion (Back-up) Project. Staff has received inquiries from Board Members about whether it might be appropriate for the Board to consider and discuss further any actions that might be suitable or opportune regarding the SEIR and the project. Also, on May 1, 2020 the M1W Board of Directors received the attached letter from the Monterey Peninsula Water Management District (MPWMD) requesting identification of specific deficiencies found in the SEIR. These matters were discussed in some detail by the Recycled Water Committee at its meeting on May 14th, 2020.

DISCUSSION

There are a number of options the Board may consider and discuss in regard to further action on the not certified SEIR and the PWM Expansion Project.

Staff has noted that the Agency does not have additional budget funds at this time for dealing with any additional deficiencies that have been identified by some Board Members or could be identified in the future. The Agency has suspended all of the remaining contracts on these matters to prevent further consultant expenditures. This includes related work that was being done specifically for Cal Am. At least one Board Member expressed at April's Board meeting an interest in seeing further work to address the questions and comments that were provided to the Board. It might be appropriate for the Board to consider providing further guidance in that regard.

At its meeting the Recycled Water Committee discussed whether, in light of other critical M1W priorities and the uncertain financial environment due to COVID 19 impacts to the economy, it might not be prudent to move forward with any work regarding PWM Expansion at this time.

Some of the other critical priorities include:

- Meeting PWM injection volumes as required by the Water Purchase Agreement with Cal Am and the Monterey Peninsula Water Management District (MPWMD).
- Deferred maintenance at the Agency's Regional Treatment plant, pump stations, and field facilities.

- Increasing rehabilitation and replacement of infrastructure assets.
- Increasing financial reserves to be more fiscally stable

Furthermore, the current financial situation will require a contraction of expenditures and potentially a decrease to levels of service provided by the Agency. The reduction of financial capacity may result in:

- Not filling needed vacant positions.
- Drastic budget cuts (about 12.5% to 15%) for 2020/2021 fiscal year.
- Furloughs and layoffs of employees.
- Opening and renegotiating of labor agreements.

In the Board's discussion, it could determine that it is appropriate for it to also consider in connection with this matter the draft list staff was directed to compile of deficiencies identified regarding the SEIR based on the statements made by Board members during the April 27, 2020 Board meeting. This list was directed to be prepared as a potential response to the letter received from the MPWMD, which requested that this Agency "identify specific deficiencies found in the SEIR," and is as follows:

1. Source Water. The SEIR does not adequately address the number of comments and concerns expressed that it cannot document the quantity and reliability of the source water available to the Expansion Project.

2. Water Supply and Demand. The SEIR fails to support its conclusion about long-term water supply and demand, and that conclusion is contrary to the CPUC demand determination and the estimates from the individual cities involved.

3. Agricultural Water Supplies. It fails to properly evaluate potential impacts to agricultural water supplies due to a significant reduction in available agricultural irrigation water because of the Expansion.

4. Cumulative Impact. The SEIR fails to evaluate the Expansion either as an alternative to or a cumulative project with the MPWSP desalination facility.

FISCAL IMPACT

None identified at this time.

RECOMMENDED ACTION:

That the Board of Directors consider and discuss these matters and make such decisions regarding same as it deems appropriate.

Attachment:

1. May 1, 2020 letter from MPWMD Board of Directors
2. E-mail Communication from Member Gaglioti with attachments

Monterey One Water
Board of Directors
Ron Stefani, Chair
5 Harris Court, Bldg. D
Monterey, CA 93940

Dear Chair Stefani and Board Members,

I write this letter to reiterate Monterey County Water Resources Agency's ("MCWRA") position concerning the recently approved Amendment No. 2 to the Amended and Restated Water Recycling Agreement ("ARWRA"). As you may know, both the M1W Board and the MCWRA Board of Supervisors approved Amendment No. 2 on May 21 and June 16, 2020, respectively.

Amendment No. 2 extends the time for the parties to continue to work on conditions precedent in Section 16.15 of the ARWRA concerning use of waters from the Blanco Drain and Reclamation Ditch ("New Source Waters"). Amendment No. 2 also gives M1W the right to utilize the New Source Waters, until the conditions in Section 16.15 are reasonably satisfied. However, the ARWRA and subsequent two Amendments limit M1W's utilization of the New Source Waters solely for use in the Pure Water Monterey Project Groundwater Replenishment Project approved on October 8, 2015. The ARWRA and Amendments do not contemplate M1W's use of the New Source Waters in any other capacity, including any proposed expansion to the Pure Water Monterey Project.

MCWRA looks forward to working with M1W to resolve these outstanding issues.

Sincerely,

E-signed 7/7/2020

Brent Buche
General Manager

Re: Use of Agriculture Produce Wash Water for the Proposed Modifications to the Pure Water Monterey Groundwater Replenishment Project, Draft Supplemental Environmental Impact Report (Draft SEIR)

Dear Ms. Guadoin:

The City of Salinas provides the following comments on the Draft Supplemental Environmental Impact Report ("Draft SEIR") for the Proposed Modifications to the Pure Water Monterey Groundwater Replenishment Project ("Expansion Project"). In particular, the City is providing clarifications as to Monterey One Water's (formerly the Monterey Regional Water Pollution Control Agency) ("M1W") permissible use of agriculture produce wash water pursuant to its existing agreements with the City.

The City of Salinas is known as the "Salad Bowl of the World" and is surrounded by agriculture on all sides. The City remains committed to preserving agriculture as its major industry, which is important for maintaining our community's quality of life. Water is a critical component of the agriculture industry, and agriculture methods and technologies continue to evolve not only to make water use more efficient, but to find ways to treat and reuse water in agriculture processes to avoid wasting limited water resources. Accordingly, any potential use of agriculture produce wash water generated in the City without the City's consent is a critical issue for our residents and businesses.

Agriculture produce wash water is an important component of the source water for the Expansion Project, which is projected in the Draft SEIR to be an annual average of 3,732 acre-feet per year ("AFY"). (Draft SEIR, App. 1, p. 3.) While the Draft SEIR appears to rely on the availability of this water in order to produce the 2,250 AFY of additional potable water that the Expansion Project proposes to produce, M1W does not have sufficient agreements in place with the City to permit M1W to use the City's agriculture produce wash water for the Expansion Project. In fact, and as discussed in detail below, existing agreements limit M1W's use of the City's agriculture produce wash water to the previously approved 3,500 AFY Pure Water Monterey Replenishment Project ("GWR Project"). In the absence of further agreements from the City, the City intends to use available agricultural wash water for its own purposes, including to support farmers, ranchers and

the City's agriculture industry. Accordingly, M1W's ability to produce an additional 2,250 AFY of potable water through the Expansion Project is uncertain.

Section 4.18.3.3 of the Draft SEIR and Draft SEIR Appendix B (the Revised Source Water Rights Memorandum) confirms that the City has exclusive right to its treated wastewater, absent agreements with M1W. (Draft SEIR Appx B, p. 6.) While the City has entered into certain agreements with M1W to permit M1W to use the City's agricultural wash water for specified purposes, the Draft SEIR (see Draft SEIR p. 4.18-6) overlooks the limited scope of M1W's rights under the Amended and Restated Water Recycling Agreement ("ARWRA") (**Exhibit A**) and does not consider the limitations in the October 27, 2015 Agreement for Conveyance and Treatment of Agricultural Produce Wash Water by and between the City of Salinas and M1W ("2015 Conveyance and Treatment Agreement") (**Exhibit B**).

The 2015 Conveyance and Treatment Agreement allows agricultural produce wash water to be used for the approved GWR Project, but does not permit that water to be used for the proposed 2,250 AFY Expansion Project. The 2015 Conveyance and Treatment Agreement has two permitted uses of the agricultural produce wash water: 1) to serve the GWR Project, and 2) augment the existing Castroville Seawater Intrusion Project's ("CSIP") crop irrigation supply. (Agreement, §1.a-b.) Sections 1.a and 1.b provide that agricultural wash water is conveyed for the "uses described in Recital B." Recital B states "The MRWPCA [now M1W] has an existing need for source water for 1) to serve its Pure Water Monterey Groundwater Replenishment Project (the "GWR Project") and 2) to augment the existing Castroville Seawater Intrusion Project's ("CSIP") crop irrigation supply." Therefore, use of the agricultural wash water is limited to these express uses, which does not include the Expansion Project.

The 2015 Conveyance and Treatment Agreement does not allow for water use beyond the scope of the approved GWR Project as it was approved in 2015. Specifically, the "Agreement implements the Pure Water Monterey Groundwater Replenishment Project ('GWR') that the MRWPCA Board approved on October 8, 2015." (Agreement, p. 2 [Recital F].) Further, the 2015 Conveyance and Treatment Agreement was approved by the parties "based on the EIR as certified" for the GWR Project. (Agreement, p. 2 [Recital F].) This language therefore limits the use of agricultural wash water to the scope of the GWR Project as it was approved in 2015, which does not include the later proposed Expansion Project.

The ARWRA does not contemplate the use of agricultural produce wash water for the Expansion Project. The ARWRA "provides for new source waters from the Blanco Drain, Reclamation Ditch and the City of Salinas [] for CSIP and the Pure Water Monterey Project." (**Exhibit C, p. 1** [Monterey One Water Staff Report].) The ARWRA contains the same limiting language as the 2015 Conveyance and Treatment Agreement, stating that it "relates to and implements certain portions of the [GWR Project] that the MRWPCA Board approved on October 8, 2015." (ARWRA, pp. 6-7 [Recitals].) The ARWRA was also "approved based on the EIR as certified" in 2015. (ARWRA, pp. 6-7 [Recitals].)

For the same reasons discussed above, the ARWRA does not support the use of agricultural produce wash water for the Expansion Project, which was not a part of the GWR Project at the time it was approved in 2015. Moreover, although the ARWRA was amended in 2019, the parties did not amend it to include use of agricultural produce wash water for the Expansion Project. (**Exhibit D** [Amendment No. 1 to Amended and Restated Water Recycling Agreement between Monterey County Water Resources Agency and Monterey One Water.])

The City of Salinas appreciates the opportunity to comment on the Draft SEIR. Should you have questions or wish clarification on the important issues the City has raised, please contact me.

Sincerely,

Joe Gunter
Mayor

October 8, 2015. The MRWPCA Board certified the Environmental Impact Report ("EIR") for the GWR Project as complete and in compliance with the California Environmental Quality Act ("CEQA"), and adopted the findings required by CEQA on October 8, 2015. This Agreement does not change the GWR Project and no change of circumstances or new information herein shows that the GWR Project would result in new or substantially more severe environmental impacts such that major revisions to the certified EIR would be required. This Agreement is approved based on the EIR as certified.

NOW, THEREFORE, for and in reliance of the foregoing, the parties hereby agree as follows:

1.0 Definitions

For the purposes of this Water Recycling Agreement, the following definitions are provided:

A. The term "Annexation Agreements" refers to the Annexation Agreement between MCWD and PCA dated April 25, 1989, and the Annexation Agreement between MCWD and WRA dated March 26, 1996. The individual Annexation Agreements are referenced herein by their respective dates.

B. The term "Bureau Loan Contract" refers to the Contract Between the United States and the Monterey Regional Water Pollution Control Agency (MRWPCA) for "A Loan for Construction of a Small Reclamation Plant," dated June 2, 1995,

C. The terms "Castroville Irrigation System," "Castroville Seawater Intrusion Project," and "CSIP," as used in this Water Recycling Agreement, refer to the tertiary treated water distribution system and are hereinafter collectively referred to simply as the "CSIP", which is owned by WRA. Reclaimed water produced by the SVRP for CSIP will be delivered to a distribution system, known as the Castroville Irrigation System, at the points indicated on Exhibit A, attached hereto and made a part hereof, as may be amended by agreement of the parties, and through that system it will be delivered to growers in the Castroville area, for use in the irrigation of crops.

D. The term "Drainage Flows" refers to WRA's portion of New Source Waters originating from Blanco Drain, Reclamation Ditch, and Tembladero Slough.

E. The term "Drought Reserve" shall refer to storage of up to 1,000 acre-ft of water for potential use during a drought.

F. The term "Interruptible Rate" applies to PCA charges for primary and secondary treatment of New Source Waters.

G. The term "New Source Water Facilities" applies to facilities required to be constructed to convey Blanco Drain, Reclamation Ditch and Tembladero Slough waters to the PCA Regional Treatment Plant, and those to be constructed to allow wintertime operation of the SVRP.

H. "New Source Waters" are defined as waters originating at the following:

1. Agricultural Wash Water
2. Blanco Drain Water
3. Reclamation Ditch/Tembladero Slough water
4. Monterey Storm Water
5. Salinas Storm Water

I. The term "Pure Water Monterey Facilities" refers to those advanced treatment facilities necessary to transform secondary treated wastewater from the Regional Treatment Facility into drinking water quality water, the agreement terms for which are not included in this Water Recycling Agreement.

J. The terms "reclaimed water", "reclaimed wastewater", "recycled water", and "tertiary treated water" all refer to the water produced by the 29.6 MGD (33,154 acre-ft per year) tertiary treatment system and are hereinafter collectively referred to as "tertiary treated water".

K. The term "Regional Treatment Plant" refers to the facilities constructed and sized to

I. CONSTRUCTION OF THE NEW SOURCE WATER FACILITIES

1.01. PCA to construct New Source Water Facilities.

Upon the receipt of final commitments for the financing described below by all applicable governmental agencies and when conditions precedent of Section 16.15 are met, PCA will finance, design, construct, and install the New Source Water Facilities, in substantial conformity with designs and plans approved by the parties in writing.

1.02. Change orders.

Change orders must be approved in writing. Any change order or related set of change orders that increases the New Source Water Facilities cost by $100,000 or more shall require the written consent of both Parties within 30 days of presentation. Any change order or related set of change orders that increases the New Source Water Facilities cost by less than $100,000 or that lowers the New Source Water Facilities cost may be approved by PCA alone, without the consent of the WRA, except that a copy of any proposed or executed change order shall promptly be provided to WRA as soon as it is available to PCA. Each Party's contract administrator shall be authorized to give consent to change orders for that Party. Neither Party's consent to a change order will be unreasonably withheld or delayed.

1.03. Location of the New Source Water Facilities.

The New Source Water Facilities shall be located as shown in Exhibit G, attached hereto and made a part hereof. PCA will acquire any rights-of-way necessary for the construction and maintenance of pipelines from the sources points of delivery to the Regional Treatment Plant.

1.04. Projected Future New Source Water Facilities.

New Source Water Facilities consist of, but are not limited to the following:

1. Blanco Drain Water
   (a) 2,738 gpm (6.1 cfs) pump station
   (b) 7,700 feet of 18 inch diameter HDPE, PVC, or Ductile Iron pipe
   (c) Intake Screen/Wet Well with appropriate appurtenances
2. Reclamation Ditch Water
   (a) 2,693 gpm (6.0 cfs) pump station
   (b) 43 feet of 6 and 12 inch diameter DIP or PVC discharge pipe
3. Tembladero Slough Water
   (a) 1,346 gpm (3 cfs) pump station
   (b) 120 feet of 16 inch diameter DIP and PVC discharge pipe
   (c) Intake screen/Wet Well with appropriate appurtenances
4. Monterey Storm Water (Lake El Estero)
   (a) 2,500+/- gpm pump station
   (b) 45 feet if 12+/- inch PVC pipe
5. Salinas Storm Water
   (a) Diversion Point No. 1
      i. 54" x 54" concrete diversion structure
      ii. 24" x 24" concrete diversion structure plus weir
      iii. Parshall Flume
      iv. Intake Screen/Sluice Gate with appropriate appurtenances
   (b) Diversion Point No. 2
      i. 66"x 66"concrete diversion structure

2.02. Estimated design and construction costs of New Source Water Facilities.

Table 1.

Component	WRA	PCA	Monterey/Salinas	TOTAL
Blanco Drain Water	$2.3 Million	$2.7 Million	0	$5.0 Million
Reclamation Ditch	$0.5 Million	$0.6 Million	0	$1.1 Million
Tembladero Slough	$0.5 Million	$0.6 Million	0	$1.1 Million
Monterey Storm Water	0	0	Not Estimated	
Salinas Storm Water	0	0	Not Estimated	
Salinas Pond Water Return Facilities	$1.3 Million	$1.5 Million		$2.8 Million
Modifications to Regional Treatment Facility	$0.6 Million	$0.7 Million		$1.3 Million
TOTAL	$5.2 Million	$6.1 Million		$11.3 Million

WRA's share of capital costs is 45.1% and PCA's share of capital costs is 54.9%. This same allocation of capital costs will be applied to Replacement and Renewal costs associated with the New Source Water Facilities, as identified in Section 9.02.

2.03. Source Water.

1. WRA shall obtain water rights to Drainage Flows from the California State Water Resources Control Board. Costs of obtaining and maintaining said water rights shall be reimbursed to WRA on the same proportional basis for water used as a component of the New Source Facilities.
2. Water rights for New Source Water within the City of Salinas and City of Monterey, and any future new source waters not identified herein, including without limitation, dry and wet weather storm drainage system flows and/or volumes, are not subject to this Agreement and may be the subject of future agreements.

III. OWNERSHIP, OPERATION AND MAINTENANCE OF CSIP, SVRP, SRDF AND NEW SOURCE WATER FACILITIES.

3.01. Ownership, operation, and maintenance, in general.

1. PCA will own, operate, and maintain the SVRP as described in Exhibit B, "Operation and Maintenance of SVRP, CSIP, SRDF, and New Source Water Facilities", attached hereto and made a part hereof, and will keep the SVRP in good condition and repair for the term of this Water Recycling Agreement. WRA shall be required to reimburse PCA for such costs and expenses of ownership, operation, and maintenance of the SVRP as described in Article VII of this Water Recycling Agreement. After expiration of this Water Recycling Agreement and any extension thereof, the SVRP will remain the property of PCA, except that WRA will own the discharge pipeline from the PCA property line near the discharge side of the storage pond to the connection with the CSIP.

2. WRA will own the CSIP facilities and PCA will operate and maintain the CSIP facilities as described in Exhibit B, "Operation and Maintenance of SVRP, CSIP, SRDF, and New Source Water Facilities", and will keep the CSIP in good condition and repair for the term of this Water Recycling Agreement. WRA shall be required to reimburse PCA for such costs

supply water to WRA on a daily basis when source water is available as described in Exhibit B "Operation and Maintenance of SVRP, CSIP, SRDF, and New Source Water Facilities", except for temporary periods of shut-down authorized by this Water Recycling Agreement or made necessary by circumstances beyond the control of PCA.

3.06. Incidental uses.
PCA may use such amounts of tertiary treated water from the SVRP as may be needed for the normal operation and maintenance of PCA's facilities, including, but not limited to, the SVRP and the primary and secondary treatment facilities.

3.07. Notice of temporary cessation of water deliveries.
PCA will give immediate notice to WRA, by telephone to WRA's General Manager, or to the person designated by the General Manager to receive such notices, with a prompt follow-up notice in writing, as soon as PCA becomes aware of the need to cease deliveries to the CSIP, whatever may be the reason for such interruption in service. Whenever an unforeseen cessation of deliveries occurs without prior notice to WRA, PCA shall immediately give notice to WRA as provided above. In addition, whenever a cessation of deliveries occurs, PCA shall use every reasonable effort to restore service as soon as possible.

3.08. Outside Contracts.
When PCA deems it more appropriate for someone other than PCA to make a repair directly, PCA will obtain contracts to perform this work through bidding or other appropriate competitive procurement process.

3.09. Access to CSIP, SRDF, and New Source Water Facilities on WRA Land or Easements.
WRA shall provide the necessary access arrangements for PCA personnel to carry out their required work on the CSIP, SRDF, and New Source Water Facilities on WRA land or Easements. WRA shall notify landowners, growers, and others who may be affected by this work in advance that PCA personnel will be entering onto and performing work on their property. Any disputes arising between PCA personnel and these affected parties will cause PCA to discontinue work on the affected facilities until WRA has established necessary access arrangements for the work to continue.

IV. PROVISION OF RECYCLED WATER TO WRA FROM PCA

4.01. Existing Allocations

1. WRA shall be entitled to tertiary treated recycled water for its CSIP Project during the agricultural growing season in a volume not less than total wastewater flows to the Regional Treatment Plant from all PCA members existing at the Effective Date of this Water Recycling Agreement, plus all other areas within PCA's 2001 boundaries less the following amounts (may be taken before tertiary treatment):
   (a) Amount claimed and utilized by MCWD pursuant to Section 15.04 as provided pursuant to the Annexation Agreements.
   (b) Such flows as are lost or as must be diverted in the ordinary course of operating and maintaining the treatment plant and ocean outfall.
   (c) Such flows as are not needed to meet WRA's authorized demand pursuant to this Water Recycling Agreement.
   (d) 650 AF of water allocated by WRA to PCA per Table 2:

WRA may be utilized by PCA for the Pure Water Monterey Project, other purposes, or be discharged.

(a) With the exception of any other New Source Waters the primary and secondary treatment costs of which are paid by others, WRA will be proportionately assessed for the incremental operation and maintenance costs of the influent pump station, primary treatment and secondary treatment of its portion of New Source Water flows actually delivered to tertiary treatment.

(b) WRA will be responsible for incremental tertiary treatment operations, maintenance, repair and replacement costs related to the volume of New Source Waters that are delivered to CSIP.

4.03. Operations and Maintenance Treatment Cost Allocation.

Table 3.

O&M Treatment Cost Allocation			
Source	**Primary and Secondary**	**Tertiary**	Pure Water Monterey Facilities
Domestic W/W	Member Entities	WRA[1]	PCA-Winter
Ag Wash Water $198[2]	Salinas (I.R)	WRA[1]	PCA

Interruptible Rate (IR)			

[1]PCA – if through tertiary treatment; operations and maintenance and increased interest rate

[2]Interruptible rates are subject to change by PCA Board as described in Exhibit F, attached hereto and made a part hereof.

All treatment costs associated with the New Source Waters will be incorporated into the annual WRA budget process, as identified in Section VII. Annual Source Water costs will be based on the demand schedule provided by WRA to PCA; and PCA's Interruptible Rate Schedule for New Source Waters.

1. If any party utilizes tertiary treated water, other than water provided to PCA pursuant to Section 3.06, Incidental Uses, it shall be proportionately assessed by PCA for operation, maintenance, repair and replacement costs and increased interest costs, for the amount of water claimed and utilized from tertiary treatment facilities.
2. PCA agrees that it will cause MCWD, or itself, in use of its recycled water entitlements, to comply with all applicable requirements set forth in Contract No. 5-07-20-W1284, between the Bureau of Reclamation and WRA including, but not limited to, those contained in the Bureau Loan Agreement, all at PCA's or MCWD's sole cost and expense.

4.04. New Incremental and Interruptible Allocations – Phase II.

PCA and WRA plan to acquire and treat additional flows up to the Regional Treatment Facility's

V. DELIVERY OF WATER TO WRA.

5.01. Quantity of water to be delivered to WRA SVRP.

Each year during the term of this contract, PCA shall deliver tertiary treated water from the SVRP to the Castroville Irrigation System. Subject to PCA's and MCWD's rights to the water as set forth in Article IV, the quantity so delivered shall include water provided in response to WRA's demand, determined as set forth in this Water Recycling Agreement.

5.02. WRA's demand schedule.

For water which will be delivered during the term of this Water Recycling Agreement, WRA shall, not later than November 1 each year, submit to PCA a schedule (see Exhibit C, attached hereto and made a part hereof) of requested water deliveries for the next calendar year. The schedule may request water deliveries of amounts up to amounts provided for WRA pursuant to Section 4.01 and 4.02 as WRA's demand. This demand schedule shall show the amount requested for each calendar month in the year.

5.03. WRA's demand.

It is understood and agreed that the wastewater committed by PCA, to which WRA is entitled pursuant to this Water Recycling Agreement, is dedicated for use by WRA for purposes of the CSIP as that seawater intrusion project as it may exist from time to time, and thereafter for direct application for such other non-urban agricultural irrigation projects in the Salinas Valley as WRA may develop for the purpose of curing seawater intrusion and other severe impacts of the groundwater imbalance in the Salinas Valley which threaten the viability of the groundwater basin as a water supply for agricultural and municipal uses, and for no other purpose. Where otherwise consistent with WRA's entitlement pursuant to this Water Recycling Agreement, WRA may use tertiary treated water produced by the SVRP for non-agricultural irrigation applications in the Salinas Valley only if PCA declines in writing to undertake such applications in the Salinas Valley; provided, however, PCA consents in writing to WRA's doing so, which consent shall not be unreasonably withheld. In no event shall PCA's obligation to provide secondary treated wastewater exceed the amount needed to produce the tertiary treated water to which WRA is entitled pursuant to this Water Recycling Agreement.

5.04. PCA'S duty to comply with WRA demand.

PCA shall supply the amount of water demanded in accordance with this Water Recycling Agreement and the demand schedule submitted by WRA, except when the SVRP and SRDF cannot produce enough water to satisfy the WRA's demand, PCA's demand, and MCWD's demand, all as limited by their respective entitlements, either because there is not enough wastewater flowing into the PCA Regional Treatment Plant, or because, for reasons beyond the reasonable control of PCA, the SVRP is unable to operate for a sufficient period of time or the SVRP fails to produce enough water of the quality described in Section 6.01, "Water Quality," for use in the CSIP.

VI. MAINTENANCE OF WATER QUALITY.

6.01. Water Quality.

1. General Water Quality: PCA will produce tertiary treated water of a quality suitable for the irrigation of edible crops, such as artichokes, Brussels sprouts, and row crops (e.g., lettuce, cauliflower, broccoli, and celery) that do not require cooking prior to human consumption. All water produced and delivered to WRA shall meet all applicable standards of quality

served. No private sector member of the Committee and no grower or private sector user of water shall be required to disclose proprietary information in connection with the Committee's work, except as may be required by governing law or regulation. The SRDF Water Quality Monitoring Plan shall be presented to the Water Quality and Operations Committee at least once per year or prior to any significant changes, for committee review and input. Any financial changes approved by the Water Quality and Operations Committee at this meeting will be submitted to the WRA Board of Director's for approval and the approved Board Resolution will be forwarded to PCA for any budget modifications.

VII. PAYMENTS BY WRA TO PCA

7.01. Consideration paid by WRA.

As consideration for the water provided and the other obligations performed by PCA under this Water Recycling Agreement, WRA shall make payments to PCA pursuant to this Water Recycling Agreement.

7.02. Amounts to be paid.

The consideration paid by WRA shall be the dollar amount that equals 100% of the annual costs reasonably and necessarily incurred in connection with the SVRP, CSIP, and SRDF (including both direct and indirect expenses), and no more. PCA will make all reasonable efforts to stay within, or below, the amounts budgeted for the SVRP, CSIP and SRDF. All budgetary savings will be applied to the following year's budgets. The annual costs include the following:

1. Amortization of any loans (USBR, SWRCB, etc.), bonds, certificates of participation, and any interim or other financing;
2. The SVRP, CSIP, and SRDF operation, maintenance, repair, replacement, power, capitalized equipment, capital improvements, contingency, and reserve costs as are contained in the budgets for the SVRP, CSIP and the SRDF. PCA will make all reasonable efforts to stay within the total budget amounts for these budgets, but will have the latitude to incur variances between individual budget accounts, so long as the total budget amounts are not exceeded.
3. Unused funds received from WRA will be placed by PCA in an interest bearing account. All interest earned on WRA accounts will be applied for WRA's benefit on a monthly basis. PCA will adjust the second semi-annual billing and year-end reconciliation statement by any interest earned on WRA accounts. PCA shall be reimbursed by WRA for the reasonable loss of interest earnings on PCA's monies used to cover any SVRP or CSIP operations and maintenance costs until such costs are reimbursed by WRA.

7.03. Payment schedule.

PCA will establish separate accounts for the SVRP, SRDF, and the CSIP. Each year, WRA will fund each account by June 30 with a payment that adjusts seed monies to 50% of the projected operations, maintenance, capital outlay, and reserve expenses for the next fiscal year. Thereafter, PCA will record into this account the payments noted in Section 7.04 based on cost share estimates determined pursuant to Section 4.02 (1) herein.

1. WRA will make six payments to PCA each year as follows:
   (a) Thirty (30) days before the date that PCA's annual payment on the USBR loan for the SVRP is due, WRA will pay an amount equal to the then current payment on the USBR loan;

2. For as long as any notes or bonds issued to finance the SVRP or CSIP are outstanding, PCA will not exercise its right to terminate or reduce the water supply of the tertiary treated water to the CSIP, except that PCA may reduce the water supply to the extent that the failure of WRA leaves PCA without all necessary and sufficient funds to operate the SVRP.
3. In addition, if WRA should fail to make any payment to PCA required under this Water Recycling Agreement for a period of ninety (90) days or more after the due date, the PCA shall have the right to seek any appropriate judicial relief, at law or in equity, for such default. Such relief may include, but need not be limited to, damages, injunctive relief, and the appointment of a receiver.

7.06. Prior approval of budget by WRA.

1. Each year, in accordance with its normal budgeting schedule, PCA will adopt budgets for the operation of the SVRP, CSIP, and SRDF, in advance of the operating year for which the budgets are proposed, including therein all costs to be paid by WRA. In preparing these budgets, the demand schedule approved by WRA's General Manager will be provided to PCA by November 1 of each year. Within six (6) weeks of receipt of the demand schedule, PCA will provide WRA with a preliminary budget estimate. Any additional costs associated with the New Source Waters will be calculated based on the demand schedule and PCA's Interruptible Rate; and will be included as a separate line item in the SVRP, CSIP, or SRDF budget. Upon receipt of the preliminary budget, both agencies will agree to meet in a timely manner sufficient to enable review and approval by both agencies' respective governing boards.
2. Once the budgets are approved by WRA's Board of Directors, WRA's Board of Supervisors, and PCA's Board of Directors, PCA will not modify the budgets so as to exceed the amount of expenditures approved by WRA without first submitting the proposed changes to WRA's Board of Directors and WRA's Board of Supervisors for review and approval, except as provided for in Section 7.11. In addition, both agencies will provide advance notification of any proposed budgetary modifications that will be considered by each agency's respective board.
3. In the event WRA's revenues to fund the CSIP, SVRP, and SRDF budgets fall below projected amounts, WRA may request that PCA revise the operations to incur lower operating costs to stay within the revised revenue projections.

7.07. SWRCB as third party beneficiary.

The State Water Resources Control Board (SWRCB) shall be a third party beneficiary of the WRA's payment obligations under this Article VII, to the extent that the WRA's payment obligations are intended to provide funds to PCA to repay the loan to the PCA from the SWRCB. In the event of default by the PCA in the repayment of said loan, the SWRCB may enforce the loan repayment obligations against the WRA, and to the extent that the WRA makes payment to the SWRCB, the WRA shall be relieved of its corresponding obligation to the PCA. If, through no fault of the WRA, the PCA defaults in its repayment obligation to the SWRCB, and the WRA thereby becomes obligated to pay any penalties, extra charges, or amounts in excess of the basic principal and interest on the loan, then PCA shall reimburse WRA for any such amounts paid by WRA.

7.08. Priorities of payment.

Notwithstanding anything to the contrary contained herein, WRA's obligations to make payments with respect to the SVRP, CSIP, and SRDF shall be prioritized as follows, and the obligations in each category shall be subordinate to the obligations in each prior category, shall be on a parity

VIII. ACCOUNTING SYSTEM, REPORTS

8.01. Accounting system.

PCA will maintain an accounting system that is in conformity with generally accepted accounting principles (GAAP) and will allow for the segregation and tracking of all revenues and direct costs related to the SVRP, CSIP, and SRDF. The accounting system shall properly allocate costs to the SVRP, CSIP, and SRDF and to PCA's other activities that are not subject to reimbursement by WRA under this Water Recycling Agreement. The accounting system shall provide the ability to adequately identify indirect cost centers and establish allocation factors to assign indirect costs proportionally to the CSIP, SVRP, SRDF, and the Interruptible Rate for New Source Waters. Cost accounting, including any overhead distributions, shall be in accordance with GAAP. PCA shall make the details of such system available to or known to WRA and/or to WRA's auditor, at WRA's request.

8.02. Financial reports.

By the last day of each month PCA will provide to WRA a report on expenditures made during the previous month and year-to-date, for each line item in the SVRP, CSIP, and SRDF budgets. These reports will identify any line items which vary appreciably from anticipated budget to date. PCA will provide WRA an annual report of WRA's proportional share of Reserves retained in the Pure Water Monterey Fund for New Source Water Facilities. This report will be provided by PCA to WRA by September 30 of each year; and include WRA's deposits made to the Repair/Renewal Reserve, proportional interest earned, and the proportional share of any replacement/renewal costs.

8.03. Direct and indirect costs.

1. Direct costs of the SVRP, CSIP and SRDF are costs which can be tracked as costs of these particular activities through invoices, time cards, record keeping systems, and other records that specifically allocate a cost to these activities. Indirect costs are all other costs incurred by PCA in order to manage, maintain, support, and operate the SVRP or the CSIP.
2. PCA shall implement the accounting system described in Section 8.01 to uniformly identify and allocate all direct and indirect costs for the SVRP and the CSIP and for all the PCA's other activities. PCA shall identify the specific functions that are typically considered administrative or support in nature. These functions or departments shall include Human Resources, Finance, Administration, Information Technology, and Safety. The annual budgeted costs of these functions will be allocated proportionally to all operational activities based on a percentage relational to the services provided to SVRP, CSIP, SRDF and all other PCA activities. A sample overview is provided in Exhibit J, attached hereto and made a part hereof. The budgets associated with the administrative or support functions will not be directly charged to the SVRP, SRDF, or CSIP. PCA will make reasonable efforts to maximize the extent to which costs to be paid by WRA can be identified as direct costs rather than as indirect costs.
3. For purposes of allocating indirect costs, PCA will not include as a direct cost the debt service (principal and interest) on the loans obtained for the project.
4. PCA and WRA retain the right to transition from the cost allocation plan identified in 8.02 (b) to a cost allocation model that is compliant with the Office of Management and Budget (OMB) Circular A-87 – Cost Principles for State, Local, and Indian Tribe Governments or a subsequent revision. Any cost allocation subject to this provision shall be accompanied by a Certificate of Cost Allocation Plan and be in compliance with Title 2 CFR, Part 200. All indirect costs charged to functional activities will be applied consistently with the results of

9.02. Replacement and Renewal Costs Associated with New Source Water Facilities.
WRA shall pay PCA the proportional share of amortized capital renewal costs associated with the New Source Water Facilities. WRA's annual contribution is provided in Exhibit I. All funds received from WRA will be placed in the Pure Water Monterey Fund's Renewal and Replacement Reserve in accordance with Section VI. All funds will be held in the Reserve for the purpose of funding capital outlay projects for the New Source Water Facilities; assisting in meeting any fiscal sustainability plan requirements for the Clean Water State Revolving Loans; and maintaining a proportional share of the Loan's debt covenant ratio. At the completion of the thirty-year loan cycle, WRA and PCA will develop a long-term Capital Improvement Plan, which includes establishing an appropriate level of Renewal and Replacement reserves. Any WRA funds that are held in Reserves in excess of the Capital Improvement Plan will be refunded within ninety (90) days of the Plan's establishment.

9.03. Expansion of treatment plant capacity.
PCA may expand the Regional Treatment Facility above the current capacity of 29.6 MGD and may construct additional reclamation facilities, at its sole cost and expense and without receiving the consent of WRA. Any increases in capacity and any additional reclamation facilities so constructed shall be used at PCA's discretion, provided, however, that PCA is precluded from providing water to customers within WRA's water supply jurisdiction.

9.04. Interruptions of service.
1. No work of construction, remodeling, renovation, replacement, repairs, addition, or expansion authorized under this Water Recycling Agreement and performed on the SVRP, CSIP and SRDF shall, either before, during, or after such work, interfere with, interrupt, or reduce the delivery of tertiary treated water and river water to WRA under this Water Recycling Agreement, except that minor interferences, interruptions, or reductions shall be allowed when necessary, unavoidable, or beyond the control of PCA.
2. PCA shall schedule its planned maintenance activities on the SVRP, CSIP and SRDF to minimize interruption of distribution of tertiary, river and/or well water by the CSIP. Unscheduled work to perform repairs or maintenance will be performed in the manner deemed by PCA to have the least impact on the distribution of tertiary, river and/or well water by the CSIP. In case of any interruption of service, PCA shall give notice in the same manner as required by Section 3.07.

9.05. Duty to apply insurance proceeds.
If either party recovers any insurance proceeds on account of loss or damage to the SVRP, CSIP, or SRDF, such proceeds shall be applied to repair or replace the damaged portion of the SVRP, CSIP, or SRDF, and not otherwise. If either party is self-insured and any loss or damage occurs that would have been covered by insurance otherwise required to be maintained by such party under this Water Recycling Agreement, then such party shall provide the funds that would have been recovered had the party been insured and shall apply the funds to repair or replace the damaged portion of the SVRP, CSIP, or SRDF.

9.06. Payment of uninsured losses.
If the SVRP, CSIP, or SRDF is damaged or destroyed during the term of this Water Recycling Agreement, by other than an intentional or willful misconduct of a PCA employee, and the amount of available insurance and self-insurance monies plus replacement reserves is insufficient to repair or replace the damage, then WRA shall pay the balance necessary to restore these facilities to their condition prior to the damage.

approval of the indemnified party. The indemnifying party shall also have the right to defend against, negotiate with respect to, settle or otherwise deal with such proceeding, claim or demand. However, no settlement of such proceeding, claim or demand shall be made without the prior written consent of the indemnified party, which consent shall not be unreasonably withheld or delayed. The indemnified party may participate in any such proceeding with counsel of its choice at its own expense.

3. In the event, or to the extent, the indemnifying party elects not to, or fails to, defend such proceeding, claim or demand and the indemnified party defends against, settles or otherwise deals with any such proceeding, claim or demand, any settlement thereof may be made without the consent of the indemnifying party if it is given written notice of the material terms and conditions of such settlement at least ten days before a binding agreement with respect to such settlement is executed.
4. Each of the Parties agrees to cooperate fully with each other in connection with the defense, negotiation or settlement or any such proceeding, claim or demand.

10.04. Payment of indemnified claims.

The indemnifying party shall forthwith pay all of the sums owing to or on behalf of the indemnified party, upon the happening of any of the following events:

1. Upon the rendition of a final judgment or award with respect to any proceeding described in Section 10.03, above, by a court, arbitration board or administrative agency of competent jurisdiction and upon the expiration of the time in which an appeal therefrom may be made; or
2. Upon the making of a settlement of such proceeding, claim or demand; or
3. Upon the parties' making of a mutually binding agreement with respect to each separate matter indemnified thereunder.

10.05. Contribution in the event of shared liability.

In the event any proceeding, claim or demand described in Section 10.03 is brought, in which allegations of fault are made against both the parties, the extent of indemnification shall be determined in accordance with the agreement of the parties, or, if there is no agreement, then in accordance with the findings of the court as to the relative contribution by each of the parties to the damage suffered by the party seeking indemnity with respect to such proceedings.

10.06. Exclusion from O&M costs.

Amounts payable by either party as indemnification shall not be included in the operations and maintenance costs of the SVRP, CSIP, SRDF, and New Source Water Facilities.

1. The indemnifying party shall have the right, at its option and at its own expense, to utilize counsel of its choice in connection with such proceeding, claim or demand, subject to the approval of the indemnified party, which approval shall not be unreasonably withheld or delayed. The indemnifying party shall also have the right to defend against, negotiate with respect to, settle or otherwise deal with such proceeding, claim or demand. However, no settlement of such proceeding, claim or demand shall be made without the prior written consent of the indemnified party, which consent shall not be unreasonably withheld or delayed, unless, pursuant to the terms and conditions of such settlement, the indemnified party is released from any liability or other exposure with respect to such proceeding, claim or demand. The indemnified party may participate in any such proceeding with counsel of its choice at its own expense.
2. In the event, or to the extent, the indemnifying party elects not to, or fails to, defend such proceeding, claim or demand and the indemnified party defends against, settles or otherwise

insurance policy and shall give WRA thirty (30) days' advance notice of any cancellation or proposed change in the insurance required by this section, and any such change shall be subject to review and approval by WRA.

2. WRA shall maintain insurance covering the CSIP and SRDF against loss or damage due to fire and other perils to the extent that such insurance is readily and practically available and within available funds for the SRDF. The amount of the insurance shall be not less than the then-current replacement cost of the CSIP and SRDF, without depreciation. Insurance coverage for the CSIP and SRDF shall be reviewed and approved by PCA, which shall not unreasonably withhold or delay its approval. WRA shall provide PCA with a copy of the insurance policy and shall give PCA thirty (30) days' advance notice of any cancellation or proposed change in the insurance required by this section, and any such change shall be subject to review and approval by PCA.

11.05. Workers' compensation insurance.

PCA shall maintain a workers' compensation plan covering all of its employees as required by Labor Code Sec 3700, either (a) through workers' compensation insurance issued by an insurance company, with coverage meeting the statutory limits and with a minimum of $100,000 per accident for employer's liability, or (b) through a plan of self-insurance certified by the State Director of Industrial Relations, with equivalent coverage. If PCA elects to be self-insured, the certificate of insurance otherwise required by this Water Recycling Agreement shall be replaced with a consent to self-insure issued by the State Director of Industrial Relations.

11.06. Certificate of insurance.

PCA shall file certificates of insurance with the WRA and with the Monterey County Risk Management Division, showing that PCA has in effect the insurance required by this agreement. PCA shall file a new or amended certificate promptly after any change is made in any insurance policy which would alter the information on the certificate then on file.

11.07. Self-insurance.

Each Party may, instead of obtaining the insurance required of it by this Water Recycling Agreement, elect to be self-insured or to participate in a self-insurance pool, provided the other Party first gives its written consent, which will not be unreasonably withheld or delayed. The Parties shall enter into a separate written memorandum of understanding specifying the proportionate amount or share of such self-insurance allocated to SVRP, CSIP, and SRDF.

11.08. Insurance costs.

Insurance expenses and equivalent self-insurance expenses are CSIP/SVRP costs, except for: costs excludable under indemnification, PCA's share of the liability insurance premium costs under Section 11.02; and costs of PCA's workers' compensation insurance covering work outside the scope of this Water Recycling Agreement. All deductibles under Section 11.02 liability insurance and Section 11.04 property insurance, as well as any self-insured retention under excess insurance held by WRA, PCA, or Monterey County will be borne by WRA. All damages, liabilities, losses and costs, including fines and penalties, that are not covered under a policy of insurance, a self-insurance pool, or other self-insurance program shall be borne by the Parties according to this Water Recycling Agreement.

11.09. Periodic increases in coverage requirements.

The coverage limits stated herein in dollar values shall be adjusted upwards by 15% for every 15% increase in the consumer price index for all urban consumers in the San Francisco Bay area over the

XIII. DISPUTE RESOLUTION.

13.01. Dispute resolution procedure.
If any dispute arises between the Parties as to the proper interpretation or application of this Agreement, and/or the proper operation of the facilities, the Parties shall first seek to resolve the dispute in accordance with this Article, and the Parties must proceed through arbitration under this Article before filing any court action as set out below.

13.02. Duty to meet and confer.
If any dispute under this Agreement arises, the Parties shall first meet and confer, in an attempt to resolve the matter between themselves. Each Party shall make all reasonable efforts to provide to the other Party all the information that the Party has in its possession that is relevant to the dispute, so that both Parties will have ample information with which to reach a decision.

13.03. Mediation and Arbitration.

1. If the dispute is not resolved by meeting and conferring within 30 days of commencing that process, the matter may be submitted to mediation. The terms of and process for the mediation shall be set by the Parties and the mediator. The Parties agree that they may, by or through consensus, elect to convert the mediation into arbitration.
2. If the dispute is not resolved by meeting and conferring, and mediation is not chosen or not implemented by the parties, or is unsuccessful, the Parties shall submit the matter to arbitration. In that event the Parties will jointly select a single arbitrator, or, if the Parties are unable to agree, they shall each select an arbitrator, and the matter shall be handled by two arbitrators. The two arbitrators may, if they deem it appropriate and warranted by the nature and significance of the dispute, themselves select a third arbitrator. Any person selected as an arbitrator shall be a qualified professional with expertise in the area that is the subject of the dispute, unless the Parties otherwise agree. The arbitration shall be conducted in accordance with the rules of the American Arbitration Association. The decision of the arbitrator or arbitrators shall be binding, unless within 30 days after issuance of the arbitrator's written decision, either party files an action in court.

XIV. ADDITIONAL RESPONSIBILITIES.

14.01. Compliance with water reclamation requirements for the CSIP.
PCA shall be responsible for compliance with all of the requirements contained in the "Recycled Water User Requirements for Monterey County Water Resources Agency (User), Castroville Seawater Intrusion Project, Monterey County," Order No. 97-52, issued by the State of California Regional Water Quality Control Board, Central Coast Region, on September 5, 1997, or as said Order may from time to time be revised and re-issued by the Regional Water Quality Control Board. PCA's responsibilities shall be limited to complying with the Water Reclamation Requirements for the SVRP, as described in Section 6.01, and for notifying WRA of any obvious violation of the CSIP requirements.

14.02. Grower and landowner requirements.
WRA shall require the growers and landowners to operate their irrigation systems and to use reclaimed water in accordance with the requirements of Water Reclamation Requirements Order No. 97-52, or as subsequently revised.

SWRCB Loan Contract. The "Actual Costs" consist of the sum of: 1) the proportional SVRP operation and maintenance, plus 2) Supplemental Well Pumping Costs, if any plus 3) the proportional cost of SVRP debt service for the SWRCB Loan Contract, plus 4) the proportional cost of principal and interest payments for the SVRP due pursuant to Article 9 (b) of the Bureau Loan Contract, including any proportional interest due pursuant to Article 9 (b) (2) of the Bureau Loan Contract as a result of deliveries of tertiary treated water to the PCA for its M&I use.

2. PCA payments will be determined and made consistent with Exhibit H and, to the extent applicable, Articles VI and VII of this Water Recycling Agreement.

15.04. No Modification of MCWD Contract Entitlement.
Nothing in this Water Recycling Agreement is intended to, nor shall it be interpreted to, expand, limit or otherwise modify MCWD's existing contractual rights, entitlements, and obligations pursuant to either of the Annexation Agreements.

XVI. GENERAL PROVISIONS.

16.01. Compliance with laws.
PCA will comply with all permit and licensing requirements applicable to the SVRP, CSIP and SRDF, and will operate the SVRP in accordance with all requirements of law and governmental regulations. Compliance with water quality requirements will be limited strictly to those set forth in Section 6.01, "Water quality."

16.02. Attorney's fees.
In the event it shall become necessary to commence or defend litigation for purposes of enforcing this Agreement or rights hereunder, the prevailing party shall be entitled to recover reasonable attorney's fees and costs.

16.03. Amendments.
No amendment or modification shall be made to this Water Recycling Agreement, except in writing, approved by the respective Boards and duly signed by both Parties.

16.04. Contract administrators.

1. WRA hereby designates its General Manager as its contract administrator for this Agreement. All matters concerning this Agreement which are within the responsibility of WRA shall be under the direction of or shall be submitted to the General Manager or such other WRA employee in the WRA as the General Manager may appoint. WRA may, in its sole discretion, change its designation of the contract administrator and shall promptly give written notice to PCA of any such change.
2. PCA hereby designates its General Manager as its contract administrator for this Agreement. All matters concerning this Agreement which are within the responsibility of PCA shall be under the direction of or shall be submitted to the General Manager or such other PCA employee in the PCA as the General Manager may appoint. PCA may, in its sole discretion, change its designation of the contract administrator and shall promptly give written notice to WRA of any such change.

16.05. Assignment.
Any assignment of this Water Recycling Agreement shall be void without the written consent of the

16.13. Severability.
If any provision of this Water Recycling Agreement is declared invalid or unenforceable by any court of competent jurisdiction, then such portion or provision shall be deemed to be severable, to the extent invalid or unenforceable, from this Water Recycling Agreement. Such declaration shall not affect the remainder of this Water Recycling Agreement, which shall remain in full force and effect, as though the invalid portion had never been included.

16.14. Waiver.
No waiver of any right or obligation of any of the parties shall be effective unless in a writing, specifying such waiver, executed by the party against whom such waiver is sought to be enforced. A waiver by any of the parties of any of its rights under this Water Recycling Agreement on any occasion shall not be a bar to the exercise of the same right on any subsequent occasion or of any other right at any time.

16.15. Conditions Precedent for New Source Water Facilities.
The portions of this Water Recycling Agreement applicable to the New Source Water Facilities (see Section I) shall not become effective until the following conditions are met:

1. Water Rights for the Blanco Drain and Reclamation Ditch are obtained from the California State Water Resources Control Board; and
2. A fully executed, and California Public Utilities Commission approved, Water Purchase Agreement, between PCA, Monterey Peninsula Water Management District, and California-American Water is approved by the California Public Utilities Commission and executed by the parties thereto; and
3. Written findings are made by the Regional Water Quality Control Board that utilization of the Blanco Drain dry weather flows as New Source Water meets all treatment requirements for the aforesaid dry weather flows; and
4. An independent third-party review of proposed capital and operating costs and preparation of an Engineer's Report is approved by the WRA Board of Directors and Board of Supervisors. The costs of the aforesaid third party review shall be shared equally between WRA and PCA; and
5. A successful assessment or Proposition 218 process for rates and charges related to the operation and maintenance of the New Source Water Facilities and proportional primary and secondary treatment charges; and
6. Inclusion of Salinas Pond Water Return Facilities as New Source Water Facilities requires execution of a separate agreement between the Parties.

Perform normal operation and maintenance on the distribution well pumps, booster stations, pipelines, instrumentation, SCADA system and cathodic protection system. Perform repairs and major maintenance services as required due to wear and tear or failure of equipment. These will be performed as prescribed in the System Operations & Maintenance Manual prepared for the CSIP by WRA's design engineer, as well as the CSIP equipment manufacturers' manuals furnished in accordance with the CSIP construction contract documents, including:

- Inspect the pipelines, supplemental wells and booster stations.
- Inspect the pipelines for leaks.
- Inspect supplemental wells for general condition, log entries, fill pump bearing oilers, and perform general housekeeping.
- Inspect of booster stations for general condition, log entries, and perform general housekeeping.
- Inspect the turn-outs for serviceability.
- Inspect and calibrate conductivity meters.
- Read power and water meters at turnouts and supplemental wells once a month for records, and once a quarter at turnouts for billing purposes.
- Respond to after-hours problems on an on-call basis.
- Perform housekeeping of all assigned areas.
- Receive water orders and schedule water deliveries.
- Assess capability of the SVRP and the CSIP to supply water orders at the times and in the quantities requested.
- Notify growers as to whether each water order can or cannot be filled.
- Monitor turn-out flow rates to insure they conform with designed flow rate.
- Read water meters monthly.
- Monitor water quality within the distribution system and perform laboratory analyses and special studies as necessary to confirm the safety and public acceptance of the water.
- Maintain proper operation of air release and vacuum relief valves, and periodically exercise isolation valves.
- Maintain accurate and complete operational records and prepare reports as required by the recycled water user requirements referred to in Section 15.01 for the CSIP Copies of these reports will be provided to WRA.
- As necessary, replace motors, bearings and gaskets; repair valves and electrical or instrumentation equipment; and remove equipment from installed locations and transport to repair facilities.

Operation and maintenance of the SRDF

The SRDF is a seasonally operated facility. WRA shall notify PCA when SRDF seasonal operations are to begin and cease. As governed by project permits, raising the inflatable dam and pumping and chlorinating of river water may occur no sooner than April 1 of each year. Cessation of pumping and chlorinating river water shall occur no later than October 31 of each year. At the end of each operational season, the river water impoundment shall be filled to capacity and allowed to drain at 2 cfs through November 29 of each year unless directed otherwise by WRA. Depending on service area water demand, river water availability, quality, or other circumstances, raising of

- Perform testing as needed to determine and optimize chemical dosages and control chemical applications for river water treatment process.
- Inventory, order and store chemicals for the SRDF.
- Inventory, order and store spare parts and equipment for the SRDF.
- Maintain accurate and complete operational records and prepare monthly and any other reports as required by the WRA, or regulatory bodies.
- Read meters, gauges, and charts.
- Utilize computers and SCADA system to assist with the operation of the SRDF.
- Maintain and monitor reclaimed water storage reservoir.
- Collect samples from throughout the various SRDF processes to ensure and optimize river water production.
- Perform laboratory analyses and studies as necessary to ensure compliance with water safety concerns.
- Abide by PCA's safety and loss prevention program policies and maintain a safe working environment.
- Perform regular preventive maintenance on the SRDF equipment. Such maintenance may be performed in the off-season if determined to be more cost effective.
- Perform general maintenance, housekeeping and grounds maintenance of all assigned areas.
- Assist with, and provide support for, tours of the SRDF for members of the public.
- Inspect the pipelines for leaks.
- Assist WRA's grower liaison with the operation of the SRDF.
- Respond to after-hours problems on an on-call basis.
- Receive water orders and schedule water deliveries.
- Assess capability of the SRDF to supply water orders at the times and in the quantities requested.
- Notify growers as to whether water orders cannot be filled, and coordinate filling of the water orders as necessary.
- Monitor water quality within the delivery system and perform laboratory analyses and special studies as necessary to confirm the safety and public acceptance of the water.
- As necessary, replace motors, bearings and gaskets; repair valves and electrical or instrumentation equipment; and remove equipment from installed locations, transport to repair facilities and back to the project.
- PCA will be responsible for the care, maintenance, and use of additional equipment to be furnished by WRA for PCA's use in providing service under this agreement.
- Maintain and repair signage at SRDF site as needed. Signage will be supplied and installed by WRA.
- Implement the River Water Contaminant Response Plan as required by Plan criteria.

In addition to those services listed above, WPCA shall operate and maintain the SRDF river water chlorination system to conform to the following parameters:

- The chlorination system shall be capable of operation whenever the SRDF is operational, 24 hours per day, 7 days per week.
- The chlorination system shall be maintained to operate under normal flow capacity ranges from approximately 12 cubic feet per second (cfs) to 36 cfs. Maximum flow capacity is up to 48 cfs. Maximum flow capacity is intended only for short durations of significant water supply loss, such as when the SVRP is out of operation.
- A two-phase river water disinfection process including contact with free chlorine and

EXHIBIT E

CALCULATION OF PCA PAYMENTS PURSUANT TO SECTION 15.03 OF THIS WATER RECYCLING AGREEMENT

As required by Section 17.08 of this Water Recycling Agreement, PCA shall pay the Actual Costs of tertiary treated water to which it takes delivery for its use. The Actual Costs will be calculated from the cost components which comprise PCA's existing budget and actual spreadsheet model(s) for the annual SVRP and CSIP costs.

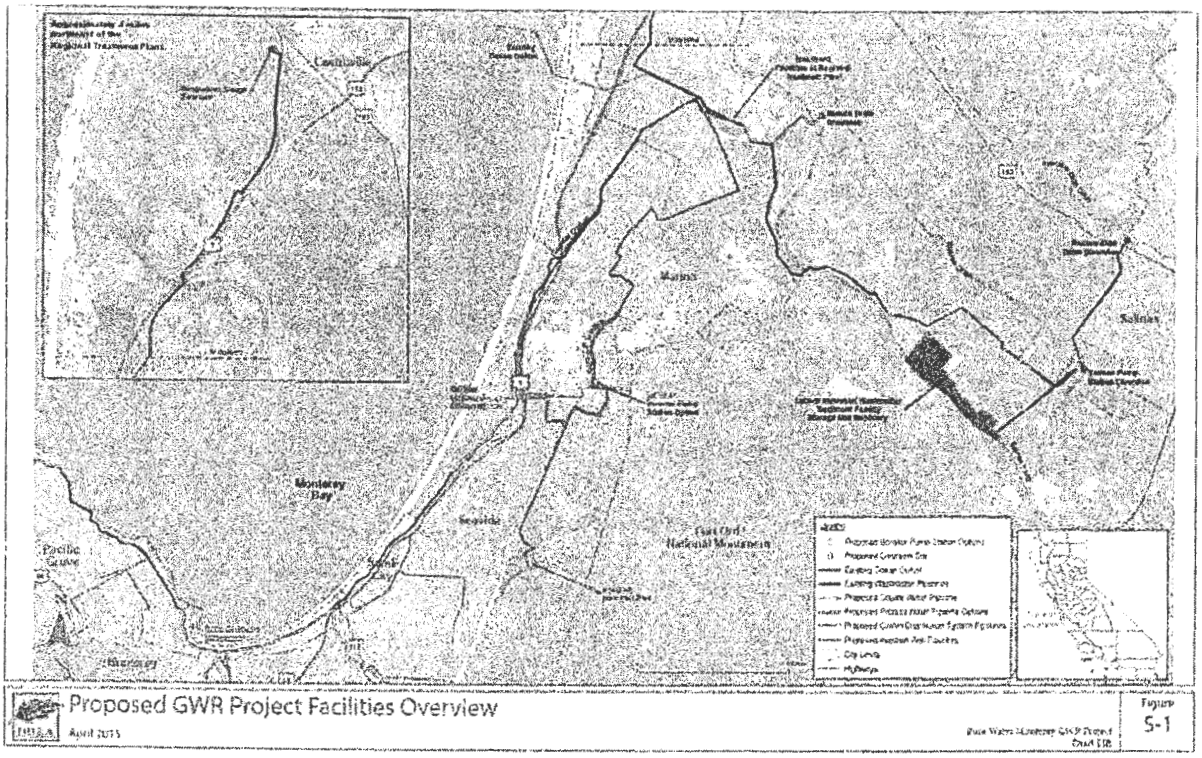
The four cost elements that compromise the Actual Costs will be computed as follows:

(1) SVRP O&M Costs: The SVRP O&M budget will be calculated based on the Total Tertiary Treated Water Production needed to serve both the CSIP and M&I uses of tertiary treated water. The amount to be paid by PCA will be computed using the formula below,in which:
A= Total Tertiary Treated Water Production, AFY
B =Tertiary Treated Water Production delivered to PCA for PCA use, AFY
C = Total O&M Expenditures from the SVRP O&M budget, excluding debt service
D =Amount to be paid by PCA

$$D = \frac{B}{A} \times C$$

(2) **Supplemental Well Pumping Cost:** The amount to be paid by PCA will be computed as indicated in Section 2.G. of Amendment No. 3.

S = Amount to be paid by PCA



(3) **SWRCB Loan Contract Debt Service:** The amount to be paid by PCA will be computed using the formula below, in which:
A= Total Tertiary Treated Water Production, AFY
B = Tertiary Treated Water Production delivered to PCA for its use, AFY
E = SVRP SWRCB Loan Debt Service
F = Amount to be paid by PCA

$$F = \frac{B}{A} \times E$$

(4) **Bureau Loan Contract Debt Service:** The amount to be paid by PCA will be computed using the formula below, in which:
A = Total Tertiary Treated Water Production, AFY
B =Tertiary Treated Water Production delivered to PCA for its use, AFY
G = SVRP Bureau Loan Debt Service, computed pursuant to Article 9 (b) (1) and 9 (c) of Bureau Loan Contract
H = Additional interest charged by the Bureau for the Bureau loan on the SVRP pursuant to Article 9 (b) (2) of Bureau Loan Contract
I = Amount to be paid by PCA

$$I = \frac{B}{A} \times G + H$$

TOTAL PCA PAYMENTS= D + S + F + I

MRWPCA COST ALLOCATION PLAN

TABLE OF CONTENTS

Section 1. Purpose 1

Section 2. Support Service Department Narratives 3

Section 3. Navigating the Cost Plan 8

Exhibits

A. Cost Allocation Plan Detail ..... Exhibit A

allocation plan was not established to be consistent with *Title 2, Code of Federal Regulations, Part 225, Cost Principles for State, Local, and Indian Tribal Governments (formerly known as OMB A-87). The* primary goal of the Title 2 Plan is typically to obtain reimbursement of overhead costs associated with State and Federal grants.

The MRWPCA Cost Allocation Plan has been reviewed by an independent consultant, NBS, and has been determined to be reasonable for this specified use. The MRWPCA Cost Allocation Plan may be replaced at any time with a Plan that is compliant with Title 2, CFR, Part 225 for the purpose of obtaining reimbursement of overhead costs associated with State and Federal Grants.

Data Sources

MRWPCA referenced the following data to support the development of the initial Cost Allocation Plan:

- Budgeted expenditures for Fiscal Year 2015/16
- Listing of all Agency positions by Department
- Number of invoices and purchase orders processed by each fund and department for Fiscal Years: 2012/13, 2013/14, and 2014/15

SUPPORT SERVICE DEPARTMENT NARRATIVES

The full cost allocation plan allocates six administrative support departments to various operational department cost centers, based on a variety of factors. The plan identifies total allocable costs at approximately $3.37 million from the following administrative units for distribution to the operating functions:

Budget Account	Allocable Department Budget	Total Allocable Expense
01-010	Administration	$1,106,677
01-013	Finance	916,737
01-011	Human Resources	383,624
01-015	Information Technology	242,449
01-030	RTP Administration	415,631
01-016	Safety	305,165
	Total Administrative Allocations	$3,370,283

The following paragraphs provide a brief description of each Administrative service department, along with a general explanation of how administrative costs are allocated to each functional department within the Plan.

Administration (01-010)

The Administration Department is responsible for all aspects of administration, operation, and planning activities of the Agency staff. The General Manager and the Executive Assistant/Clerk to the Board's salaries are included in this budget. The Administration Department is responsible for assisting the Board with policy development, implementation of strategic goals, and providing Agency leadership and management. Costs include legal counsel, insurance, contract services, and utility costs for the Harris Court administrative offices. While the Stormwater Program Manager's salaries are included in the FY 15/16 personnel expenses, they are directly charged to

telephone, and audio video systems; while serving as a technical resource to staff on technology needs. The Information Systems Department defines, delivers, and supports strategic plans for implementing information technologies.

- The costs of the Information Systems budget are allocated based on the percentage of full-time equivalent positions in each operating department

RTP Administration (01-030)

The RTP Administration Department is a centralized support service team located at the Regional Treatment Plant Facility. The Assistant General Manager provides leadership to all departments located at the Regional Treatment Plant and works closely with the General Manager to accompany Agency goals. Costs included within this budget unit primarily consist of salary and benefits associated with the Assistant General Manager, Administrative Support Specialist, and office expenses.

All costs associated with the RTP Administration are allocated based on the following:

- General Manager salary and proportional share of expenses based on the operational department's percentage of the budget

- Administrative Support Specialist salary and proportional share of expenses based on the average percentage of budget and full-time equivalency positions within each operational department.

Safety (01-016)

The Safety Department provides service to all Agency employees though training and assistance in implementing safe work practices. The Safety Officer works to implement programs which meet and exceed Federal, State, and Regional requirements for work safety, contractor safety; and materials safety at all Agency facilities. The Safety Budget includes costs associated with Agency-wide safety training, protective equipment, and the safety shoe reimbursement program.

- Costs associated with the Safety Department are allocated based on the percentage of full-time equivalent positions in each operating department

Additional Notes

Administrative costs that are charged directly to specific functional areas or capital projects are not allocated as part of this cost allocation plan.

NAVIGATING THE COST ALLOCATION PLAN

An overview of the MRWPCA Cost Allocation Plan is listed below and attached to this report.

- Agency-Wide Chart – Illustrates the departments identified as administrative cost centers and departments identified as operational cost centers. The allocation percentage of each administrative cost center is listed below each administrative cost function.

RESOLUTION NO. 20862 (N.C.S.)

A RESOLUTION AUTHORIZING THE MAYOR TO EXECUTE AN AGREEMENT FOR CONVEYANCE AND TREATMENT OF AGRICULTURAL PRODUCE WASH WATER BY AND BETWEEN THE CITY OF SALINAS AND MONTEREY REGIONAL WATER POLLUTION CONTROL AGENCY

WHEREAS, the City of Salinas is interested in providing alternative sources of water to the Monterey Peninsula Cities for a Groundwater Replenishment facility (GWR) to be built and operated by the Monterey Regional Water Pollution Control Agency (PCA) for the purpose of supplying replacement drinking water supplies; and

WHEREAS, the City of Salinas is also interested in providing alternative sources of water to Salinas Valley agricultural producers to hold sea water intrusion in abeyance via the Castroville Seawater Intrusion Project (CSIP) that is owned by local agricultural interests and managed by the Monterey County Water Resources Agency (WRA); and

WHEREAS, the signing of this Agreement will set the framework for PCA and the City of Salinas to come to a final agreement in the near future on the treatment and conveyance of the produce wash water and storm water for use as a source water for the GWR and CSIP of said waters for the next thirty years; and

WHEREAS, in order to provide water to these sources the City of Salinas agrees that the PCA is the agency best qualified to transfer and recycle the produce wash water and storm water to these projects; and

WHEREAS, the PCA Board certified the Environmental Impact Report ("EIR") for the GWR Project as complete and in compliance with the California Environmental Quality Act ("CEQA"), and adopted the findings required by CEQA on October 8, 2015; and

WHEREAS, the City of Salinas commented on the Draft EIR because it included using the City's produce wash water and storm water for use as source water for the Ground Water Replenishment (GWR) project and the Castroville Seawater Intrusion Project (CSIP); and

WHEREAS, by signing this agreement will allow PCA to begin taking over maintenance of the City's industrial waste water facility and begin paying the City of Salinas $300,000 annual lease starting on 2017; and

WHEREAS, approving this agreement will result in low interest State Revolving Fund resources (loans/grants) being acquired by PCA to complete final design, engineering, and implementation of the GWR project.

NOW, THEREFORE, BE IT RESOLVED BY THE CITY COUNCIL OF THE CITY OF SALINAS AS FOLLOWS:

Section 1. The above recitals are true and correct.
Section 2. That the Mayor is authorized to execute the agreement attached hereto for the purpose of conveyance and treatment of agricultural produce wash water for use as source water for the Ground Water Replenishment (GWR) project and the Castroville Seawater Intrusion Project (CSIP).

PASSED AND ADOPTED this 27th day of October 2015, by the following vote:

AYES: Councilmembers: Barrera, Craig, De La Rosa, Lutes, McShane and Mayor Gunter

NOES: Councilmember Castaneda

ABSENT: None

ABSTAIN: None

APPROVED:

Joe Gunter, Mayor

ATTEST:

Patricia M. Barajas, City Clerk

AGREEMENT FOR CONVEYANCE AND TREATMENT OF INDUSTRIAL WASTE WATER BY AND BETWEEN THE CITY OF SALINAS AND THE MONTEREY REGIONAL WATER POLLUTION CONTROL AGENCY

THIS AGREEMENT is made and entered into on October 27, 2015, by and between the **City of Salinas**, a California charter city and municipal corporation (hereinafter referred to as the "City"), and the **Monterey Regional Water Pollution Control Agency**, a California joint powers agency (hereinafter referred to as the "MRWPCA"), sometimes collectively referred to herein as the "Parties" and individually as "Party," as follows:

Recitals

A. The City owns and operates an Industrial Waste Water Collection and Conveyance System (the "IWCCS") that receives industrial waste water from approximately 25 processing and related businesses operating in the southeast corner of the City, and transports that water to the City's Industrial Waste Water Treatment Facility (the "IWTF") located at South Davis Road in the City and has the rights and access to and receives for treatment (by aeration) and disposal (by evaporation and percolation) approximately 4,000 acre feet/year of industrial waste water or also called agricultural wash water.

B. The MRWPCA has an existing need for source water for 1) to serve its Pure Water Monterey Groundwater Replenishment Project (the "GWR Project") and 2) to augment the existing Castroville Seawater Intrusion Project's ("CSIP") crop irrigation supply.

C. In July 2014 the Parties hereto, along with the Monterey County Water Resources Agency (the "MCWRA"), entered into a short-term Produce Wash Water Utilization Agreement (the "Utilization Agreement"), whereby industrial waste water from the IWTF was diverted, by means of a by-pass shunt to the MRWPCA's Regional Treatment Plant (the "RTP"), for treatment to provide additional water for treatment to the MRWPCA/MCWRA Salinas Valley Reclamation Project, to then be delivered as recycled water to the CSIP service area. That Utilization Agreement has been extended by the parties thereto for additional periods as deemed necessary and it is anticipated by the Parties that it will be extended into 2017.

D. In March 2015 the City and the MRWPCA entered into a further agreement, set forth and memorialized in mutual resolutions and minute actions of the governing bodies of each Party, to share the costs of design and construction of the permanent diversion facilities necessary to permit the redirection of the industrial waste water from the IWTF to the municipal waste water system for conveyance to the RTP. The permanent diversion facilities are as depicted and described in **Attachment A**, consisting of two pages, attached hereto and incorporated herein by this reference.

E. The purpose and intent of this Agreement, therefore, is for the Parties to set forth the terms and conditions by which they will continue the transfer, conveyance, treatment and use of the industrial waste water, utilizing the permanent diversion facilities, to the mutual benefit of the Parties and the communities served by the GWR Project and the CSIP.

F. This Agreement implements the Pure Water Monterey Groundwater Replenishment Project ("GWR") that the MRWPCA Board approved on October 8, 2015. The MRWPCA Board certified the Environmental Impact Report ("EIR") for the GWR Project as complete and in compliance with the California Environmental Quality Act ("CEQA"), and adopted the findings required by CEQA on October 8, 2015. This Agreement does not change the GWR Project and no change of circumstances or new information shows the GWR Project would result in new or substantially more severe environmental impacts such that major revisions to the certified EIR would be required. This Agreement is approved based on the EIR as certified.

Terms & Conditions

In consideration of the foregoing recitals, and the mutual promises, conditions and covenants made herein, the Parties agree to the following terms and conditions:

1. Source and Conveyance of Industrial Waste Water.

a. The City currently operates and maintains an industrial waste water, collection, conveyance and treatment system, the IWCCS, described in Recital A, above. For the term and any extended term of this Agreement, City agrees to continue to operate that system, or contract for operation of the system in a manner consistent with this agreement, and agrees unless otherwise directed by MRWPCA, to convey all industrial waste water collected in IWCCS to the permanent diversion facilities described in Recital D, to MRWPCA via its Salinas pump station and other facilities to the RTP for treatment and distribution for the uses described in Recital B, above.

b. For the term of this Agreement, City will provide MRWPCA access and rights to the industrial waste water in order for the MRWPCA to use the industrial waste water in a manner that is beneficial and consistent with the uses described in Recital B, above, and consistent with the Recitals and the terms and conditions listed in this Section.

c. For purposes of this Agreement, the point of transfer of industrial waste water described hereinabove from the City to the MRWPCA is the permanent shunt jointly installed by the Parties located ahead of the IWTF, as depicted in Attachment A.

d. As of the date of execution of this Agreement, City confirms that it is aware that approximately 25 wastewater producers deliver waste water to the City's

industrial waste water system described hereinabove, the IWCCS, with those producers and amounts they delivered in the years noted and listed in **Attachment B**, consisting of two pages, attached hereto and incorporated herein by this reference. All waste water from all producers listed in Attachment B, and all waste water from producers added to the industrial waste water system subsequent to the execution of this Agreement, shall be directed and conveyed as provided by this Section 1.

e. Non-Compliant Discharge

(i) City agrees to cooperate with MRWPCA's Source Control division to ensure that all water quality characteristics are complied with.

(ii) Non-compliant waste water means water, delivered pursuant to this Section 1, that does not meet applicable legal standards or standards agreed to by the Parties by separate agreement, and that therefore is not suitable for delivery to MRWPCA.

(iii) City shall notify MRWPCA immediately upon City becoming aware of any non-compliant discharge. MRWPCA will then direct such rejected discharge to the IWTF.

(iv) Attached hereto as **Attachment C,** and incorporated herein by this reference is the Interruptible Rate Schedule, including Parties' agreed upon handling of non-compliant waste water. In case of conflict between **Attachment C** and the body of this agreement, provisions of the body of this agreement shall apply.

f. Disruption/Interruption of Service

(i) Disruption or interruption of service caused by but not limited to, acts of God, acts of war, or criminal acts of others, water shortages, fires, floods, earthquakes, epidemics, quarantine restrictions, strikes, or failure or breakdown of transmission or other facilities or similar occurrences may result in damages. Other reasons for disruption/interruption may include but are not limited to the flooding of the Salinas River, high flows at the pump station, industrial waste water not being needed at the regional treatment plant, a spill or toxic matter in the waste water. The harm thereby caused may delay or suspend delivery of the industrial waste water until such time as successful effort is made to restore service.

(ii) In the event of such disruption or interruption MRWPCA may close the permanent diversion facility to allow the industrial waste water to flow to the City's IWTF. MRWPCA will notify the appropriate City personnel within 24 hours regarding the reasons for diversion.

(iii) Interruption or disruption of service shall be according to the Interruptible Rate schedule set out in **Attachment C**, attached hereto and incorporated herein by this reference.

Lease for Operation and Maintenance of IWTF

g. (i) Upon execution of this Agreement, the parties will negotiate and endeavor in good faith to enter into an agreement whereby MRWPCA would assume responsibility for the operation and maintenance of the IWTF ponds starting in 2017. The annual lease payment shall be $300,000 a year, payable as negotiated, with an escalation factor to be negotiated as well.

(ii) The parties shall negotiate terms regarding the City's obligation to repair, maintain, reimburse or contract out in order to uphold their responsibility as the lessor of the Industrial Waste Treatment Facility Ponds to MRWPCA the Lessee. These items include but are not limited to rate of treatment which would include capital and reserve allocations, infrastructure improvements, water quality parameters, electricity, roads, costs associated with removal of sludge, etc.

(iii) As conditions of the lease agreement, the parties shall negotiate the level of MRWPCA's commitment to provide infrastructure improvements to the IWTF during the term of the lease to include MRWPCA consulting with the City regarding improvements required for the ponds to remain a productive and efficient means for treating, storing and reusing industrial waste water and which the infrastructure improvements are allocated. MRWPCA would employ a variety of options in order to meet the required infrastructure improvement figure. Options for securing the resources necessary to improve the pond infrastructure may include but are not limited to low interest loans, grants, public/private partnerships, in-kind labor by MRWPCA or other partner agencies.

2. Payment for Treatment.

a. City agrees to pay to MRWPCA all costs of treatment of the industrial waste water conveyed to MRPWCA and measured by meter pursuant to Section 1 above. As determined by a rate study prepared by MRWPCA and agreed to by City, the initial rate for treatment shall be $179.00/acre foot. If and as costs of treatment change, either as provided in the rate study or by other means, MRWPCA shall, by written notice given no later than 45 days prior to a rate change, notify City of such rate change, to include an explanation and accounting of the costs requiring a change. City shall, upon the effective date of a rate change, pay for costs at the new rate. MRWPCA shall make no more than one rate change in any twelve-month period, unless otherwise provided in the rate study. MRWPCA invoices for treatment costs shall be rendered monthly and paid by City within 45 days of receipt.

b. If City contests an invoice submitted under this Section, it shall give MRWPCA notice of the dispute at least 10 days prior to the day payment is due. To the

extent MRWPCA finds City's contentions correct, it shall revise the statement accordingly and City shall make payment of the revised amount within 45 days of notice of the revised amount. If MRWPCA rejects City's contentions or where time is not available for review of the contentions prior to the due date, City shall make payment of the invoiced amount on or before the due date and make the contested part of such payment under protest and seek to recover the amount thereof from MRWPCA.

c. Upon the improvements to the IWTF system, industrial waste water or storm water that is stored at the IWTF site and returned to the Salinas Pump Station for the treatment and reuse at the Regional Treatment Plant (RTP), it is anticipated that the intended user of the water will pay for the cost of conveyance and treatment of water. The rates for treating this stored water will be in accordance to the Interruptible Rate table as calculated by the MRWPCA.

3. **Source Control Monitoring.** Source control monitoring of the City's industrial waste water processing facilities by MRWPCA shall continue pursuant to existing agreements between City and MRWPCA.

4. **Term.** The effective date of this Agreement is January 1, 2016. Unless earlier terminated or extended in writing by mutual agreement of the Parties, this Agreement shall remain in effect for a period of thirty (30) years from the effective date hereof. This Agreement shall be automatically extended for two successive five-year terms after the initial thirty (30) year term unless either Party gives written notice of termination no later than two years before the end of the initial term or later term as extended per this Section.

5. **Disputes.**

a. If any dispute under this Agreement arises, the Parties shall first meet and confer in an attempt to resolve the matter between themselves. Each Party shall make all reasonable efforts to provide to the other Party all the information in its possession that is relevant to the dispute, so that both Parties have ample information with which to reach a decision.

b. In the event a dispute involving the enforcement or interpretation of this Agreement is not resolved by the meet and confer process described in subsection a. of this Section, it must be submitted to non-binding mediation before suit is filed. Upon request by either Party, the Parties will within ten (10) days of submission to such arbitration, select a single mediator to mediate the dispute. If the Parties are unable to agree on a mediator within ten (10) days of the request to select, then either Party may ask the then presiding judge of the Monterey County Superior Court to select a mediator. If a dispute is not resolved within 45 days of selection, however selected, either Party may file suit specifically to enforce or interpret this Agreement and to seek any damages to which the Party may be entitled.

6. **Insurance/Self-Insurance.** Each Party is either insured or self-insured as to any requirements under this Agreement. No policies or bonds are required of either Party as to any provisions of this Agreement. The Parties are aware of and shall comply with the requirements of Section 3700 of the California Labor Code at their own cost and expense and, further, neither Party nor its insurer shall be entitled to recover from the other any costs, settlements, or expenses of Workers' Compensation claims arising out of this agreement.

7. **Indemnification and Hold Harmless.** Each Party hereto agrees that it shall indemnify, defend, and hold harmless the other Party, including Party's officers, agents and employees, from and against any and all claims, liabilities, and losses whatsoever occurring or resulting to any person, firm, corporation, or other entity for foreseeable consequential damage, property damage, injury, or death arising out of or connected a Party's negligence or non-performance of its obligations under this Agreement. The provisions of this Section 7 shall survive the expiration of the term or termination of this Agreement.

8. **Miscellaneous.**

   a. Each Party represents that it has read all terms set out herein and each fully understands and accepts all terms of this Agreement.

   b. The Parties acknowledge that each has reviewed this Agreement and that the usual rule of construction that ambiguities are to be resolved against the drafting party shall not be employed in the interpretation of this Agreement

   c. This Agreement sets for the entire understanding of the Parties with respect to the subject matter hereof. Neither Party has made any statement or inducement for the other to enter into this Agreement, except as expressly set forth herein or incorporated herein by reference. The Parties agree that this Agreement shall not be altered, amended, modified, or otherwise changed except in writing by mutual consent of the Parties.

   d. This Agreement shall be governed by the laws of the State of California. Venue for any legal action relating to this Agreement is Monterey County.

   e. If any part of this Agreement is for any reason ruled unenforceable by a court of competent jurisdiction, the remainder shall remain in full force and effect unless the unenforceable part is a material consideration to a Party.

f. In the event of any claim, controversy or dispute that results in litigation or binding arbitration, the prevailing Party shall be entitled to recover from the losing party reasonable expenses, attorney fees, and costs.

g. Both parties shall cooperate fully to execute any and all documents, and to take any actions necessary and appropriate to give full force and effect to this Agreement, and which are not inconsistent with its terms.

h. The individuals whose signatures appear herein below represent, warrant and guarantee that they have the authority to execute this Agreement on behalf of the Party on whose behalf they purport to sign and execute.

i. It is expressly understood that this Agreement is intended by the Parties to be between two independent contractors and that no agency, employment, partnership, joint venture, or other relationship is established by this Agreement.

j. The Parties agree that neither Party shall be considered or deemed to have waived, released, or altered in any manner any or all rights which it would otherwise have pursuant to law with regard to any other matter not dealt with or affected by this Agreement.

9. **Counterparts.** This Agreement may be executed in two counterparts, each of which shall be deemed an original, but each of which shall be deemed to constitute one and same document.

10. **Notices.** All notices or other writings in this Agreement provided to be given or made or sent, or which may be given or made or sent, by one Party hereto or another, shall be deemed to have been fully given or made or sent with made in writing and deposited in the United States mail, registered, certified or first class, postage paid, and addressed as follows:

To MRWPCA: General Manager
Monterey Regional Water Pollution Control Agency
5 Harris Court, Building D
Monterey, CA 93940

To City of Salinas: City Manager
City of Salinas City Hall
200 Lincoln Ave.
Salinas, CA 93901

With a copy provided to the City & Agency's Attorney.

The address to which any notice or other writing may be given or made or sent to either Party may be changed upon written notice given by such Party as provided above.

IN WITNESS WHEREOF, the Monterey Regional Water Pollution Control Agency and the City of Salinas have entered into this Agreement as of the date first written above.

Monterey One Water
Providing Cooperative Water Solutions

Board of Directors Meeting
Staff Report

TO:	Board of Directors
FROM:	Paul A. Sciuto, General Manager
MEETING DATE:	June 24, 2019
AGENDA ITEM NO:	8 – B
SUBJECT:	Consider Approval of Amendment No. 1 to the Amended and Restated Water Recycling Agreement (ARWRA) Between Monterey One Water (M1W) and Monterey County Water Resources Agency (MCWRA)

BACKGROUND

In October of 2016 the Monterey One Water (M1W) Board approved the Amended and Restated Water Recycling Agreement (ARWRA) with Monterey County Water Resources Agency (MCWRA.) The ARWRA provides, *inter alia*, for new source waters from the Blanco Drain, Reclamation Ditch and the City of Salinas (produce wash water) for Castroville Seawater Intrusion Project (CSIP) and the Pure Water Monterey Project. It was developed by combining provisions of (i) the M1W agreement with MCWRA, dated June 15, 1992, for construction and operation of a tertiary treatment system (the "1992 Agreement"), with subsequent amendments thereto, as follows: Amendment No. 1 on May 30, 1994; Amendment No. 2 on February 16, 1998; and Amendment No. 3 on May 28, 2002, (ii) agreement between M1W and MCWRA entitled "Operation and Maintenance of the Salinas River Diversion Facility," dated February 3, 2011 (SRDF Agreement) and, (iii) the MOU.

Portions of the ARWRA applicable to the New Source Water Facilities will not become effective until the following conditions are met:

1. Water Rights for the Blanco Drain and Reclamation Ditch are obtained from the California State Water Resources Control Board; and,
2. A fully executed, and California Public Utilities Commission (CPUC) approved, Water Purchase Agreement, between MRWPCA, MPWMD, and California-American Water, is approved by the CPUC and executed by the parties thereto; and,
3. Written finding by the Regional Water Quality Control Board that utilization of the Blanco Drain dry weather flows as New Source Water meets all treatment requirements for the aforesaid dry weather flows; and,

4. An independent third-party review of proposed capital and operating costs and preparation of an Engineer's Report is approved by the MCWRA Board of Directors and Board of Supervisors. The costs of the aforesaid third-party review shall be shared equally between MCWRA and MRWPCA; and,
5. A successful assessment or Proposition 218 process for rates and charges related to the operation and maintenance of the New Source Water Facilities and proportional primary and secondary treatment charges; and,
6. Inclusion of Salinas Pond Water Return Facilities as New Source Water Facilities requires execution of a separate agreement between the Parties.

Due to delays in completing the cost based Engineers Report (Number 4 above) and changes in MCWRA personnel, the conditions noted above have not been completed.

Therefore, MCWRA and M1W have developed an amendment to the ARWRA that will allow additional time to address the conditions precedent, delay required payments for the project by MCWRA, and allow M1W to use source waters for the Pure Water Monterey Project.

The Monterey County Water Resources Agency Board of Directors unanimously recommended approval of Amendment No. 1 at their June 17 Board meeting.

FISCAL IMPACT

The cost of the above items is to be determined with future costs to be funded from a combination of M1W Reclamation funds from MCWRA and Pure Water Monterey funds.

RECOMMENDED ACTION:

That the Board of Directors approve Amendment No. 1 to the Amended and Restated Water Recycling Agreement (ARWRA) Between Monterey One Water (M1W) and Monterey County Water Resources Agency (MCWRA)

ATTACHMENTS:

1. Draft Amendment No. 1 to ARWRA
2. Original ARWRA

AMENDMENT NO. 1 TO
AMENDED AND RESTATED WATER RECYCLING AGREEMENT
BETWEEN MONTEREY COUNTY WATER RESOURCES AGENCY AND
MONTEREY ONE WATER

THIS AMENDMENT NO. 1 to the Amended and Restated Water Recycling Agreement , dated November 3, 2015, (hereinafter, "Agreement") between the Monterey County Water Resources Agency, a political subdivision of the State of California (hereinafter, "WRA") and Monterey One Water (hereinafter, "M1W," referred to in the Agreement as "PCA") is hereby entered into between WRA and M1W (collectively, WRA and M1W are referred to as the "Parties").

WHEREAS, the portions of Agreement applicable to the New Source Water Facilities will not become effective until the following conditions in Section 16.15 are met:

1. Water Rights for the Blanco Drain and Reclamation Ditch are obtained from the California State Water Resources Control Board; and,
2. A fully executed, and California Public Utilities Commission approved, Water Purchase Agreement, between MRWPCA, MPWMD, and California-American Water, is approved by the California Public Utilities Commission and executed by the parties thereto; and,
3. Written findings are made by the Regional Water Quality Control Board that utilization of the Blanco Drain dry weather flows as New Source Water meets all treatment requirements for the aforesaid dry weather flows; and,
4. An independent third-party review of proposed capital and operating costs and preparation of an Engineer's Report is approved by the WRA Board of Directors and Board of Supervisors. The costs of the aforesaid third-party review shall be shared equally between WRA and M1W; and,
5. A successful assessment or Proposition 218 process for rates and charges related to the operation and maintenance of the New Source Water Facilities and proportional primary and secondary treatment charges; and,
6. Inclusion of Salinas Pond Water Return Facilities as New Source Water Facilities requires execution of a separate agreement between the Parties; and,

WHEREAS, the status of the conditions in Section 16.15 are as follows; conditions 1 and 2 are satisfied; conditions 3,4, and 5 are pending; and condition 6 has not yet commenced; and,

WHEREAS, the capital cost of the New Source Water Facilities are funded by M1W through grants and a low-interest loan from the State of California, Water Resources Control Board, State Revolving Funds with the first payment due on December 31, 2019; and,

WHEREAS, if all conditions in Section 16.15 are satisfied, the WRA's share of the capital costs and the repair and replacement costs associated with the New Source Water Facilities are 45.1%; and,

Technical Memorandum

Supplement: Updated Coastal Erosion Hazard Analysis for CalAm Monterey Peninsula Water Supply Project

This technical memorandum is a supplement to the previously completed coastal erosion hazard analysis for the California-American Water Company (CalAm) Monterey Peninsula Water Supply Project contained in a technical memorandum submitted to Coastal Commission staff on October 2, 2019.[1] The purpose of this supplemental memo is to confirm that the previously completed sea level rise analysis is consistent with the recently adopted State of California document, *Making California's Coast Resilient to Sea Level Rise: Principles for Aligned State Action*. Principle 1 of this document directs state agencies to use a minimum target for planning of 3.5 feet of sea level rise by 2050.

Consistent with the 2018 California Ocean Protection Council's State Sea-Level Rise Guidance, AECOM's previously completed coastal erosion analysis evaluated the H++ scenario at 2060, which considered 3.8 feet of sea level rise. This scenario is more conservative than the 3.5 feet of sea level rise by 2050 in two ways. First, it considered 3.8 feet of sea level rise instead of the recommended 3.5 feet. Second, it considered an additional 10 years of ongoing shoreline erosion from 2050 to 2060. As a result, the projected coastal erosion estimated for the 2060 planning horizon would exceed that estimated for 3.5 feet of sea level rise at 2050. Even under this conservative scenario, the previously completed analysis showed no projected coastal erosion impacts to the existing test well or slant well field by storms up to a 500-year coastal storm event at 2060 for the H++ scenario. Assuming this same analysis were applied in 2050, the results would not change.

Therefore, the sea level rise and planning horizon considered in AECOM's previous analysis (i.e., 3.8 feet of sea level rise at 2060) satisfies the sea level rise planning recommendations of the recently adopted Principles document. No adverse impacts to the test slant well or the proposed slant well field would occur based on 3.5 feet of sea level rise at 2050. Accordingly, no new analysis or revisions to the previously submitted technical memo are required.

[1] In response to the October 28, 2019, Staff Report, AECOM prepared a technical memorandum evaluating inland dune migration, profile shifts, and wind-blown sand as potential coastal hazards. That technical memorandum was submitted to Coastal Commission staff on June 30, 2020.

Good afternoon, Tom – hope this email continues to find you well.

Attached is a submittal from Cal-Am addressing various issues in the Commission's November 2019 Staff Report, which we hope will be helpful in preparing the Commission's next staff report concerning the Monterey Peninsula Water Supply Project. To access the compiled set of exhibits referenced in the submittal, please use the link below. If you have any questions or would like to discuss any of the materials provided, please do not hesitate to let me or Ian Crooks know.

Many thanks,
DJ

Re: Responses to October 28, 2019 Staff Report for the Monterey Peninsula Water Supply Project, Coastal Development Permit Application No. 9-19-0918, and Appeal No. A-3-MRA-19-0034

Dear Mr. Luster:

On behalf of California-American Water Company ("Cal-Am"), this letter responds to the Coastal Commission's ("Commission") October 28, 2019, Staff Report regarding the coastal development permit ("CDP") application for and appeal regarding the Monterey Peninsula Water Supply Project ("Project"), which was considered in an informational hearing on Agenda Items Th8a and 9a at the Commission's November 2019 meeting.

While we appreciate Commission staff's efforts in preparing the Staff Report, as noted in our testimony at the Commission's November 2019 meeting, we believe the Staff Report contains a number of inaccuracies about the Project, its potential impacts, and potential water supply alternatives. To ensure that staff has an accurate record upon which to assess the Project and prepare an updated Staff Report in advance of the planned August 20, 2020, hearing on the Project, a fulsome response to the Staff Report and certain opponent submittals is provided in **Attachment A** to this letter. We also have provided responses to questions that the Commissioners raised at the end of the Project's informational hearing in **Attachment B**.

Our most significant concern with the Staff Report's analysis is staff's consistent, misplaced reliance on the proposed expansion of the Pure Water Monterey recycled water project ("PWM Expansion") as an alternative to desalination and a reason to deny the Project's CDPs. Not only does the Commission lack the authority under either the Coastal Act or the California Environmental Quality Act to evaluate the PWM Expansion as a Project alternative, but the PWM Expansion is wholly infeasible. Since the Commission's November 2019 meeting, the Monterey One Water ("M1W") Board of Directors has denied certification of the PWM Expansion's Final Supplemental Environmental Impact Report ("SEIR") and did not approve the PWM Expansion. As a result, the PWM Expansion is not moving forward and cannot serve as the alternative water supply project that staff previously envisioned. Moreover, the original Pure

Water Monterey recycled water project that was supposed to come online in January 2020, and supply Cal-Am's customers with 3,500 acre-feet per year ("afy") of recycled water has run into significant technological and feasibility issues, is not currently providing Cal-Am with any water, and the current annual injection volume is only 2,030 afy – ***just 58% of its commitment.*** Further, M1W now estimates that the original Pure Water Monterey project will not come online until late August or early September. This information calls into question all of the supply and demand analyses submitted to the Commission by various Project opponents – each of which relies on the full 3,500 afy from the original Pure Water Monterey project plus a full 2,250 afy from the PWM Expansion to claim Cal-Am's Project is not needed. The Peninsula will need a water supply source to make up for the Pure Water Monterey project's shortfalls—the Project remains the only reliable water supply to make up these water shortfalls and satisfy the Peninsula's water demands.

Reliability of available water supplies was one of the most significant issues the California Public Utilities Commission considered when it approved Cal-Am's Project and concluded the PWM Expansion was not a feasible alternative to desalination. (See CPUC Decision D.18-09-017, Appx. C, p. C-17.) The current inability of the original Pure Water Monterey project to provide its promised amount of water also raises similar technical concerns about the PWM Expansion. In addition, and as raised by numerous stakeholders in the M1W Board proceedings, the PWM Expansion is further flawed because M1W has failed to secure adequate source waters for that project, has not disclosed all of that project's potential environmental impacts, and cannot commit to provide a certain quantity of product water. Simply put, the PWM Expansion cannot provide a drought-proof water supply sufficient to meet current and future demands of the Monterey Peninsula, and cannot be considered a feasible alternative to the Project.

In addition, the Staff Report reaches several incorrect conclusions regarding the Project's impacts and consistency with the Coastal Act and the City of Marina LCP. Those issues are addressed in detail in **Attachment A**, and summarized below.

- **ESHA**: The Staff Report concluded that the Project could impact 35 acres of ESHA. Based on a more detailed impact assessment, AECOM has confirmed Project construction and maintenance will permanently impact only 2.181 acres of ESHA and temporarily impact 15.306 acres of ESHA. Cal-Am has submitted a proposed Habitat Mitigation and Monitoring Plan to the Commission through which it proposes to restore approximately 14.6 acres on the CEMEX site to mitigate these impacts, including 1.8 acres beyond the amount required, which will ensure the Project will not result in a substantial adverse impact to sensitive habitats.

- **Coastal Hazards**: Technical analyses by AECOM confirm the Project's slant wells will not be impacted by coastal erosion until near the 2120 planning horizon, contrary to the Staff Reports assertions. Accordingly, the Project is entirely consistent with coastal hazard policies.

- **Coastal Waters and Marine Resources**: The Staff Report claims that it is unclear what effects the Project would have on water quality and marine life. However, the

Project's potential impacts to ocean water quality and marine life were analyzed in detail in the Project's Final Environmental Impact Report/Environmental Impact Statement ("EIR/EIS"), which concluded that the Project would not result in a significant impact with the implementation of feasible and enforceable mitigation measures.

- **Groundwater**: The Staff Report requests additional groundwater data, however, experts and the State Water Resources Control Board have confirmed additional groundwater data collection and modeling is unnecessary. The modeling in the EIR/EIS represents the culmination of a multi-year, peer-reviewed effort, and any additional modeling would not change the Final EIR/EIS's conclusions that the Project's potential impacts to groundwater supplies in the Salinas Valley Groundwater Basin would be less than significant.

- **Public Access**: The Staff Report alleges that Project operation could result in adverse effects to public access and recreation, but the Project footprint will be *de minimis* and would not impede beach use or access at any time. Specifically, under regular operations, Project infrastructure within fenced areas will occupy only about 0.06 percent (approximately 0.24 acres) of the CEMEX site (approximately 400+ acres) and during yearly maintenance activities (commencing in year five of operations) an additional approximately 0.25 acres would be occupied for a 9 to 18 week period.

- **Environmental Justice**: Staff contends that the Project would disproportionately burden communities of concern through higher water rates and that a feasible alternative could provide water without such impacts (the PWM Expansion). Staff inappropriately disregards many Project benefits to low income communities – including the severely disadvantaged community of Castroville – and fails to consider the infeasibility and drawbacks of the PWM Expansion. Moreover, staff does not consider Cal-Am's low income ratepayer assistance program or that the CPUC carefully evaluated Cal-Am's water rates and determined them to be just and reasonable

- **Water Supply and Demand**: The Staff Report asserts that an "updated analysis" of Monterey Peninsula water supply and demand provided by the Monterey Peninsula Water Management District's General Manager, David Stoldt, demonstrates a decrease in water demand in the area, such that the PWM Expansion has become a feasible alternative to the Project. This ignores extensive critiques of Mr. Stoldt's analysis from Cal-Am and other interested parties, and fails to recognize that the CPUC has already determined appropriate levels of supply and demand for the Cal-Am service area, consistent with its statutory mandate. Contrary to Mr. Stoldt's conclusions, implementation of the PWM Expansion instead of the Project would only lead to significant water supply shortfalls along with corresponding economic hardship on the Monterey Peninsula and impacts to the steelhead trout because of additional water diversions from the Carmel River.

- **PWM Expansion Environmental Impacts**: Staff's determination that the PWM Expansion will have fewer adverse environmental effects than the Project largely ignores the CPUC's analysis of the Project's environmental impacts in the Final EIR/EIS, and severely understates the PWM Expansion's own potential environmental effects. Notably, the M1W Board denied certification of the PWM Expansion's SEIR based on inadequate analysis of that project's environmental impacts.

Notwithstanding any potential inconsistencies with the City of Marina LCP or Coastal Act policies, the Commission can approve the Project under Coastal Act section 30260. The Project is a coastal-dependent industrial facility and, as demonstrated in **Attachment A**, (1) alternative locations of the Project are infeasible or more environmentally damaging; (2) to not permit the Project would adversely affect the public welfare; and (3) the Project's environmental impacts have been mitigated to the maximum extent feasible. Further, **Attachment C** hereto provides a series of special conditions proposed by Cal-Am, in an effort to help address several of Commission staff's stated concerns regarding the Project and its consistency with the Coastal Act. Cal-Am also remains willing to discuss with staff these and other additional special conditions that staff may deem appropriate.

Cal-Am appreciates staff's ongoing efforts in review of the Project, and hopes that the information provided herein will assist in staff's preparation of a Staff Report for the upcoming August 20 hearing. Cal-Am has endeavored to work cooperatively with staff on all aspects of Cal-Am's Project, both in responding to staff's informational requests and in authorizing supplemental studies that staff has requested. Accordingly, Cal-Am hopes to continue that cooperation and respectfully requests that staff review Cal-Am's application, the appeals, and the information in the record objectively and recommend approval of Cal-Am's CDPs. Thank you for your consideration in this matter.

Very truly yours,

Duncan Joseph Moore

RESPONSE TO STAFF REPORT AND COMMENTS ON STAFF REPORT FOR APPLICATION 9-19-0918 AND APPEAL A-3-MRA-19-0034

A. Environmentally Sensitive Habitat Areas

Consistent with the analysis provided in the Project's Final EIR/EIS, the Project would not result in a substantial adverse impact to sensitive habitats during Project construction or operation with the implementation of all feasible and enforceable mitigation measures. (Final EIR/EIS at pp. 4.6-198, 4.6-201, 4.6-204 to 4.6-205, 4.6-215, 4.6-258 to 4.6-259.) As requested by Commission staff, Cal-Am has prepared a comprehensive Habitat Mitigation and Monitoring Plan ("HMMP") addressing all potential ESHA impacts within the Coastal Zone.[1] In particular, for the 2.181 acres of potential permanent impacts to ESHA, the HMMP provides for approximately 6.6 acres of restoration (3:1 mitigation ratio) and for the approximately 15.306 acres of potential temporary impacts to ESHA the HMMP would mitigate in-kind and in-place at a 1:1 mitigation ratio. (See HMMP, p. 3-10.) In addition, while not required, Cal-Am proposes to remove an additional 1.825 acres of iceplant and the area would be restored with native vegetation to help ensure the overall success of the restoration program. Thus, as demonstrated below, the Project would conform to the Habitat Protection Policies in the City of Marina's Local Coastal Program ("LCP"), as supplemented by its consistency with the Coastal Dependent Development priorities in the LCP and Coastal Act section 30260, which allows for coastal-dependent industrial facilities like the Project to be approved despite any potential LCP inconsistencies.

Staff Report Contention #1: Staff repeatedly mischaracterizes the scope of the Project's ESHA impacts and estimated timing for restoration. (See Staff Report, pp. 34-37, 42-44.)

Cal-Am Response: Commission staff overestimates the amount of ESHA the Project will impact and the length of time it would take to restore the ESHA impacted. The Staff Report references a 35 acre area, however, that area reflects the approximate footprint of the entire Project in the Coastal Zone, and not those specific areas that contain ESHA. As detailed in the HMMP, the Project would only permanently impact 2.181 acres of ESHA and temporarily impact 15.306 acres of ESHA. (See HMMP, p. 3-10.) These figures were determined utilizing the definitions of ESHA found in the LCP, Monterey County's North County Land Use Plan, and the City of Seaside Local Coastal Land Use Plan. Based on these definitions AECOM created detailed mapping using GIS accuracy, which is provided at Appendix A to the HMMP.

In addition, as provided in the HMMP, in areas of temporary impacts, restoration work will consist of in-place and in-kind restoration of the same special-status biological resources to their pre-construction condition and as one area of the Project is completed, restoration in that area will begin concurrent with Project construction in other areas of the site. Sequencing work to begin as soon as possible will ensure that the impacts

[1] Cal-Am submitted the HMMP to staff on June 18, 2020.

remain temporary and therefore the impacts should not be considered permanent. (See HMMP, p. 4-11.)

The HMMP was prepared consistent with the requirements of the Final EIR/EIS which, concluded, based on substantial evidence, that the Project would not result in substantial adverse effects on sensitive natural communities, including ESHA, during Project construction or operations with the implementation of feasible and enforceable mitigation measures. (Final EIR/EIS at pp. 4.6-198, 4.6-201, 4.6-204 to 4.6-205, 4.6-215, 4.6-258 to 4.6-259.) As discussed below in Section J, because the Project would not result in a substantial adverse impact on sensitive habitats, the Project may be sited in an area defined as primary habitat without violating the City of Marina's LCP and the Coastal Act.

Staff Report Contention #2: Staff contends that, although the Project's well field will be located on a portion of the CEMEX site that has been disturbed by sand mining activities, those activities are scheduled to end by December 31, 2020, and the site will be restricted to restoration and passive recreation activities pursuant to Settlement Agreement and Cease and Desist Order CCC-17-CD-02 ("Settlement Agreement"). (Staff Report, p. 39.) Public Water Now similarly raises concerns about the Project's impacts to the restoration of the CEMEX site "to its natural state for public access and recreation." (PWN Letter (Nov. 11, 2019), p. 2.)

Cal-Am Response: Staff and Public Water Now misinterpret the Settlement Agreement, which allows for *both* Cal-Am's Project and habitat, public access, *and* low-impact passive recreation to occur on the CEMEX site. (Settlement Agreement, §§ 6.1, 6.2(D)(3), attached hereto as **Exhibit 1**; Final EIR/EIS, p. 8.2-123.) Specifically, the Settlement Agreement memorializes the agreement between the CCC and CEMEX regarding the future allowable uses of the CEMEX site and expressly protects Cal-Am's rights related to the CEMEX Site as follows:

> [N]o development . . . shall occur . . . , provided that improvements to provide low-impact passive recreation, public access, public education, removal activities, activities to restore native habitat, ***and activities consistent with existing easements or other rights of record identified by CEMEX . . . , including those noted in Section 23.2, will not be prohibited.***

(See Ex. 1, Settlement Agreement, § 6.2.D.1 [emphasis added].)[2] Settlement Agreement Section 23.2 further acknowledges Cal-Am's rights to develop the Project on the

[2] The Settlement Agreement's effectiveness was conditioned on the City of Marina's approval of its own agreement with CEMEX regarding Marina's claim that CEMEX's sand mining operations were a public nuisance (the "Mutual Release"). By entering into the Mutual Release, Marina waived any argument that Cal-Am lacks a property right to use the CEMEX site for the express purposes allowed by the easements consistent with the Settlement Agreement. (See Ex. 1, Settlement Agreement, § 9 & Ex. 2.)

CEMEX site, explicitly providing that the Settlement Agreement "is not intended to and ***shall not be construed or deemed to supersede or interfere with any existing rights or obligations of California-American Water Company . . . related to the [CEMEX Site], including but not limited to, the recorded easement and related option.***" (*Id.*, § 23.2 [emphasis added].)

Cal-Am acquired from CEMEX an option to purchase permanent easements at the CEMEX site on November 4, 2014, which Cal-Am recorded with the Monterey County Recorder on November 25, 2014. (See Grant of Temporary Easement (Nov. 4, 2014), attached hereto as **Exhibit 2**.) On February 27, 2018, Cal-Am exercised its option to acquire the permanent easements, and, on May 23, 2018, CEMEX, through its subsidiary RMC Pacific Materials, LLC, granted to Cal-Am a permanent easement and an access easement over and across the CEMEX Site for the express purpose of accessing, constructing, installing, operating, and maintaining slant wells and related pipelines and utilities for the Project. (See Recorded Grant of Permanent Easement (May 23, 2018), attached hereto as **Exhibit 3**.) Cal-Am's property interest in the permanent easement at the CEMEX site relates back to the date the option was first made in 2014, two-and-a-half years before CEMEX and the Commission executed the Settlement Agreement. (See *Wachovia Bank v. Lifetime Industries, Inc.* (2006) 145 Cal.App.4th 1039, 1050 [citing cases]; *Anthony v. Enzler* (1976) 61 Cal.App.3d 872, 876 ["option vests in the grantee *the right of acquiring an interest in the land and when the right is exercised it necessarily relates back to the time of giving the option.*"] [emphasis in original].)

Further, Section 6.1 of the Settlement Agreement requires CEMEX to transfer title in the property to either manage the property for conservation uses, or use the property for other allowable activities. ***The Settlement Agreement does not require the purchaser to use and manage the property for ESHA restoration.***

> Subject to Section 23.2, Respondent shall transfer fee title to all of the Property to a non-profit or governmental entity or consortium approved by the Commission, in consultation with the City of Marina, . . . such approval not to be unreasonably withheld, that commits to hold and manage the property primarily for conservation purposes, with the only other allowable uses being for low-impact, passive recreation purposes or activities, public access, public education, removal activities, activities to restore native habitat, and activities consistent with existing easements identified by Cemex prior to the Effective Date.

(Ex. 1, Settlement Agreement, § 6.1.A.)

Thus, the Settlement Agreement expressly provides that allowable uses of the CEMEX site include "activities consistent with existing easements identified by Cemex prior to the Effective Date," including Cal-Am's permanent easement for the subsurface slant well network and a non-exclusive access easement to access and use the site for construction and maintenance. (*Id.*, § 6.1.) Because Cal-Am is proposing to use the

easement to facilitate Project construction and operation, the Project is consistent with the Settlement Agreement's restrictions on the use of the CEMEX site.

Nonetheless, Cal-Am has proposed to further the Settlement Agreement's intent through the proposed HMMP it has delivered to the Commission, which requires the restoration of approximately 14.6 acres at the CEMEX site (6.6 acres for permanent impacts, 6.2 acres for temporary impacts, and an additional 1.8 acres that is not required but is proposed to benefit the overall restoration of the CEMEX site). Pursuant to the HMMP, restoration at the CEMEX site would include re-establishment, rehabilitation and enhancement of habitats through removal of existing sizeable invasive species populations, and reintroduction of native species indigenous to the dune habitat. The HMMP also requires long-term management activities to remove newly emerging invasive vegetation and protect and preserve the restored and existing native habitats. Therefore, Cal-Am's proposed use is entirely consistent with the Settlement Agreement's intent.

Moreover, although the Settlement Agreement does not require restoration of the entire CEMEX site, Cal-Am's proposed HMMP ensures that any impacts on the CEMEX site as a result of Project construction and operation will be mitigated to the maximum extent feasible. Implementation of the HMMP will result in the restoration of approximately 14.6 acres on the CEMEX site to its natural condition, the funding for which would not be secured in the absence of Cal-Am's Project and the proposed HMMP.

In addition, the Staff Report improperly relies on a baseline for the CEMEX site that includes restored conditions *after* implementation of CEMEX's proposed Reclamation Plan. (See Staff Report, pp. 36-37.) The proper baseline is existing conditions. (See *Neighbors for Smart Rail v. Exposition Metro Line Construction Auth.* (2013) 57 Cal.4th 439, 447; CEQA Guidelines, § 15125.) Staff's post-restoration baseline is improper because final removal of CEMEX buildings and facilities is not required until December 31, 2024, with an additional year—until December 31, 2025—to complete grading and seeding. (Final EIR/EIS, p. 8.2-122.) Staff provides no support for its reliance on conditions five years in the future as a baseline for Cal-Am's CDP. Indeed, staff conducts biological surveys based on *existing* conditions in order to evaluate potential impacts. Therefore, the appropriate baseline to measure biological impacts is against existing conditions (i.e., degraded or disturbed dunes), not against possible restoration years in the future.

Staff Report Contention #3: Staff suggests that Cal-Am will perform slant well construction and maintenance work, as well as work on the Monterey One Water outfall, during western snowy plover breeding season in order to meet project deadlines. (Staff Report, pp. 40, 44-45.)

Cal-Am Response: Contrary to staff's suggestion that Project construction will coincide with western snowy plover breeding season and adversely impact plover habitat, the CPUC's Mitigation Monitoring and Reporting Program ("MMRP") limits both when and how Cal-Am can perform Project work to minimize potential impacts to western snowy plover.

First, staff ignores that Cal-Am cannot perform work during western snowy plover breeding season without first obtaining approval from the U.S. Fish and Wildlife Service ("USFWS") and subject to conditions. The MMRP requires that "[c]onstruction work at the slant well heads and along the segment of the Source Water Pipeline located west of the CEMEX processing plant [] ***occur during the western snowy plover non-breeding season*** . . . unless otherwise approved by the USFWS." (Final EIR/EIS, p. 4.6-175 [emphasis added]; CPUC Decision D.18-09-017, Appx. C, p. C-18; *id.*, Appx. D, pp. D-19 to D-21.) Similarly, the MMRP requires that slant well maintenance be conducted "between October and February to avoid the western snowy plover nesting season" without prior approval from USFWS. (Final EIR/EIS, p. 4.6-247.) If Cal-Am applies for, and obtains, such approval, it is anticipated that USFWS would condition the construction or maintenance work to avoid or minimize impacts to western snowy plover.

In fact, the Commission approved a similar Special Condition for Cal-Am's test slant well. The test well CDP did not prohibit construction during western snowy plover breeding season, but rather imposed pre-construction and pre-disturbance survey requirements and protections for any work performed between February 28 and October 1. (See Final Adopted Findings, CDP App. No. 9-14-1735, Appeal No. A-3-MRA-14-0050 (Nov. 12, 2014), pp. 8, 13-15, attached hereto as **Exhibit 4**.) The MMRP provides these very same protections, in addition to requiring USFWS approval as a condition to any work that might be required to be performed during plover breeding season.

Further, regardless of whether construction occurs during plover breeding season, slant well construction has been designed to "occur ***outside*** of western snowy plover critical habitat and ***would not result in direct impacts on critical habitat***." (Final EIR/EIS, p. 4.6-197 [emphasis added].) The MMRP also imposes measures to mitigate any potential indirect impacts to snowy plover. (See Final EIR/EIS, pp. 4.6-175 to 4.6-176.) The Final EIR/EIS concluded that, based on substantial evidence, "after mitigation, the permanent loss of snowy plover habitat attributable to the proposed project would be less than significant." (*Id.*, p. 4.6-269.) Thus, even if Cal-Am obtains authorization from USFWS to conduct construction or maintenance work during western snowy plover breeding and nesting season, Cal-Am has designed the Project and the CPUC has imposed mitigation to minimize or avoid impacts to western snowy plover. (*Id.*, p. 4.6-175.)

In addition, as detailed in the HMMP, temporary impacts to western snowy plover habitat will be mitigated in-place and in-kind and as mitigation for the 2.12 acres of permanent impacts to western snowy plover breeding and foraging habitat, 6.359 acres of new habitat will be established, re-established, rehabilitated, enhanced, and permanently preserved on the CEMEX site. (See HMMP, p. 3-9 to 3-12.) Accordingly, all impacts to western snowy plover will be fully mitigated.

As for potential work on the M1W outfall, the M1W outfall work is a wholly separate project that may be separately conditioned when M1W applies for a CDP for that work. Cal-Am is currently working with M1W to determine how best to implement the outfall work contemplated in the EIR/EIS and is also evaluating potential alternatives to the outfall liner. For purposes of this CDP, however, Cal-Am proposes a Special Condition

(see Attachment C) that would require approval of the outfall work prior to the commencement of Project operations.

Staff Report Contention #4: Staff contends that Cal-Am plans to remove 1,600 cubic yards ("CY") of spoils from well drilling and proposes to spread the spoils evenly in an approximately two-inch think layer across eight acres of ESHA on the CEMEX site. (Staff Report, p. 40.) The salinity of these spoils will adversely affect plant species and could bury the plants or seedlings. (Ibid.) Although the Final EIR/EIS includes mitigation measures requiring Cal-Am to restore these areas, that restoration could take up to five years, "which would represent a significant diminution of that habitat and its ecological function." (Ibid.) Additionally, spoils spreading would disrupt the western snowy plover's use of this habitat. (Id., p. 41.)

Cal-Am Response: As an initial matter, the 1,600 CY of spoils referenced by staff assumes that the Project would be constructed with nine new slant wells (on seven concrete well pads), which was the original scope of the Project when it was proposed to be a 9.6 mgd desalination facility. (See Final EIR/EIS, p. 4.6-150.) Because the CPUC adopted Alternative 5a—a 6.4 mgd desalination project—Project construction will involve only the development of six new slant wells (on five well pads), which will result in a reduced amount of approximately 1,003 CY of spoils. (See AECOM Technical Memorandum, Response to CCC Comments on MPWSP Slant Well Drilling Spoils Spreading (June 19, 2020), attached hereto as **Exhibit 5**.) Thus, any impacts to ESHA resulting from the spreading of spoils at the CEMEX site would be less than the Staff Report anticipates.

Nonetheless, Cal-Am agrees with staff's suggestion that spoils be disposed of off-site at an appropriate location to avoid potential impacts to the dunes. Accordingly, Cal-Am will dispose of the well drilling spoils at the Monterey Peninsula Landfill.

As AECOM's Technical Memorandum demonstrates, the disposal of 1,003 CY of spoils offsite at the Monterey Peninsula Landfill would not result in new or more severe impacts beyond those already evaluated in the Final EIR/EIS. (Ex. 5, pp. 2-3.) For instance, the 1,003 CY of spoils represents "less than two one-thousands of one percent of the remaining capacity at the landfill," and thus, disposal of the spoils would not change the EIR/EIS's conclusion that Project impacts to landfill capacity would be less than significant with mitigation. (See *id.*, p. 4; see also Final EIR/EIS, pp. 4.13-19 to 4.13-20.) Further, spoils disposal would require only a single truck trip every two to three days during the anticipated seven-month construction period. "[T]he anticipated increase in traffic volumes on public roads would be negligible," and would not create any new or more severe impacts to traffic beyond those identified in the EIR/EIS. (See Ex. 5, p. 4.) In addition, "[g]iven the limited number of 4-mile round trips generated [by off-site disposal], no substantive increase in mobile air emissions would result." (*Id.*, p. 5.)

In sum, to avoid potential impacts to ESHA resulting from the spread of well drilling spoils across the CEMEX site, Cal-Am will dispose of the spoils off-site. Any impacts resulting from off-site disposal are negligible and do not create any new or more severe impacts in addition to those identified and mitigated in the Final EIR/EIS.

Staff Report Contention #5: Staff asserts that additional ESHA impacts would result "from the need for Cal-Am to protect or relocate its well sites due to the effects of sea level rise and coastal erosion." (Staff Report, p. 41.) According to staff, "[e]ither of these approaches – protection or relocation – would . . . cause additional and longer-term, though unquantified, disturbance of ESHA." (Ibid.)

Cal-Am Response: Staff's assertion that the Project's slant well network will need to be relocated due to sea level rise, and that well relocation will cause additional impacts to ESHA, is wholly speculative. As explained in detail in Section B below, there is no evidence that the Project's slant wells will be impacted by coastal erosion until near the 2120 planning horizon. This timing is well beyond the slant wells' useful life. Although two wells may be at risk from wind-blown sand burial within their useful life, it is expected that this risk would be eliminated by implementation of "soft measures" such as revegetation, monitoring, and maintenance. These soft measures will not cause any new ESHA impacts. In the unlikely event that monitoring efforts reveal that the soft measures would be unsuccessful at eliminating potential wind-blown sand hazards at the slant wells, a number of structural "hard" adaptive measures could be implemented including sand fencing, barriers, or relocating or raising well heads. The need for any such hard measures is speculative at this time. Further, hard measures such as raising well heads could be accomplished within the existing permanent impact areas on site, without causing additional ESHA impacts. Therefore, in the unlikely event that hard measures might be needed, the specific measures that may be required and any potential impacts would need to be evaluated through a CDP amendment process. See Section B *infra* for additional discussion regarding coastal erosion and sea level rise and any need for Cal-Am to protect the wells from potential dune migration.

Staff Report Contention #6: Staff recognizes that the Final EIR/EIS identifies "a number of mitigation measures" to avoid or reduce ESHA impacts. (Staff Report, p. 45.) However, staff contends that the mitigation identified in the Final EIR/EIS and adopted by the CPUC is not enough because it "would not result in mitigation 'to the greatest extent possible,' as required by [the City's] LCP." (Staff Report, p. 45.) In particular, staff appears concerned that the measures are "commonly-required" or "not consistent with Commission guidance and past approvals as to what is required to provide adequate mitigation." (Id., pp. 45-46.) Yet, instead of requiring additional mitigation to address any inadequacies, staff simply claims that "there is no need to identify special conditions" to alleviate staff's concerns because the Project would still be inconsistent with the City's LCP as to other environmental resource areas. (Id., p. 47.)

Cal-Am Response: That certain of the measures required by the Final EIR/EIS might be "commonly-required" does not negate the CPUC's determination, supported by substantial evidence, that such mitigation would be effective. (See Final EIR/EIS, pp. 4.6-128 to 4.6-267; *id.*, Appx. C, pp. C-20 to C-22; see also *Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d at 1011, 1027 [attacks to the adequacy of mitigation measures rejected "where substantial evidence supports the approving agency's conclusion that mitigation measures will be effective"].) The CPUC adopted a robust MMRP to ensure the Project's potential impacts are mitigated to the greatest extent possible. (See Final EIR/EIS, Appx. D, pp. D-1 to D-58.)

Moreover, in compliance with the MMRP and in response to requests from Commission staff and the Commission, Cal-Am has prepared a comprehensive HMMP addressing impacts to habitat within the Coastal Zone. This HMMP expands on the "Mitigation Strategy Overview for CalAm Monterey Peninsula Water Supply Project" (the "Mitigation Strategy") included as Exhibit 5 to the Staff Report, describes all restoration and compensatory mitigation requirements for the Project in the Coastal Zone, and identifies performance standards and success criteria for restoration, long-term monitoring methods, adaptive management and corrective action, reporting requirements, and specific forms of compensatory mitigation. As such, Cal-Am's compliance with the MMRP and HMMP will mitigate potential impacts to ESHA "to the greatest extent possible," as required by the LCP.

Further, staff indicated that additional mitigation imposed through Special Conditions could resolve its concerns regarding the Project's ESHA impacts and consistency with the LCP and the Coastal Act. Cal-Am remains willing to work with staff to develop Special Conditions applicable to the Project to address potential impacts to habitat should staff have continuing concerns regarding LCP and Coastal Act consistency following its review of the attached HMMP.

Staff Report Contention #7: Staff identifies several concerns with the Mitigation Strategy included as Exhibit 5 to the Staff Report. In particular, staff claims that the Mitigation Strategy: (1) inappropriately proposes an in-lieu fee approach as its primary mitigation strategy; (2) focuses solely on impacts within the CEMEX site; (3) identifies areas for proposed mitigation that are already slated for preservation; and (4) fails to account for all permanent or "greater than temporary" ESHA impacts. (Staff Report, p. 46.) MCWD echoes these concerns in its November 13, 2019 letter to staff. (See MCWD Letter (Nov. 13, 2019), p. 6.)

Cal-Am Response: As an initial matter, Cal-Am appropriately tailored its Mitigation Strategy to the mitigation proposed for the CEMEX site based on the Commission's August 22, 2019, Notice of Incomplete Application. In the Notice, the Commission stated: "The proposed project would result in adverse effects within an area the Commission previously determined to be [ESHA] at the CEMEX site in the City of Marina. We recommend you provide a proposed mitigation plan that identifies all steps Cal-Am would implement to address the project's expected ESHA impacts." Consistent with the Commission's request in the Notice, the Mitigation Strategy provided an overview of the mitigation proposed for the CEMEX site.[3] The Mitigation Strategy was not intended to be a comprehensive, exhaustive recitation of all mitigation measures for the entire Project.

Nonetheless, as discussed above, Cal-Am has prepared a comprehensive HMMP for the Coastal Zone that addresses staff's and MCWD's concerns.

[3] Moreover, Commission staff did not respond to Cal-Am's Notice of Incomplete response and identify that there was any deficiency or that or need for a mitigation proposal that involved Project components outside of the CEMEX site.

- **In-Lieu Fee Mitigation.** As explained in the HMMP, Cal-Am proposes to mitigate permanent impacts to ESHA through on-site restoration and conservation at the CEMEX site. Because the CEMEX site is subject to the Settlement Agreement and has not yet been purchased by an approved entity, Cal-Am proposes the following options for HMMP implementation:

    1. Cal-Am could develop, implement, and fund HMMP implementation prior to the transfer of the CEMEX site to a Commission-approved entity. Once the CEMEX site is transferred to the Commission-approved entity, Cal-Am would establish an endowment to fund any remaining restoration and monitoring work, as well as long-term mitigation efforts;

    2. Cal-Am could fund HMMP implementation, but the actual implementation would be undertaken by a Commission-approved entity subject to any requirements imposed through Special Conditions in Cal-Am's CDP; or

    3. Cal-Am could fund an endowment, equal to the cost of HMMP implementation, to contribute toward the purchase of the CEMEX site by a Commission-approved entity. Implementation of the HMMP would be a requirement of the purchase.

    As described in the HMMP, restoration would be implemented through the establishment and re-establishment of habitats, including the removal of existing sizeable invasive species populations and re-introduction of native species indigenous to the dune habitat. Long-term management activities would focus on diligent removal of newly emerging invasive vegetation, and the protection and preservation of restored and existing native habitats.

- **Impacts within the Coastal Zone.** To address staff's concerns about the geographical scope of the Mitigation Strategy, Cal-Am prepared an HMMP that covers Project components throughout the entire Coastal Zone. The HMMP identifies mitigation for all potential ESHA impacts, not just those on the CEMEX site. (See HMMP, p. 3-10.)

- **Restoration on the CEMEX Site.** Staff claims that because the CEMEX site is already slated for preservation, Cal-Am's proposed mitigation is insufficient "to make up for the loss of ESHA acreage." (Staff Report, p. 46.) Contrary to staff's contention, the CEMEX site is not currently "slated for preservation." (*Ibid.*) Rather, the Settlement Agreement requires CEMEX to transfer title to a Commission-approved entity to either manage the property for conservation uses, or use the property for other allowable activities—including the Project. The Settlement Agreement does not require the purchaser to use and manage the property for ESHA preservation or restoration. Further, the areas that the HMMP proposes for restoration at the CEMEX site are not areas that have already been identified for restoration under the Settlement Agreement or the Reclamation Plan for the CEMEX site. (See Ex. 1]; see also Reclamation Plan, attached hereto as

Exhibit 6.) Moreover, Project construction will impact only approximately 8.4 acres (2.181 acres of permanent impacts and 6.2 acres of temporary impacts) of ESHA at the CEMEX site, for which a mitigation ratio of 3:1 will be provided for permanent impacts and 1:1 will be provided for temporary impacts. In addition, while not required, Cal-Am proposes to remove an additional 1.825 acres of iceplant at the CEMEX site and restore the area with native vegetation to benefit the overall restoration of the CEMEX site. This results in a restoration of approximately 14.6 acres at the CEMEX site.

- **Scope of Potential ESHA Impacts.** As demonstrated earlier in this Section A, the Project will only permanently impact 2.181 acres of ESHA and will temporarily impact approximately 15.306 acres of ESHA (for a total acreage of 17.487) as compared to the "up to about 35 acres" identified by staff. (Compare HMMP, p. 3-10, with Staff Report, p. 46.) Thus, the scope and extent of potential ESHA impacts are less than those included in the Staff Report, and the HMMP provides measures and standards to mitigate potential ESHA impacts "to the greatest extent possible," as required by the LCP.

Further, and as discussed above, Cal-Am remains willing to work with Staff to develop Special Conditions to address any of staff's outstanding concerns to the extent those concerns are not addressed through the proposed HMMP.

B. Coastal Hazards

The Project is consistent with the LCP's requirement that projects be unaffected by coastal hazards for their economic life. The only components of the Project with the potential to be impacted by coastal hazards are the slant wells, which have useful lives of approximately 20 to 25 years. Under extremely conservative assumptions, the slant wells would not be impacted by coastal erosion until long after their useful lives—likely not until near the 2120 planning horizon. While there may be some minimal risk to the well heads from sand burial due to wind-blown sand at the end of their useful lives, those risks can be minimized and/or eliminated by "soft measures" such as revegetation, maintenance, and monitoring. Moreover, the slant wells fit within the LCP's exception for an essential support facility to a coastal-dependent industry, as they are part of a seawater desalination project. (See, e.g., Staff Report, p. 53.) Accordingly, the Project, including the test slant well, is consistent with the LCP's coastal hazards policies for development.

Staff Report Contention #8: The Staff Report alleges that the test well site could be at risk from coastal erosion by 2060, and that both the test well site and other well sites would likely be at risk by 2120. (Staff Report, p. 52.)

Cal-Am Response: Cal-Am agrees with the Staff Report's finding that exposure of the majority of the slant well sites is not anticipated to occur until the 2120 planning horizon, well after the Project's operational life. (AECOM Coastal Erosion Hazard Analysis, attached as Exhibit A to Cal-Am's October 2, 2019, Response to Commission Staff's August 22, 2019, Notice of Incomplete Application, pp. 5-6; Staff Report, p. 52.)

However, the Staff Report finds that the test well (and only the test well) has the potential to be exposed to coastal hazards by 2060 and that this creates tension with the Local Coastal Land Use Plan ("LUP") and Local Coastal Implementation Plan ("LIP") policies generally requiring setbacks that will protect new development from coastal hazards for the economic life of a project (at least 50 years). This is incorrect. Exposure of the test well to coastal hazards is not projected to occur until near the 2120 planning horizon, long after its anticipated useful life of 20 to 25 years and the 50 year period provided in LUP and LIP. (AECOM Coastal Erosion Hazard Analysis, pp. 5-6.) Therefore, the Project does not result in tension between the LUP and LIP policies and the risk for the test slant well to be impacted by coastal erosion.

Staff's claim that the test slant well could be at risk by 2060 relies on unreasonable and excessive coastal retreat assumptions. (Staff Report, p. 52.) Staff's reliance on these assumptions and rejection of AECOM's reasonable and supported analysis is wrong—the test slant well is unlikely to be impacted until the 2120 planning horizon, long after 2060. AECOM's analysis is extremely conservative. AECOM considered three sea level rise scenarios to conservatively assess the potential for coastal erosion impacts on the Project:[4] (1) a low-risk aversion scenario, which has a 17% chance of being exceeded; (2) a medium-high risk aversion scenario, which has a ***0.5%*** chance of being exceeded; and (3) an extreme risk aversion scenario which does not even have an associated probability because it is so speculative. (AECOM Coastal Erosion Hazard Analysis, pp. 5-6.) Further, as staff notes, the analysis of coastal hazards "includes the high GHG emission scenario for each [planning horizon of 2040, 2060, and 2120] to provide a more conservative assessment of expected effects" and "also considers the effects of both a 100-year and 500-year storm event on site erosion to provide additional conservatism." (Staff Report, p. 51.) Using the extreme risk aversion scenario and the 500-year storm event, the most conservative option, AECOM concluded that the slant wells (including the test slant well) would not be at risk from coastal erosion until near the 2120 planning horizon. (AECOM Coastal Erosion Hazard Analysis, pp. 5-6.)

In conducting this analysis, AECOM applied a reasonable and conservative 60 percent reduction in the historic coastal retreat rate to account for the cessation of sand mining activities, based on prior analysis of retreat reductions at other sand mine closure sites along the southern Monterey Bay coastline earlier in the 20th century, combined with a site-specific sand budget analysis. (AECOM Coastal Erosion Hazard Analysis, pp. 6-7; see also Staff Report, p. 51, fn. 47.) This reduction is based in part on a study commissioned by the Office of Naval Research that assessed sand mining impacts on long-term dune erosion in southern Monterey Bay.[5] Moreover, when the Commission

---

[4] These are the same scenarios advised by the Commission's guidance documents. (California Coastal Commission, Sea Level Rise Policy Guidance (2018) Projected Sea Level Rise: Monterey, Table G-6, p. 298, available at https://documents.coastal.ca.gov/assets/slr/guidance/2018/0_Full_2018AdoptedSLRGuidanceUpdate.pdf.)

[5] E.B. Thornton, et al., *Sand mining impacts on long-term dune erosion in southern Monterey Bay* (February 2006), available at https://apps.dtic.mil/dtic/tr/fulltext/u2/a464654.pdf.

was considering the CEMEX Settlement Agreement in 2017, its own staff prepared a technical report stating, "[i]f sand mining from the CEMEX Pond were to stop, the rate of shoreline retreat and dune erosion within the SMB Littoral Cell would likely ***reduce significantly***." (See Exhibit 5 to Commission Staff Recommendations and Findings for CEMEX Closure, p. 2, attached hereto as **Exhibit 7**, [emphasis added].) Here, staff acknowledges that the closure of the CEMEX sand mine is anticipated to result in "improvements to shoreline change and reductions in dune retreat" (Staff Report, Exhibit 6, p. 3), but fails to apply ***any*** reduction in the coastal retreat rate to the CEMEX site resulting from closure of mining operations.[6] Staff states only that "the 60% assumption might be high" and without providing a basis for rejecting the assumption, instead applies ***no*** reduction as an "upper bound" on potential coastal retreat. (Staff Report, Exhibit 6, pp. 2-3.) Applying no reduction of coastal retreat rate due to cessation of sand mining conflicts with the available literature on coastal retreat, as well as staff's own prior conclusions, and is not supported by any evidence. (See, e.g., Staff Report, p. 51, fn. 47.) The Staff Report itself acknowledges that AECOM's analysis was not only using extreme scenarios, but considered 100- and 500-year storm scenarios "to provide additional conservatism." (Staff Report, p. 51.) Staff's refusal to assume any reduction of coastal retreat is not a reasonable approach, and staff does not provide any modeling or data to support its assumption.[7] As a result, the Staff Report's projections of sea level rise and coastal erosion do not take into account the actual physical conditions on the CEMEX site and should not be relied upon for planning purposes.

Even though the test slant well is not projected to be exposed to coastal hazards until well after the 2060 date claimed by staff and likely near the 2120 planning horizon, Mitigation Measure 4.2-10 conservatively requires Cal-Am to monitor and report the rate of coastal retreat to the Commission annually. (Final EIR/EIS, p. 4.2-72.) Beginning at least five years prior to anticipated slant well exposure, Cal-Am must take steps to remove the wells from service and abandon them. (*Ibid.*) Thus, even in the extremely unlikely event that the coastal retreat far exceeds any probable scenario, impacts would be less than significant with mitigation and would remain consistent with Coastal Act and LCP policies regarding coastal hazards.

Further, it is important to note that the Project has seven wells for reliability purposes, but does not need all seven to be operating in order to maintain the Project's permitted water deliveries. Operation of five is sufficient. Thus, in the very unlikely event that the test

---

[6] The improvements to shoreline change and reductions in erosion were precisely some of the factors contemplated in seeking the closure of the CEMEX sand mining operations. (See, e.g., Ex. 7, Commission Staff Recommendations and Findings For CEMEX Closure, pp. 3, 21-23 ["once CEMEX stops dredging the pond, erosion and dune retreat should be much lower due to the increased volume of sand that will stay in the system"]; see also Ex. 1, Settlement Agreement, p. 1; City of Marina Resolution No. 2017-57 Finding the CEMEX Mine in Violation of the Municipal Code, pp. 1-2, attached hereto as **Exhibit 8**.)

[7] Even under staff's approach, eliminating any and all reductions to coastal retreat from the cessation of sand mining, the Staff Report only identifies a potential impact at 2060, years after the useful life of the test slant well has passed. (Staff Report, p. 52.)

slant well needs to be decommissioned early due to coastal hazards, the Project could continue to supply water to the Monterey Peninsula.

Staff Report Contention #9: The Staff Report alleges that foredune recession could bury the slant well heads with dune sand by 2040 and that no significant analysis was provided of the potential for sand burial of the slant well from wind erosion. (Staff Report, p. 52-53; Exhibit 6, p. 4.)

Cal-Am Response: In response to the Staff Report's suggestion that additional analysis of foredune recession be conducted, AECOM has evaluated the possibility for sand burial based on observations of historical dune behavior and application of conceptual models. AECOM's analysis is attached here to as **Exhibit 9**. In its analysis, AECOM determined that the primary mechanism for landward dune migration is through dune blowouts—windblown sand processes that are funneled through dune formations. (*Ibid.*) Specifically, blowouts from existing trough formations in the dunes pose the largest risk for landward sand migration, while new trough and saucer formations present less risk. (*Ibid.*) Consistent with the Staff Report, AECOM concluded that under conservative assumptions, dune migration could potentially expose two of the seven well head sites to wind-blown sand near the end of their useful lives of 20 to 25 years. (See Ex. 9, AECOM Coastal Dune Analysis.) However, AECOM's analysis also determined that impacts to those two well head sites could be effectively eliminated with implementation of certain measures. (*Ibid.*) The other well head sites are not projected to be impacted by dune migration within their useful lives. (*Ibid.*)

AECOM's analysis found that the slant well sites could be protected from risk of sand burial through the implementation of "soft measures" such as a simple maintenance and monitoring program, removal of invasive non-native plant species, and reestablishment of native dune species that would stabilize the dunes and prevent landward migration of sand. (See Ex. 9, AECOM Coastal Dune Analysis.) Monitoring of the dunes could be combined with the shoreline change monitoring that will already occur as part of Mitigation Measure 4.2-10. (*Ibid.*; see also Cal-Am Response to Staff Contention #8, *supra*.) Contrary to the Staff Report's conclusion, these proposed soft measures would not result in any additional adverse impacts to ESHA because the measures are restorative in nature and would work to stabilize the existing dune habitat. (*Ibid.*; Staff Report, p. 53.) Dune stabilization is well-recognized as an important tool in coastal management. The dune restoration and stabilization efforts proposed by AECOM are also recommended by the Commission's Sea Level Rise Policy Guidance and are being used throughout the state, including regionally. (See Ex. 9, AECOM Coastal Dune Analysis.) Indeed, the removal of invasive plant species and revegetation with native dune species would likely enhance ESHA value in the area. (*Ibid.*) Accordingly, it is expected that the risk of sand burial can be avoided with soft measures that will result in no additional ESHA impacts during the useful lives of the slant wells, and likely for much longer.

In the unlikely event that these soft measures do not fully stop landward migration of sand toward the two at-risk well heads, AECOM's analysis determined that other mitigation options are available. (See Ex. 9, AECOM Coastal Dune Analysis.) For

example, measures could include raising a potentially impacted well head at its current location or constructing physical protective barriers. (*Ibid.*) Staff noted that such simple measures likely would be effective. (Staff Report, p. 53.) Because raising the well heads or constructing protective barriers would occur within the permanent impact area of the well head sites, those measures would result in no new impacts to ESHA. (See Ex. 9, AECOM Coastal Dune Analysis.) Additionally, sand fencing could be installed to further reduce the risk of burial and would have the added benefit of providing important dune stabilization. (*Ibid.*) However, depending on its placement, sand fencing installed outside of the Project footprint could have the potential to affect small areas of ESHA. (*Ibid.*) If any of these "hard measures" become necessary, they would need to be proposed to the Commission under a permit amendment at a later date given that the specific measures needed would be dependent on future, unknown conditions.

Moreover, as discussed above, decommissioning two wells would not prevent the Project from maintaining its permitted water deliveries, because the Project only requires five of its seven wells to provide 6.4 mgd as authorized by the CPUC. Accordingly, as an available option, the Commission could consider decommissioning up to two well heads depending on the observed risks of sand burial and the efficacy of the proposed soft measures through ongoing monitoring.

Cal-Am proposes a Special Condition (see Attachment C) regarding the potential risks to the wellheads from sand burial and associated measures to eliminate such risks.

Staff Report Contention #10: The Staff Report contends that Mitigation Measure 4.2-10 would be ineffective to mitigate impacts related to coastal hazards because relocation of the well field "may be infeasible due to property ownership issues," "would result in substantially greater adverse effects on ESHA," and "would likely interfere with habitat restoration efforts expected to occur inland of the well sites." (Staff Report, pp. 52-53.) MCWD also submitted a comment letter to the Coastal Commission on November 13, 2019, which restates the Staff Report allegations regarding Cal-Am's inability to mitigate coastal hazards.

Cal-Am Response: Mitigation Measure 4.2-10 requires Cal-Am to monitor and annually report the rate of coastal retreat to the Commission. (Final EIR/EIS, p. 4.2-72.) The data shall be used to establish an erosion rate to estimate the year at which the wells and associated pipelines have five years left before exposure to coastal hazards. (*Ibid.*) To ensure the rate is conservative, it will assume that at least one 100-year storm event will occur within that timeframe. (*Ibid.*) Beginning at least five years prior to the anticipated exposure of any slant well, Cal-Am will begin to remove the slant wells from service. (*Ibid.*) Contrary to staff's assertions, this measure is effective to mitigate any potential coastal hazard impacts resulting from coastal erosion.

First, as discussed above, even under extremely conservative assumptions, the slant well field, including the test slant well, are not projected to be impacted by coastal erosion until near the 2120 planning horizon—long after their useful lives. (AECOM Coastal Erosion Hazard Analysis, pp. 5-6.) In the unlikely event Mitigation Measure 4.2-10 does require Cal-Am to remove a slant well that is at risk of exposure due to coastal hazards, relocation of that well may be unnecessary because Cal-Am does not need all seven of

the wells to be operating in order to maintain the Project's permitted water deliveries. Specifically, even if two slant wells are impacted and need to be removed from service, Project operations may continue without well relocation. As explained in AECOM's Coastal Erosion Hazard Analysis, to ensure water supply reliability for the Monterey Peninsula, two of the slant wells constructed for the Project are backup wells to be utilized in the event that an active well cannot be used. Thus, even under an extreme scenario where coastal hazards do affect one or two wells, those wells could be removed without affecting Project capacity or operations. (AECOM Coastal Erosion Hazard Analysis, p. 7, fn. 10; Final EIR/EIS, p. 5.4-51.)

Further, and as noted above, although a well head may be exposed to burial from wind-blown sand at the end of their useful lives, it is expected that burial impacts could be avoided using "soft measures" such as removal of non-native/invasive plants, restoration of the dunes, revegetation of native dune species, and basic monitoring and maintenance. (See Ex. 9, AECOM Coastal Dune Analysis.) These measures will further reduce the likelihood that well relocation would be necessary.

Second, if well relocation is required, the Settlement Agreement does not preclude relocating the slant wells or modifying the boundaries of Cal-Am's permanent easement. The CEMEX Settlement Agreement expressly provides that Cal-Am retains all of its existing rights associated with its recorded easement and related option. (See Ex. 1, Settlement Agreement, § 23.2.) Further, the CEMEX Settlement Agreement provides for conveyances of additional rights of ownership or use, if approved by the Executive Director. (*Id.*, § 6.2(B).) Thus, the Executive Director retains the discretion to permit changes to the easement to accommodate relocation of the slant wells, subject to a CDP amendment process, if needed.[8]

Third, impacts associated with well abandonment would not be any greater than already analyzed by the CPUC. As noted in the Staff Report, Mitigation Measure 4.2-10 requires Cal-Am to monitor and decommission the slant wells should they be threatened by coastal hazards. This includes sand burial. The measure would ensure that the slant wells are decommissioned and abandoned prior to being buried in the event that the "soft measures" described above are ineffective.[9] Mitigation Measure 4.2-10 also includes protections for environmentally sensitive habitat and species by restricting abandonment activities to the snowy plover non-nesting season. Any further analysis of impacts to ESHA is unnecessary given the entirely speculative nature of the need to relocate the wells and the fact that the EIR/EIS already includes all feasible mitigation. Further, relocation would be the subject of a future CDP amendment application and could be separately conditioned to address potential impacts, if necessary.

---

[8] Relocation may require consent of the CEMEX property owner at that time.

[9] The secondary effects of slant well abandonment were analyzed in the EIR (see Final EIR/EIS pp. 4.2-72 to 4.2-74) and were found to be less-than-significant with mitigation.

Staff Report Contention #11: The Staff Report argues that the Project's proposed well locations are inconsistent with the LCP provisions for locating development near the shore. (Staff Report, p. 53.) MCWD submitted a comment letter to the Coastal Commission on November 13, 2019, which reiterates the Staff Report's concern that the Project may conflict with LCP. (MCWD Letter, p. 5.)

Cal-Am Response: The Project's slant well locations are consistent with applicable LCP policies. The LUP requires that "structural development" shall not be allowed "on the ocean-side of the dunes, in the area subject to wave erosion in the next 50 years, or in the tsunami run-up zone" unless the development is an "essential support facilit[y] to a coastally-dependent industry." (Staff Report, p. 48.) Similarly, the LIP provides that future development should be set back to "protect the economic life of the proposed development (at least 50 years)." (*Id.*, p. 49.) Here, none of the wells are located on the ocean side of the dunes or in a tsunami run-up zone. (*Id.*, p. 50 [acknowledging that the wells are located beyond the tsunami run-up zone].) Further, as discussed in the responses above, the wells are not projected to be exposed to coastal erosion from waves, storms, or sea level rise until near the 2120 planning horizon, even under the most extreme assumptions—long after the slant wells' 20 to 25 year anticipated useful life. (AECOM Coastal Erosion Hazard Analysis, pp. 5-6.) Finally, as staff acknowledges, the Project is a coastal-dependent industrial facility. (Staff Report, p. 53.) Indeed, the Project's components must be located near the coast so that the Project's Source Water Pipeline can convey feedwater to the inland destination facility and use the existing M1W outfall to convey the facility's brine discharges into coastal waters. (See Section J, *infra.*) As such, although Cal-Am believes the Project to be consistent with the LUP and LIP's coastal hazards policies, the Commission is authorized to apply Coastal Act section 30260 to approve the Project notwithstanding any potential inconsistencies with LUP or LIP policies.

C. Protection of Coastal Waters and Marine Resources

The Project would not result in a substantial adverse impact to coastal waters or marine resources during Project construction or operation with the implementation of all feasible and enforceable mitigation measures. (Final EIR/EIS at pp. 4.3-60, 4.3-63, 4.3-66, 4.3-68, 4.3-91 to 4.3-93, 4.3-104 to 4.3-106, 4.3-115, 4.3-117, 4.3-122 to 4.3-130.) Additionally, while potential structural changes to the M1W outfall are not part of this application, impacts to the outfall were reviewed as part of the Final EIR/EIS and determined to be less than significant. (*Id.*, p. 4.3-109.) Further, the Project would not involve the placement of "fill" in coastal waters, so as to trigger the requirements of Coastal Act section 30233.

Staff Report Contention #12: The Staff Report alleges that it is "unclear at this time as to what effects the proposed desalination facility would have on water quality and marine life and what structural or operational changes would be needed to ensure Cal-Am's discharge would meet the relevant Ocean Plan objectives, and thereby minimize its potential adverse effects." (Staff Report, p. 56.) The Staff Report notes that one potential structural change would be a modification of the diffuser on the existing M1W outfall. (Ibid.)

Cal-Am Response: The Project's potential effects on ocean water quality and marine life were analyzed in detail in the Final EIR/EIS. Specifically, Impact 4.3-5 assessed whether the Project's operational brine discharge would violate water quality standards or waste discharge requirements, or degrade ocean water quality. (Final EIR/EIS, pp. 4.3-95 to 4.3-113.) As discussed therein, the Final EIR/EIS concluded that implementation of the Project could potentially cause exceedances of Ocean Plan water quality objectives for the ammonia and cyanide under certain operational conditions when wastewater volumes co-mingled with the brine are low. For an additional thirteen constituents, the Final EIR/EIS determined that there is not enough information to assess concentrations at the edge of the zone of initial dilution. Therefore, the Final EIR/EIS conservatively concluded that Ocean Plan water quality objectives could potentially be exceeded during operations for some operational discharge scenarios.

However, the Final EIR/EIS determined that Impact 4.3-5 would be less than significant with implementation of Mitigation Measure 4.3-5 (Implement Protocols to Avoid Exceeding Water Quality Objectives), which requires Cal-Am to perform an extensive water quality assessment prior to Project implementation. (Final EIR/EIS, p. 4.3-104.) Operational discharges that cannot be demonstrated to conform to the Ocean Plan water quality objectives may only be released following implementation of additional design features, engineering solutions, and/or operational measures that ensure compliance with these objectives.[10] (*Id*, p. 4.5-64.) In other words, no exceedance of Ocean Plan objectives will occur because no discharges will be permitted unless the water quality assessment confirms that the discharges comply with the Ocean Plan. The Commission did not comment on or object to Mitigation Measure 4.3-5 in its comments on the EIR/EIS.

With respect to the potential structural changes to the M1W outfall, the work is a wholly separate project that is not part of this application. Structural changes to the M1W outfall may be separately conditioned when M1W applies for a CDP for that work. For purposes of this CDP, Cal-Am proposes a Special Condition (see Attachment C) that would require approval of the outfall work prior to the commencement of Project operations.

Nevertheless, the impacts associated with the potential structural changes to the outfall were described and analyzed in the Final EIR/EIS. (Final EIR/EIS, pp. 4.3-109 to 4.3-110. *See Id.*, Appx. D1 (Roberts 2017); *Id.* Appx. D3 (Trussel Tech).) As described therein, retrofitting the existing M1W diffuser would be achieved by installing inclined nozzles on the existing diffuser check valves and/or replacing the end gate opening with a minimum of one 6-inch Tideflex (or similar) check valve. (*Id.*, p. 4.3-109; *Id.* Appx. D1

[10] The Final EIR/EIS also described the potential design features and operational measures that could be employed, such as retrofitting the existing outfall diffuser, additional pre-treatment of source water to the Desalination Plant component of the Project, treatment of discharge, flow augmentation, and end gate modification. (Final EIR/EIS, pp. 4.3-106 to 4.3-108.) The Final EIR/EIS also analyzed the potential secondary impacts of these potential design features and operational measures, and determined that those secondary impacts would be less than significant. (*Id.*, pp. 4.3-109 to 4.3-113.)

(Roberts 2016), pp. 41-46).) The construction impacts would be minor and temporary, likely consisting primarily of minor construction-related sea-bed disturbance and water quality degradation in the form of increased turbidity and disturbance on and adjacent to the outfall diffuser, and would occur over several hours to a day or two. (Final EIR/EIS, pp. 4.3-109.) Work would be conducted by divers and support craft for staging equipment and construction supplies or to facilitate the removal of built up sediment from the terminus of the diffuser pipe. (*Ibid.*) Prior to implementation of the retrofit, the Monterey Bay National Marine Sanctuary would review and approve design specifications and construction plans to ensure that disturbances to benthic communities are minimized or avoided. (*Ibid.*) The disturbance would be short in duration and of low intensity and benthic communities would be expected to recover to baseline conditions. (*Ibid.*) Accordingly, the Final EIR/EIS determined that the secondary impacts associated with the potential diffuser retrofit would be less than significant. (*Ibid.*) The Staff Report ignores this detailed analysis and instead states that it is "unclear at this time as to what effects the [Project] would have on water quality and marine life." (Staff Report, p. 56.) The Final EIR/EIS, which is supported by expert technical analysis, is clear that impacts would be minimal. Moreover, Cal-Am has not proposed any changes to the diffuser retrofit beyond what the Final EIR/EIS analyzed.

Staff Report Contention #13: The Staff Report alleges that structural changes to the M1W outfall could affect ocean water quality or marine resources. (Staff Report, p. 56.)

Cal-Am Response: Potential modifications to the M1W outfall are not part of Cal-Am's CDP application, and may be separately conditioned when M1W applies for a CDP for that work.

Nevertheless, the impacts associated with the potential structural changes to the outfall were described and analyzed in the Final EIR/EIS. (Final EIR/EIS, pp. 4.3-109 to 4.3-110.) Retrofitting the outfall's existing M1W diffuser would be achieved by installing inclined nozzles on the existing diffuser check valves and/or replacing the end gate opening. (*Id.*, p. 4.3-109.) The construction impacts would be minor and temporary, likely consisting primarily of minor construction-related sea-bed disturbance and water quality degradation in the form of increased turbidity and disturbance on and adjacent to the outfall diffuser, and would occur over several hours to a day or two. Work would be conducted by divers and support craft. The Monterey Bay National Marine Sanctuary would review and approve design specifications and construction plans to ensure that disturbances to benthic communities are minimized or avoided. The disturbance would be short in duration and of low intensity and benthic communities would be expected to recover to baseline conditions. Accordingly, the Final EIR/EIS determined that the secondary impacts associated with the potential diffuser retrofit for the outfall would be less than significant.

Staff Report Contention #14: The Staff Report alleges that the Project will require the placement of fill in coastal waters, either due to potential modifications to the M1W diffuser, or through the use of monitoring equipment and buoys to collect water quality data, triggering Coastal Act section 30233. (Staff Report, p. 57.)

Cal-Am Response: With respect to any fill associated with potential modifications to the M1W diffuser, as described above, the potential modifications to the M1W outfall are not part of Cal-Am's CDP application, and may be separately conditioned when M1W applies for a CDP for that work.

With respect to the monitoring equipment and buoys, the Staff Report does not identify any "fill" related to these components, which consist of temporary anchors or moorings that will be removed at the completion of monitoring. (See AECOM, Monterey Peninsula Water Supply Project (MPWSP) Components in Commission's Original Jurisdiction (Sept. 19, 2019), pp. 2-5, which was attached as Exhibit M to Cal-Am's September 19, 2019, response to Commission Staff's August 22, 2019, Notice of Incomplete Application.)

Public Resources Code section 30108.2 defines "fill" as "earth or any other substance or material, including pilings placed for the purposes of erecting structures thereon, placed in a submerged area." In applying section 30233, the Commission typically considers projects installing permanent structures or placement of sediment or similar material on the seafloor, not temporary anchors, and assesses whether those structures can be modified or arranged differently to avoid impacts on the chosen project site.[11]

Indeed, when considering the use of temporary anchors for the recommissioning of the Charles E. Meyer Desalination Facility in Santa Barbara, staff did not invoke Coastal Act section 30233 at all.[12] There, the project involved " two main categories of activities—reinstallation of equipment, and ongoing maintenance and repair." (Staff Report, Application No. 9-14-1781 (Jan. 30, 2015), p. 12.) Since "[e]ach of the project components that the City would place within Commission jurisdiction[, including the temporary anchors,] are components of a desalination facility that generally require regular repair and maintenance… the proposed activities are considered 'repair and maintenance' pursuant to Coastal Act Section 30610." (*Id.* at 14.) Pursuant to Coastal Act section 30610, a CDP is not required for repair activities that "do not result in an addition to, or enlargement or expansion of, the object of those repair or maintenance activities." (Coastal Act, § 30610(d).) However, because the activities would involve the use of mechanized equipment and the placement of materials within coastal waters, staff concluded that the activities required a CDP pursuant to section 13252(a) of the Commission's regulations. (Staff Report, Application No. 9-14-1781 (Jan. 30, 2015), p.

---

[11] See, e.g., Staff Report, Application No. 5-10-293, available at https://documents.coastal.ca.gov/reports/2011/6/W10b-6-2011.pdf [applying Section 30233 to installation of new piles, pier, gangway, and platform and assessing alternative configurations of the piles]; Staff Report, Consistency Certification No. CC-0006-14, available at https://documents.coastal.ca.gov/reports/2014/12/F11b-12-2014.pdf [applying Section 30233 to the placement of riprap and excavated sediments and assessing alternative dredging and structural improvements at the proposed project site].

[12] See Staff Report, Application No. 9-14-1781 (Jan. 30, 2015), available at https://documents.coastal.ca.gov/reports/2015/2/f12b-2-2015.pdf.

14.) Importantly, staff did not treat any aspect of the project, including the temporary anchoring, as "fill" material.

Likewise, here, the proposed monitoring equipment and buoys are not "fill" as contemplated by the Coastal Act. "The proposed monitoring equipment and telemetry buoy . . . would be temporarily attached to the sea floor" by an anchor. (See Monterey Peninsula Water Supply Project (MPWSP) Components in Commission's Original Jurisdiction (Sept. 19, 2019), p. 5.) The temporary attachments are not "pilings" or other materials that would be permanently installed or constructed in the ocean floor. The impacts associated with this monitoring equipment will be minimal—each buoy's anchor will temporarily impact four square feet, and the monitoring sondes' anchors will impact one square-foot each. (*Id.*, p. 5.) "The proposed temporary equipment anchoring systems are static and would be less impactful to benthic resources than a typical fishing or research vessel mooring anchor." (*Ibid.*) Installation will be complete in a matter of hours, and impacts would be limited to temporary seabed disturbance. (*Ibid.*) Accordingly, this minor temporary anchoring does not constitute "fill" and does not trigger Coastal Act section 30233.[13]

Nonetheless, as the Staff Report acknowledges, the Commission could consider adopting Special Conditions to ensure the Project complies with applicable Coastal Act policies. Cal-Am remains willing to coordinate with staff to develop appropriate Special Conditions to ensure the Project's compliance with the Coastal Act should staff determine that additional protective measures are required. (See e.g. Attachment C, which includes Cal-Am proposed Special Conditions.)

D. Groundwater Resources

Contrary to staff's determination, the Commission has sufficient information regarding the Project's potential impacts to groundwater supplies in the Salinas Valley Groundwater Basin ("SGVB" or "Basin") to determine that the Project conforms to the groundwater protection provision of Coastal Act Section 30231. (See Staff Report Addendum, p. 3.) Through the CPUC's administrative process, the EIR/EIS consultant team performed over six years of fieldwork, data analysis, and groundwater modeling. The modeling and its results were subject to peer review and public comment. Based on the extensive data and peer-reviewed modeling, the Final EIR/EIS conservatively analyzed the Project's potential impacts to groundwater supplies in the SVGB, finding that such impacts would be less than significant. Staff claims that additional modeling is needed to address existing data gaps, but as Cal-Am has maintained all

[13] By analogy, for purposes of the federal Clean Water Act (33 U.S.C. § 1251 et seq.), fill material is defined under applicable regulations as material that has the effect of "(i) [r]eplacing any portion of a water of the United States with dry land; or (ii) [c]hanging the bottom elevation of any portion of a water of the United States." (33 C.F.R. § 323.2(e).) The regulations list examples of fill material, which include "rock, sand, soil, clay, plastics, construction debris, wood chips, overburden from mining or other excavation activities, and materials used to create any structure or infrastructure." (*Ibid.*) In light of the examples listed, which consist primarily of settling materials and components used to "create" structures, the Clean Water Act does not regulate the temporary placement of anchors used to maintain buoys.

along, additional, non-peer reviewed modeling is unnecessary and would not change the Final EIR/EIS's conclusions. Accordingly, staff has sufficient evidence to find that the Project is consistent with the groundwater protection provision of Coastal Act Section 30231.

Staff Report Contention #15: The prior groundwater modeling for the Final EIR/EIS did not adequately capture some of the aquifer characteristics and may have underestimated the amount of non-seawater that the slant wells would extract. (Staff Report Addendum, p. 3.) Staff recommended that the groundwater model be adjusted and run with new parameters. (Id. at pp. 3, 5.) On November 13, 2019, MCWD submitted a letter to Coastal Commission staff asserting that any new groundwater analysis should address the data from its airborne electromagnetic ("AEM") surveys. (See MCWD Letter (Nov. 13, 2019), p. 3.)

Cal-Am Response: Cal-Am understands that the Commission's consultant, Weiss Associates, is conducting limited additional modeling work. Nonetheless, Cal-Am maintains that additional groundwater modeling is unnecessary and duplicative of the extensive work performed as part of the Final EIR/EIS and would not change the Final EIR/EIS's conclusions regarding the Project's groundwater impacts. Not only did the CPUC rely on its own independent consultant team[14] in evaluating the Project's potential groundwater impacts, but the CPUC also reviewed groundwater analyses and data prepared by the Hydrogeologic Working Group ("HWG"), a group of hydrogeologists representing multiple stakeholders and government agencies. The EIR/EIS process involved years of field work and data collection, technical and field data analysis, groundwater modeling, peer review and the receipt of thousands of pages of comments that required evaluation, public presentation of results and public review of draft documents, and public meetings to present analyses and receive comments. Any additional modeling to re-analyze the extensive peer-reviewed technical record developed before the CPUC and in the Final EIR/EIS would not incorporate a similar public and peer review process. As the State Water Resources Control Board ("State Water Board") expressed in its May 8, 2020, letter to the Commission, the Project's groundwater impacts "have already been resolved by the Public Utilities Commission, after extensive environmental review and consideration of evidence and testimony over a multi-year adjudicative proceeding." (See Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), at p. 3.)

Further, as acknowledged by the Commission's consultant, Weiss Associates, in its November 2019 Report ("Weiss Report"), the Final EIR/EIS's modeling was conservative. (See Staff Report Addendum, Ex. 7, pp. 19-20.) The Final EIR/EIS evaluated a broad range of potential groundwater impacts and scenarios, utilizing a set of conservative assumptions that bookend the range of anticipated impacts. (See Final EIR/EIS, pp. 8.2-86, 8.2-97, 4.4-65.) Based on these conservative modeling scenarios, the Final EIR/EIS overestimated the extent of groundwater drawdown and capture

[14] As explained in the Final EIR/EIS, the EIR/EIS' analyses and conclusions "were prepared by the consultants on behalf of the Lead Agencies and were independently evaluated, reviewed, and revised by Lead Agency staff." (Final EIR/EIS, p. 8.2-1.) In other words, the CPUC and its consultant team operated independently of Cal-Am in preparing and evaluating the EIR/EIS.

zones.[15] (*Id.*, pp. 8.2-45, 4.4-90 to 4.4-92.) The Weiss Report recognizes that any predictions from its modeling will likely be in the range already evaluated in the Final EIR/EIS. (Weiss Report, p. 19-20.)

Indeed, the State Water Board has reviewed the existing groundwater record and the Weiss Report, and concluded that the modeling "already conducted, revised, and relied upon by the Public Utilities Commission . . . provides a conservative overprediction of the volume of shallow, inland water that the Project would capture during full operation." (See Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), at p. 3.) Weiss' proposed modeling also focuses on approximately 1% of the area covered by the existing groundwater modeling, such that refining the existing model in this small area will not result in significant differences in model output. (*Id.*, p. 4.) As a result, "State Water Board staff's opinion remains that the groundwater impacts of the Project will not be any greater than those stated, analyzed, and mitigated under the Public Utilities Commission's certified Final EIR," even after additional modeling. (*Id.*, p. 3.) The Commission should defer to the State Water Board on matters of water quality, consistent Coastal Act section 30412.

This understanding has been further confirmed by the HWG in its April 6, 2020, comments on Weiss' Scope of Work (attached hereto as **Exhibit 10**). The HWG explained that "[t]he results of Weiss' proposed scope of work would essentially replace the entire groundwater impacts section of the [EIR/EIS] with technical work done by one consultant that would not be required to undergo extensive public review, peer review, and response to comments." (*Id.*, p. 5.) Further, "Weiss' November 2019 Report essentially stated that the [EIR/EIS'] analysis of groundwater impacts was conservative (i.e., overpredicted project impacts) and provided bookend (lowest possible and highest possible) values for ocean water percentage expected for the [Project] . . . that already agree with [the EIR/EIS]." (*Id.*, p. 4.) The HWG even noted that "Weiss has already concluded . . . that [Project] impacts will not be greater even if groundwater gradients in the shallow aquifer have changed from what occurred in 2015 and 2016," when originally modeled. (*Ibid.*)

Therefore, although Cal-Am has consented to additional modeling work by Weiss Associates for purposes of moving the Project forward through the Commission process, Cal-Am still believes additional modeling will not identify any new impacts.

Finally, staff need not consider MCWD's airborne electromagnetic ("AEM") surveys[16] because the CPUC already considered and rejected the AEM surveys as flawed. The

---

[15] The capture zone is the localized region that would contribute source or feedwater to the Project's slant wells. (Final EIR/EIS, p. 4.4-452.)

[16] MCWD submitted a preliminary AEM study after the CPUC released the Draft EIR/EIS and submitted a "final" AEM to the CPUC after publication of the Final EIR/EIS. The AEM surveys purport to identify seawater intrusion, but a comparison of groundwater monitoring well data and the AEM data shows that the "fresh" water that the surveys claim exist is, in fact, unfit for

CPUC rejected the AEM surveys because "[t]he organization, presentation of data, and discussion of findings in the final report of the Stanford AEM study . . . does not appear to be on par with the technical rigor displayed in the previous peer-reviewed academic works . . . prepared through Stanford University." (CPUC Decision D.18-09-017, Appx. J, p. 19.) "The lack of adherence to standard protocols for the presentation, data analysis, and technical peer review calls into question whether the report can be used as a reliable, unbiased technical source." (*Ibid.*) As such, the AEM reports are unreliable technical sources that do not warrant further consideration.

Because additional modeling will not lead to an improved understanding of the Project's potential impacts on groundwater conditions or change the Final EIR/EIS's conclusions, staff's proposed modeling is not necessary.

Staff Report Contention #16: Some groundwater studies have used a 3,000 mg/L total dissolved solids ("TDS") threshold to determine the expected amount of non-seawater that the Project's slant wells would withdraw. These studies have concluded that the Project would extract "substantially greater volumes of 'non-seawater' than Cal-Am's models have shown." (Staff Report Addendum, p. 4.)

Cal-Am Response: The use of a 3,000 mg/L TDS threshold to delineate the extent of seawater intrusion and determine whether water is "fresh" or potable, as opposed to "non-seawater" is inappropriate because water with 3,000 mg/L TDS is not suitable for human consumption or irrigation without treatment.[17]

The applicable standards for suitable drinking water are set forth in regulations promulgated under the California Safe Drinking Water Act, Health & Safety Code sections 116270 et seq. The California Secondary Drinking Water Standard for TDS is 500 mg/L. (Cal. Code Regs., tit. 22, § 64449.) Water with 1,000 mg/L TDS is acceptable for a community water system to supply to the public only if "it is neither reasonable nor feasible to provide more suitable waters." (Cal. Code Regs., tit. 22, § 64449, subds. (a), (d)(2).) Water with 1,500 mg/L TDS is acceptable "only for existing community water systems on a temporary basis pending construction of treatment facilities or development of acceptable new water sources." (*Id.*, subds. (a), (d)(3).) Thus, water with 3,000 mg/L TDS—over twice the limit for temporary community water

---

human consumption or agricultural use because it exceeds applicable water quality standards. (Final EIR/EIS, p. 8.2-61; CPUC Decision D.18-09-017, Appx. J, pp. 15, 19-21.)

[17] The 3,000 mg/L TDS level is a threshold set forth in State Water Board Resolution 88-63, a policy document used by regional water quality control boards to make beneficial use designations for receiving waters in order to evaluate water quality impacts from discharges of pollution into those waters. Resolution 88-63 is not a water quality objective, nor does it provide any guidance on TDS levels that are suitable for human consumption. Resolution 88-63 merely defines those water bodies that are suitable, *or potentially suitable*, for municipal or domestic water supply uses. Because Resolution 88-63 makes no distinction between water bodies that are suitable or potentially suitable as a municipal or domestic water supply, it is irrelevant for determining whether a water body contains "fresh" or potable water suitable for human consumption without prior treatment.

supply—is unfit for human consumption or irrigation without treatment, and should not be used as the threshold to determine the expected amount of non-seawater that the Project's slant wells would withdraw. Indeed, the Final EIR/EIS properly evaluated the Project's potential impacts to groundwater supplies using the 500 mg/L standard, and this approach was affirmed by the California Supreme Court when it rejected MCWD's and Marina's challenges to the EIR/EIS. (See Order Denying Petitions for Writ of Review, *Marina Coast Water District, et al. v. Public Utilities Commission*, Case No. S253585 (Aug. 28, 2019).)

Regardless, the use of a 3,000 mg/L TDS standard would not affect the Final EIR/EIS's overall conclusion regarding groundwater impacts given the existing salinity levels in the Project capture zone or change the Project's ocean water percentage ("OWP") for purposes of Cal-Am's compliance with the Monterey County Water Resources Agency Act ("Agency Act").[18] Existing groundwater data shows TDS concentrations in the Project's capture zone ranging between 23,000 mg/L to 30,900 mg/L—***orders of magnitude above acceptable levels for potable groundwater supplies or the 3,000 mg/L standard suggested by staff.*** (Final EIR/EIS, pp. 8.5-729, 4.4-31, 4.4-69.) Thus, as the Final EIR/EIS explains, TDS levels in the 180-Foot Aquifer near the Project closely resemble the TDS levels of seawater (33,500 mg/L TDS) as opposed to "fresh" water. (*Id.*, pp. 4.4-27, 8.2-20.) Further, assuming ocean water contains 33,500 mg/L TDS, and the slant wells capture water with up to 30,900 mg/L TDS, then the ocean water percentage in the feedwater is roughly 92% (30,900/33,500 x 100)—regardless of whether the standard for delineating fresh water is 500 or 3,000 mg/L TDS. (See Final EIR/EIS, p. 8.2-20.) Because 92% falls within the OWP range estimated in the Final EIR/EIS of 87-99% (see Final EIR/EIS, p. 4.4-69), the use of a 3,000 mg/L TDS standard does not result in the Project withdrawing more "fresh" water from the SVGB.

Further, the EIR/EIS did not rely solely on TDS levels alone to evaluate groundwater quality. (See, e.g., Final EIR/EIS, pp. 4.4-27, 8.5-735.) The EIR/EIS explained that the existing groundwater data showed elevated concentrations of chloride and nitrate, in addition to elevated TDS levels, and explained that TDS, alone, does not delineate the extent of seawater intrusion or otherwise "fresh" water. (See *id.*, pp. 8.5-734 to 8.5-735; see also *id.*, Appx. E3, Table 1, pp. 3, 12, 21, 29, 38, 46-47, 61-62, 186, 221, 242.) In fact, the data showed that the areas with relatively low TDS levels have high nitrate or chloride levels that exceed the Drinking Water Standards for those constituents. (See Ex. 10, HWG Comments on Weiss SOW, pp. 2, 5-6.)

For instance, MCWRA defines the leading edge of inland seawater intrusion as groundwater containing chloride of 500 mg/L or more. (See Final EIR/EIS, p. 4.4-31; see also CPUC Decision D.18-09-017, p. 19.) "A chloride concentration of 500 mg/L represents a level that is ***twice*** the National Secondary Drinking Water Regulation (250 mg/L) and that exceeds the concentration for water to be considered of 'Class III –

[18] The Agency Act prohibits the exportation of groundwater for any use outside the SVGB. (See Final EIR/EIS, p. 8.2-17.) The Commission has no jurisdiction over MCWRA's enforcement of and Cal-Am's compliance with the Agency Act.

injurious or unsatisfactory' quality for agricultural irrigation (350 mg/L)." (CPUC Decision D.18-09-017, Appx. J, p. 20.) Groundwater quality data from the test slant well indicates that groundwater in the Project area contains between 11,680 mg/L to 16,037 mg/L—over 45 times the National Secondary Drinking Water Regulation. (*Id.*, p. 8.5-877.)

In addition, the drinking water standard for nitrate is 10 mg/L. (Cal. Code Regs., tit. 22, § 64431 [Table 64431-A].) Nitrate levels far in excess of this standard have been detected at the test slant well's monitoring wells, precluding untreated consumption of groundwater extracted from these areas, irrespective of their TDS and chloride levels. (See Final EIR/EIS, Appx. E3, Table 1, pp. 186, 221, 242.) The test slant well monitoring data measured nitrate as NO_3 concentrations and found levels of nitrate as NO_3 at 258 mg/L at MW-5S, 198 mg/L at MW-7S, and 116 mg/L at MW-8S. (*Ibid.*) Nitrate as NO_3 concentrations can be converted to nitrate as N concentrations by dividing the nitrate as NO_3 levels by 4.5. As a result, the Project's monitoring wells have nitrate as N levels of 57 mg/L at MW-5S, 44 mg/L at MW-7S, and 26 mg/L at MW-8S—all of which significantly exceed the drinking water standard of 10 mg/L.

TABLE 8.2.8-1
TOTAL DISSOLVED SOLIDS CONCENTRATIONS IN MPWSP MONITORING WELLS LOCATED WITHIN THE SLANT WELL CAPTURE ZONE

Well Number	Sample Date	Aquifer	Total Dissolved Solids (TDS) (mg/L)	Chloride (mg/L)
			California Drinking Water Standard: 500 mg/L[a]	California Drinking Water Standard: 250 mg/L[a]
MW-1S	2/13/15	Dune Sand	26,600	14,504
MW-1M	2/14/15	180-FTE	30,900	16,037
MW-3S	2/25/15	Dune Sand	23,400	11,680
MW-3M	2/24/15	180-FTE	28,500	14,686
MW-4S	3/7/15	Dune Sand	11,900	5,497
MW-4M	3/6/15	180 FTE	17,900	9,751

NOTES:
[a] California Secondary Maximum Contaminant Level (Cal. Code Regs., tit. 22, § 64449)
SOURCE: Geoscience, 2015

Because the water in the Project's capture zone exceeds Drinking Water Standards for several constituents (see Final EIR/EIS, p. 8.2-48 [Table 8.2.8-1, copied above]), TDS alone is an insufficient measure for whether any groundwater extracted by the Project is "fresh" or potable water.

Nevertheless, and as explained above, a 3,000 mg/L TDS threshold to define "fresh" water is not supported in applicable state law and is not an appropriate threshold for staff to apply to the Project.

Staff Report Contention #17: Cal-Am will need to obtain appropriative rights for all or some of the "non-seawater" it extracts and exports from the Salinas Valley Groundwater Basin. This is an issue for the State Water Resources Control Board to decide. (Staff Report Addendum, p. 4.) Margaret-Anne Coppernoll similarly argued that Cal-Am does not have the necessary "water rights" to develop water from the SVGB. (Coppernoll Letter (Nov. 11, 2019), p. 1.)

Cal-Am Response: As a preliminary matter, Cal-Am generally agrees with staff that the issue of water rights is not for the Commission to decide. Cal-Am's water rights for the Project are wholly separate from the Project's potential impacts to groundwater resources and, thus, are not relevant to the Project's consistency with the Coastal Act's groundwater protection policies.

The EIR/EIS analyzed Cal-Am's potential water rights for the Project to determine whether the Project would be feasible, and based on substantial evidence in the record, the EIR/EIS and CPUC concluded that the Project can be deemed feasible. (Final EIR/EIS, pp. 8.2-5, 2-31 to 2-32; CPUC Decision D.18-09-017, p. 80.) As the EIR/EIS explained, the "SVGB is not an adjudicated groundwater basin, so use of the groundwater in the Basin is not subject to existing court decree, written agreements or oversight by an impartial watermaster." (Final EIR/EIS, p. 2-32.) Because Cal-Am has no prescriptive rights in the Basin, Cal-Am would be required to obtain appropriative rights for water extracted from the Basin.[19] (*Ibid.*) If Cal-Am extracts unusable or contaminated Basin groundwater without harm to existing lawful water users—and any fresh groundwater is returned to the Basin—then Cal-Am could develop appropriative rights to that portion of the Project feedwater. (See Final EIR/EIS, p. 2-34.) Here, the technical record confirms that there is surplus (unused) groundwater in the SVGB that is contaminated and, thus, available for Cal-Am to appropriate.

Indeed, the State Water Board—the state agency with primary responsibility for the regulatory and adjudicatory functions of the state regarding water resources (Water Code, § 174; Pub. Resources Code, § 30412)—determined that Cal-Am could develop the necessary water rights to operate the Project. (See CPUC Decision D.18-09-017, p. 80.) In 2013, the State Water Board issued a report that explained that Cal-Am may extract brackish groundwater from the SVGB, and thus appropriate and obtain rights to that water, so long as Cal-Am can extract the water without negatively impacting the SVGB or existing groundwater users. The State Water Board explained that "extracting

[19] "There are three relevant types of groundwater rights: (1) overlying rights whereby those who own land atop the Basin may make reasonable use of groundwater on such overlying land; (2) prescriptive rights whereby a water user has acquired another's rights to use water via an open, adverse and sustained use under a claim of right that such user would otherwise not be entitled to; and (3) appropriative rights whereby groundwater may be used outside the Basin or for municipal purposes." (Final EIR/EIS, p. 2-32.)

seawater from the ocean does not require water rights," and given landward gradients in the Project area, the project wells will primarily extract seawater.[20] (*Ibid.*)

With this in mind, the CPUC evaluated the Project's potential to impact the SVGB and groundwater users, and determined that substantial evidence in the record demonstrates that any impacts would be less than significant.[21] (CPUC Decision D.18-09-017, pp. 81, 174-175.) The California Supreme Court rejected Marina's and MCWD's challenges to the CPUC's Decision and EIR/EIS' discussion of and determinations regarding water rights. (See Order Denying Petitions for Writ of Review, *Marina Coast Water District, et al. v. Public Utilities Commission*, Case No. S253585 (Aug. 28, 2019).) Thus, there are no legal impediments to Cal-Am's ability to develop rights to this contaminated groundwater in the SVGB.

Further, contrary to staff's contention that Cal-Am will "export" the "non-seawater" that the Project extracts, any "non-seawater" extracted from the SVGB will be returned to the Basin as part of Cal-Am's obligations under the Agency Act. (See CPUC Decision D.18-09-017, pp. 103-112.) To comply with the Agency Act, Cal-Am has agreed to calculate annually the percentage of Project feedwater that originated in the SVGB as "fresh" water and "return" that water to the SVGB by providing desalinated product water to the Castroville Community Services District and Castroville Seawater Intrusion Project. (Final EIR/EIS, p. 8.2-17; see also CPUC Decision D.18-09-017, pp. 104-105, 110.) The CPUC approved this "Return Water Settlement Agreement," agreeing with the parties to the Agreement—including MCWRA, the agency vested with authority to implement and enforce the Agency Act—"that the provisions establish a return water delivery arrangement that is in the public interest, consistent with the record, and in compliance with the law." (See CPUC Decision D.18-09-017, p. 110.) Similarly, the State Water Board has confirmed that the Project is consistent with the Agency Act, even though the Project would withdraw some usable groundwater (i.e., fresh water) from the SVGB, because Cal-Am will return any usable groundwater withdrawn to the Basin. (See Final EIR/EIS, Appx. B2, pp. 39-40; see also Final EIR/EIS, p. 8.2-18.)

Staff Report Contention #18: The Project's groundwater extraction is likely to have limited to negligible impacts on the rate of seawater intrusion in the area, but a change in the groundwater gradient in the Dune Sand Aquifer "suggests that Cal-Am's wells would extract greater volumes of non-seawater than identified in [the Final EIR/EIS's] models." (Staff Report Addendum, pp. 4-5; see also MCWD Letter (Nov. 13, 2019), p. 5.)

---

[20] The issue of water rights was briefed extensively before the California Supreme Court as part of Marina's and MCWD's challenges to the CPUC's approval of the Project. The Supreme Court affirmed the CPUC's determinations. (See Order Denying Petitions for Writ of Review, *Marina Coast Water District, et al. v. Public Utilities Commission*, Case No. S253585 (Aug. 28, 2019).)

[21] Although not required, Cal-Am proposed Applicant Proposed Measure 4.4-3, which requires Cal-Am to monitor groundwater level changes to ensure that existing groundwater supply wells suffer no harm as a result of Project pumping. (See Final EIR/EIS, pp. 4.4-87 to 4.4-89.)

Cal-Am Response: The Staff Report underestimates the Project's benefit to the SVGB from halting further seawater intrusion into the Basin, and incorrectly characterizes groundwater gradients in the SVGB aquifers.

As explained in the Final EIR/EIS, the Project's slant wells will inhibit further seawater intrusion beyond the Project's capture zone. (See Final EIR/EIS, p. 4.4-92; HWG Response to Coastal Commission (Feb. 20, 2020), p. 2.) As a result of extensive overpumping of groundwater from the SVGB since the 1940s, the Basin has experienced substantial seawater intrusion and groundwater gradients that flow inland.[22] (Final EIR/EIS, p. 4.4-16.) However, Project pumping will draw contaminated groundwater from the SVGB, creating a seaward gradient that will halt or reverse the current landward movement of seawater intrusion into the SVGB. (*Id.*, pp. 4.4-92, 8.5-561.)

Further, there is no basis for staff to assume that the existing landward groundwater gradients have changed or will change. The Dune Sand Aquifer recharges predominantly from saline water at the coast and beneath the ocean due to the direct hydraulic connectively between the Aquifer and the ocean, and the large volume of ocean water available to recharge, or refill, the Aquifer. (Final EIR/EIS, pp. 4.4-19, 4.4-31, 4.4-70.) As a result, it is very difficult for the existing landward groundwater gradients to reverse and become seaward. (CPUC Decision D.18-09-017, Appx. J, p. 16.)

Even if groundwater gradients in the SVGB were reversed, the Project's slant wells would continue to draw in primarily seawater as a result of the ocean recharge. (*Id.*, p. 17.) However, as the CPUC explained, there is no credible evidence that existing landward groundwater gradients would reverse and begin to flow seaward. (See *id.*, pp. 16-17 ["What is important to consider here is that there is very little likelihood, and it would be total speculation to believe, that the existing groundwater gradient . . . could be reversed within the life of the project"].) Therefore, staff's assertion that the Project will extract greater volumes of inland freshwater upon a change in groundwater gradient is both speculative and unsupported by the existing record.

In addition, the Weiss Report confirms that the amount of seawater withdrawn by the Project, or OWP, would likely range from 90 to 99%, consistent with the range identified in the Final EIR/EIS. (See Weiss Report, pp. 19-20.) Using a large capture zone, the Weiss Report conservatively determined that the low end of the OWP estimates would be 85 to 90%. (*Ibid.*) Nonetheless, the Weiss Report explained that this low bookend "is likely to be an ***underestimate of the true OWP***" and is a "***worst-case scenario***." (*Ibid* [emphasis added].) Further, the Weiss Report concluded that changes in groundwater gradients would not likely result in an OWP outside of the 90-99% range. (*Id.*, p. 20.) Thus, even Commission staff's own consultant has determined that the Project will not extract "greater amounts of non-seawater than identified in [prior] modeling." (Staff Report Addendum, pp. 4-5.)

---

[22] Groundwater gradients are expressed as the ratio of the vertical change to lateral distance. "For example, if groundwater levels decrease 5 feet over a horizontal distance of 10,000 feet, the gradient is expressed as 0.0005 feet per foot." (Final EIR/EIS, p. 8.2-44.)

Moreover, even if the Project withdraws "greater volumes of non-seawater" than identified in the EIR/EIS (Staff Report Addendum, p. 5), there is no resulting environmental impact to the SVGB that implicates Coastal Act section 30231. As explained above, any "non-seawater" withdrawn by the Project will be returned to the SVGB pursuant to Cal-Am's obligations under the Agency Act and Return Water Settlement Agreement. These obligations are not mitigation measures to reduce or avoid any environmental impact. (See Final EIR/EIS, p. 8.2-13 ["The purpose of the return water element of the project is not to alleviate or address any environmental effects."].)

Therefore, while staff's consultant and Cal-Am agree that the Project will not extract greater volumes of "non-seawater" than identified and evaluated in the Final EIR/EIS, in the highly unlikely event that greater "non-seawater" volumes were extracted, no impact would occur because Cal-Am is obligated to return such water under the Agency Act and Return Water Settlement Agreement.

Staff Report Contention #19: The modeling in the Final EIR/EIS is flawed because it does not account for potential "fresh water" capture beyond the identified capture zone. (Staff Report Addendum, p. 5.)

Cal-Am Response: The Project's capture zone is located in a coastal area of the SVGB ***already intruded with seawater*** that is not usable for human consumption or irrigation without treatment. (Final EIR/EIS, pp. 4.4-69 to 4.4-70.) The capture zone will also be supplied by an unlimited source of ocean water recharge from the Monterey Bay. (*Id.*, p. 4.4-70.) As a result, the Project will withdraw primarily seawater from the SVGB. (*Id.*, p. 4.4-56.) Indeed, Project modeling showed—consistent with test slant well monitoring data—that as Project pumping continues, the OWP increases over time to reach 99%. (See Final EIR/EIS, p. 4.4-56; see also *id.*, Appx. E3.) "As pumping continues, the wells would extract increasing proportions of infiltrating recharge from the ocean," because "[t]he steady ocean recharge would gradually replace ambient groundwater within the capture zone." (See *id.*, p. 8.2-9.)

As the HWG has explained in multiple submittals to Commission staff , the vast majority of potential "fresh water" pockets noted by staff occur in areas hydraulically disconnected from the aquifers from which the Project's wells will extract water. (See HWG Aug. 15, 2018 Tech. Response, p. 5; see also Ex. 10, HWG Comments on Weiss SOW, pp. 6-7.) "[T]here is a very important distinction being missed by many hydrogeologists (including Weiss . . .) that the coastal Dune Sand Aquifer is a distinct hydraulic gradient zone" from the pockets of freshwater in the "Perched/Mounded Aquifer." (*Id.*, p. 6.) "This hydraulic discontinuity . . . means that pumping at the coast in the coastal Dune Sand Aquifer cannot impact groundwater levels in the Perched/Mounded Aquifer." (*Ibid.*) Nor can the Project's capture zone extend into the Perched/Mounded Aquifer to access the purported "fresh water" pockets. (*Ibid.*) In fact, the Project's capture zone and any groundwater drawdown cannot access these pockets "regardless of the direction and magnitude of the groundwater gradient." (*Id.*, p. 7.)

Since Project pumping is limited to the capture zone, and the Aquifers from which the Project will withdraw water are hydraulically disconnected from the identified areas of

potential "fresh" water, there is no need to perform additional data collection and modeling to determine whether the Project will impact any "fresh water" pockets outside of the capture zone. Moreover, as discussed above, the TDS level of 3,000 mg/L advocated by MCWD as "fresh water" is by no means fresh or potable and cannot be used for human consumption or agricultural use without treatment, such as desalination.

Staff Report Contention #20: Staff is uncertain about how much additional "fresh water" would be captured, but believes that that some of this uncertainty would be reduced if the slant wells were able to extend further seaward at a lower angle so as to shorten the flow path between the well intakes and the seafloor. (Staff Report Addendum, p. 5.)

Cal-Am Response: In reviewing the Project, the CPUC evaluated different configurations of the slant well network, but determined that slant wells developed at the proposed angle of approximately fourteen degrees were the environmentally superior alternative. (See Final EIR/EIS, pp. 3-18, 8.5-730.)

For instance, the EIR/EIS evaluated horizontal wells, which would extend further seaward at a lower angle than the slant wells. (See Final EIR/EIS, Appx. I1, pp. I1-5 to I1-7.) However, the CPUC determined horizontal wells are infeasible because: "(1) the amount of pipeline that would be pushed under the seafloor (upwards of 2,500 feet) would be challenging in terms of physical limitations; and (2) [the horizontal well technology] would not avoid or minimize any of the impacts associated with the proposed [Project]." (Final EIR/EIS, Appx. 11, p. I1-7; see also Final EIR/EIS, p. 8.5-771.) The Final EIR/EIS also explained the technical limitations of horizontal wells, which have "yet to be demonstrated successfully for an intake well," such as tendency to clog and decreased or loss of productivity over time. (*Id.*, p. 8.5-770 to 8.5-771.) Therefore, the use of wells at a "lower angle" is not feasible or environmentally superior to the Project's proposed slant wells.

In addition, extending the slant wells further seaward as proposed by staff would not make a material difference to the percentage of ocean water extracted by the Project. Any slant well ranging from completely beneath the beach (landward of the shoreline) to completely under the ocean will effectively extract the same OWP given that the coastal aquifers are recharged significantly by ocean water. (See Final EIR/EIS, pp. 8.5-638, 8.5-730.) As the HWG explained in its Hydrogeologic Investigation Technical Report (Final EIR/EIS, Appendix E3):

> [W]hile placement of production well screens closer to or under the ocean may result in a quicker ramping-up to maximum ocean water percentage (OWP) in the first few months and a very slight increase in the medium-term OWP, a difference of a few hundred feet in [well] screen placement relative to the ocean boundary will have minimal overall effect on the OWP.

(Final EIR/EIS, Appx. E3, p. 23.) The ocean provides a significant volume of seawater at the recharge boundary in the Dune Sand Aquifer, rendering wells screened just beneath

the beach as effective in extracting a high percentage of seawater as wells screened a couple of hundred feet further under the seafloor. (See Final EIR/EIS, p. 8.5-730.)

Therefore, extending the slant wells further seaward at a lower angle would not impact the amount of "fresh water" captured, and as the CPUC determined, the current location and configuration of the Project's slant well network is the environmentally superior design to capture groundwater contaminated by seawater intrusion and prevent the further inland migration of seawater. (See, e.g., Final EIR/EIS, pp. 8.5-580 to 8.5-581; CPUC Decision D.18-09-017, p. 173.)

Staff Report Contention #21: Staff asserts that the Project's uncertainties regarding groundwater impacts raise public welfare concerns because "if it turns out that Cal-Am would be pumping larger quantities of non-seawater than previously thought, it would need to send larger quantities of desalinated water to Castroville Community Services District." (Staff Report Addendum, p. 5.) As a result, "the rest of Cal-Am's water [would be] more expensive, thereby raising customers' rates and affecting the public welfare findings." (Ibid.)

Cal-Am Response: Staff's public welfare assertion is pure speculation and contradicts Weiss' determinations. Both Weiss and the EIR/EIS are consistent in their calculations of how much water Cal-Am would be required to provide to the Castroville Community Services District ("CCSD") as part of Cal-Am's return water obligations. Staff's assertion that Cal-Am would be required to send more water to CCSD, which in turn would cause higher rates for Cal-Am customers, is unsupported by the CPUC's and Commission's record.

As explained above, Cal-Am's return water obligations depend on how much ocean water comprises the slant well feedwater, or the OWP. The Final EIR/EIS conservatively estimated a return water percentage between 0-12% based on an OWP of 88 to 99%. (See Final EIR/EIS, pp. 4.4-56, 8.2-21 to 8.2-22.) As the Weiss Report confirmed, the "worst-case scenario" for the Project's OWP would be 85%, and this low bookend "is likely to be an underestimate of the true OWP." (Weiss Report, pp. 19-20.) According to the Weiss Report, the Project's OWP will likely fall within the range of 90-99%. (*Id.*, p. 20.) In other words, the Weiss Report contemplates ocean water and return water percentages consistent with the range evaluated in the Final EIR/EIS and by the CPUC in approving the Project. There is no basis for staff to assume that Cal-Am's return water obligations would be larger than those identified in the EIR/EIS and Weiss Report.

Further, as part of its Project approval, the CPUC considered issues such as the reasonableness of Cal-Am's rates and the public convenience and necessity for the Project. (See CPUC Decision D.18-09-017, pp. 178, 184, 193.) These determinations are all within the CPUC's purview as the state agency charged with exclusive jurisdiction to ensure that investor-owned water utilities deliver water at reasonable rates. (See Pub. Util. Code, § 451, 454, 728.) The CPUC's review of the Project included exercising its ratesetting authority wherein the CPUC was statutorily "charged with the responsibility of ensuring that all rates demanded or received by a public utility [such as Cal-Am] are just and reasonable." (See CPUC Decision D.18-09-017, pp. 19-20.) Based on its robust record developed over six years, the CPUC determined the Project "achieves an

appropriate balance between supplying a sufficient amount of safe, reliable, potable water and maintaining just and reasonable rates." (*Id.*, p. 178.)

The CPUC also determined that Cal-Am would incur the costs for meeting its return water obligation if that obligation "is increased due to a greater OWP than that estimated in the FEIR/EIS." (*Id.*, p. 192.) Thus, the record does not support staff's determination that any increased costs from Cal-Am's return water obligations would be passed onto consumers.

In sum, the CPUC—not the Commission—has authority over determining the reasonableness of Cal-Am's rates, and the CPUC determined following its multi-year ratesetting process that Cal-Am's rates are just and reasonable.

E. Energy Consumption & Climate Change

The Staff Report concludes that the Project appropriately minimizes energy consumption and is consistent with the LCP and Coastal Act policies regarding energy consumption and climate change. (Staff Report, p. 61.) Cal-Am agrees with Staff's determinations.

However, the Staff Report bases its conclusion by citing to the data for the larger project that was analyzed in the EIR/EIS, not Alternative 5a, which was the reduced project approved by the CPUC. To clarify the record, Alternative 5a (the Project for which Cal-Am has applied to the Commission) would reduce the GHG emissions and energy use as follows:

- Annualized construction emissions reduced from 357 tonnes CO_2e per year to 342 tonnes CO_2e per year. (See Final EIR/EIS, pp. 4.11-16, 5.5-244.)

- Operational emissions reduced from 8,008 tonnes CO_2e per year to 5,188 tonnes CO_2e per year. (See Final EIR/EIS, pp. 4.11-17, 5.5-244.)

- Operational electricity use for the intake and desalination plant reduced from approximately 57,000 megawatt hours of electricity per year to approximately 38,000 megawatt hours of electricity per year. (See Final EIR/EIS, pp. 4.11-12, 5.5-341.)

In addition, as noted in the Staff Report, the Project includes Mitigation Measure 4.11-1, which would reduce the carbon footprint of the Project's electricity consumption to zero; the electricity would be generated from renewable energy sources, and/or would otherwise be offset through the procurement of Renewable Energy Certificates and/or retirement of Carbon Offsets.

Nevertheless, staff also asserts that the Pure Water Monterey Groundwater Replenishment Project ("PWM Expansion") constitutes a feasible alternative that would reduce energy consumption as compared to the Project. Public Water Now makes a similar argument in their letter. (Public Water Now Letter, p. 2.) However these statements do not take into account Mitigation Measure 4.11-1, which ensures the Project would result in net zero operational emissions from electricity consumption. Cal-Am is not aware of the PWM Expansion making a similar commitment to net zero operational emissions from electricity consumption. In addition, as explained in Section I, *infra*, PWM Expansion is infeasible, and should not be considered as

an alternative to the Project. Accordingly, comparing the Project's energy consumption to the PWM Expansion is unnecessary.

F. Public Access and Recreation

Cal-Am agrees with the Staff Report's conclusion that the Project's construction-related activities would be consistent with LUP and Coastal Act policies related to public access. However, staff's concern that public access may be reduced after construction due to Project operations is unfounded. The Project will occupy 0.06 percent of the 400+ acre CEMEX site. (Staff Report, p. 23.) Beginning in year five of operations, yearly maintenance activities would occupy an additional approximately 0.25 acre of the CEMEX site for a period of 9 to 18 weeks at a time. None of the area impacted by the Project's construction or operation, including maintenance activities, would impede beach use or access. (Final EIR/EIS, pp. 3-59, 4.8-33; Staff Report, p. 65.) Accordingly, the Project's impact on public access is de minimis. Nevertheless, to ensure that public access will not be impeded by future Project operations, Cal-Am is proposing a Special Condition requiring development and approval of a Public Access Plan. Proposed language for that condition is included at Attachment C, hereto.

Staff Report Contention #22: The Staff Report states that the outfall liner has not been evaluated, and because as currently described, installation would require heavy equipment operating on the beach, placement of barriers, and protective work zones, there may be temporary adverse effects on public access. The Staff Report states that there is not yet sufficient information to determine the full extent of the outfall liner impacts. (Staff Report, p. 64.)

Cal-Am Response: The outfall liner is not part of Cal-Am's CDP application. It may be appropriate to separately evaluate and condition construction and operation of the outfall liner when M1W applies for a CDP for that work, depending on its scope. That scope has yet to be determined and is in M1W's control. In addition, potential alternatives to installation of the outfall liner are being evaluated, including implementation of a spray liner that could avoid ground disturbance and potential ESHA impacts that were evaluated and disclosed in the EIR/EIS. Further, M1W is also evaluating as a separate project the relocation of the outfall, which may be necessary to address sea level rise. As part of that project, a pre-lined outfall could be installed and thus avoid the need for ground disturbance and ESHA impacts associated solely with outfall lining activities. The final approach to the outfall liner with be determined by M1W. Nevertheless, for purposes of this CDP, Cal-Am proposes a Special Condition (see Attachment C) that would require approval of the outfall work prior to the commencement of Project operations. *Staff Report Contention #23: The Staff Report alleges that during operations, the Project could result in adverse effects to public access and recreation, depending on the eventual restoration and access plan that emerges from implementation of the CEMEX Settlement Agreement. (Staff Report, p. 64.) Public Water Now submitted a comment letter on November 12, 2019, similarly stating that the Project could limit public access and recreation. (PWN Letter, p. 2.)*

> Cal-Am Response: Staff's concerns that the Project could result in adverse effects to public access and recreation depending upon implementation of the CEMEX Settlement Agreement are misplaced. As an initial matter, the Commission already contemplated that the Project could be built on the CEMEX site when it approved the CEMEX

Settlement Agreement subject to Cal-Am's existing rights. (Settlement Agreement, § 23.2 ["this Agreement is not intended to and shall not be construed or deemed to supersede or interfere with any existing rights or obligations of California-American Water Company . . . related to the Property"].) To now use the Settlement Agreement as the basis for asserting a public access impact is improper and plainly contradicts the Commission's earlier determination.

Further, neither construction nor operation of the Project will impede coastal access or recreation, as the area occupied by the slant wells will be relatively small—only 0.24 acres. Further, the Project will not impede beach access because the Project does not involve construction of any structure or operations on the beach—no barrier to lateral beach access has ever been contemplated or suggested. The slant wells will occupy minimal space and not impede vertical beach access. (See, e.g., Final EIR/EIS, p. 4.8-35 ["The wells would be constructed approximately 500 feet landward of the back of the beach. No work on the beach is proposed."]; p. 6-54 ["The subsurface slant wells would be set back from the beach at a distance that would not preclude public access on the beach. No other proposed components would interfere with vertical or lateral public access to the shoreline or coastal waters."]; 4.8-17 ["most MPWSP components in proximity to the coastal zone . . . would be buried underground and would not substantially affect long-term public access to or along the coast."].)

Notably, vertical access to the beach is not even possible until closure of the CEMEX sand mine in 2022 and as stated in the Staff Report "construction would likely be complete before public access is developed." (Staff Report, p. 64.) After construction, the total fenced area as proposed by Cal-Am would occupy less than one-quarter of an acre of the 400+ acre CEMEX site. (See, e.g., Staff Report, p. 23 [referencing Cal-Am's proposal to fence 10,389 square feet or approximately 0.24 acres].) Specifically, Cal-Am proposes to fence six well sites (the largest of which is 56' by 38') and two surge tank sites (the largest of which is 22' by 53'). (See Proposed Fence Perimeters, included with Cal-Am's local CDP application to the City of Marina.) All fencing will be 8-feet tall and have PVC coating with tan (sand) colored privacy slats. Accordingly, the fenced area represents only 0.06 percent of the CEMEX site. This de minimis presence cannot be construed as limiting public access to the beach or other coastal resources.

Staff also raises concerns that the ongoing maintenance of the slant wells will occupy an area of up to about six acres. (Staff Report, p. 65.) Commencing in year five of operations, yearly maintenance activities would occupy an additional approximately 0.25 acre of the CEMEX site for a period of 9 to 18 weeks. The six acre figure cited by staff represents the total maintenance area that could be utilized over the course of the Project. However, the six acre area would not be utilized all at once—instead, on a yearly basis the additional area necessary for maintenance would be significantly smaller at approximately 0.25 acre, which represents the area surrounding individual pieces of infrastructure or well pads on the site that would be maintained. In addition, the Final EIR/EIS found that potential impacts associated with use of the entire six acre area would be less than significant with mitigation. (Final EIR/EIS, pp. 3-59, 4.6-247 to 4.6-257.) Among other mitigation measures, "[m]aintenance activities would occur between October and February to avoid the nesting season for snowy plover" and "[m]aintenance

workers would access the slant wells via the existing CEMEX access road." (Final EIR/EIS, pp. 3-59; see also *id.*, pp. 4.6-249, 4.6-254 to 4.6-257 [listing no less than twelve mitigation measures for maintenance related impacts].) Thus, commencing in year five of operations, yearly maintenance activities would occupy only a very small portion of the CEMEX site and these temporary impacts will be less than significant with mitigation.

The Staff Report states that if not for its rejection of the override provided in Section 30260, "the Commission could require special conditions requiring Cal-Am to implement measures needed to ensure its proposed project would be consistent with the . . . Coastal Act and LCP provisions related to public access and recreation." (Staff Report, p. 65.) As noted above, Cal-Am believes that Project construction and operations will present de minimis interference with public access to the beach. Nevertheless, to ensure that there will be no impacts, Cal-Am is proposing a Special Condition requiring the development and approval of a Public Access Plan. The proposed language is included at Attachment C, hereto.

G. Visual Resources

The Staff Report concludes that Project components within the Coastal Zone would be largely hidden from public view, and that ongoing Project maintenance would be limited and would not conflict with the LCP's policies regarding visual resources. (Staff Report, p. 67.) Staff further concludes that the Project's impacts on visual resources could conform with LCP and Coastal Act visual resources policies if the Commission were to impose special conditions on the Project. (*Ibid.*) Cal-Am agrees with staff's conclusion that Project development would be primarily concealed from public view, and that Project maintenance activities would not conflict with LCP policies intended to limit development above dune ridgelines.

Nevertheless, staff also asserts that, because the Project does not conform with other LCP and Coastal Act policies unrelated to visual resources, and also does not qualify for a Coastal Act section 30260 exemption as a coastal-dependent industrial use, "there is no need to identify special conditions that may be needed to ensure conformity" with visual resources policies. (Staff Report, p. 67.) As explained in Sections I.A, B, and C, the Project is consistent with LCP and Coastal Act policies regarding ESHA, coastal hazards, and protection of coastal waters. The Project is further consistent with policies regarding visual resources because: (1) the Project will not be visible from any entrance to the City of Marina; (2) above-ground components of the Project would not be visible from areas outside of the CEMEX site; and (3) as explained in the Final EIR/EIS, any necessary fencing will be designed to be minimally intrusive and to complement the architectural character of the community. (See Final EIR/EIS, p. 4.14-43.) While staff has not identified with which visual resources policies it contends the Project may conflict, Cal-Am remains willing to coordinate with staff to develop appropriate Special Conditions regarding visual resources to address staff's concerns.

H. Environmental Justice

The Project is consistent with Coastal Act Section 30604(h), including substantive and procedural elements of environmental justice. The Staff Report errs in finding that the Project's

overall effect would be to burden communities of concern and overlooks many important Project benefits. For example, the Project will support economic growth in the area by providing a reliable and much-needed supply of water to the Monterey Peninsula. The Project will

> ensure[] long-term water supply in the Monterey Peninsula area[, and] will boost the region's economic vitality, particularly the County's 'four pillars' – agriculture, tourism, education, and research, by substantially enhancing the reliability of water resources and water infrastructure. The Project will allow residential, commercial (including tourism) and industrial activities to continue to exist and flourish within the greater Monterey area, benefitting those who live and work throughout the greater Monterey area (and not merely in the CalAm Monterey service territory).

(CPUC Decision D.18-09-017, Appx. C, pp. C-74 to C-75.) Accordingly, the CPUC determined that implementation of the Project would provide local and regional economic benefits, both from construction and operation. (*Ibid.*)

The Staff Report also downplays the importance of the Project's return water component to CCSD, which will prevent CCSD from undertaking costly new well development and groundwater treatment. Castroville, by staff's own analysis, is a community of concern with a higher proportion of low-income residents than any of the other communities that staff evaluated and the Project's benefits to Castroville must be considered. (Staff Report, pp. 70-71.) Castroville "currently relies on about 780 afy of groundwater from the SVGB to meet Castroville's water demands, and increasingly has experienced water supply challenges because the water is getting saltier." (CPUC Decision D.18-09-017, Appx. C, p. C-75.) The Project will resolve those challenges. (*Ibid.*) The CCSD Manager has called the Project "an essential element of CCSD's long-term water supply" and stated that "halting construction of the MPWSP will severely prejudice CCSD and the disadvantaged community of Castroville that desperately needs a new, reliable long-term water supply." (Declaration of Eric Tynan in Case No. 19CV003305, p. 4, attached hereto as **Exhibit 11**.)

Finally, the CPUC also found that the Project would provide many other benefits, including:

- A reliable water supply for CalAm's Monterey District (CPUC Decision D.18-09-017, Appx. C, p. C-74);
- An alternative water supply that adheres to Cal-Am's obligations under the Water Board's CDO (*ibid.*);
- The protection and promotion of the Monterey regional economy by providing a permanent solution for Monterey Peninsula's water supply, supporting economic recovery of the Monterey area tourism industry (*id.*, pp. C-74 to C-75); and
- Environmental benefits to habitat and wildlife and marine species in the Carmel River and would "be expected to retard future inland migration of the seawater

intrusion front, by intercepting and capturing some of the seawater that currently migrates inland across the coastline" (*id.*, p. C-75; see also Section D).

Therefore, the Project provides substantial benefits to the disadvantaged communities both on the Monterey Peninsula and in the larger region that heavily relies on the Peninsula's jobs and economic activity,[23] and is consistent with the Commission's environmental justice policies. In addition to the responses below, Cal-Am will provide the Commission with an Environmental Justice technical analysis under separate cover at a later date.

Staff Report Contention #24: The Staff Report contends, based on a Food & Water Watch survey, that Cal-Am's water rates are among the highest in the country. (Staff Report, p. 73.)

Cal-Am Response: The Staff Report's reliance on the Food & Water Watch survey regarding Cal-Am's water rates is misplaced. The average water use of a single-family residential household in Monterey is 44,400 gallons of water per year rather than the 60,000 gallons per year cited by the Staff Report. (See Informational Flyer, attached hereto as **Exhibit 12**, , p. 1; see also Update to General Rate Case Application, Central Division, attached hereto as **Exhibit 13**, Table 3.7 [showing single-family residential water consumption well below 60,000 gallons per year].) This is an important distinction, because like many water utilities in the state, Cal-Am's "conservation pricing" has higher tiered rates assigned to higher than average levels of water use in order to encourage water conservation. Accordingly, basing estimated payments on 60,000 gallons per year skews the average cost of water to seem more severe than it actually is. (*Ibid.*) If you apply the correct usage model into a monthly estimate utilizing a 5/8-inch meter, you get a monthly bill of about $78—not the $100 that is claimed in the Food & Water Watch survey for 2017. (*Ibid.*)

Moreover, the Food & Water Watch survey cites three separate papers that each explicitly warn against the sort of rate comparison practice that the survey employs.[24] The Food & Water Watch survey also ignores the fact that water rates are a reflection of water utility investment, and that a utility that is properly maintaining its infrastructure and planning for the future will necessarily have higher rates than a utility that defers investment or provides inadequate solutions in favor of lower rates. For these reasons,

---

[23] "The Project will allow residential, commercial (including tourism) and industrial activities to continue to exist and flourish within the ***greater Monterey area***, benefiting those who live and work throughout the greater Monterey area (and not merely in the CalAm Monterey Service territory)." (CPUC Decision D.18-09-017, Appx. C, pp. C-74 to C-75 [emphasis added].)

[24] Truth from the Tap Blog, available at https://truthfromthetap.com/two-key-reasons-to-dismiss-latest-food-water-watch-report/. For example, one of the papers explains that "costs and rates charged for water services differ in many respects between public and investor-owned purveyors. . . . [P]ublic purveyors have tax payer sources of capital and revenue that are assumed by the tax payers but are not reflected in water rates." (*Ibid.*) Differences between public and investor-owned utilities as well as "[f]actors such as geographic location, demand, political climate, water source, level of treatment, and age of system" all impact rates, and "casual comparisons of or generalizations about rates are strongly discouraged." (*Ibid.*)

comparison between water rates is often an unhelpful exercise. Nevertheless, the CPUC – which is the state agency charged with determining water rates—has determined Cal-Am's rates to be just and reasonable. (See CPUC Decision D.18-09-017, pp. 19-20, 123-24; Pub. Util. Code, §§ 451, 454.)

Staff Report Contention #25: The Staff Report alleges that communities of concern would be disproportionately affected by increased water rates resulting from the Project's construction and operation and that a feasible alternative would not exacerbate or increase burdens to these communities. (Staff Report, pp. 73-74.)

Cal-Am Response: The CPUC has exclusive jurisdiction to ensure that investor-owned water utilities deliver water at reasonable rates, based on factors such as fixed costs and variable use charges. (See, e.g., Pub. Util. Code, §§ 451, 454, 728.) The CPUC's review of the Project included exercising its ratesetting authority wherein, under Public Utilities Code sections 451 and 728, the CPUC was "charged with the responsibility of ensuring that all rates demanded or received by a public utility [such as Cal-Am] are just and reasonable." (See CPUC Decision D.18-09-017, pp. 19-20.) The CPUC stated:

> In approving the MPWSP we recognize that desalinated water is relatively expensive, both in terms of capital costs and ongoing operations and maintenance costs. In reaching our decision here, the [CPUC] must balance potential benefits against the cost burden to CalAm's ratepayers from the construction of the MPWSP, and consider the relative benefits and costs of reasonable alternatives. . . . The [CPUC] must decide what is a reasonable cost burden for ratepayers to bear, under what conditions such a cost can be justified, and how the cost increase can be minimized and controlled to achieve an appropriate balance between supplying a sufficient amount of safe, reliable, potable water and maintaining just and reasonable rates. . . . We must determine what is reasonable in this context. At the same time we must not burden ratepayers with such a high cost that it becomes prohibitive.

(*Id.*, pp. 123-24.) After extensive briefing and input from the community, the CPUC approved the Project and Cal-Am's rate recovery. (*Ibid.*) Indeed, the rates ultimately approved by the CPUC were based on extensive collaboration: "Sixteen parties (a sub-set of parties, including the applicant, ratepayer advocates, environmental groups, and public water agencies) submitted a proposed Comprehensive Settlement Agreement (Comprehensive Settlement) that addresses O&M expenses, cost caps, financing and ratemaking for the MPWSP." (*Id.*, p. 88.) This Comprehensive Settlement formed the basis for the CPUC's ratemaking decision. Although the CPUC did not adopt the Comprehensive Settlement in full it stated that "substantial testimony and materials have been submitted into the record as to many of the proposed components of the agreement. This allow[ed CPUC] to adopt the framework (with additional conditions) and key elements as to O&M costs, financing, ratemaking, and contingency provisions[.]"

(CPUC Decision, D.18-09-017, p 99.) Ultimately, the CPUC "adopted the framework set out in the Comprehensive Settlement with ***additional protections***." (*Id.*, pp. 124-125 [emphasis added].)

The CPUC gave "great weight to the City of Marina's community values, and also considers the community values expressed by others, such as The Latino Water Coalition, Latino Seaside Merchants, and Communidad en Accion, Coalition for Peninsula Businesses, Cal-Am ratepayers, Salinas Valley Water Coalition, the County of Monterey, and others." (CPUC Decision D.18-09-017, p. 158.) The CPUC "[a]ddressed the probable rate increases for ratepayers . . . including identified low-income populations in Sand City, Seaside, and downtown Monterey." (*Id.*, p. 164.) As a result, the CPUC added additional ratepayer protections as advised by the California Public Advocates Office (*id.*, pp. 184-85) and retained "continuing jurisdiction over Cal-Am to ensure that rates are just and reasonable" (*id.*, p. 204).

The CPUC exercised its exclusive jurisdiction and special expertise in determining the future rates associated with construction and operation of the Project. It did so while specifically considering and weighing the impacts on ratepayers, such as those in identified low income communities, against the need for a reliable source of water on the Monterey Peninsula.[25] It is not the Commission's role to use alleged environmental justice concerns as a backdoor to independently review utility rates or second-guess the CPUC's ratesetting determinations.

The projected costs of Project water are far below the approximately $6,000 per acre foot claimed in the Staff Report. (Staff Report, p. 73.) The CPUC decision states that the "cost per acre-foot (AF) for the 6.4 mgd plant 'under the Tier 2 and PTM caps (inclusive of the 3,500 AF of GWR water) is $4,265 per AF and $4,472 per AF respectively." (CPUC Decision D.18-09-017, p. 123, fn. 332; see also Rebuttal Testimony of Jeffrey Linam, attached hereto as **Exhibit 14**.)

Additionally, for low income ratepayers within Cal-Am's service area, including Seaside, Cal-Am offers a low income ratepayer assistance ("LIRA") program that discounts rates for qualifying customers by up to 30%.[26] (See **Exhibit 15** [Regular and LIRA Rates].) In addition, to the extent that the Staff Report suggests that the City of Marina will experience an increase in water rates, this is entirely wrong. Marina is not within Cal-Am's service territory and its water rates will not change regardless of whether the Project is built. Marina's claims of environmental justice impacts on its citizens simply have no merit.

Staff contends that the PWM Expansion represents a feasible alternative that would not exacerbate or increase burdens to communities of concern. However, as explained in

---

[25] As discussed in Section I.2, CPUC found that PWM Expansion was not a feasible alternative to the Project.

[26] The LIRA program does not discount water usage in excess of 17,200 gallons in a single month.

Section I, *infra*, the PWM Expansion is infeasible, and should not be assessed as an alternative to the Project.

Staff Report Contention #26: The Staff Report contends that its mandate to ensure "coastal access" broadly includes ensuring the affordability of cost of living in coastal communities. (Staff Report, p. 74.)

Cal-Am Response: Staff interprets "coastal access" to mean "ensuring the affordability of cost of living" and accordingly staff asserts that it reviews water rates to evaluate the affordability of living in coastal communities. Cal-Am's rates were assessed by the CPUC and found to be both just and reasonable after considering the potential impacts on low-income populations. (CPUC Decision D.18-09-017, p. 164, 184-85, 204.) In addition, as discussed above, the Staff Report relied on inaccurate rate information and did not take into account Cal-Am's robust LIRA program. Moreover, without the Project there will be insufficient water for essential affordable housing in the region . (See Section I.3.g [discussing PWM Expansion's inability to supply sufficient water to meet housing demand].) Therefore, the Project ensures coastal access by being consistent with ensuring affordability of cost of living in coastal communities.

Staff Report Contention #27: The Staff Report argues that if not for the Project, seven acres of beach and dune habitat would be available in the near future for public access, habitat restoration, and passive public recreational use. The Staff Report also states that some members of the community worry about losing some of the negotiated access at the site due to limitations Cal-Am may impose around its well field. (Staff Report, pp. 74-75.)

Cal-Am Response: As discussed in Section F, the Commission already considered the Project's presence at the CEMEX site and approved the CEMEX Settlement Agreement so as "not to be construed or deemed to supersede or interfere with any [of Cal-Am's] existing rights or obligations[.]" (Ex. 1, Settlement Agreement, § 23.2.) Additionally, a government agency or non-profit entity must purchase the property before it may become available for public access. (See *id.*, § 6.1.) There is no guarantee when or if the property will actually be purchased, and how much of the land will be opened for public access. Thus, analyzing whether public access will be impeded is premature and speculative.

In any case, the environmental and public recreational effects of Project components are expected to be extremely minimal and Cal-Am has not proposed any limitations around the well field other than its fencing. After construction, less than one acre will be occupied by fenced well pads. (See, e.g., Staff Report, pp. 23, 39.) This represents an impact of less than one percent of the 400+ acre CEMEX site. Staff's reference to "seven acres of beach and dune habitat" includes the projected six acres needed for heavy equipment and materials during maintenance periods. (*Ibid.*) As discussed in Section F, the six acre figure cited by staff represents the total maintenance area that could be utilized over the course of the Project, all six acres would not be utilized at once. Instead, commencing in year five of operations, yearly maintenance activities would occupy an additional approximately 0.25 acre area for a period of between 9 to 18 weeks and would be scheduled in the late Fall and Winter specifically to avoid snowy plover nesting

season. (Final EIR/EIS, p. 3-59.) Including all six acres results in an impact of approximately 1.5 percent to the 400+ acre CEMEX site. These impacts would not limit any public access or entrance to the beach or coastal resources. (See Section F for further discussion.)

Staff Report Contention #28: The Staff Report states that there is a "credible assertion" that the Project could compromise aquifers via saltwater intrusion and deplete the City of Marina's groundwater supplies. (Staff Report, Addendum, p. 8.) Letters from Victoria Bañales and Margaret-Anne Coppernoll among other commenters also stated or implied that the Project would "steal" Marina's groundwater. (Bañales Letter (Nov. 16, 2019); Coppernoll Letter (Nov. 11, 2019), p. 1.)

Cal-Am Response: Contrary to staff's assertion, the Project will not pump any water from aquifers that supply Marina's municipal wells, which are over 2 miles outside of the Project's capture zone. (See Final EIR/EIS, p. 4.4-75.) Rather, the Project will extract contaminated groundwater from the Dune Sands Aquifer and the 180-Foot Aquifer of the SVGB, whereas Marina's municipal wells are screened in the Deeper Aquifer. (*Ibid.*) The CPUC specifically evaluated the Project's potential to impact the SVGB and groundwater users, and determined that substantial evidence demonstrates that any impacts would be less than significant. (CPUC Decision D.18-09-017, pp. 81, 174-175.)

Further, Cal-Am is not "stealing" Marina's groundwater. As explained in Section D, the "SVGB is not an adjudicated groundwater basin, so use of the groundwater in the Basin is not subject to existing court decree, written agreements or oversight by an impartial watermaster." (Final EIR/EIS, p. 2-32.) As such, Cal-Am is able to obtain appropriative rights for water extracted from the basin. (*Ibid.*; see Section D, *infra*.) Marina has no rights in the groundwater unless it too acquires appropriative rights, and the Project's use will not take anything belonging to Marina or otherwise affect Marina's ability to draw water from its municipal wells in the Deeper Aquifer. If the water the Project will extract was viable for municipal use, Marina already would have developed wells in the vicinity for its own supplies—but it has not.

Moreover, contrary to staff's claims, the Project will prevent rather than exacerbate further seawater intrusion beyond the Project's capture zone. (See Final EIR/EIS, pp. 4.4-92, 8.5-561; HWG Response to Coastal Commission (Feb. 20, 2020), at p. 2; see also Section D, *supra*.) These conclusions were confirmed by the Commission's own consultants. (See, e.g., Weiss Report, p. 2, 7.) Neither staff nor commenters have presented any "credible assertions" that the Project could negatively affect the City of Marina's groundwater supplies or exacerbate saltwater intrusion.[27] Accordingly, there are no environmental justice implications associated with the Project's effects on groundwater.

---

[27] A robust discussion of the Project's consistency with the groundwater protection provision of Coastal Act section 30231 is provided at Section D, *supra*.

Staff Report Contention #29: The Staff Report alleges that residents of the City of Marina were not fully engaged by the CPUC because they were not ratepayers and therefore suffered procedural prejudice. (Staff Report, p. 75.)

Cal-Am Response: The CPUC proceedings included a robust public process for the City of Marina and its residents. Attached to its decision, the CPUC provided a detailed chronology of the extensive communications between the City of Marina as a Responsible Agency and the CPUC as Lead Agency. (See CPUC Decision D.18-09-017, Appx. C, Ex. A.) Marina's contact began in October 10, 2012, and was maintained throughout the entire life of the CPUC's review of the Project, which lasted through September 13, 2018. (*Ibid.*) Marina and its residents, as members of organizations such as Citizens for Just Water, Water Plus, and Public Water Now, were also active members throughout the CPUC's administrative proceedings, submitting hundreds of comment letters on the EIR/EIS over a lengthy public comment period. (See Final EIR/EIS, §§ 8.6-8.8; see also *id.*, p. ES-4 to ES-5 [discussing public involvement and public meetings in Marina, Seaside, and Carmel-by-the-Sea].) For years, Citizens for Just Water has sought to prevent the Project from being constructed and consists primarily of Marina residents and public officials, including Marina Mayor Bruce Delgado, as well as Marina City Councilmembers and Planning Commissioners, among others.[28] Citizens for Just Water actively opposed the Project in CPUC hearings, submitted opposition comments letters to the CPUC during the EIR/EIS process, and organized numerous public forums to criticize the Project and advise its members on how to advocate against the Project during the administrative process.[29] After the Final EIR/EIS was released, the City of Marina, Citizens for Just Water, Water Plus, Public Water Now, and several other organizations submitted hundreds of pages of materials during multiple stages of briefing that were reviewed by both the CPUC and the California Supreme Court.

CPUC hearings were accessible to residents, who appeared both in support and in opposition to the Project. The CPUC also held public meetings in a variety of locations to hear concerns from the public on topics such as the "needs of low income ratepayers, . . . [the] role of the [CPUC] in protecting ratepayers, . . . high rates" and other matters. (CPUC Decision D.18-09-017, Appx. A, p. 14.)

It is undisputable that residents from the City of Marina were afforded significant opportunities to provide input to the CPUC. That certain members of the community

[29] See https://www.citizensforjustwater.org/what-has-citizens-for-just-water-done.html (summarizing Citizen for Just Water's extensive opposition efforts); Citizens for Just Water Public Forum in City Council Chambers (April 11, 2018) 2m25s, https://www.youtube.com/watch?v=xJ3YrkG-CoE (Marina City Councilmember coaching Marina residents on how to effectively advocate against the Project).

disagree with the CPUC's decision does not render the process inadequate or demonstrate prejudice. Some portion of the community will disagree with actions taken by the CPUC, particularly related to water. As the CPUC noted, "[t]he water supply problems on the Monterey Peninsula are long-standing, contentious, and bitterly disputed by many parties and interests. The results of this continuing conflict have rendered some prior proposed solutions unachievable." (CPUC Decision D.18-09-017, p. 125.) Members of the community were provided with ample opportunities to participate in the administrative process. Finding a solution that satisfies all parties has proved impossible and attempting to do so will merely prevent the Monterey Peninsula from obtaining a practical solution to its water needs, a result that will most severely impact the very communities of concern the Commission seeks to protect.

MCWD Contention: Approval of Cal-Am's CDP would make it more difficult or financially infeasible for MPWMD to implement Measure J and therefore be inconsistent with the Commission's environmental justice policies.

Cal-Am Response: In 2018, voters in the MPWMD approved Measure J which requires MPWMD to assess the feasibility of a public takeover of Cal-Am's Monterey water system. Measure J only mandates that such a takeover actually occur if it is financially feasible. Nothing in the measure precludes Cal-Am from applying for and obtaining permits it needs for the Project. MPWMD has not issued any final findings indicating whether a public buyout of Cal-Am's water delivery system would be financially feasible with or without the Project. Preliminary findings were issued at a workshop last year, on November 12, 2019, which explicitly included the cost of the "whole desalination plant" in its valuation of Cal-Am's system and there was no analysis indicating that the Project would impede the financial feasibility of a public buyout. The Measure J Draft EIR released by MPWMD on June 18, 2020, similarly states that the acquisition of the water system "includes planned facilities associated with the Monterey Peninsula Water Supply Project (MPWSP) including the 6.4 million gallons per day Desalination Plant with sub-surface intake wells and related infrastructure improvements[.]"[30] Therefore, it is not clear why obtaining a permit in furtherance of the Project would prevent MPWMD's implementation of Measure J.[31] Moreover, MPWMD's preliminary findings regarding the valuation of Cal-Am's water delivery system are disputed by Cal-Am's independent consultants who have valued Cal-Am's water delivery system in Monterey at over $1 billion. As a result, a public buyout of Cal-Am's system, combined with follow-on

If all the required permits are received and the MPWSP is proceeding at the time the potential acquisition is performed, the District intends to acquire the 6.4 MGD Desalination Plant and all pertinent contracts, lands, and easements"].)

[31] MPWMD, Measure J Feasibility Study, Frequently Asked Questions (November 12, 2019), available at https://www.mpwmd.net/wp-content/uploads/FAQs-from-11-12-19-Feasibililty-Study-Workshop.pdf.

litigation costs would likely result in significantly increased water costs for the average Monterey Peninsula customer. Due to those substantial costs, public ownership is unlikely to move forward and would not support the environmental justice policies as MCWD claims. Any future findings or decisions related to MPWMD's implementation of Measure J are unrelated to this CDP and, in any case, would not impact the Coastal Act environmental justice policies.

I. Assessment of Alternatives

The Staff Report bases its recommendation that the CDPs should be denied on a conclusion that the PWM Expansion is a feasible and less environmentally damaging alternative to the Project. The Staff Report's analysis of the PWM Expansion as an alternative is deeply flawed. To begin, the proponents of the PWM Expansion never intended the PWM Expansion as an alternative, it was only ever intended as a back-up that would serve as a stop-gap measure in the event that the Project is delayed. (See Monterey One Water Resolution 2019-19, attached hereto as **Exhibit 16**); Final Supplemental EIR for the PWM Expansion, pp. 1-1, 3-6, 3-8, 3-24.)[32] Further, as discussed in additional detail below, the Commission does not have the authority, under either the Coastal Act or CEQA, to evaluate the PWM Expansion as a wholesale alternative for the Project. (See Coastal Act sections 30233 and 30260; Pub. Res. Code, § 21002.1, subd. (d).)

Nevertheless, the Staff Report evaluated the PWM Expansion as a Project alternative in four main ways: (1) feasibility; (2) analysis of water supply and demand; (3) consistency with Project objectives and criteria; (4) and comparison of adverse environmental effects, and concluded that the PWM Expansion is a feasible, less environmentally damaging Project alternative. (Staff Report, p. 80.) Contrary to the Staff Report conclusion, the PWM Expansion does not satisfy these stated requirements for a feasible Project alternative.

First, the Staff Report's conclusion that the PWM Expansion is a "feasible" alternative to the Project is not supported by substantial evidence. Contrary to the Staff Report's assertions, there is no evidence that the PWM Expansion can be accomplished in a successful manner, within a reasonable period of time, or with fewer environmental impacts than the Project. Notably, as demonstrated in comments submitted by Cal-Am and numerous other interested parties, the Final Supplemental EIR ("SEIR") for the PWM Expansion is deeply flawed. Recognizing these flaws, on April 27, 2020, the Monterey One Water ("M1W") Board of Directors denied certification of the SEIR for the PWM Expansion. (See M1W June 8, 2020 Letter to Cal-Am, p. 1, attached hereto as **Exhibit 17**.) As a result, the PWM Expansion is no longer moving forward. Moreover, the CPUC has already rejected the PWM Expansion as an alternative to the Project "for myriad independent reasons." A complete discussion of the infeasibility of the PWM Expansion is provided below in Section I.2.

Second, the Staff Report's analysis of water supply and demand was based largely on speculation and an improper and inaccurate September 2019 analysis of supply and demand for the Monterey Peninsula prepared by Monterey Peninsula Water Management District

---

[32] M1W, Final Supplemental EIR for the Pure Water Monterey Expansion (April 13, 2020), available at https://purewatermonterey.org/wp/wp-content/uploads/Final-SEIR-Proposed-Modifications-PWM-GWR-Project-April-2020.pdf.

("MPWMD") General Manager David Stoldt (the "Stoldt Memo"). The Staff Report failed to address or acknowledge Cal-Am's October 2019 response to the Stoldt Memo, which was provided to Commission staff and demonstrated that the analysis in the Stoldt Memo is deficient for numerous reasons and could not be relied upon by the Commission. After the release of the Staff Report and last November's informational hearing before the Commission, water supply and demand have been evaluated in additional reports, which include reports prepared by Stoldt, Hazen and Sawyer, Cal-Am and others. In addition to the responses to the Staff Report's analysis of supply and demand provided below in Section I.3, Cal-Am will provide the Commission with a separate response that accounts for the additional information provided in these new reports.

Third, given uncertainties in the PWM Expansion's ability to provide a reliable water supply to the Monterey Peninsula, and the M1W Board of Directors' recent decision to not certify the Final SEIR for the PWM Expansion, the PWM Expansion simply cannot meet and is not consistent with the Project's objectives and criteria. A complete discussion of the PWM Expansion's inconsistency with Project objectives and criteria is provided below in Section I.4.

Fourth, the Staff Report's conclusion that the PWM Expansion would be less environmentally harmful than the Project wholly ignores the CPUC's analysis of the Project in the Final EIR/EIS and conflicts with the significant flaws identified in the environmental analyses for the PWM Expansion.[33] A complete discussion regarding the environmental impacts of the PWM Expansion and Project is provided below in Section I.5.

In sum, the Staff Report's analysis of the PWM Expansion as an alternative to the Project is flawed. Implementation of the PWM Expansion instead of the Project would lead to significant water supply shortfalls along with corresponding economic hardship on the Monterey Peninsula, and could require additional water diversions from the Carmel River causing further impacts to the endangered steelhead trout.

1. Interpretation of Coastal Act Sections 30233 and 30260

Staff Report Contention #30: The Staff Report asserts that Coastal Act sections 30233 and 30260 require the Coastal Commission to assess alternatives to projects for which the Commission is asked to grant Coastal Development Permits. (Staff Report, p. 77.) As a result, staff, and MCWD, argue that the Commission now has an independent obligation to assess alternatives to the Project based on current information, including the PWM Expansion. (Id., p. 79; MCWD Letter, p. 9.)

> Cal-Am Response: The Staff Report misapplies sections 30233 and 30260 and errs in concluding that either section permits the Commission to engage in the type of assessment of Project alternatives provided in the Staff Report. Section 30233 provides that diking, dredging, or filling shall not be permitted in coastal waters except: (1) where there is no feasible less environmentally damaging alternative; (2) where feasible

[33] The PWM Expansion Draft SEIR was released on November 7, 2019, shortly before the Commission's November 14 hearing on the Project. The Final SEIR was released on April 13, 2020.

mitigation measures have been provided to minimize adverse environmental effects; and (3) where limited to certain categories of projects. (Pub. Resources Code, § 30233, subd. (a).) Public Resources Code section 30108.2 defines "fill" as "earth or any other substance or material, including pilings placed for the purposes of erecting structures thereon, placed in a submerged area." As discussed in Section C, *supra*, none of the Project construction proposed under these applications involve fill. As the Project does not involve any diking, dredging, or filling in coastal waters, section 30233 does not provide the Commission with the authority to consider whether there is a "feasible less environmentally damaging alternative" to the Project. Moreover, even if the Project components that are the subject of these applications did involve fill, which they do not, the Commission's authority under Section 30233 would be limited to review of alternatives to those Project components within the Commission's jurisdiction that do involve fill, rather than wholesale alternatives to the entire Project.

Section 30260 separately provides that new or expanded coastal-dependent facilities that are otherwise inconsistent with Coastal Act Chapter 3 policies may nonetheless be permitted where: (1) alternative locations are infeasible or more environmentally damaging; (2) permit denial would adversely affect the public welfare; and (3) adverse environmental effects are mitigated to the maximum extent feasible. The plain language of Section 30260 grants the Commission the authority to consider only "***alternative locations***" for coastal-dependent facilities, ***not alternative projects***. This interpretation is confirmed by numerous prior Coastal Commission staff reports, which have consistently interpreted section 30260 as only permitting consideration of alternative locations for the project before the Commission. Cal-Am is not aware of prior instances where the Commission has interpreted section 30260 to mean an alternative to the ***entire*** project before the Commission.[34] Here, the Final EIR/EIS thoroughly analyzed alternative locations for the Project's slant well intake infrastructure—that assessment made clear that the CEMEX site is the least environmentally damaging location feasible for the Project. (See Section J, *infra*; see also Final EIR/EIS, §§ 5.1-5.6.) Where there are no feasible alternative locations, the Commission does not consider whether the project is

---

[34] See, e.g., Th14a-12-2018, p. 135, available at https://documents.coastal.ca.gov/reports/2018/12/Th14a/Th14a-12-2018-report.pdf (in considering a CDP application for new oil production and wetlands restoration projects, stating that, "[t]he first test of 30260 requires a finding that ***alternative project locations*** are 'infeasible or more environmentally damaging.'") (emphasis added); Th6a-9-2005, p. 36, available at https://documents.coastal.ca.gov/reports/2005/9/Th6a-9-2005.pdf (in assessing a CDP application for a nuclear fuel storage facility, stating that, "there are no other offsite locations available to store the spent fuel and there is considerable doubt as to when, if ever, alternative sites might become available. Additionally, none of the onsite alternative locations at the power plant would be less environmentally damaging, since they are lower in elevation or less stable geologically."); W6c-11-1995, p. 16, available at https://documents.coastal.ca.gov/reports/1995/11/W6c-11-1995.pdf (in analyzing a pipeline project, concluding that, "The purpose of this project is to replace sections of two existing pipelines. … Since the new pipeline sections are to be installed for the purpose of reconnecting the existing pipelines, any alternative locations are infeasible.").

sited in the least environmentally damaging location. (See W6c-11-1995, p. 16.) As such, section 30260 does not provide the Commission with the authority to determine whether there are any feasible alternatives to the entire Project.

Further, the Commission, as a CEQA responsible agency, is limited to considering alternatives within its jurisdiction. The PWM Expansion, which is not located within the Coastal Zone, is outside of the Commission's jurisdiction. (See, e.g., Pub. Res. Code, § 21002.1, subd. (d); Cal. Code Regs., Tit. 14, Div. 6, Ch. 3 ("CEQA Guidelines"), §§ 15042, 15096, subd. (g)(1) ["When considering alternatives and mitigation measures, a responsible agency is more limited than a lead agency. A responsible agency has responsibility for mitigating or avoiding only the direct or indirect environmental effects of those parts of the project which it decides to carry out, finance, or approve."]; *RiverWatch v. Olivenhain Mun. Water Dist.* (2009) 170 Cal.App.4th 1186, 1207 ["If the responsible agency finds that any alternatives or mitigation measures ***within its powers*** are feasible and would substantially lessen or avoid a significant effect of the project, the responsible agency may not approve the project as proposed, but must adopt the feasible mitigation measures or alternatives."] [emphasis added]; *Sierra Club v. Cal. Coastal Com.* (2005) 35 Cal.4th 839, 860 [holding that neither the Coastal Act nor CEQA allow the Commission to consider impacts of projects located outside the Coastal Zone]; *Schneider v. Cal. Coastal. Com.* (2006) 140 Cal.App.4th 1339, 1347 [concluding that the Coastal Act did not permit the Commission to consider ocean boaters' right to view coastline from the ocean].)

Therefore, as an initial matter, the Staff Report should not have considered the PWM Expansion as a Project alternative because the Commission does not have authority under the Coastal Act or CEQA to consider the PWM Expansion as an alternative.

2. Feasibility

Staff Report Contention #31: The Staff Report states that the PWM Expansion conforms to the criteria of the Coastal Act Section 30108 definition of feasibility. Staff argues that the PWM Expansion may be "accomplished in a successful manner," can be constructed within a reasonable period of time, will be more economically efficient than the Project, will have fewer environmental impacts, has fewer environmental justice impacts, and relies on proven technology for treating and distributing water. (Staff Report, pp. 80-81.) Similarly, MCWD asserts that the PWM Expansion must be assessed as a feasible alternative to the Project under both CEQA and the Coastal Act, thus requiring preparation of a supplemental EIR for the Project, and that Cal-Am's critiques of the PWM Expansion are financially motivated. (MCWD Letter, pp. 7-9.)

Cal-Am Response: The Staff Report's determination, and MCWD's assertion, that the PWM Expansion is a feasible alternative to the Project is not based on the actual status of the PWM Expansion. On April 27, 2020, the M1W Board denied certification of the SEIR for the PWM Expansion. (See M1W Board of Directors Staff Report, May 20, 2020, attached hereto as **Exhibit 18;** M1W Board of Directors Agenda, May 21, 2020, attached hereto as **Exhibit 19**.) ***As such, the PWM Expansion is no longer moving forward.***

The M1W Board rejected certification of the SEIR as a result of substantial deficiencies in the environmental analysis related to: source water for the PWM Expansion; water supply and demand; impacts to agricultural water supplies; and, importantly for the Commission's review of the Project, because ***the SEIR failed to evaluate the PWM Expansion either as an alternative to or a cumulative project with Cal-Am's Project.*** (Ex. 18, M1W Board of Directors Staff Report.) Cal-Am and numerous other entities, including the Monterey County Water Resources Agency, the State Water Board, and the Seaside Basin Watermaster, submitted comments to M1W expressing significant concerns regarding the many deficiencies in the SEIR and the infeasibility of the PWM Expansion. (See April 24, 2020 Cal-Am Comments on PWM Expansion Final SEIR and May 9, 2020 Cal-Am Comments on Cost, Operational Performance and Status of PWM Expansion attached hereto as **Exhibits 20 & 21**; see also January 30, 2020 Cal-Am Comments on PWM Expansion Draft SEIR; January 31, 2020 MCWRA Comments on PWM Expansion Draft SEIR; January 31, 2020 State Water Board Comments on PWM Expansion Draft SEIR; and January 8, 2020 Seaside Basin Watermaster Comments on PWM Expansion Draft SEIR, which were separately submitted to staff on April 9, 2020, by the Coalition of Peninsula Businesses.) Accordingly, even if the PWM Expansion were to move forward, its timeline is unknown because the significant deficiencies in the SEIR would need to be corrected prior to the M1W Board moving forward with the Project. Notably, M1W "[s]taff has noted that ***the [M1W] does not have additional budget funds at this time for dealing with any additional deficiencies that have been identified*** . . . or could be identified in the future. ***[M1W] has suspended all of the remaining contracts on these matters to prevent further consultant expenditures***." (Ex. 18, M1W Board of Directors Staff Report [emphasis added].) As the M1W Board is not undertaking efforts to move forward with the PWM Expansion because of the deficiencies in the SEIR and a lack of funding, the PWM Expansion cannot be considered a feasible alternative to the Project.

Moreover, while the Staff Report acknowledges that the CPUC did consider the PWM Expansion as an alternative to the Project, staff and MCWD fail to recognize that the CPUC rejected the PWM Expansion as infeasible for "***myriad independent reasons***." (See CPUC Decision D.18-09-017, Appx. C, p. C-17 [emphasis added].) The CPUC noted that by September 2018, PWM Expansion was already far behind schedule and there was not "sufficient certainty concerning short- and long-term availability of source water supplies for the PWM Expansion." (*Id.*, p. C-71.) The issuance of the PWM Expansion SEIR, which has not been approved by M1W, has not changed the validity of the CPUC's conclusions, and instead highlights many of the feasibility concerns discussed by the CPUC. (See Ex. 20, Cal-Am Comments on PWM Expansion Final SEIR; see also January 30, 2020 Cal-Am Comments on PWM Expansion Draft SEIR, separately submitted to staff on April 9, 2020 by the Coalition of Peninsula Businesses.) Contrary to MCWD's assertions, there is no evidence to suggest that the proposed PWM Expansion is "considerably different" from the PWM Expansion proposal that was analyzed and rejected as an alternative by the CPUC, such that the PWM Expansion has suddenly become a feasible Project alternative that must be re-analyzed in a supplemental

EIR for the Project. (See MCWD Letter, p. 7; CEQA Guidelines, § 15162, subd. (a)(3)(C).)[35]

Each of the feasibility factors discussed in the Staff Report are discussed further below.

a. *"Capable of Being Accomplished in a Successful Manner"*

First, in concluding that the PWM Expansion is capable of being accomplished in a successful manner, the Staff Report cites to the "proven" technology of the first phase of the PWM (the "Original PWM Project"). Staff's claim that the technology of the Original PWM Project is "proven" is not supported by the actual events that have occurred with respect to that project. More specifically, there are serious concerns regarding the technology associated with the Original PWM Project. (See Ex. 21, pp. 3-4.) As examples, sinkholes or subsidence are affecting the shallow injection wells that may not be repairable, certain deep wells are experiencing injection refusal and are functioning at rates of 60% or less, and some of the source waters identified and intended for treatment by the Original PWM Project have not been utilized since startup. (*Ibid.*; see also Staff Report for May 14, 2020 M1W Recycled Water Committee Meeting, attached hereto as **Exhibit 22**; Staff Report for April 16, 2020 M1W Recycled Water Committee Meeting, attached hereto as **Exhibit 23**; Final Minutes from March 16, 2020 MPWMD Regular Board Meeting, p. 3, attached hereto as **Exhibit 24** [noting that Original PWM Project production wells were only running at two-thirds capacity].) Indeed, M1W estimates that the current annual injection volume for the Original PWM Project is only 2,030 afy—this equates to less than 58% of the 3,500 afy allocated for Cal-Am, and only 36% of the 5,600 afy design capacity for the Original PWM Project. (See PWM Status Update Presentation from June 18, 2020 PWM Meeting, attached hereto as **Exhibit 25**.)

Moreover, M1W's consultants recently confirmed that current injection rates for the Original PWM Project are only half of the planned capacity rate for the Original PWM Project injection wells. (See Ex. 25.) Indeed, the Original PWM Project's vadose zone wells are not currently injecting any water. (*Ibid.*) As a result, M1W is proposing to add a new deep injection well to the Original PWM Project, which will further increase costs of the Original PWM Project, possibly by as much as $11 million, resulting in an additional increase in product water prices. ("When will Pure Water Monterey start providing water?", Monterey Herald, June 20, 2020, attached hereto as **Exhibit 26**.) M1W's consultants estimate that construction on this additional well will not begin until November, further delaying the Original PWM Project. (See Ex. 25.)

---

[35] Moreover, even if the PWM Expansion were to be considered a feasible alternative, which it is not, a supplemental EIR would not be required here because Public Resources Code section 21080.5 "exempts the Coastal Commission's regulatory program from CEQA requirements for preparation of an [EIR]." (See *Hines v. California Coastal Commission* (2010) 186 Cal.App.4th 830, 852; see also *La Costa Beach Homeowners' Assn. v. California Coastal Com.* (2002) 101 Cal.App.4th 804, 819.)

Accordingly, currently the Original PWM Project is not on track to be able to deliver 3,500 afy to Cal-Am – and it is unclear whether such delivery amount will ever be achieved given the issues the project is facing. The problems with the Original PWM Project raise significant uncertainty regarding the technological feasibility of the PWM Expansion and its ability to provide the claimed 2,250 afy. Accordingly, at this time, the PWM Expansion does not satisfy the test of being "capable of being accomplished in a successful manner."

Second, there remains significant uncertainty surrounding the availability of source waters for the PWM Expansion, which raises doubts that the PWM Expansion can be accomplished in a successful manner. Without secure source waters, the PWM Expansion is not feasible. The following are examples of issues that have been identified regarding the adequacy and sufficiency of source waters for the PWM Expansion:

- **ARWRA Source Waters**. The Amended and Restated Water Recycling Agreement ("ARWRA") between M1W and MCWRA sets forth the responsibilities for construction, operation, and financing of new source water for the Original PWM Project. (January 30, 2020 Cal-Am Comments on PWM Expansion Draft SEIR, p. 26.) Multiple outstanding conditions are required to be completed before the ARWRA can become effective. (PWM Expansion Draft SEIR, p. 4.18-5.)[36] Therefore, the reliability of certain ARWRA source waters is speculative due to the significant conditions precedent that must be met for the sources of water to become fully secured. (See Ex. 20, pp. A-16 to A-17.)

- **Questionable Modifications of Source Waters**. Source waters identified for the PWM Expansion have been modified throughout the environmental review process without adequate analysis or justification, raising doubts as to their reliability and ultimately the feasibility of the PWM Expansion. (Ex. 20, p. A-16.) For instance, though the Draft SEIR initially identified Tembladero Slough as a reliable water source, M1W later conceded that the source was unreliable and it has since been removed from the Final SEIR's source water analysis. (PWM Expansion Final SEIR, Responses to Comments VV-85 to VV-86.) Further, the Final SEIR increasingly relies upon the availability of certain municipal wastewater flows even though it acknowledges that such flows have not been previously metered and that the estimates are based in part upon assumptions. (*Id.*, pp. 24-25 [Master Response #3, pp. 3-11 to 3-12].) When confronted with comments regarding the reliability of water from agricultural produce wash, Lake El Estero, or the Salinas Storm Water Collection System, M1W elected to evaluate source water scenarios where such sources are not used by the PWM Expansion, rather than demonstrate their reliability. (*Id.*, Responses to Comments VV-93 to VV-94 and VV-96 to VV-99.) M1W's inability to establish a consistent list of source waters for the PWM Expansion confirms that the project

[36] M1W, PWM Expansion Draft SEIR (November 7, 2019), available at https://purewatermonterey.org/wp/wp-content/uploads/Main-Body-of-M1W-Draft-Supplemental-EIR-Nov-7-2019.pdf.

lacks an adequate source water supply and raises serious questions about the PWM Expansion's feasibility. (Ex. 20, p. A-21.)

- **Disputed Agricultural Source Waters**. The City of Salinas has disputed M1W's rights to use the City's agricultural produce wash water for the PWM Expansion and asserts that the ARWRA only permits M1W to use agricultural produce wash water for the Original PWM Project, and not for the PWM Expansion. (City of Salinas Letter to M1W, April 27, 2020, attached hereto as **Exhibit 27**.) The City also explains that these water sources will not be available for the PWM Expansion because "the City fully intends to use available Agricultural Wash Water for its own purposes, including to support farmers, ranchers and the City's agriculture industry, as determined by the City in its sole and absolute discretion." (*Id.*, p. 2.) Therefore, agricultural produce wash water from the City of Salinas cannot be considered a reliable water source for the PWM Expansion.

- **Source Water Quality Issues**. Agricultural wash water, upon which both the Original PWM Project and the PWM Expansion heavily rely, does not appear to be a reliable source water for the PWM. The treatment technologies currently used by the Original PWM Project, and proposed for use in the PWM Expansion, may be incapable of treating agricultural wash waters to safe levels. (See Ex. 26; see also Hazen and Sawyer, Peer Review of Supply and Demand for Water on the Monterey Peninsula (Jan. 22, 2020) ("Hzen Memo"), p. 9, attached hereto as **Exhibit 28**.) Indeed, M1W staff has admitted that no agricultural wash water has been treated by the Original PWM Project to this point. (See Ex. 26.)

- **Overestimation of Water Supplies During Drought Years**. Source water availability for the PWM Expansion has not been analyzed during multi-year drought conditions. (CEQA Guidelines, Appx. G, § XIX(b); Ex. 20, p. A-20.) Therefore, it is unclear whether PWM Expansion can serve as a viable alternative to the Project during such conditions.

Overall, the PWM Expansion's haphazard and incomplete source water analysis raises serious doubts as to the security and adequacy of source waters and whether the PWM Expansion is capable of being accomplished in a successful manner such that it can be considered a feasible alternative to the Project.

b. *"Within A Reasonable Period of Time"*

The Staff Report claims that the PWM Expansion is anticipated to be completed in sufficient time to meet the CDO's December 2021 deadline. However, as explained above, the PWM Expansion is no longer moving forward because the M1W Board denied certification of the PWM Expansion Final SEIR, and M1W does not have funds to remedy the inadequacies in the SEIR. (See Ex. 18, M1W Board of Directors Staff Report; Ex. 17, June 8, 2020 M1W Letter to Cal-Am, p. 1.) In addition, M1W is currently estimating a nearly eight-month delay in implementation of the Original PWM Project. (See Ex. 21, p. 1).) It is likely that the PWM Expansion, if it were ever approved by the M1W Board, would face similar delays—indeed, the PWM Expansion

would likely face further delays caused by the additional approvals, including the need to secure certain water rights and a Water Purchase Agreement, that are still necessary for the PWM Expansion to operate. (See Section I.4, *infra*.) As noted by the State Water Board in a recent letter to the Commission, the timeline for implementation of the PWM Expansion has been delayed well beyond the CDO deadline, and the PWM Expansion requires "approvals and funding for which the details are uncertain and the timeline is indefinite." (See May 8, 2020 State Water Board Letter to John Ainsworth, Coastal Commission, p. 4.) Therefore, "[i]t is uncertain whether or when the proposed [PWM Expansion] may proceed beyond its currently pending environmental review . . ." (*Id.*, pp. 4-5.) Accordingly, there is insufficient evidence to conclude that the PWM Expansion can be completed "within a reasonable period of time" such that it can be considered a feasible alternative to the Project.

c. *"Taking Into Account Economic, Environmental, Social, and Technological Factors"*

- **Economic**. *The Staff Report claims that expected costs associated with the Project are much higher than the PWM Expansion, asserting that construction, operation and maintenance, and water rate costs for the Project would all be higher than for the PWM Expansion. (Staff Report, p. 81.)*

    - The Staff Report's attempt to compare Project costs with costs associated with the PWM Expansion is inaccurate, as the PWM Expansion costs quoted by the Staff Report likely do not reflect realistic projections of construction, operation and maintenance, and water rate costs for the PWM Expansion. In reality, there is significant uncertainty regarding the costs of PWM Expansion, given that the Original PWM Project is already facing major cost overruns and resulting increases in projected water rates. During the CPUC proceedings on the Project, Cal-Am, M1W, and MPWMD submitted testimony projecting a year 1 water rate of $1,720 per acre-foot for Original PWM Project product water. In June 2020, M1W staff and consultants presented revised cost estimates for Original PWM Project water based on recent construction and operational issues, projecting an increase in year 1 Original PWM Project water rates up to $3,678 per acre-foot, representing a 114% increase in costs. (See Ex. 25, PWM Status Update Presentation.) Costs for PWM Project water are therefore continuing to increase. (See June 12, 2020 Cal-Am Advice Letter No. 1298 to the CPUC, attached hereto as **Exhibit 29**.) It is highly likely that the PWM Expansion would face similar cost increases, rendering the Staff Report's cost comparisons meaningless.

- **Environmental**. *The Staff Report asserts that the Project would result in significant adverse effects on coastal resources, while the PWM Expansion, which would be constructed outside the coastal zone, would have few environmental impacts in comparison. (Staff Report, p. 81.)*

    - As explained in Section I.5, *infra*, the Staff Report's conclusion that the PWM Expansion would have fewer environmental impacts than the Project is not

based on substantial evidence, and does not account for either the PWM Expansion SEIR or the numerous comment letters pointing out flaws in the SEIR's environmental analysis. Moreover, staff's conclusion that the Project would have significant adverse effects on coastal resources is belied by the EIR/EIS, which concluded that, with implementation of all feasible and enforceable mitigation measures, the Project would not result in substantial adverse impacts to sensitive habitats or marine life and water quality. (See Sections I.A and I.C, *supra*.) Further, as explained in Cal-Am's comments on the PWM Expansion Draft SEIR, M1W has thus far failed to evaluate potential impacts to the SVGB related to seawater intrusion, if the PWM Expansion is constructed in lieu of the Project. (See January 30, 2020 Cal-Am Comments on PWM Expansion Draft SEIR, pp. 17-18, separately submitted to staff on April 9, 2020 by the Coalition of Peninsula Businesses; Ex. 20, pp. A-9 to A-10.) As such, the Staff Report does not demonstrate that the PWM Expansion would have fewer environmental impacts than the Project.

- **Social**. *The Staff Report argues that while both projects would provide sufficient water to Cal-Am's service area, the Project would have greater environmental justice impacts on low-income ratepayers and other vulnerable communities. (Staff Report, p. 81.)*

    - As explained above, the conclusion that the PWM Expansion can provide a sufficient water supply for the Monterey Peninsula is not based on substantial evidence. In reality, only the Project, not the PWM Expansion has been proven to be capable of providing a reliable, drought-proof water supply for the Peninsula's most vulnerable communities. Notably, the PWM Expansion would involve taking additional waters from the disadvantaged community of Salinas in order to treat and provide that source water to the wealthier communities on the Monterey Peninsula. (See City of Salinas Comment Letter on PWM Expansion Draft SEIR, attached hereto as **Exhibit 30**; see also Letter from Chris Lopez, Monterey County Supervisor to Commission, attached hereto as **Exhibit 31**; SB 535 Disadvantaged Communities, Cal. Office of Environmental Health Hazard Assessment, https://oehha.ca.gov/calenviroscreen/sb535 [providing a map of SB 535 disadvantaged communities in California].) The Staff Report does not evaluate this potential impact on the vulnerable agricultural communities in Salinas. (See Section H, *supra*.)

- **Technological**. *The Staff Report claims that both the PWM Expansion and the Project will rely on proven technology. (Staff Report, p. 81.)*

    - While the Staff Report is correct that the Project will utilize proven slant well intake and ASR technology, it dramatically misrepresents the reliability of the technology proposed for use in the PWM Expansion. As discussed above, the Original PWM Project has faced significant technological roadblocks since its inception, including failures in injection and extraction wells and the

unavailability of certain water sources. (See Section I.2.a, *supra*.) The PWM Expansion would rely upon the same technology as the Original PWM Project—as such, there is every reason to suspect that the PWM Expansion would face similar technical issues. The numerous technical flaws in both the Original PWM Project and the PWM Expansion make clear that in reality, the Project is by far the more technologically feasible water supply solution.

In sum, the Staff Report fails to demonstrate that the PWM Expansion constitutes a feasible alternative to the reliable, drought-proof water supply to be provided by the Project.

MCWD Contention: MCWD asserts that Cal-Am's criticisms of the PWM Expansion are financially motivated, in the interest of obtaining a return on capital costs expended in constructing the Project. (MCWD Letter, p. 9.)

Cal-Am Response: MCWD is incorrect. Cal-Am's interest in constructing the Project is to ensure that it complies with the State Water Board's CDO and develops an alternative water supply to replace unauthorized Carmel River diversions, to ensure that the Monterey Peninsula has a long-term, reliable, and drought-proof water supply. Cal-Am is a regulated public utility whose rates are set by the CPUC. Cal-Am's critiques of the PWM Expansion are focused on ensuring that the Monterey Peninsula is not saddled with an inadequate and unreliable water supply in the face of continued mandatory reductions in Cal-Am's Carmel River withdrawals.

Moreover, MCWD fails to acknowledge that the CPUC has placed a cap on capital costs that Cal-Am can expect to recover from ratepayers for the Project. (See CPUC Decision D.18.09.017, p. 210.) In addition, in accordance with a settlement reached among Cal-Am, MPWMD, M1W, Surfrider Foundation, LandWatch Monterey County, Sierra Club, Monterey County, Planning and Conservation League, and Monterey County Farm Bureau, among others, the CPUC specifically authorized four financing elements: a construction funding charge, state revolving fund debt, securitized debt, and equity, and limited Cal-Am's equity investment to 27% with the use of securitized debt.

Staff Report Contention #32: The Staff Report asserts that Cal-Am currently lacks approval to use a shared key pipeline component owned by MCWD. (Staff Report, p. 81.) MCWD submitted a letter on November 13, 2019, similarly arguing that the existing agreements between Cal-Am and MCWD do not permit Cal-Am to use the pipeline. (MCWD Letter, p. 6.)

Cal-Am Response: On March 10, 2009, Cal-Am and MCWD entered into a Potable Water Wheeling Agreement ("Wheeling Agreement") for the construction and shared use of a pipeline and related appurtenances ("Shared Pipeline") to convey potable water along and within General Jim Moore Boulevard, from Coe Avenue in the City of Seaside to the border of the City of Del Rey Oaks near Plumas Avenue, approximately 1.85 miles south. The Wheeling Agreement allows Cal-Am to use any unused capacity in the Shared Pipeline to convey potable water that meets statutory and regulatory quality standards for domestic use and consumption, at a monthly wheeling charge of $2,000.

(See September 19, 2019 Cal-Am Response to August 22, 2019, Notice of Incomplete Application, pp. 1-4.)

The Shared Pipeline is not before the Commission as the Staff Report and MCWD fail to recognize that the Shared Pipeline is outside of the Coastal Zone and therefore is beyond the Commission's jurisdiction. (See, e.g., *Sierra Club*, *supra*, 35 Cal.4th at p. 860.) Further, as explained in Cal-Am's response to the Commission's August 22, 2019 Notice of Incomplete Application, the Wheeling Agreement and Water Code sections 1810-1814 provide Cal-Am with the legal right to use the Shared Pipeline while there is sufficient capacity available in the Shared Pipeline. (See September 19, 2019 Cal-Am Response to August 22, 2019, Notice of Incomplete Application, pp. 1-4.) Moreover, MCWD is obligated to adhere to the terms of the Wheeling Agreement and to "act in a reasonable manner consistent with the requirements of law to facilitate the voluntary sale, lease, or exchange of water[.]" (*Central San Joaquin Water Conservation Dist. v. Stockton East Water Dist.* (2016) 7 Cal.App.5th 1041, 1047.) Further, the Shared Pipeline has adequate capacity to serve CalAm's uses given that the Project will produce 6.4 mgd of desalinated water and the capacity in the Shared Pipeline is 15.9 mgd on an average day and 14.3 mgd at peak hour. (See September 19, 2019 Cal-Am Response to August 22, 2019, Notice of Incomplete Application, pp. 3-4.) MCWD's arguments to the contrary have been rejected by the CPUC and the California Supreme Court. (See Order Denying Petitions for Writ of Review, *Marina Coast Water District, et al. v. Public Utilities Commission*, Case No. S253585 (Aug. 28, 2019).)

MCWD made similar assertions regarding Cal-Am's pipeline use in a Staff Report where it recommended adoption of a resolution concluding that there is not sufficient unused capacity available in MCWD's pipeline to accommodate shared use for Project water. (See Staff Report for October 21, 2019 MCWD Agenda Item 11-A, pp. 5-6, attached hereto as **Exhibit 32**.) MCWD staff asserted then, as they do now, that the existing Wheeling Agreement between MCWD and Cal-Am does not permit Cal-Am to use the Shared Pipeline for transportation of Project product water. (*Id.*, p. 1.) As explained by Cal-Am in an October 21, 2019, response to the MCWD Staff Report, the only limitation in the Wheeling Agreement is that the pipeline be used to convey potable water meeting all statutory and regulatory quality requirements for human domestic use and consumption. (October 21, 2019 Cal-Am Letter to MCWD, p. 2, attached hereto as **Exhibit 33**.) The only relevant limitation in the California Water Code is that Cal-Am use the Shared Pipeline to convey potable water based on water quality standards, which will be achieved by Project water. (*Ibid.*) Moreover, Cal-Am explained that as MCWD does not currently use the pipeline at all, there is currently excess capacity in the pipeline, regardless of any capacity restraints that could possibly occur in the future. (*Ibid.*)

Nevertheless, if necessary, Cal-Am could construct a product water pipeline running parallel to the MCWD pipeline, within the same area and outside the Coastal Zone. Therefore, the Commission should not consider the MCWD pipeline as an issue of Project feasibility.

MCWD Contention: Cal-Am's use of the Shared Pipeline for the transportation of Project water would conflict with State Water Board's requirement that ASR water flow south to north in the

winter to be injected at the same time desalinated water would need to flow north to south in the same pipeline. (MCWD Letter, p. 6.)

Cal-Am Response: MCWD is simply incorrect in asserting that the State Water Board has imposed some regulatory requirement on directional flows within the Shared Pipeline. Instead, directional flow within the Shared Pipeline is dictated by water supply planning and a determination of when the Shared Pipeline will be used to convey desalinated Project water versus ASR flows. While numerous factors must be taken into account in determining which water source while be utilized at any given time, the State Water Board does not play any role in determining when the Shared Pipeline may be used for ASR water or Project product water.

3. Supply and Demand

Staff Report Contention #33: The Staff Report asserts that an "updated analysis" of Peninsula water supply and demand, set forth in the Stoldt Memo, demonstrates a decrease in customer demand in Cal-Am's service area, such that the PWM Expansion is a feasible alternative to the Project. (Staff Report, p. 82.) Based on updated data from 2018, the Stoldt Memo projects that current demand in the Monterey District service area is between 12,299 and 12,656 afy, rather than the 14,000 afy set forth in the CPUC's decision. (Id., pp. 87-89.) Stoldt cuts demand based on assumed reductions in existing demand, Pebble Beach water entitlements, water demand for hospitality industry rebounds, and allocations for legal lots of record. (Id., p. 87.) The Staff Report adopts these projections without any further analysis, and applies them to conclude that PWM Expansion is a feasible alternative to the Project, capable of meeting water demands on the Monterey Peninsula. Similarly, Public Water Now argues that the Stoldt Memo supports the implementation of the PWM Expansion. (See Public Water Now Letter, p. 1.)

Cal-Am Response: In addition to the responses to the Staff Report's analysis of supply and demand provided below, Cal-Am will provide the Commission with a separate response that accounts for additional reports prepared by Stoldt and other project opponents, including MCWD, since the release of the Staff Report. Nonetheless, Cal-Am provides initial responses below to the water supply and demand contentions in the Staff Report, which uses the Stoldt Memo and its modified supply and demand figures to support its conclusion that the PWM Expansion is a feasible Project alternative. As explained below, this conclusion is wholly improper and is unsupported by substantial evidence.

a. *The CPUC Made Binding Determinations of Supply and Demand*

The Staff Report's conclusions regarding supply and demand and its complete reliance on the Stoldt Memo ignore the conclusions of the CPUC, the agency that is charged by statute with exclusive jurisdiction to determine utility supply and demand. "[T]he jurisdiction to determine the adequacy of service actually being rendered by a public utility under its franchise is vested exclusively in the [CPUC] when it has elected to determine whether the service is inadequate." (See *Citizens Utilities Company of California v. Super. Ct.* (1976) 56 Cal.App.3d 399, 408; see also *City of Oakland v. Key System* (1944) 64 Cal.App.2d 427, 435 [exclusive jurisdiction vested in CPUC to

determine adequacy of service rendered by public utility].) Therefore, neither the Commission, nor MPWMD, has the authority to reverse course and make binding determinations as to the levels of supply and demand within Cal-Am's service area—that authority rests solely with the CPUC. (See CPUC Decision D.18-09-017, pp. 167-171, 194-195.)

Moreover, numerous parties, including MPWMD, participated in the supply and demand process before the CPUC and were given the opportunity to testify and present evidence ***under oath*** before the CPUC arrived at its decision. The CPUC considered all of this testimony to determine that Cal-Am's future customer demand is 14,000 afy. This determination from the CPUC constitutes the only unbiased analysis of Peninsula water supply and demand—by contrast, the analyses put forward by MCWD, MPWMD, and others, are the work of entities with specific motivations seeking to have the Project fail. As noted in the EIR/EIS, "[t]he [water] demand estimates provided by CalAm and others throughout this CEQA/NEPA process have been independently reviewed and assessed by the Lead Agencies." (Final EIR/EIS, p. 8.5-726.) More recently, the State Water Board explicitly stated that it "does not have a basis to conclude that the Public Utilities Commission's prior analysis and determinations regarding the water demand, sizing, reliability, or diversity of supply were unreasonable, invalid, or outdated." (See May 8, 2020 State Water Board Letter to John Ainsworth, Coastal Commission, p. 4.) Accordingly, it is the CPUC supply and demand levels that should be utilized by staff, not those proposed by the Stoldt Memo.

b. *The Staff Report Fails to Account for Critiques of the Stoldt Memo*

The Staff Report fails to acknowledge other letters received prior to publication of the Staff Report that refute key assumptions in the Stoldt Memo. Specifically, Cal-Am submitted a letter to the Commission, dated October 15, 2019, responding to the Stoldt Memo, which does not appear to have been included in the administrative record. As such, Cal-Am's October 15 letter is attached hereto as **Exhibit 34** and is hereby incorporated by reference. The Coalition of Peninsula Businesses also submitted a letter to MPWMD refuting key assumptions in the Stoldt Memo,[37] while Pebble Beach Company submitted correspondence to the Commission refuting Stoldt's claims. Neither of these letters from key stakeholders were mentioned in the Staff Report.

Moreover, since the release of the Staff Report, the engineering firm of Hazen & Sawyer, worldwide experts in drinking water and water supply, has conducted a thorough peer review of the Stoldt Memo (the "Hazen Memo"), refuting the flawed positions set forth by the Stoldt Memo—the Hazen Memo is also attached hereto as Exhibit 28. The Hazen Memo concluded that Stoldt's water supply assessments do not meet engineering practices of reliability and resiliency necessary to provide a reliable and adequate water supply under California law, and that the Project is necessary to provide a safe and reliable water supply to meet Peninsula demand, regardless of whether the PWM Expansion is ever developed. Further, a group of City Managers, representing the

[37] A copy of the Coalition for Peninsula Businesses' September 24, 2019, letter to MPWMD is attached hereto as **Exhibit 35**.

Monterey Peninsula cities of Monterey, Carmel, Del Rey Oaks, Sand City, and Pacific Grove, have voiced significant concerns to MPWMD regarding the supply and demand estimates put forth in the Stoldt Memo, pointing out that use of Stoldt's estimates and implementation of the PWM Expansion will result in "fewer economic opportunities for our residents and our children, increased rents, lower quality of life for our entire region and loss of basic rights for local governments to make majority based decisions." (See City Managers' May 14, 2020 letter to MPWMD is attached hereto as **Exhibit 36**.)

c. *The Stoldt Memo's Supply and Demand Estimates Are Flawed*

A summary of the Stoldt Memo's positions, and responses provided by Cal-Am, the Hazen Memo, and others, is provided below:

- **Current Demand**. Stoldt asserts that, based on updated data from 2018, existing customer demand in Cal-Am's service area should be reduced from the 12,000 afy decided upon by the CPUC, to 11,232 afy. (Staff Report, p. 87.) However, Stoldt's methodology for projecting existing demand based upon ten-year, five-year, and three-year averages is flawed and relies on projections that are inconsistent with the California Waterworks Standard and CPUC General Order 103-A, which require that demand be determined based on the maximum month demand in a ten-year period, rather than by simply taking the average of the maximum months over any given period. (See Ex. 34, p. 12; California Waterworks Standards, Cal. Code Regs., tit. 22, § 64554, subd. (b)(2)(A); see also CPUC Decision D.18-09-017, pp. 21-23.) Moreover, any argument that the addition of data from 2018 results in a decrease in average demand is undercut by Stoldt's own figures, which show an increase in demand in 2017 and 2018. (See Staff Report, p. 90.) The CPUC also has specifically rejected any projection of existing customer demand that assumes downward trends in water use on the Monterey Peninsula. (See CPUC Decision D.18-09-017, pp. 169-170.) The California Supreme Court also rejected these same arguments from the City of Marina in its denial of Marina's challenge to the CPUC's Decision. (See City of Marina Amended Petition for Writ of Review, p. 153, attached hereto as **Exhibit 37**; see also Order Denying Petitions for Writ of Review, *Marina Coast Water District, et al. v. Public Utilities Commission*, Case No. S253585 (Aug. 28, 2019).)

- **Pebble Beach Build-Out**. The Stoldt Memo also projects a decrease in the water allocated for build-out in the Pebble Beach area, from 325 afy to between 103 and 160 afy. (Staff Report, pp. 87-88.) Stoldt asserts that Pebble Beach demand is actually lower, around 299 afy, and is split between two categories—145 afy for expected build-out, which Stoldt argues was overstated by the CPUC, and 154 afy in "other entitlement demand," which Stoldt asserts will "go away" when a new water supply comes online. (*Ibid.*) However, the 154 afy in "other entitlement demand" will not simply "go away" when a new water supply comes online—rather, pursuant to MPWMD's Ordinance 109, that entitlement may be used by Pebble Beach for any lawful use. (See Ex. 34, p. 14.) Moreover, estimated demand for buildout cannot be reduced further, as long-term supply planning requires Cal-Am to ignore temporary reductions through conservation measures and part time use of homes, and instead plan for pending projects like the Spyglass Hotel. (*Ibid.*; see also Pebble Beach

Company Letter to CCC.) Indeed, Pebble Beach Company has expressly rejected the assumptions set forth in the Stoldt Memo, and has stated that they intend to "fully utilize" the entirety of their entitlement. (Pebble Beach Company Letter to CCC, p. 2.)

- **Economic Recovery**. Stoldt also asserts that Project demand to accommodate economic recovery and tourism bounce back on the Monterey Peninsula should be reduced from 500 afy to between 100 and 250 afy, arguing that tourism and occupancy rates have returned to pre-2001 levels without any increase in water use, thanks in large part to the implementation of conservation measures. (Staff Report, p. 88.) Both the Stoldt Memo and the Staff Report ignore the fact that MPWMD made nearly identical arguments before the CPUC, which the CPUC rejected in adopting 500 afy as the appropriate demand level for economic recovery. (See Ex. 34, p. 13.) Moreover, as explained by the Coalition for Peninsula Businesses, the occupancy statistics relied upon by the Stoldt Memo are county-wide, not Peninsula-specific. (See Ex. 35, p. 4).) Additionally, the 500 afy for economic recovery is not intended to include only a return to prior levels of occupancy on the Peninsula, but to also accommodate additional water increases as the rest of the Peninsula economy recovers, including a number of new lodging facilities that will be constructed in the next few years. (*Ibid.*)

- **Legal Lots of Record**. Stoldt argues that demand allocated for existing legal lots of record should be reduced from 1,180 afy to between 864 and 1,014 afy, which Stoldt alleges is due to implementation of conservation programs, and the possibility that some lots have already been built, are unbuildable, have been remodeled, or that general plans and housing elements have been revised. (Staff Report, p. 89.) However, Stoldt's assertions are based solely on speculation and are contradicted by MPWMD's own arguments before the CPUC. Specifically, during the CPUC process, MPWMD argued that 1,180 afy was a reasonable estimate of future water demand for legal lots of record but Stoldt fails to provide any reason for MPWMD now changing its position. (See Ex. 34, pp. 12-13.) Indeed, the opposite conclusion is much more likely—once the CDO is lifted and mandatory conservation measures are no longer in place, pent-up demand for housing on the Peninsula will drive up demand for water. The City of Monterey made arguments to this effect in a letter to MPWMD commenting on the Stoldt Memo, stating that demand for housing in Monterey, and related demand for additional water supplies, exceeds the Stoldt Memo's projections. (See February 4, 2020 Letter from City of Monterey to MPWMD, attached hereto as **Exhibit 38**.) The CPUC agreed with Cal-Am's positions regarding pent-up demand, stating that Cal-Am's projection for demand for legal lots of record at 1,180 afy was "reasonable" and that "development is halted pending adequate water." (See CPUC Decision D.18-09-017, p. 50.)

- **Future Demand**. As discussed above, the Stoldt Memo and the Staff Report's use of three-year, five-year, and ten-year demand averages to project present and future water demand is inconsistent with the California Waterworks Standards and CPUC General Order 103-A. (See Staff Report, pp. 86-87, 90-91; see also Ex. 34, p. 12; California Waterworks Standards, Cal. Code Regs., tit. 22, § 64554, subd. (b)(2)(A);

CPUC Decision D.18-09-017, pp. 21-23.) Further, the CPUC specifically rejected MPWMD's method of projecting demand based on the most recent five-year average, given the fluctuations in monthly and annual demand in the area over the last decade. (See CPUC Decision D.18-09-017, pp. 57-58.) If the Stoldt Memo instead used the maximum demand year to project demand, as is required, the Monterey Peninsula water supply in 2020 without desalination, but with PWM Expansion, would already be at a deficit of more than 200 afy, according to Stoldt's own tables. (See Ex. 34, p. 15.) Even assuming Stoldt's depressed demand figures, Peninsula water supply with the PWM Expansion, but without the Project, would only be able to meet Peninsula five-year demand for a maximum of three years before falling short. (See Ex. 28, pp. 10-11.) Without implementation of the Project, the gap between available water supplies and total Peninsula demand only will continue to widen over time, leading to ongoing moratoria on non-essential water uses.

d. *The Stoldt Memo is Contradicted by Stoldt's Prior Statements*

Many of the positions taken in the Stoldt Memo directly contradict arguments put forward by Stoldt during earlier proceedings related to the Project before the State Water Board. Specifically, the Stoldt Memo asserts that Monterey Peninsula demand estimates should be reduced due to implementation of various water conservation efforts, which Stoldt argues represent a permanent reduction in demand. (Staff Report, pp. 88-89.) However, in a December 14, 2015 letter to the State Water Board regarding proposed modifications to Cal-Am's diversion limits from the Carmel River, Stoldt explicitly argues that recent decreases in demand should not be used to justify reductions in Cal-Am's diversion limits, as such reductions were likely due to extensive water conservation campaigns carried out by Cal-Am and MPWMD. (See December 14, 2015 MPWMD Letter to State Water Board, p. 2, attached hereto as **Exhibit 39**.) Stoldt goes on to argue that it cannot be assumed that such reductions in demand are permanent. (*Ibid.*) Stoldt also notes that following periods of drought, such as the drought conditions currently seen on the Monterey Peninsula, demand for water typically rebounds as irrigation uses increase and conservation behaviors relax. (*Ibid.*) Moreover, as another example of Stoldt taking inconsistent positions, in a series of emails to Cal-Am employees and other interested parties regarding the State Water Board proceedings, Stoldt argues that depressed demand levels seen in recent years cannot be used to justify reductions in Cal-Am's diversions from the Carmel River, as: (1) drought awareness and corresponding cuts in water use are likely to fade; (2) economic activity on the Peninsula has been cut due to implementation of the CDO; and (3) demand rebounds are likely once drought conditions abate. (See March 20, 2016 Email from D. Stoldt to R. MacLean, attached hereto as **Exhibit 40**; see also March 17, 2016 Email from D. Stoldt to J. Burnett, as **Exhibit 41**.) Stoldt therefore has taken contrary positions on many of the assumptions used to justify the Stoldt Memo and, by extension, the Staff Report conclusion that the PWM Expansion is a feasible Project alternative. As a result, it is inappropriate for staff to rely on the Stoldt Memo's assumptions, particularly where supply and demand already has been evaluated and determined through an unbiased, public evidentiary process before the CPUC—the state agency charged with making utility supply and demand determinations.

e. *There Is No Evidence to Suggest PWM Expansion Can Meet Maximum Month Demand*

After describing Stoldt's "updated" demand figures, the Staff Report asserts that the PWM Expansion can serve as an alternative to the Project because the PWM Expansion can meet Cal-Am's maximum daily demand ("MDD") and peak hour demand ("PHD"). (Staff Report, p. 93; see also Exhibit 9, p. 1.) To reach this conclusion, staff relies on a one-page analysis of 10-year MDD and PHD prepared by Stoldt and included as Exhibit 9 to the Staff Report. (*Ibid.*) However, Stoldt's analysis does not demonstrate that the PWM Expansion can meet maximum month demand ("MMD") as required by the California Waterworks Standards (Cal. Code Regs., tit. 22, § 64554, subds. (a), (b)(2)). Rather, Stoldt only uses calculations based on the MMD from July 2012 to show that the PWM Expansion could meet the projected MDD and PHD from that one month. (See Staff Report, Exhibit 9.) As explained in the testimony of Ian Crooks and Richard Svindland before the CPUC, using only MDD and PHD to project demand is inappropriate in this case because public water systems must be able to "deliver water supplies at near MDD levels during dry years over a few maximum months of demands." (See September 27, 2017 Crooks Direct Testimony, pp. 6, 15-16, excerpts attached hereto as **Exhibit 42**.) The only way to ensure this capacity is by calculating demand based on MMD. (*Ibid.*) Failure to accommodate MMD, and thereby failing to accommodate uncertainty in water supply due to natural pressures such as climate change and drought, will mean that "water supplies will fall short over the duration of maximum month demands." (See October 13, 2017 Crooks Rebuttal Testimony, p. 9, excerpts attached hereto as **Exhibit 43**.)

Stoldt's conclusion that the PWM Expansion can meet MDD and PHD also relies on the availability of drought reserves to meet such demand—however, Stoldt also assumes that no drought conditions will occur on the Monterey Peninsula between now and 2034, allowing for the buildup of such reserves. (See Staff Report, Ex. 9 9, p. 2; see also *id.*, Ex. 10, p. 3.) As explained below, the assumption that the Peninsula will not experience drought conditions over any significant period is wholly untenable, given that California has experienced a multi-year drought in nearly every decade since 1917, and recharge of groundwater reserves is essentially unavailable under drought conditions. (See Section I.3.f, h, *infra*.)

f. *Supplies of ASR Water Assumed by Staff Are Not Guaranteed*

The Staff Report asserts that PWM Expansion is capable of providing a drought-proof supply to the Monterey Peninsula because of the potential for the PWM Expansion to provide additional aquifer storage and recovery ("ASR") water. The Staff Report assumes that ASR water supply is available each year, such that the Peninsula can build up a reserve of ASR water to compensate for extended drought conditions. (Staff Report, pp. 93-94; see also Exhibit 10.) However, the Staff Report ignores the fact that ASR recharge is unreliable and takes place intermittently, at best. Currently, ASR has the capacity to reinject roughly 1,300 afy, under ideal conditions— however, between 1997 and 2019, annual ASR reinjection only reached the 1,300 afy assumed by the Staff Report twice, averaging only 450 afy over a 22 year period. (See Table of ASR Injection

and Recovery Totals, attached hereto as **Exhibit 44**.) In fact, in 2014, 0 afy in ASR water was injected for storage. (*Ibid.*) As explained in the Hazen Memo, ASR water availability is reduced to 63% in a single dry year, and even further reduced to 4% following three dry years. (See Ex. 28, pp. 6-7.) During drought conditions, ASR water is essentially unavailable. (*Id.*, p. 8.) There is simply no guarantee that sufficient water is available for ASR reinjection in any given year. Further, assuming constant, maximum ASR water availability is inconsistent with the requirement that projections of supply must be based on an assessment of available water in dry and multiple dry water years, and must include the source's lowest anticipated daily yield. (See Wat. Code, § 10635, subd. (a); Cal. Code Regs., tit. 22, § 64554, subd. (k).) Without ASR, the PWM Expansion would yield only 9,994 afy in reliable supplies, below both the Stoldt Memo's 10-year and 5-year annual averages, when considering projected growth.

g. *PWM Expansion Cannot Supply Water to Meet Peninsula Regional Housing Goals*

Because the PWM Expansion would fail to provide a water supply sufficient to accommodate increased demand and population growth on the Monterey Peninsula, it also would depress the buildout of necessary affordable housing on the Peninsula, as dictated by the Regional Needs Housing Assessment ("RHNA") for the Monterey Bay Area.[38] At the December 17, 2019, meeting of the MPWMD Water Demand Committee, Stoldt provided a memorandum quantifying the RHNA goals for each jurisdiction on the Monterey Peninsula, and estimating the water supply required to meet these goals. A copy of Stoldt's memorandum regarding Monterey Peninsula RHNA goals and estimated water required to meet such goals is attached hereto as **Exhibit 45**. In that document, Stoldt estimated that a water supply of 190 afy will be needed to meet the Peninsula's RHNA goals. However, as explained in the Hazen Memo, Peninsula water supply with the PWM Expansion, but without the Project, will only be able to meet Peninsula demand, even assuming Stoldt's depressed five-year average demand estimates, for a maximum of three years. (See Ex. 28, pp. 10-11.) Based on projections in the Stoldt Memo, by 2024, demand for water will exceed the 10,000 afy supply that will be available with the PWM Expansion, leaving the Peninsula without any excess water supply to accommodate development of legal lots of record and regional housing growth. (*Ibid.*) Moreover, even assuming Stoldt's estimates, the PWM Expansion would not supply sufficient water to meet the RHNA goals as of 2020. Specifically, Stoldt's five-year average demand estimates project a 2020 demand of 9,825 afy and Stoldt finds that water supply with the PWM Expansion, but without the Project, would provide 9,994 afy. This leaves only 169 afy (9,994 – 9,825 = 169) to meet RHNA goals in 2020, but this is already less than the 190 afy set forth by Stoldt in his December 2019 memorandum. (See *id.*, pp. 9-10.) Therefore, even assuming the demand estimates set forth in the Stoldt Memo and the Staff Report, the PWM Expansion will not supply sufficient water to meet even the RHNA needs set forth in Stoldt's December 2019 memorandum.

---

[38] The 2014-2023 RHNA Plan for the Monterey Bay area is available here: https://ambag.org/sites/default/files/documents/RHNP%202014-2023_Final_revised_PDFA.pdf.

h. *The Staff Report Relies on a Memorandum Doctored by Stoldt*

Finally, the Staff Report's assumptions regarding ASR supply are based entirely upon Exhibit 10 to the Staff Report, which is an excerpt from a draft technical memorandum prepared as an exhibit to the Draft SEIR for the PWM Expansion, which was released to the public on November 7, 2019. As explained in Cal-Am's November 11, 2019, letter to the boards of M1W and MPWMD, attached hereto as **Exhibit 46**, it appears that Stoldt intentionally manipulated Exhibit 10 to make it appear that the technical memorandum's authors had concluded the ASR reserve will be sufficient to meet a 4-year drought by 2034—possibly in an effort to influence the Commission's consideration of the Project. (See Staff Report, Ex. 10, p. 3.) As reported by Rob Wellington, legal counsel to M1W, in his November 7, 2019, memo to the M1W Board Chair and Board Members, Stoldt not only cut and pasted portions of the technical memorandum to create Exhibit 10, he also included the following concluding sentence that was not contained in the technical memorandum: "This shows that the built-up reservoir of ASR in storage is sufficient to meet a 4-year drought, and likely longer, as shown beginning in 2034."

Stoldt's added conclusion sentence is improper for a number of reasons. First, the purpose of the technical memorandum was to evaluate the PWM Expansion's impacts on groundwater, not to evaluate PWM Expansion's ability to meet Cal-Am's annual or monthly demands under drought conditions. Second, Figure 7 in the technical memorandum, which Stoldt used to support his conclusion in Exhibit 10, is based on the unrealistic assumption that no drought will take place between now and 2034. Such an assumption is contradicted by plain history—there has been a multi-year drought in California in virtually every decade since 1917. Finally, Stoldt's conclusion in Exhibit 10 is based on his own unverified calculations of demand in the Stoldt Memo, which, as explained herein, are entirely unsupportable. While Stoldt manipulated Exhibit 10 to make it appear as if the technical memorandum's authors had reached this conclusion regarding drought storage, the authors never reached such a conclusion, and apparently never authorized Stoldt to manipulate the memorandum in this way.

* * *

Given the foregoing, the supply and demand estimates set forth in the Stoldt Memo, and in turn, in the Staff Report, cannot constitute substantial evidence to conclude that the PWM Expansion could serve as a feasible alternative to the Project.

4. PWM Expansion Conformity to Project Objectives

Staff Report Contention #34: The Staff Report concludes that PWM Expansion is capable of meeting all twelve primary and secondary objectives set forth by the CPUC in the Final EIR/EIS and Decision. (Staff Report, pp. 94-96.)

Cal-Am Response: The Staff Report's conclusion that the PWM Expansion can satisfy all twelve Project objectives as provided by the CPUC is not supported by substantial evidence. Because the PWM Expansion is not capable of satisfying the Project

objectives, it cannot be a feasible alternative to the Project. Each Project objective is discussed below.

- **Primary Objective 1**: Develop water supplies for the Cal-Am Monterey District service area to replace existing Carmel River diversions in excess of Cal-Am's legal entitlement of 3,376 afy, in accordance with SWRCB Orders 95-10 and 2016-0016.

    - Staff's conclusion that implementation of the PWM Expansion is sufficient to replace Carmel River diversions in excess of Cal-Am's entitlement is unsupported by the evidence. As explained above, in Cal-Am's October 15, 2019 letter, and in Hazen's January 2020 report, the PWM Expansion does not provide enough water to meet the demands of Cal-Am's Monterey District service area. Because PWM Expansion will not provide enough water to meet demand it therefore cannot, by definition, meet this Project objective. As explained by the CPUC:

> [T]he PWM Expansion Progress Report indicates that the PWM Expansion would satisfy the basic and key purposes of the Project (i.e., sufficient and reliable water supply) ***only in conjunction with construction of a desalination plant of some size within five to fifteen years***. Thus, the PWM Expansion would not substitute for a desalination plant, but would merely delay it and possibly (but not certainly) enable it to be smaller or to be operated differently.

(See CPUC Decision D.18-09-017, Appx. C, p. C-71 [emphasis added].) As the agency vested with the sole authority to determine proper levels of supply and demand for Cal-Am as a regulated public utility, the CPUC already has determined that PWM Expansion would not satisfy the water supply required by Cal-Am customers, and should only be examined as an "additional or supplemental source water supply" to the Project. (See CPUC Decision D.18-09-017, pp. 42-43.) Even under the Stoldt Memo's estimated demand numbers, and assuming continued strict water conservation, the water supply with the PWM Expansion, but without the Project, is barely sufficient to meet existing demand. (See Section I.3.c, *supra*.) As such, in the absence of the Project, PWM Expansion would not provide a sufficient, reliable water supply that would allow Cal-Am to replace its Carmel River diversions.

Moreover, the Staff Report drastically oversimplifies the process by which Cal-Am may be deemed to have satisfied the CDO. The 2016 State Water Board CDO provides that the conditions thereto, as well as conditions set forth in previous iterations of the CDO, "shall remain in effect until (a) Cal-Am certifies, with supporting documentation, that it has obtained a

permanent supply of water that has been substituted for the water illegally diverted from the Carmel River and (b) the Deputy Director for Water Rights concurs, in writing, with the certification." (See State Water Board Order WR 2016-0016, p. 27, attached hereto as **Exhibit 47**; see also May 8, 2020 Letter from State Water Board to John Ainsworth, Coastal Commission, p. 2.) Given the substantial uncertainties in the supply that could potentially be provided by the PWM Expansion, it is unlikely that without the Project, Cal-Am would be able to certify that a permanent water supply has been secured or obtain the required certifications from the State Water Board such that the CDO will be lifted.

- **Primary Objective 2**: Develop water supplies to enable Cal-Am to reduce pumping from the Seaside Groundwater Basin from approximately 4,000 to 1,474 afy, consistent with the adjudication of the groundwater basin, with natural yield, and with the improvement of groundwater quality.

    - The CPUC has previously determined that the PWM Expansion, without implementation of the Project, would not satisfy demand requirements in Cal-Am's service area. (See CPUC Decision D.18-09-017, p. 40.) As a result, the PWM Expansion, by definition, would put at risk Cal-Am's ability to reduce its pumping from the Seaside Groundwater Basin. As such, the CPUC has already determined that the PWM Expansion, without the Project, is incapable of ensuring this objective can be met.

- **Primary Objective 3**: Provide water supplies to allow Cal-Am to meet its obligation to pay back the Seaside Groundwater Basin by approximately 700 afy over 25 years as established by the Seaside Groundwater Basin Watermaster.

    - The Staff Report fails to provide any evidence that the PWM Expansion can provide water supplies sufficient for Cal-Am to pay back its extractions from the Seaside Groundwater Basin. (Staff Report, p. 94.) Moreover, the CPUC has already determined that the PWM Expansion could not "provide supply to allow for replenishment of water that Cal-Am previously pumped from the Seaside Basin in excess of Cal-Am's adjudicated right . . ." (See CPUC Decision D.18-09-017, p. 40.) As explained above, the PWM Expansion is incapable of supplying water sufficient to meet demand in Cal-Am's service area—given this supply shortfall, there is a significant risk that the PWM Expansion would not produce a water supply sufficient to allow Cal-Am cut its Seaside Groundwater Basin withdrawals to a level that permits Basin recharge. (See Section I.3.c, *supra*.)

- **Primary Objective 4**: Develop a reliable water supply for the Cal-Am Monterey District service area, accounting for the peak month demand of existing customers.

- As explained above, there is no evidence to suggest that the PWM Expansion, without the Project, can supply water sufficient to meet the Peninsula's MMD, in accordance with the California Waterworks Standards. (See Cal. Code Regs., tit. 22, § 64554, subds. (a), (b)(2); see also Section I.3.e, *supra*.) Moreover, M1W has failed to secure sufficient source water for the PWM Expansion—as such, the PWM Expansion simply cannot constitute a "reliable water supply" for the Monterey District service area and fails to satisfy this Project objective. (See Section I.2, *supra*.)

- **Primary Objective 5**: Develop a reliable water supply that meets fire flow requirements for public safety.

  - The Staff Report asserts that PWM Expansion can satisfy this Project objective because it is designed to meet both MDD and peak hour demands. However, as explained above, this conclusion is based solely on the Stoldt Memo's calculation of MDD and PHD, which fails to accommodate MMD, as required by the California Waterworks Standards. (See Cal. Code Regs., tit. 22, § 64554, subds. (a), (b)(2); see also Section I.3.e.) As such, there is no evidence to demonstrate that the PWM Expansion can provide a reliable water supply that meets relevant fire flow requirements.

- **Primary Objective 6**: Provide sufficient water supplies to serve existing vacant legal lots of record.

  - The Staff Report's conclusion that the PWM Expansion can provide sufficient water supplies to serve existing legal lots of record is based solely on the Stoldt Memo—as explained above, the Stoldt Memo uses an improperly depressed demand figure for legal lots of record, which, as recognized by the CPUC, fails to account for rebounds in development and corresponding increases in demand upon the easing of water restrictions on the Peninsula. (See Section I.3.c; see also CPUC Decision D.18-09-017, p. 50.) Moreover, in addition to the failure to account for the legal lots of record the PWM Expansion would not be able to satisfy the housing demand projections set forth by the City of Monterey. (See Ex. 38, February 4, 2020 City of Monterey Letter.) Therefore, the PWM Expansion does not meet this Project objective.

- **Primary Objective 7**: Accommodate tourism demand under recovered economic conditions.

  - The Staff Report's conclusion that the PWM Expansion could produce water sufficient to accommodate expected increases in tourism over the next two decades is based solely on the Stoldt Memo's depressed demand figures. The Stoldt Memo's estimates fail to account for the fact that hotel occupancy rates and tourism on the Monterey Peninsula have yet to return

to pre-2008 levels, and fail to consider additional water that will be needed for growth in tourism in the near future. (See Section I.3.c; Ex. 34, p. 13; Ex. 35, p. 4.) As such, the Staff Report has not provided sufficient evidence that the PWM Expansion can supply water required to accommodate increased tourism demand once the CDO is lifted.

- **Primary Objective 8**: Minimize energy requirements and greenhouse gas emissions per unit of water delivered.

    - The Staff Report concludes that PWM Expansion "more strongly conforms" to this objective than the Project, because the PWM Expansion would utilize 45 megawatts of electricity per year produced by landfill gas, while the Project would use around 38,000 megawatts of grid-based electricity per year. (Staff Report, p. 96.) However, as explained above, this comparison fails to take into account the Project's Mitigation Measure 4.11-1, implementation of which would result in the Project having net zero operational emissions from electricity consumption. (See Section E, *supra*.)

      Moreover, the PWM Expansion's proposal to utilize landfill gas as a power source is uncertain at this time. As discussed at the May 14, 2020, meeting of the M1W Recycled Water Committee, M1W is currently working to secure construction bids to build infrastructure that would allow M1W to convert landfill gas to electricity for the PWM project. (See Ex. 22, p. 1.) M1W has so far received construction bids that were twice as high as M1W's estimates and as a result, M1W was forced to reject these bids over budget concerns. (*Ibid.*) If M1W is unable to secure reduced bids or obtain additional funding for this infrastructure, it will be unable to implement the landfill gas power system. (*Ibid.*) Therefore, the Staff Report should not assume that the PWM Expansion would utilize landfill gas because that proposal is speculative at this time.

- **Primary Objective 9**: Minimize project costs and associated water rate increases.

    - The Staff Report's conclusion that PWM Expansion would better conform to this objective by minimizing project costs and water rate increases is unsupported by substantial evidence. In reality, the Original PWM Project has been plagued by significant cost overruns, resulting in drastic increases of up to 114% in projected costs per acre-foot of water. (See Section I.2.c, *supra*; Ex. 25, PWM Status Update Presentation.) The Original PWM Project is on track to deliver only 58% of the 3,500 afy allocated to Cal-Am's customers, and costs for Original PWM Project water will only continue to rise if M1W is unable to provide the promised allocation. (Section I.2.a, *supra*; Ex. 25, PWM Status Update Presentation.) There is every reason to believe that the PWM Expansion would face similar cost overrun issues, resulting in further increases in

water rates. Moreover, the PWM Expansion has not secured all necessary water rights, which could further increase project costs. Given the current state of the PWM Expansion, there is simply no certainty regarding its cost. Therefore, any comparison of PWM Expansion costs against costs associated with the Project are entirely speculative and cannot be made at this time.

- **Secondary Objective 1**: Locate key project facilities in areas that are protected against predicted future sea-level rise in a manner that maximizes efficiency for construction and operation and minimizes environmental impacts.

    - The Staff Report concludes that the Project slant well intake field "would likely be affected directly by sea level rise and the accompanying erosion of the shoreline," while stating that the PWM Expansion would take place inland, outside of the coastal zone. (Staff Report, p. 95.) However, as disused in Section B, the Project is not expected to face any impact from coastal erosion or rising sea levels during the economic life of the Project's slant wells and is entirely consistent with this Secondary Objective. (See Section B; see also AECOM Coastal Erosion Hazard Analysis.)

- **Secondary Objective 2**: Provide sufficient conveyance capacity to accommodate supplemental water supplies that may be developed at some point in the future to meet build out demand in accordance with adopted General Plans.

    - The Staff Report's conclusion that the PWM Expansion can satisfy this Project objective appears to be based solely on Exhibit 10 to the Staff Report, which is a doctored draft technical memorandum prepared as an exhibit to the Draft SEIR for the PWM Expansion. (Staff Report, pp. 95-96.) As explained above, reliance upon this doctored memo is wholly improper, and Exhibit 10 does not constitute substantial evidence to demonstrate that the PWM Expansion can meet this objective. (See Section I.3.h.) Moreover, Exhibit 10 does not speak to conveyance capacity.

- **Secondary Objective 3**: Improve the ability to convey water to the Monterey Peninsula cities by improving the existing interconnections at satellite water systems and by providing additional pressure to move water over the Segunda Grade.

    - The Staff Report fails to provide ***any*** evidence that the PWM Expansion will provide any improvements to existing water system connections or provide additional pressure to move water over the Segunda Grade.

Accordingly, because the PWM Expansion is not capable of satisfying the primary and secondary objectives set forth for the Project by the CPUC, it cannot be concluded to be a feasible alternative to the Project.

Staff Report Contention #35: The Staff Report evaluates the PWM Expansion against the criteria that the CPUC applied to evaluate the viability of the Original PWM Project as a viable Project alternative. (Staff Report, pp. 96-99.)

Cal-Am Response: As with other portions of the Staff Report, the conclusion that the PWM Expansion can meet all the criteria used to evaluate the viability of the Original PWM Project rests on a series of unsupported assumptions and in many cases simply ignores that significant questions remain regarding the feasibility of the PWM Expansion. The uncertainty surrounding the Staff Report's assessment of the PWM Expansion has become all the more pronounced in the wake of the M1W Board of Directors' decision to not certify the PWM Expansion Final SEIR. Moreover, the CPUC itself has stated that the PWM Expansion does not satisfy all of these criteria. (CPUC Decision D.18-09-017, Appx. C, p. C-70.) Each criterion is discussed separately below.

- **Criterion 1 – Final EIR**. *The Staff Report evaluates whether PWM Expansion has an approved EIR, is subject to a CEQA lawsuit, or is subject to a judicial stay. Staff concluded that although the PWM Expansion did not yet have a completed EIR, the EIR was unlikely to be lengthy or complex, given that it would be tiered off of the EIR for the Original PWM Project, and therefore would be unlikely to face legal challenge. (Staff Report, p. 96.)*

    - Contrary to the Staff Report's conclusion, the fact that the PWM Expansion did not have an approved EIR is a significant issue. The Draft SEIR for the PWM Expansion was issued on November 7, 2019, just a few days before the Commission's informational public hearing regarding the Project in Half Moon Bay. The comment period on the Draft SEIR ran until January 31, 2020, and on April 13, 2020, M1W released a Final SEIR. Many commenters submitted substantial concerns to M1W during the public comment period, pointing out numerous flaws in M1W's analysis of the potential environmental impacts of the PWM Expansion. Taking these comments in to account, the M1W Board of Directors denied certification of the Final SEIR on the PWM Expansion at the Board's April 27, 2020 meeting. (See Ex. 17, p. 1.) As such, CEQA approval for the PWM Expansion has not occurred and so PWM Expansion does not meet this feasibility criteria.

- **Criterion 2 - Permits**. *The Staff Report states that, like the Original PWM Project during the CPUC proceeding, the PWM Expansion has not obtained all of its needed permits. However, staff asserts that these permits will likely be new or amended versions of existing permits for the Original PWM Project and that the PWM Expansion sponsors expect to receive the permits in time to operate the facility near the CDO's December 2021 deadline. (Staff Report, pp. 96-97.)*

    - Contrary to the Staff Report conclusion, there have been no permits issued for PWM Expansion. Since the M1W Board rejected the SEIR, no discretionary permits for the PWM Expansion can be legally issued. Therefore, the PWM Expansion does not meet this criteria for consideration as a feasible alternative.

- **Criterion 3 – Source Water**. *The Staff Report claims that the PWM Expansion has sufficient legal certainty as to source waters because the PWM Expansion would use the same source waters as the Original PWM Project. (Staff Report, p. 97.)*

    - Contrary to the Staff Report, the source waters for the PWM Expansion are anything but secure, and the PWM Expansion cannot use the same source waters as the Original PWM Project. As explained above, M1W has yet to satisfy several conditions required for the PWM Expansion to utilize ARWRA source waters, there are significant disputes over source waters that M1W claims may be used by the PWM Expansion, and there is no evidence that PWM Expansion source water would be available during multiple drought years. (See Section I.2, *supra*.) Moreover, the City of Salinas has confirmed that its existing agreements with M1W limit M1W's use of the City's agricultural wash water to the Original PWM Project and that in the absence of further agreements, the City intends to use all available agricultural wash water for its own purposes. (See Ex. 27, p. 2.) The Staff Report fails to recognize these issues and—as such, there is not substantial evidence to demonstrate that the PWM Expansion can satisfy this feasibility criteria.

- **Criterion 4 - Water Quality and Regulatory Approvals**. *The Staff Report asserts that because the Original PWM Project and PWM Expansion will use the same treatment methods, the PWM Expansion will be able to treat wastewater to meet the standards set by the California Department of Health and the Regional Water Quality Control Board ("Regional Board"). As such, the Staff Report claims that the PWM Expansion will be able to obtain the corresponding water quality permits and begin operation by December 2021. (Staff Report, p. 97.)*

    - As noted above, as an initial matter, the M1W Board denied certification of the SEIR, and the PWM Expansion is not currently moving forward. Accordingly, it is not anticipated that the PWM Expansion will be able to seek approvals from the Department of Health or the Regional Board. In addition, even if the PWM Expansion were to move forward, there are significant concerns about the quality of PWM Expansion product water, specifically with respect to the inclusion of agricultural water runoff as source water and, therefore, whether approvals from the Department of Health or the Regional Board could ever be obtained. The inclusion of this source water may result in lingering pesticides or other chemical constituents in the PWM Expansion product water. (See Water Plus Conditional Joinder to Motion to Open a Phase 3 CPCN Proceeding, pp. 2-3 (attached hereto as **Exhibit 48**.) No agency has ever prepared an environmental analysis of the impacts from using wastewater contaminated with pesticides or other chemicals as source water for the PWM Expansion. As explained by the CPUC, "[w]hile the PWM Expansion Progress Report states that, after treatment, the water would meet or exceed drinking water standards, there has yet been no environmental analysis of this key technical feasibility issue." (See D.18-09-017, Appx. C, p. C-71.) While the PWM Expansion would utilize the same treatment technology as the Original PWM Project, there is no evidence that the PWM

Expansion would be able to treat wastewater to the standards imposed by the Department of Health and the Regional Board, and thereafter obtain the corresponding permits. As such, the PWM Expansion cannot satisfy this key feasibility criteria.

- **Criterion 5 – PWM Expansion Project Schedule Compared to Desalination Schedule**. *The Staff Report analyzed the ability of the PWM Expansion to comply with the construction schedule set forth for the Project, so as to meet the December 2021 CDO deadline. (Staff Report, pp. 97-98.) The Staff Report also stated that while there is some doubt about whether the PWM Expansion can meet the CDO deadline, there is "greater doubt" about whether the Project can meet the CDO deadline.*

    - As noted above, the M1W Board denied certification of the SEIR, and the PWM Expansion is not moving forward. Accordingly, based on the current status of the PWM Expansion, and considering the many delays experienced by the Original PWM project, the PWM Expansion cannot meet the December 2021 CDO deadline.

      The Original PWM Project has yet to produce a single drop of water and is behind schedule to begin water deliveries. (See Ex. 21, p. 3; see also Ex. 25.) Even if the PWM Expansion were to move forward in the future, it could experience even greater delays than the Original PWM Project, given the number of outstanding permits and agreements required for the Expansion. At this time, there is simply no evidence to support any schedule associated with the PWM Expansion moving forward.

      Finally, the assertion that there is "doubt" about the Project's schedule because of issues with the MCWD pipeline, the outfall line, and potential future litigation is misplaced. As discussed above, Cal-Am is already entitled to utilize the MCWD conveyance pipeline under an existing agreement—therefore, there will be no delays associated with Cal-Am's use of the pipeline. (See Section I.2, *supra.*) Further, the required Project outfall liner is not a part of this application before the Commission, and any potential delay associated with the CDP application for the liner is speculative. (See Section F, *supra.*) Moreover, the Staff Report's assumption that any Commission decision approving the Project would be subject to litigation is speculative and should not be used to justify a recommendation of denial. Based on the current status of the PWM Expansion as compared to the Project, it is clear that the Project is closer to achieving the CDO timeline, and the PWM Expansion does not meet this criterion.

- **Criterion 6 – Status of PWM Expansion Project Engineering**. *The Staff Report states that the PWM Expansion is well beyond the 10% design threshold, and thus satisfied this criteria. (Staff Report, p. 98.)*

- The status of the PWM Expansion's engineering and design is irrelevant to the feasibility of the PWM Expansion as an alternative because the M1W Board of Directors has denied certification of the SEIR for the project, and it is speculative to assume that M1W will move forward with the PWM Expansion because, as stated by M1W staff, funds are not available to address the multiple deficiencies with the analysis in the SEIR. (See Ex. 18; Ex. 17, p. 1.)

- **Criterion 7 – PWM Expansion Project Funding.** *The Staff Report evaluates PWM Expansion for its ability to obtain sufficient project funding via government loans. Staff notes that PWM Expansion would rely in part on a commitment from Cal-Am to purchase product water as well as a government loan through the U.S. EPA. (Staff Report, p. 98.)*

    - As noted above, the M1W Board denied certification of the SEIR and the PWM Expansion is no longer moving forward. Accordingly, there are no commitments for project funding. Further, if the PWM Expansion were to ever move forward, it would require a Water Purchase Agreement between Cal-Am and M1W, which would require CPUC approval, as was required for the purchase of Original PWM Project water. The Staff Report failed to account for that timing or process. Further, the Water Purchase Agreement between Cal-Am and M1W would need to be revised to include additional terms, such as more stringent performance guarantees to provide greater assurances to Cal-Am and its customers that the recycled water would be produced as promised, and greater protections in the event that recycled water is not or cannot be produced. (See November 3, 2019 Letter from Cal-Am to M1W Board of Directors, attached hereto as **Exhibit 49**.) The M1W Board has not confirmed that they are willing to take on the liability that would be required by those performance guarantees. In addition, the CPUC highlighted a lack of secure funding in its wholesale rejection of PWM Expansion as a Project alternative. (See CPUC Decision D.18-09-017, Appx. C, pp. C-71 to C-72.) Therefore, even if the PWM Expansion were to move forward, numerous questions remain about the viability of funding such that this criterion cannot be satisfied.

- **Criterion 8 – Reasonableness of Water Purchase Agreement Terms.** *The Staff Report notes that the CPUC found the 2016 Water Purchase Agreement between Cal-Am and the PWM sponsors for Original PWM Project water met this criteria, and asserts that PWM Expansion water would cost less than water produced by the Project. (Staff Report, p. 98.)*

    - The Staff Report does not reach any conclusion regarding PWM Expansion conformance with this criterion, and indeed cannot do so, given that Cal-Am and the PWM Expansion project sponsors have not reached any agreement regarding the purchase of PWM Expansion water. Indeed, as discussed above, before Cal-Am purchases a drop of water from a possible PWM Expansion, the parties would need to agree to additional performance

guarantees to ensure a continued water supply in the event that the PWM Expansion cannot fulfill its promised water supply or otherwise meet Peninsula demands. Accordingly, this criterion cannot be used to support the feasibility of the PWM Expansion.

- **Criterion 9 – Reasonableness of the PWM Expansion Project Revenue Requirement**. *The Staff Report asserts that greater certainty regarding PWM Expansion project costs exists at this point than at the time of the CPUC's Decision, providing certainty as to the reasonableness of expected revenue requirements. (Staff Report, p. 99.)*

    - Contrary to the Staff Report's assertion, there is even less certainty regarding PWM Expansion costs than in 2017. The Original PWM Project has incurred significant cost overruns, and continues to face numerous technical and construction obstacles, resulting in substantially increased water rates from what was projected. (See Ex. 25.) It is therefore likely that the PWM Expansion could face similar cost overruns and corresponding water rate increases. (See Sections H, I.2.c, *supra*; see also Ex. 25.) It is not currently possible to speculate as to the reasonableness of the PWM Expansion's project revenue requirements. Therefore, the PWM Expansion does not meet this feasibility criteria.

5. Overall Adverse Project Effects

Staff Report Contention #36: The Staff Report asserts that the PWM Expansion would have fewer overall adverse environmental effects than the Project, given that the PWM Expansion will be located outside the coastal zone, and given the PWM Expansion's use of electricity generated by landfill gases. (Staff Report, p. 99.)

Cal-Am Response: The Staff Report's conclusion that the PWM Expansion would have fewer environmental effects than the Project is unsupported and did not have the benefit of the environmental analysis prepared for the PWM Expansion that was released just prior to the Commission's November 2019 informational hearing concerning the Project. The environmental analysis conducted for the PWM Expansion, as discussed in various comment letters on the PWM Expansion Draft and Final SEIRs, has significant flaws and requires substantial additional analysis. (See Ex. 20, Cal-Am Comments on PWM Expansion Final SEIR; see also January 30, 2020 Cal-Am Comments on PWM Expansion Draft SEIR, provided separately to Commission staff.) In fact, based on these significant flaws, the M1W Board denied certification of the SEIR. (See Ex. 18, M1W Board of Directors Staff Report.) Consequently, the full scope of the PWM Expansion's environmental impacts remains unknown.

In addition, staff's statements do not accurately reflect the Project's environmental impacts, as discussed herein. First, contrary to the Staff Report's conclusion, the Project would not result in a substantial adverse impact to sensitive habitats during Project construction or operation with the implementation of all feasible and enforceable mitigation measures. (See Section A, *supra*.) Second, the Project is not anticipated to be

impacted by sea level rise of coastal erosion until near the 2120 planning horizon, well beyond the economic lifespan of the Project's wells. (See Section B, *supra.*) Third, the assertion that the Project's potential impacts on marine life and ocean water quality "have not yet been determined" is inaccurate—the CPUC, as lead agency, has already determined that the Project will not result in substantial adverse impacts to coastal waters or marine resources during Project construction or operation with the implementation of all feasible and enforceable mitigation measures. (See Section C, *supra.*) Fourth, as explained in Section E, *supra*, staff fails to account for the Project's incorporation of Mitigation Measure 4.11-1, which would result in net zero operational emissions from electricity consumption.

Therefore, the Staff Report's conclusion that the PWM Expansion would have fewer adverse environmental effects is not supported by substantial evidence.

Staff Report Contention #37: The Staff Report acknowledges that "an underlying environmental concern applicable to both projects is the potential effect of Cal-Am not having an adequate water supply project in place by December 2021," so as to allow the CDO to be lifted. Staff admits that missing that deadline, or interim deadlines, would result in reductions in Cal-Am's legal diversion limits from the Carmel River. Staff states that if this occurs, Cal-Am would have to seek an extension from the State Water Board to permit continued Carmel River withdrawals, which may cause further environmental harms to the River. However, the Staff Report dismisses that concern by alleging that "the Cal-Am project appears to have a higher risk of delay than does the PWM Expansion." (Staff Report, p. 99.)

Cal-Am Response: Contrary to the Staff Report, the PWM Expansion has a high risk of delay. In comparison, Cal-Am's Project already has received numerous approvals, including a Certificate of Public Convenience and Necessity from the CPUC and a Combined Development Permit from Monterey County. While the Project has received those approvals and is currently pending before the Coastal Commission, the PWM Expansion has obtained no approvals and is no longer moving forward as a result of the M1W Board's decision to deny certification of the PWM Expansion Final SEIR. In addition, given the current delays seen in implementation of the Original PWM Project, there are questions about how long it could take the Original PWM Project to achieve its water delivery obligations. Currently the Original PWM Project is expected to deliver only 58% of its 3,500 afy delivery target. (See Ex. 25, PWM Status Update Presentation; Section I.2.a, *supra.*) Given this information, there is substantial uncertainty about whether the PWM Expansion could achieve its water delivery targets, or how quickly it could come on line even if it were to move forward. It is virtually impossible that the PWM Expansion would meet the 2020 interim milestone or the CDO 2021 deadline. Accordingly, the assertion that the Project has a higher risk of delay than the PWM Expansion is not supported by the available facts.

6. "No Action" Alternative

Staff Report Contention #38: The Staff Report asserts that under a "no action" scenario, wherein the Commission does not approve the Project, the "most likely scenario" is that Cal-Am

would pursue the PWM Expansion, and the PWM Expansion could provide an adequate water supply to Cal-Am's service area. (Staff Report, p. 100.)

Cal-Am Response: Since the issuance of the State Water Board's 1995 order reducing Cal-Am's allowable withdrawal from the Carmel River by 10,730 afy, Cal-Am has been working to implement an alternative water supply to provide a reliable and sustainable water supply to the Monterey Peninsula, as well as to lift the State Water Board CDO. In the past 25 years, Cal-Am's efforts have included working on the possibility of a new dam and reservoir, as well as a different desalination project that was proposed in conjunction with MCWD and MCWRA. Cal-Am was forced to abandon the prior desalination project when a MCWD consultant violated conflict of interest laws. In order to fulfill its obligations under the CDO and provide a long-term solution to the Peninsula's water supply problems, Cal-Am moved forward with designing the Project on its own, and applied to the CPUC for its approval in 2012. In the course of reviewing the Project over six years, the CPUC analyzed, and rejected, eleven different alternatives to the Project, including the PWM Expansion. With the M1W Board of Directors' decision to deny the certification of the PWM Expansion Final SEIR, the PWM Expansion also can no longer be considered as an alternative option. The Project therefore remains the only possible option to satisfy the CDO's requirements and provide much-needed water to the Peninsula.

Moreover, if Cal-Am were to proceed with the PWM Expansion in lieu of the Project, given the significant shortfalls in production from the Original PWM Project (see Section I.2.a, *supra*), and the potential for the PWM Expansion to similarly fail to meet expected deliveries, there is a significant likelihood that Cal-Am would not be able to cease its withdrawals from the Carmel River in order to make up for shortfalls in supplies from the PWM project as a whole. As such, the Staff Report must consider as the "no action" alternative the reasonably foreseeable scenario in which Cal-Am is forced to continue pumping from the Carmel River to meet regional water demands or otherwise implement severe water rationing measures, along with any associated environmental, economic and environmental justice impacts.

J. Coastal Act Section 30260 Override for Coastal-Dependent Facility

As explained throughout this Attachment A, and contrary to the Staff Report's determinations, the Project is not inconsistent with the Coastal Act or LCP policies regarding ESHA, coastal hazards, coastal waters, or groundwater. (See Sections A through D *supra*.) Nonetheless, as the Commission found with the test slant well (CDP Nos. 9-14-1735 and A-3-MRA-14-0050), the Project satisfies the three requirements of Coastal Act section 30260, which allows the Coastal Commission to approve certain uses notwithstanding potential inconsistencies with applicable LCP policies. The Project is a coastal-dependent industrial facility and 1) alternative locations of the Project are infeasible or more environmentally damaging; 2) to not permit the Project would adversely affect the public welfare; and 3) the Project's environmental impacts have been mitigated to the maximum extent feasible. Staff's primary reason for determining that the Project does not satisfy Section 30260 is that the PWM Expansion is a feasible alternative to desalination, but as explained above in Section I, PWM Expansion is not feasible. Therefore, the

Commission is authorized under Coastal Act, section 30260 to approve the Project despite any potential inconsistency with LCP.

Staff Contention #39: Staff has determined that the Project qualifies as a coastal-dependent industrial facility under Coastal Act sections 30260 and 30101. (Staff Report, pp. 102-103.)

Cal-Am Response: Cal-Am agrees with staff that the Project is a coastal-dependent industrial facility. As the Staff Report explains, the Project is "coastal-dependent" because it must be located adjacent to Monterey Bay to extract primarily seawater from beneath the seafloor. (Staff Report, p. 102.) Further, the Project's Source Water Pipeline is necessary to convey that feedwater to the inland desalination facility. (*Ibid.*) Finally, the Project will use the existing M1W outfall to convey the facility's brine discharges into coastal waters. (*Ibid.*) Moreover, staff correctly determined that the Project is "industrial" because it is a water supply infrastructure project implemented by Cal-Am, a publicly regulated utility. (*Id.*, p. 103.)

Because the Project constitutes a coastal-dependent industrial facility, the Commission can apply Section 30260 to approve the Project notwithstanding any potential inconsistencies with LCP and Chapter 3 of the Coastal Act.

Staff Contention #40: Staff contends that the PWM Expansion is a feasible, less environmentally damaging alternative to the Project. According to staff, the PWM Expansion "fully meets the criteria of the Coastal Act's definition of feasibility." (Staff Report, p. 104.) Therefore, staff finds that the Project does not meet the first test of Section 30260.

Cal-Am Response: As a preliminary matter, Section 30260's plain language focuses on "***alternative locations***," ***not alternatives to an entire project***. (See Pub. Resources Code, § 30260 [emphasis added].) Staff's current interpretation of Section 30260 goes against the Commission's long-standing interpretation of "alternative locations" as alternative sites to the proposed project, not completely separate and distinct alternative projects. (See, e.g., Staff Report for Test Slant Well, App. No. 9-14-1735, A-3-MRA-14-0050, pp. 3, 57 [evaluating on- and off-site alternative locations for the test slant well].) Here, the PWM Expansion is not an alternative location to the Project; it is a wholly separate project. Staff's misinterpretation and incorrect application of Coastal Act section 30260 is not entitled to deference. (See *S. Cal. Edison Co. v. Pub. Util. Com.* (2000) 85 Cal.App.4th 1086, 1105 [finding that "an agency's interpretation of a regulation or statute does not control if an alternative reading is compelled by the plain language of the provision"]; *Motor Vehicle Mfrs. Assn. of United States, Inc. v. State Farm Mut. Auto. Ins. Co.* (1983) 463 U.S. 29, 42 [holding no deference warranted for agency's change from its "settled course of behavior"].)

The Final EIR/EIS thoroughly analyzed alternative locations for the Project's subsurface intake slant wells and associated Project infrastructure, concluding that the Project's proposed location offers environmental advantages to alternative sites, such as use of an existing outfall, no construction on the seafloor, avoiding impingement and entrainment of an open water intake, and less than significant impacts to groundwater resources, surface water resources and marine biological resources. (Final EIR/EIS, §§ 5.1-5.6.) As

the Staff Report acknowledges, "Cal-Am selected a site where it could obtain its source water using subsurface intakes, ***which is the state's preferred method for seawater desalination facilities, due to their limited or non-existent adverse effects on marine life***." (Staff Report, p. 104 [emphasis added].) Cal-Am also selected to site the slant well network on the previously disturbed CEMEX site, "rather than a completely undeveloped coastal location where it may have caused additional adverse effects."[39] (*Ibid.*) Thus, the CEMEX site is the least environmentally damaging location feasible for the Project.

Moreover, staff cites Coastal Act section 30233 regarding fill in coastal waters as a basis for evaluating whether alternative projects are less environmentally damaging. (See Staff Report, p. 104.) However, as explained above in Section C, staff's interpretation of Coastal Act section 30233 is incorrect. Coastal Act section 30233 allows diking, filling, or dredging of open coastal waters only "where there is no feasible less environmentally damaging alternative." The Project does not involve the "diking, filling, or dredging" of coastal waters. (See Pub. Resources Code, § 30233.) The Project's underwater monitoring equipment and single buoy do not constitute "fill" as contemplated by section 30233 because the equipment uses anchors placed on the seafloor. The equipment does not involve the installation of permanent structures in the seafloor or the fill the ocean with sediment, earth, or similar substance.

Finally, as explained above in Section I.2, the PWM Expansion is not feasible. Significant questions remain regarding the adequacy of the PWM Expansion's environmental review, economic feasibility, and ability to secure sufficient water supplies and provide a certain quantity of product water.

Because the PWM Expansion is not feasible, and the CEMEX site is the best available location for the Project, the Project satisfies the first test of Coastal Act section 30260.

Staff Contention #41: Staff asserts that the Project would not promote the public welfare for three reasons: (1) the Project would impact ESHA, public access, and groundwater supplies; (2) the PWM Expansion can provide a water supply adequate for current demand and future growth and will allow Cal-Am to meet its CDO obligations; and (3) the Project would create economic hardships for communities of concerns due to high water rates. (Staff Report, p. 105; see also Addendum, pp. 7, 9.) Therefore, staff finds that the Project does not meet the second test of Section 30260.

Cal-Am Response: "Public welfare" is not defined in the Coastal Act, but it generally includes "the economic welfare, public convenience and general prosperity of the

---

[39] In fact, the Project's slant wells will be sited at the exact same location on the CEMEX site as the proposed wellfield for the Regional Desalination Project—the Project's predecessor. The Regional Desalination Project would have been jointly implemented by Cal-Am, MCWRA, and MCWD, with MCWD owning the desalination facility and infrastructure. (See CPUC Decision D.10-12-016, 2010 Cal. PUC LEXIS 548, at *2.) As such, any claims by MCWD—or even Marina—the Project is inappropriately located at the CEMEX site is belied by their prior support of the former Regional Desalination Project at this location. (See MCWD presentation regarding the Regional Desalination Project, attached hereto as **Exhibit 50**, pp. 4, 25.)

community.'" (*Miller v. Bd. of Pub. Works* (1925) 195 Cal. 477, 487.) Under Coastal Act section 30260, the evaluation of what would adversely affect the public welfare requires a balancing of interests: "[the] protection and preservation of coastal natural resources and the need for some coastal development." (*Gherini v. Cal. Coastal Com.* (1988) 204 Cal.App.3d 699, 708; see also *Marina Coast Water Dist. v. Cal. Coastal Com.* (2016) 2016 WL 6267909, at *12, *23.) Not permitting the Project would adversely affect the public welfare for several reasons.

As a preliminary matter, the Staff Report acknowledges that Cal-Am must obtain a new water supply under the CDO. (Staff Report, p. 104.) The Staff Report fails to appreciate, however, that without the Project, a deficit between available water supplies and total demand will result and worsen over time, potentially leading to prohibitions on all or specified non-essential water uses. (See Section I.3.c *supra*.) Without the Project, Cal-Am would fail to meet the CDO milestones, which could have harmful consequences for Cal-Am, its customers, the community, and the regional economy. (Final EIR/EIS, pp. 5.4-10 to 5.4-11 [potential rationing of and restrictions on water usage].) The Project would provide a water supply to replace that obtained from the Carmel River, benefiting the river watershed (Final EIR/EIS, p. 4.6-126); would prevent further seawater intrusion into the SVGB (*id.*, p. 4.4-92; D.18-09-017, Appx. C, p. C-75); and would provide sufficient water to enable cities on the Monterey Peninsula to accommodate planned growth and existing legal lots of record. (See Section I.3.)

Moreover, the Project will not impact public or beach access following any restoration at the CEMEX site, as described above in Section F. Similarly, the Project will not significantly impact ESHA following the implementation of all feasible and enforceable mitigation measures. (See Section A *supra*.) Nor will the Project adversely affect groundwater supplies in the SVGB, as described above in Section D.

Further, as explained throughout this Attachment A, the PWM Expansion is not a feasible alternative to the Project. (See Sections I.2.) The CDO requires that Cal-Am "certif[y], with supporting documentation, that is has obtained a permanent supply of water that has been substituted for the water illegally diverted from the Carmel River." (See Ex. 49, p. 27.) The PWM Expansion is neither an adequate nor permanent water supply sufficient to meet the Peninsula's water needs, and M1W has not demonstrated permanent water rights necessary for PWM Expansion operation. Therefore, absent another source from which Cal-Am can obtain water—such as the Project—Cal-Am cannot meet its CDO obligations or supply sufficient water to its service district.

Finally, as explained above in Section H, the Final EIR/EIS evaluated whether the Project would result in a disproportionately high and adverse impact on minority or low-income populations. (Final EIR/EIS, pp. 4.20-16 to 4.20-19.) As discussed above and in the Final EIR/EIS, Cal-Am has a rate assistance program for qualifying water consumers that will help defray increased water costs associated with the Project. "These programs would reduce the burden of increased prices on low-income households in the Monterey District." (*Id.*, p. 4.20-18.) Based on substantial evidence in the record, the Final EIR/EIS concluded the Project would not result in significant environmental justice impacts. (*Ibid.*) In fact, the Final EIR/EIS identified benefits to CCSD, a disadvantaged

community, in the form of high quality water for the same price that pumping degraded water would otherwise cost. (*Id.*, p. 4.20-19.)

Because not permitting the Project would adversely affect the public welfare, contrary to the Staff Report conclusion, the Project satisfies the second test of Coastal Act section 30260.

Staff Report Contention #42: Staff claims that impacts from "several project components are not yet fully mitigated." (Staff Report, p. 105.) In particular, staff contends that the Project's ESHA, groundwater, and coastal hazard impacts have not been "fully mitigated," and that Cal-Am's CDP application fails to identify necessary work to the outfall liner, which will result in environmental impacts. (Ibid.) Therefore, staff finds that the Project does not meet the third test of Section 30260.

Cal-Am Response: The Coastal Act and its regulations do not require that impacts be "fully mitigated," as staff represents, but rather requires that impacts are mitigated to the "***maximum extent feasible***."[40] (See, e.g., 14 Cal. Code Regs., § 13053.5, subd. (a); see also *id.*, §§ 13328.1, 13356, subd. (b)(2), 13540, 13666.4.) Similarly, the LIP—which the Commission certified in 1982—states that, for CDPs, the City's Planning Commission shall consider "feasible mitigation measures which substantially reduce significant impacts of the projects as described in any applicable EIR." (LIP, p. 24.) Here, and as explained throughout this Attachment A, the Project's impacts have been mitigated to the maximum extent feasible.

For instance, the MMRP imposes a wide range of robust mitigation measures designed to mitigate the Project's environmental impacts to terrestrial biological resources in the coastal zone to the maximum extent feasible. (See Final EIR/EIS, pp. 4.6-170 to 4.6-195, 4.6-216 to 4.6-220, 4.12-37 to 4.12-38, 4.14-38; see also *id.*, Appx. D.) The Final EIR fully analyzed impacts to ESHA and determined that, ***with mitigation, there would be no significant physical impacts to ESHA***. (See Final EIR/EIS, § 4.6.) Consistent with the MMRP, Cal-Am prepared the HMMP, which describes all the Project's mitigation requirements in the Coastal Zone and identifies performance standards and success criteria for restoration, long-term monitoring methods, adaptive management and corrective action. (See Section A *supra*.)

In addition, as explained above, in May 2020, AECOM provided a technical response to staff's coastal hazards concerns, attached hereto as **Exhibit 5**. AECOM's analysis demonstrates that the Project conforms to the LCP policies regarding coastal hazards by mitigating potential impacts caused by sea level rise and coastal erosion. (See Section B *supra*.)

---

[40] As explained above, "feasible" means "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors." (See Pub. Resources Code, § 30108.) The City's Zoning Ordinance definition of "feasible" is substantively identical to the Coastal Act's definition. (Marina Municipal Code, § 17.41.110.)

Moreover, as described above in Section D, the Project will have a less than significant impact to groundwater supplies in the SVGB. Not only is mitigation not required for less than significant impacts (CEQA Guidelines, § 15124.6, subd. (a)(3)), but additional modeling is not expected to change the Final EIR/EIS's conclusions. (See Section D *supra*.) The consultant retained by Commission staff, Weiss Associates, even acknowledges that the Final EIR/EIS's modeling was conservative. (See Weiss Report, pp. 19-20.) Thus, staff's assertions that mitigation may be required—or that additional modeling will change the Final EIR/EIS's conclusions—are unsupported.

Finally, the M1W outfall work is a wholly separate project that may be separately conditioned when M1W applies for a CDP for that work. Although Cal-Am is currently in discussions with M1W to determine how best to implement the outfall work contemplated in the EIR/EIS, M1W owns and controls the outfall; Cal-Am cannot compel M1W to apply for the outfall work in conjunction with this pending CDP application. Thus, Cal-Am appropriately did not include the outfall work in its CDP application.

Nevertheless, Cal-Am remains willing to work with staff on developing measures and special conditions that would ensure consistency with applicable Coastal Act policies if staff identifies specific concerns it believes need to be addressed further.

ATTACHMENT B

RESPONSES TO COMMISSIONER QUESTIONS FROM NOVEMBER 14, 2019, HEARING

A. Scope of Commission's Authority

Questions from Commissioner Rice: We know there are other agencies involved in permitting the Project who have authority that is different from the Commission's. What is the scope of the Commission's authority for this Project? For instance, which issues (particularly those raised in public comment) are irrelevant or outside the scope of the Commission's evaluation of the Project? (Transcript of Nov. 14, 2019, Commission Hearing,[41] pp. 325:24-327:1.)

Cal-Am Response: The Commission's jurisdiction is limited to the Project components located in the Coastal Zone, which are specifically identified in the Staff Report.[42] Further, the Commission is only responsible for assessing the Project's consistency with the Coastal Act and applicable LCPs in determining whether to approve or deny Cal-Am's CDP application. (See Pub. Resources Code, § 30200; see also *Charles A. Pratt Construction Co. v. Cal. Coastal Com.* (2008) 162 Cal.App.4th 1068, 1075.) Thus, the Commission's review is limited to Project components within the Coastal Zone and potential impacts to Coastal Zone resources.

The Commission does not have jurisdiction to consider the reasonableness of Cal-Am's water rates or the public need for the Project—both of which fall squarely within the CPUC's statutory jurisdiction to regulate public utilities. (See Pub. Util. Code, § 701 ["The [CPUC] may supervise and regulate every public utility in the State and may do all things . . . which are necessary and convenient in the exercise of such power and jurisdiction."].) The CPUC evaluated the Project's potential impacts on Cal-Am's water rates and the appropriate water supply and demand figures for Cal-Am's Monterey District service area over a six-year administrative process, during which it received evidence and testimony submitted under oath. (See also Attachment A, Sections H, I.)

Moreover, the issue of water rights is not for the Commission to decide. Cal-Am's water rights for the Project are wholly separate from the Project's potential impacts to groundwater resources and, thus are not relevant to the Project's consistency with the Coastal Act's groundwater protection policies. The State Water Board—not the Commission—is the state agency with primary responsibility for the regulatory and adjudicatory functions of the state regarding water resources. (Water Code, § 174; Pub. Resources Code, § 30412.) The State Water Board determined that Cal-Am could

---

[41] The transcript is attached hereto as **Exhibit 51**.)

[42] Specifically, the Commission has jurisdiction over those Project components in the Coastal Zones of the City of Seaside, County of Monterey, and the Commission's retained jurisdiction in an area of deferred certification within the County. (Staff Report, p. 4.) Further, the Commission has appellate jurisdiction over the City of Marina's decision to deny a local coastal development permit for those Project components in the Marina Coastal Zone. (*Ibid.*)

develop the necessary water rights to operate the Project. (See CPUC Decision D.18-09-017, p. 80.)

The Commission also should defer to the State Water Board on matters of water quality, consistent with Coastal Act section 30412. (See Pub. Resources Code, § 30412 ["The commission shall not . . . take any action in conflict with any determination by the State Water Resources Control Board or any California regional water quality control board in matters relating to water quality or the administration of water rights."].) The State Water Board has reviewed the existing groundwater record for the Project, and concluded that the modeling "already conducted, revised, and relied upon by the Public Utilities Commission . . . provides a conservative overprediction of the volume of shallow, inland water that the Project would capture during full operation." (See Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), p. 3.) As a result, "State Water Board staff's opinion remains that the groundwater impacts of the Project will not be any greater than those stated, analyzed, and mitigated under the Public Utilities Commission's certified Final EIR," even if additional modeling is conducted. (*Id.*, p. 3.)

Finally, because the Commission's jurisdiction does not extend outside of the Coastal Zone, the Commission is limited to considering alternatives within its jurisdiction. (See Pub. Resources Code, §§ 21002.1, subd. (d), 30260; see also Attachment A, Section I.) Under Coastal Act section 30260, the Commission has the authority to consider only "alternative ***locations***" for coastal-dependent facilities, not alternative projects. (See Pub. Resources Code, § 30260 [emphasis added].) The PWM Expansion project is not located within the Coastal Zone, and thus, is outside of the Commission's jurisdiction. (See, e.g., Pub. Resources Code, § 21002.1, subd. (d); CEQA Guidelines, §§ 15042, 15096, subd. (g)(1) ["When considering alternatives and mitigation measures, a responsible agency is more limited than a lead agency. A responsible agency has responsibility for mitigating or avoiding only the direct or indirect environmental effects of those parts of the project which it decides to carry out, finance, or approve."]; *RiverWatch v. Olivenhain Mun. Water Dist.* (2009) 170 Cal.App.4th 1186, 1207 ["If the responsible agency finds that any alternatives or mitigation measures within its powers are feasible and would substantially lessen or avoid a significant effect of the project, the responsible agency may not approve the project as proposed, but must adopt the feasible mitigation measures or alternatives."] [emphasis added]; *Sierra Club v. Cal. Coastal Com.* (2005) 35 Cal.4th 839, 860 [holding that neither the Coastal Act nor CEQA allow the Commission to consider impacts of projects located outside the Coastal Zone]; *Schneider v. Cal. Coastal. Com.* (2006) 140 Cal.App.4th 1339, 1347 [concluding that the Coastal Act did not permit the Commission to consider ocean boaters' right to view coastline from the ocean].)

In sum, the scope of the Commission's authority in determining whether to approve or deny the coastal development permits extends to evaluating those Project components located within the Coastal Zone and whether they will impact Coastal Zone resources.

B. Role of Other Agencies

Questions from Commissioners Rice and Groom: What role is the CPUC playing? What is the status of the CPUC's approval? (Transcript, pp. 325:24-327:1, 329:24-330:19.)

Cal-Am Response: The CPUC is the constitutionally established state agency charged with regulating investor-owned utilities, like Cal-Am, and reviewed the Project as the lead agency under CEQA for over six years. (See Final EIR/EIS, p. 1-3.) The CPUC, in conjunction with the Monterey Bay National Marine Sanctuary, prepared the EIR/EIS to evaluate the Project's environmental impacts and potential Project alternatives. Based on the EIR/EIS' analysis and conclusions, the CPUC approved a Certificate of Public Convenience and Necessity ("CPCN") for the Project and certified the EIR/EIS in September 2018. Following its approval of the Project, as the lead agency the CPUC oversees Cal-Am's compliance with the MMRP. (CPUC Decision D.18-09-017, p. 161.)

Further, the CPUC is charged by statute with exclusive jurisdiction to oversee Cal-Am's ratesetting and determine utility supply and demand. "[T]he jurisdiction to determine the adequacy of service actually being rendered by a public utility under its franchise is vested exclusively in the [CPUC] when it has elected to determine whether the service is inadequate." (See *Citizens Utilities Company of California v. Super. Ct.* (1976) 56 Cal.App.3d 399, 408; see also *City of Oakland v. Key System* (1944) 64 Cal.App.2d 427, 435 [exclusive jurisdiction vested in CPUC to determine adequacy of service rendered by public utility].) Therefore, only the CPUC has the authority to make binding determinations as to the levels of supply and demand within Cal-Am's service area. (See CPUC Decision D.18-09-017, pp. 167-171, 194-195.)

See Section C below for a discussion of the CPUC's role vis-à-vis the PWM Expansion.

Questions from Commissioners Rice and Groom: What role is the State Water Board playing? (Transcript, pp. 325:24-327:1, 329:24-330:19.)

Cal-Am Response: The State Water Board regulates Cal-Am's water withdrawals from the Carmel River. In 1995, the State Water Board issued an order finding that Cal-Am was diverting more water from the Carmel River than it was legally allowed. (See Ex. 52, State Water Board, Order WR 2009-0060, pp. 1-2.) Recognizing Cal-Am's obligation to provide water to the people and businesses on the Monterey Peninsula to protect public health and safety, the State Water Board ordered Cal-Am to immediately limit its diversions of water from the Carmel River system, and to diligently implement various actions to address the situation and develop water from other sources of supply. (See *id.*, pp. 36-37.)

In 2009, the State Water Board adopted a CDO in which it set a compliance schedule requiring Cal-Am to take actions necessary to reduce its diversions from the Carmel River and ultimately terminate the withdrawals by December 31, 2016. (See *id.*, p. 57.) The CDO also imposed a moratorium on new service connections and certain increases in use until Cal-Am obtained sufficient alternative water supplies. (See *id.*, p. 59.) In 2016, the State Water Board approved an amended CDO that would maintain Cal-Am's effective

diversion limit from the Carmel River from the start of water year 2015-2016 until December 31, 2021, as long as Cal-Am meets defined Project approval and construction milestones. (See Ex. 47, State Water Board, Order WR 2016-0016, p. 19.)

Currently, the State Water Board oversees Cal-Am's compliance with the CDO's milestones. (*Id.*, pp. 20-21.) Indeed, the State Water Board has the power to lift the current moratorium on new water service connections and increases in use provided that Cal-Am certifies that it has secured sufficient permanent water supplies for its Monterey service district. (See *id.*, p. 27.)

Further, the State Water Board oversees issues of water quality and preservation of water resources. (See Section A *supra*.)

See Section C below for a discussion of the State Water Board's role vis-à-vis the PWM Expansion.

C. Alternatives

Questions from Commissioner Mann: What alternative locations were evaluated for the Project's slant wells? Why are alternative locations of the slant wells infeasible? Why is the CEMEX site the environmentally superior alternative location? (Transcript, p. 322:14 – 322:19.)

Cal-Am Response: In analyzing the Project as proposed, the Final EIR/EIS assessed the feasibility of a series of alternatives at two different locations, each of which would avoid the need to construct the slant well system at the CEMEX site. These two alternatives involved the construction of intake systems at a site on Potrero Road site and a site at Moss Landing. (See Final EIR/EIS, pp. 5.4-2 to 5.4-3.)

First, the Potrero Road alternative, as evaluated in the Final EIR/EIS, involved construction of the same type of slant well system as proposed for the CEMEX site, but located instead at a site at the western end of Potrero Road in northern Monterey County. (See Final EIR/EIS, pp. 5.3-13, 5.4-12, 5.4-59.) Under this alternative, the desalination plant, brine discharge, product water pipelines, and ASR components would be identical to the proposed Project. (*Id.*, p. 5.4-12.)

The Final EIR/EIS found that a Project utilizing a slant well system located at Potrero Road would be infeasible because it would draw a greater volume of water from the SVGB than the proposed Project, given the unique hydrology of the Potrero Road area. (Final EIR/EIS, pp. 5.4-14, 5.4-59.) Under the Return Water Settlement Agreement Cal-Am is required to return product water to the SVGB based on the amount of water drawn from the SVGB. Given the increased draw from the SVGB that would result from slant wells at Potrero Road, the amount of water that Cal-Am would be obligated to return to the SVGB would result in a remaining water supply that would be insufficient to meet recovered tourism demand or serve vacant legal lots of record, as required by the Project objectives set forth by the CPUC. (*Ibid.*) Moreover, slant wells at Potrero Road would capture groundwater that would otherwise flow into Elkhorn Slough—resulting in

significant and unavoidable impacts on marine and terrestrial biological resources. (*Id.*, p. 5.6-6.)

Second, the Final EIR/EIS analyzed a series of alternatives involving construction of open ocean intake systems at a site located to the southwest of the Moss Landing Harbor, including: (1) an alternative that would retain most Project components but would utilize open ocean intakes that would be located at the Moss Landing site; (2) the Monterey Bay Regional Water Project, a desalination facility proposed by DeepWater Desal, LLC that would produce over three times more product water than the Project; and (3) the People's Moss Landing Water Desalination Project, a desalination project proposed by Moss Landing Green Commercial Park, LLC. (See Final EIR/EIS, pp. 5.4-17, 5.4-21, 5.4-40.)

The Final EIR/EIS found that a proposed intake alternative at Moss Landing would involve "additional permitting complexity associated with the construction and operation of an open-water intake due to entrainment and impingement of marine organisms," which would hinder Cal-Am's ability to implement the alternative before the CDO deadline. (Final EIR/EIS, pp. 5.4-21, 5.4-39, 5.4-50.) The Final EIR/EIS also concluded that open ocean intakes at the Moss Landing Site would involve the following increased impacts as compared to the Project: (1) significant and unavoidable impacts to marine habitat and biological resources associated with construction and operation of the intakes; (2) potentially significant impacts related to the open ocean intakes' potential to cause underwater landslides and interfere with oceanic processes; and (3) significant and unavoidable impacts to marine biological resources caused by intake and entrainment of marine life. (*Id.*, p. 5.6-4.)

In comparing the above alternative locations to the proposed Project, the Final EIR/EIS concluded that siting intake systems at either Potrero Road or the Moss Landing site would not "offer an overall environmental advantage over the proposed project," due to the impacts described above. (See Final EIR/EIS, p. 5.6-6.) The Final EIR/EIS noted that siting the slant well system at the CEMEX site would avoid the groundwater impacts associated with siting a similar intake system at the Potrero Road site. (*Ibid.*) Specifically, unlike the aquifers underlying the Potrero Road site, the 180-FTE and 400-Foot Aquifers below the CEMEX site are heavily intruded by seawater (*Id.*, p. 4.4-34.) Siting the slant wells at the CEMEX site therefore ensures that the Project slant wells will extract seawater-intruded groundwater that is otherwise unusable. As such, the Final EIR/EIS selected the Project, with slant wells located at the CEMEX site, as the environmentally superior alternative. (*Id.*, p. 5.6-8.) The CPUC later affirmed this decision, concluding that no other alternatives are feasible, capable of meeting Project objectives, or reducing significant impacts of the Project. (See CPUC Decision D.18-09-017, pp. 79-80.)

Finally, as explained in Attachment A *supra*, the CEMEX site is the least environmentally damaging location feasible for the Project, as siting the slant wells at the CEMEX site enables Cal-Am to obtain Project source water using subsurface intakes, thereby preventing impingement or entrainment of marine life, and also allows Cal-Am to construct the slant wells in areas previously disturbed by sand mining operations,

rather than in undeveloped locations on the coast. (See Attachment A, Sections A, B, J; see also Staff Report, p. 104.)

Questions from Commissioner O'Malley: Is staff's finding regarding the feasibility of the PWM Expansion driven by the CDO deadline? (Transcript, p. 325:10-325:16.)

Cal-Am Response: The Staff Report claims that the PWM Expansion can be operational in sufficient time to meet the CDO's December 2021 deadline and used that conclusion to support a finding that the PWM Expansion is a feasible project alternative. (See Staff Report, p. 80.) However, the PWM Expansion is not feasible because the M1W Board has since denied certification of the project's Final SEIR and did not approve the project, and M1W has confirmed that it does not have the funds to remedy the faults in the SEIR. (See Ex. 17, M1W Letter to Cal-Am re: Pure Water Monterey Project – Cost, Operational Performance and Status (June 8, 2020), p. 1; Ex. 18, M1W Board of Directors Staff Report (May 20, 2020).) Moreover, M1W currently estimates a roughly eight month delay in implementation of the first phase of the PWM (the "Original PWM Project"), which both imposes additional delays on the PWM Expansion and indicates it likely will face similar delays. (See Ex. 21, Cal-Am Comments on Cost, Operational Performance and Status of PWM Expansion (May 9, 2020), p. 1.) Indeed, the Original PWM Project is currently plagued by a number of technical issues, including sinkholes or subsidence around the shallow injection wells, injection wells running at less than half of their planned capacity, and an inability to utilize planned source waters, all of which are resulting in significant increases in projected PWM water rates. (See Attachment A, Section I.2.a.) It is likely that the PWM Expansion could experience even greater delays than the Original PWM Project, given the additional permits and source water agreements needed for the Expansion. The State Water Board recently expressed concern in a letter to the Commission that the timeline for implementation of the PWM Expansion has been delayed well beyond the CDO deadline. (See Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), at pp. 4-5.) Therefore, staff's conclusion that the PWM Expansion can be completed by the CDO is not substantiated by the available evidence and cannot support a finding of feasibility. (See Attachment A, Section I.2.b.)

Questions from Commissioner Rice: What are the next steps with respect to the PWM Expansion SEIR and what is the timeline for finalization of that document? Does it impact the CPUC's decision going forward? Does it impact the State Water Board's role going forward? (Transcript, pp. 326:17-327:1.)

Cal-Am Response: The PWM Expansion is no longer moving forward, as the M1W Board has denied certification of the Final SEIR. (See Ex. 18, M1W Board of Directors Staff Report (May 20, 2020).) The M1W Board rejected certification of the Final SEIR due to deficiencies in the environmental analysis of: source water for the PWM Expansion; water supply and demand; impacts to agricultural water supplies; and because the SEIR failed to evaluate the PWM Expansion either as an alternative to or a cumulative project with the Project. (*Ibid.*) The M1W Board has stated that these deficiencies will need to be corrected before the Board decides to move forward with the Project. However, M1W "[s]taff has noted that the [M1W] does not have additional

budget funds at this time for dealing with any additional deficiencies that have been identified . . . or could be identified in the future. [M1W] has suspended all of the remaining contracts on these matters to prevent further consultant expenditures." (*Ibid.*; see also Attachment A, Section I.2.) Moreover, there remains significant doubt regarding the availability of source waters for the PWM Expansion—so long as M1W fails to obtain secure and adequate source waters, the PWM Expansion remains infeasible. (See Attachment A, Section I.2.a.)

Should the M1W Board ever secure the funds needed to correct the substantial inadequacies in the PWM Expansion SEIR, and obtain all necessary source water rights, the Expansion would require the implementation of a Water Purchase Agreement between Cal-Am and M1W. (See Attachment A, Section I.2.) As with purchase of Original PWM Project water, this Water Purchase Agreement would require CPUC approval. (*Ibid.*) Moreover, to account for the numerous uncertainties surrounding the proposed PWM Expansion, the Water Purchase Agreement would need to include additional terms beyond those included in the Original PWM Project agreement, including more stringent performance guarantees to provide greater assurances to Cal-Am and its customers that the recycled water would be produced in specified amounts, and greater protections in the event that recycled water is not or cannot be produced. (*Ibid.*) Again, these terms would all be subject to CPUC approval, assuming the M1W Board ever decides to move forward with the PWM Expansion after correcting the Final SEIR. Such protections are even more critical given that the Original PWM Project is on track to produce only 2,030 afy, or only 58% of the 3,500 afy that was planned and allocated for Cal-Am's customers. (See Ex. 25, Pure Water Monterey: Injection Wells Facilities Status Presentation, M1W Recycled Water Committee Meeting (June 18, 2020).) There are no additional water supplies that can make up for that shortfall, apart from the Project.

Further, unlike the PWM Expansion, the CPUC has already certified the Final EIR/EIS and issued a CPCN for the Project. In issuing that decision, the CPUC explicitly determined that the PWM Expansion "would satisfy the basic and key purposes of Project (i.e., sufficient and reliable water supply) ***only in conjunction with construction of a desalination plant of some size within five to fifteen years***," and therefore ordered that the PWM Expansion be considered as an ***addition***, to the Project, not as an alternative. (See CPUC Decision D.18-09-017, Appx. C, p. C-71 [emphasis added].) The CPUC's decision has been upheld by the California Supreme Court and is now final. Neither the Commission's decisions with respect to the Project, nor any decision on the part of M1W to move forward with the PWM Expansion, has ***any*** impact on the Project's approval status before the CPUC.

With respect to the State Water Board—should the PWM Expansion move forward instead of the Project, the PWM Expansion would need to satisfy the requirements of the 2016 State Water Board CDO for a new permanent water supply before Cal-Am may be deemed to have satisfied the CDO. (See Attachment A, Section I.4.) Specifically, the 2016 State Water Board CDO states that the conditions thereto, as well as conditions set forth in previous iterations of the CDO, "shall remain in effect until (a) Cal-Am certifies, with supporting documentation, that it has obtained a permanent supply of water that has

been substituted for the water illegally diverted from the Carmel River and (b) the Deputy Director for Water Rights concurs, in writing, with the certification." (See Ex. 47, State Water Resources Control Board, Order WR 2016-0016 (July 19, 2016), p. 27; see also Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), at p. 2.)

As discussed above, there are significant uncertainties regarding the feasibility of the PWM Expansion and its ability to serve as an adequate water supply for Cal-Am's service area. Indeed, the PWM Expansion is not capable of providing a sufficient water supply to meet Monterey Peninsula water demand. Even assuming the depressed demand figures utilized by the Staff Report, Peninsula water supplies with the PWM Expansion, but without the Project, would only be able to meet Peninsula demand for a maximum of five years before falling short. (See Attachment A, Section I.3.c; see also Ex. 28, Hazen Memo, pp. 10-11.) That analysis also assumes that the Original PWM Project would provide a full 3,500 afy. As demonstrated in M1W staff's June 18, 2020 presentation to the M1W Recycled Water Committee, the Original PWM Project is only providing 2,030 afy, which means even existing demand cannot be met without desalination. Moreover, neither the Staff Report nor M1W has demonstrated that existing Peninsula water supplies plus PWM Expansion can meet maximum month demand (MMD) as required by the California Waterworks Standards (Cal. Code Regs., tit. 22, § 64554, subds. (a), (b)(2)). (See Attachment A, Section I.3.e.) Given these substantial issues, it is highly unlikely that Cal-Am could obtain the required certifications from the State Water Board needed to lift the CDO without the Project. (See Attachment A, Section I.4.)

Questions from Commissioner Brownsey: What is going to be the source of the water recycling? Are there drought conditions that could stress the system? How would that impact the Salinas Aquifer? (Transcript, p. 328:9-328:15.)

Cal-Am Response: The sources of water available for the PWM Expansion are discussed in more detail in Attachment A, Section I.2.a. As discussed therein, there remains significant uncertainty surrounding the availability of source waters for the PWM Expansion, which raises serious doubts that the PWM Expansion can be accomplished in a successful manner. First, M1W has failed to commit to a consistent list of source waters for the PWM Expansion, so the certainty of source waters is very difficult to ascertain. (Ex. 20, Cal-Am Letter to Monterey One Water re: PWM Expansion Final SEIR (Apr. 24, 2020), pp. A-16, A-21.) These issues were raised by multiple commenters on the PWM Expansion's SEIR, including from the City of Salinas, which controls the use of the City's agriculture produce wash water. (PWM Expansion Final SEIR, Comments F1-I to F-3.) The City of Salinas has publicly confirmed it has not granted M1W the rights or approvals necessary for the PWM Expansion to utilize the City's agriculture produce wash water beyond the scope of the Original PWM Project and "the City intends to use available agriculture wash water for its own purposes[.]" (*Id.* at F1.) Other significant concerns surround the availability of source waters for the PWM Expansion, including the reliability of certain source waters under an existing agreement between M1W and the MCWRA referred to as the ARWRA. This agreement sets forth the responsibilities for construction, operation, and financing of new source water for the Original PWM Project. (PWM Expansion Final SEIR, Comment H-3.)

However, M1W has yet to satisfy several conditions required to utilize ARWRA source waters and its ability to do so is uncertain. (Ex. 20, pp. A-16 to A-17.) Thus, M1W's reliance on disputed rights to agricultural produce wash waters and ARWRA source waters results in an overestimation of available water supplies.

Though each of these issues is individually important, Commissioner Brownsey's concern regarding water supply availability during drought years is particularly critical because multiple dry years are very common in California. It is certain that California will experience another drought in the coming years, but the PWM Expansion's SEIR does not analyze that project during multi-year drought conditions, as required by the CEQA Guidelines, and has not established that the PWM Expansion is drought resilient. (CEQA Guidelines, Appx. G, § XIX(b); Ex. 20, Cal-Am Letter to Monterey One Water re: PWM Expansion Final SEIR (Apr. 24, 2020), p. A-20.) Therefore, serious questions remain as to the feasibility of the PWM Expansion as a viable alternative to the Project during extended drought conditions and the extent to which PWM Expansion would impact the SVGB under such constraints. The M1W Board acknowledged the substantial deficiencies with the SEIR's analysis of source waters and included this issue as one of its reasons for denying certification of the Final SEIR. (Ex. 19, M1W Board of Directors Agenda (May 21, 2020); see Ex. 18, M1W Board of Directors Staff Report (May 20, 2020).)

The PWM Expansion also has the potential to result in seawater intrusion in the SVGB, however these impacts have not been fully evaluated by M1W in the Final EIR for the PWM Expansion. (January 30, 2020 Cal-Am Comments on PWM Expansion Draft SEIR , p. 17; Ex. 20, Cal-Am Letter to Monterey One Water re: PWM Expansion Final SEIR (Apr. 24, 2020), p. A-9.) The EIR for the PWM Expansion evaluated impacts to groundwater resources without considering the impact the PWM Expansion would have if the Project is not built. The Project would benefit the SVGB by reducing existing and preventing additional seawater intrusion. If the PWM Expansion Project is seen as a replacement for the Project—and the Project is not built—then the Project's benefits to the SVGB will not occur and further seawater intrusion of the coastal aquifers can be expected.

Questions from Commissioner Hart: Will the PWM Expansion be able to provide the water that staff assumes will be available? (Transcript, pp. 331:4-332:2.)

Cal-Am Response: Based on the available evidence, the PWM Expansion is not capable of producing the 2,250 afy that staff has assumed. As discussed in detail below, there have been significant complications in development of the Original PWM Project that have resulted in a much lower water production than initially estimated, which raise substantial questions regarding the technology to be used by the PWM Expansion. In addition, there are substantial concerns about the availability of PWM Expansion source waters as discussed above. These issues raise significant doubt as to the PWM Expansion's ability to provide 2,250 afy. (See Attachment A, Section I.2.)

For example, while PWM Expansion will utilize the same technologies that are currently being implemented in the Original PWM Project, there are serious concerns with that

project's ability to produce the water it has agreed to provide. (See Attachment A, Section I.2.a.) Indeed, sinkholes or subsidence are affecting the Original PWM Project's shallow injection wells, which may not be repairable, certain deep wells are experiencing injection refusal and are functioning at rates of 60% or less, and some of the source waters identified and intended for treatment by the Original PWM Project have not been utilized since startup. (See Ex. 21, Cal-Am Comments on Cost, Operational Performance and Status of PWM Expansion (May 9, 2020), pp. 3-4; Ex. 22 Staff Report for May 14, 2020 M1W Recycled Water Committee Meeting, Agenda Item #5; Ex. 23 Staff Report for April 16, 2020 M1W Recycled Water Committee Meeting, Agenda Item #5; Ex. 24, Final Minutes from March 16, 2020 MPWMD Regular Board Meeting, p. 3.) Moreover, M1W recently confirmed that current injection rates for the Original PWM Project are only half of the planned capacity rate for the Original PWM Project injection wells. As a result, M1W may propose to add a new deep injection well to the project, further delaying implementation of the Original PWM Project and causing additional increases to water rates. (See Ex. 25, Pure Water Monterey: Injection Wells Facilities Status Presentation, M1W Recycled Water Committee Meeting (June 18, 2020).) Given these significant obstacles, the Original PWM Project is currently capable of producing only 2,030 afy of the planned 3,500 afy allocated for Cal-Am's customers. (*Ibid.*) These issues raise significant uncertainties regarding the use of this same technological approaches for the PWM Expansion.

Further, as discussed above, there is significant uncertainty regarding the availability of source water for the PWM Expansion—without such source waters, the PWM Expansion cannot, by definition, provide a sufficient water supply. (See Attachment A, Section I.2.a.) Moreover, even if the PWM Expansion could produce the water supplies discussed in the Staff Report, such supplies are inadequate to meet demand on the Monterey Peninsula, as assessed by the CPUC. (See *id.*, Section I.3-4.) Only the Project, not the PWM Expansion, has been proven capable of providing a reliable, drought-proof water supply. (See CPUC Decision D.18-09-017, Appx. C, p. C-71 [concluding that the PWM Expansion would only satisfy Project objectives "in conjunction with construction of a desalination plant of some size within five to fifteen years."].)

Questions from Commissioner Gold: What is the reliability of the PWM Expansion source water? How is the region's wastewater accounted for? Does it all go to M1W? Or is some additional wastewater available as source water for the Expansion? (Transcript at 335:7-335:16.)

Cal-Am Response: Source water reliability for the PWM Expansion is discussed in detail in Attachment A, Section I.2.a. As discussed above, there is significant uncertainty surrounding the availability of source waters for the PWM Expansion, including the reliability of certain source waters under the ARWRA between M1W and MCWRA, M1W's inability to commit to a consistent list of source waters for the PWM Expansion, disputed rights to agricultural produce wash waters and overestimation of water supplies during drought years. The extent that wastewater flows are available for the PWM Expansion is not readily apparent or proven. For instance, as discussed in Attachment A, Section I.2.a, M1W's ability to use a portion of such water is governed by the ARWRA, under which M1W previously contractually granted certain rights to municipal

wastewater to MCWRA. Under the ARWRA, certain wastewater flows from outside of M1W's 2001 service area boundary are to be evenly divided between M1W and MCWRA. (PWM Expansion Final Supplemental EIR/EIS, Appendix M, p. 3-10.) Though the PWM Expansion relies on the use of such water for recycling, M1W has admitted that "[t]hese flows have not previously been individually metered" and therefore the associated quantities cannot be reasonably relied upon for a specific quantity. (*Id.* at p. 3-10.) Moreover, multiple outstanding conditions are required to be completed before the ARWRA can become effective. (Draft SEIR, p. 4.18-5.) Therefore, the reliability of certain ARWRA source waters is speculative due to the significant conditions precedent that must be met for the sources of water to become fully secured. (Ex. 20, Cal-Am Letter to Monterey One Water re: PWM Expansion Final SEIR (Apr. 24, 2020) , pp. A-16 to A-17.)

Further, the source waters identified for the PWM Expansion remain uncertain since they have been modified by MIW throughout the environmental review process without adequate analysis or justification, raising doubts as to their reliability and ultimately the feasibility of the PWM Expansion. For instance, the Final SEIR for the PWM Expansion increasingly relies upon the availability of certain municipal wastewater flows even though it acknowledges that such flows have not been previously metered and that the estimates are based in part upon assumptions. (Final Supplemental EIR for the PWM Expansion, pp. 3-11 to 3-12.) When questioned about the reliability of such water supplies, M1W elected to evaluate source water scenarios where such sources are not used by the PWM Expansion, rather than demonstrate their reliability. (*Id.*, Responses to Comments VV-93 to VV-94 and VV-96 to VV-99.) M1W's inability to establish and rely on a stable, consistent set of source waters confirms that the project lacks a definite source water supply and raises serious questions about the PWM Expansion's feasibility and M1W's ability to accomplish the project in a successful manner. In part because of concerns associated with the reliability and availability of source waters, the M1W Board denied certification of the SEIR for the PWM Expansion. (See Ex. 18, M1W Board of Directors Staff Report (May 20, 2020); Ex. 17, M1W Letter to Cal-Am re: Pure Water Monterey Project – Cost, Operational Performance and Status (June 8, 2020), p. 1.)

Regarding how the region's wastewater is accounted for, according to the Final SEIR for the PWM Expansion, "[r]elative contributions of municipal wastewaters from M1W's geographic areas that enters the M1W headworks and is metered there include: 51% from the Salinas urban area, 3% from Moss Landing and Castroville, 45% from the Monterey Peninsula, Marina, and Fort Ord areas." (PWM Expansion Final Supplemental EIR/EIS, Appendix M, p. 2.) While the majority of these municipal flows are from areas within M1W's service area, some are received from beyond that boundary.

In response to the question concerning the availability of "some additional wastewater" for the PWM Expansion, M1W has not demonstrated the availability of additional sources of wastewater for the PWM Expansion, much less the availability and reliability of the water sources evaluated in the SEIR for the PWM Expansion.

D. Environmental Justice

Question from Commissioner Mann: What would Cal-Am's water rates be if the Project is not operated at full capacity? (See Transcript, pp. 322:10-323:7; also see Staff Report, p. 92.)

Cal-Am Response: As approved by the CPUC, the Project is intended to function at 86% capacity, producing 6,252 afy of water per year in normal years. (See Ex. 42, Direct Testimony of Ian Crooks to the CPUC Errata Version (Sept. 27, 2017).) This "provides a reasonable 14% operational reserve capacity to meet maximum day/month demands, dry weather reserves, variable water return percent, and additional supply for other system supply constraints in availability" to ensure water supply reliability. (*Ibid.*) During dry years, a "water supply shortfall can be covered by increasing desalination plant output to 100% and peaking other system supplies . . . depending on operational variables and regulatory availability." (*Ibid.*) Accordingly, the CPUC's ratesetting determination already considers that the Project will run at 86% capacity.

Further, as described in Attachment A, Section H, *supra*, staff's assumption that Project water would cost $6,100 per acre foot is incorrect. The CPUC decision expressly states that the "cost per acre-foot (AF) for the 6.4 mgd plant 'under the Tier 2 and PTM caps (inclusive of the 3,500 of GWR water) is $4,265 per AF and $4,472 per AF respectively." (CPUC Decision D.18-09-017, p. 123, fn. 332; see also Ex. 14, Rebuttal Testimony of Jeffrey T. Linam (Oct. 13, 2017).) These costs assume the Project is operating at 86% capacity. There is no reasonable basis for staff's reliance on a projected per acre foot cost of $6,100 per year.

Questions from Commissioner Brownsey: Why are Cal-Am's water rates, as included in a 2017 study, among the highest out of a survey of 500 public and private companies? How do water conservation and reduction of use have the unintended consequence of increasing water prices? (See Transcript, pp. 328:16-329:4.)

Cal-Am Response: The numbers provided in Food & Water Watch's 2017 study are misleading and do not reflect actual average water use in Monterey. As discussed in Attachment A, Section H, *supra*, the study wrongly assumed that the average water use of a single-family residential household in Monterey is 60,000 gallons per year. (Staff Report, p. 73.) The correct average use is 44,000 gallons per year. (Ex. 12, p. 1.) Conservation pricing generally charges higher tiered rates for higher than average levels of water use to discourage excessive use of water. Therefore, under conservation pricing, assuming a baseline of 60,000 gallons per year—16,000 gallons per year above the actual average water use in Monterey—artificially skews the average cost of water above actual costs. (*Ibid.*) Applying the correct usage model into a monthly estimate utilizing a 5/8-inch meter, the average monthly water bill is about $78 (or $936 annually), rather than the approximately $100 per month cited in the Food & Water Watch study for 2017. (*Ibid.*) Additionally, Food & Water Watch relies on sources that explicitly warn against the sort of rate comparison employed by the study. (See Attachment A, Section H, *supra*.) As such, the Commission should not rely on the Food & Water Watch study and instead should credit the CPUC's thorough ratesetting determination for the Project as

reasonable and just. (See CPUC Decision, D.18-09-017, pp. 19-20, 123-24; Pub. Util. Code, §§ 451, 454.)

In addition, water conservation and reduction in water use can have the unintended consequence of increasing water prices because water utilities generally have high fixed costs associated with infrastructure, improvements, staff, and maintenance. This situation is not unique to Cal-Am; on average, about 70 percent of a water utility's revenue is devoted to fixed costs. When sales are reduced as a result of water conservation, the variable costs go down, but the fixed costs remain, so the cost of each unit of water must increase to support the fixed costs and keep the water utility's finances stable. While customers who conserve will always pay less than those who do not, they may not see substantial reductions in monthly bills due to conservation because the fixed costs remain.

Question from Commissioner Groom: Is there a water rate chart or analysis available for the Commission to review? (See Transcript, pp. 329:24-330:19.)

Cal-Am Response: The ratemaking framework approved by the CPUC was developed through a lengthy briefing process and included input from ratepayers and community organizations. (See CPUC Decision, D.18-09-017, pp. 19-20, 123-124; see also Section H, *supra*.) The rates ultimately approved by the CPUC were based on extensive collaboration: "Sixteen parties (a sub-set of parties, including the applicant, ratepayer advocates, environmental groups, and public water agencies)" contributed to the process. A description of the ratemaking framework and the process is provided in the CPUC decision. (CPUC Decision, D.19-09-017, pp. 77, 88-99; see also *id.*, Appendix F.) As stated above, the CPUC found that costs per acre foot would be between $4,265 and $4,472. (*Id.*, p. 123, fn. 332.)

In addition, Cal-Am's rate schedule for Monterey County is based on use: single family; multi-family; and non-residential.[43] For each use, the rates feature pricing tiers with price in the first tier being the lowest. Each tier has a certain amount of water allocated to it and if the user uses more water than is allocated to a particular tier, the user moves to the next higher priced tier associated with a greater consumption of water. Cal-Am's water rate schedule in Monterey County for single-family residences effective January 2020 is as follows:

[43] Cal-Am's Monterey Rate Schedules are available at: https://amwater.com/caaw/customer-service-billing/billing-payment-info/water-rates/monterey-district

Residential Customers:	Base Rate Per 100 gal (CGL)	
For the first 29.9 CGL	$1.0078	(I)
For the next 29.9 CGL	$1.5117	|
For the next 44.9 CGL	$3.5274	|
For the next 67.3 CGL	$6.5508	|
For all water over 172.0 CGL	$8.0625	(I)

(See Regular and LIRA Rates, Ex. 15.) Cal-Am also offers a low income ratepayer assistance ("LIRA") program that discounts rates for qualifying households by up to 30%.[44] The water rate schedule in Monterey County for the LIRA program effective January 2020 is as follows:

Residential Customers:	Base Rate Per 100 gal (CGL)	
For the first 29.9 CGL	$0.7055	(I)
For the next 29.9 CGL	$1.0582	|
For the next 44.9 CGL	$2.4692	|
For the next 67.3 CGL	$4.5856	|
For all water over 172.0 CGL	$8.0625	(I)

(*Ibid.*)

E. Coastal Waters

Questions from Commissioner O'Malley: Is there sufficient wastewater available for mixing with the Project's brine discharges? What impact would highly concentrated brine discharges have on the receiving marine environment? What is the process for the Project's brine discharge? Will it comingle with wastewater? Where will the water for brine dilution come from? (See Transcript, p. 324:4-18.)

Cal-Am Response: The Project's potential environmental impacts from brine discharges were analyzed in detail in the Final EIR/EIS. The Final EIR/EIS incorporates mitigation measures developed jointly by various parties as part of the "Brine Discharge Settlement," including *inter alia*, Surfrider Foundation ("Surfrider"), Monterey Peninsula Regional Water Authority ("MPRWA"), Monterey Regional Water Pollution Control Agency, and Cal-Am. (CPUC Decision 18-09-017, p. 116.) Due largely to the leadership and direction of Surfrider in the settlement process, the Brine Discharge Settlement creates standards and conditions for the collection of relevant, long-term water quality data to determine and ensure compliance with defined water quality standards. (Brine Discharge Settlement at Section 3.) It also requires implementation of specific corrective actions if salinity standards are exceeded, before Cal-Am can continue to

[44] For example, for a household of 4 persons to qualify for LIRA rates, the total gross income from all sources must be less than $52,400. Exhibit 15 provides further detail on qualifying households.

discharge brine. (*Id.* at Sections 4.4-4.6.) Accordingly, the Project's brine discharges and associated mitigation measures, which are described below, were thoroughly evaluated by and reflect the interests of multiple stakeholders.

As discussed in the Final EIR/EIS, the Project will generate approximately 9 mgd of brine that will be discharged through MIW's existing ocean outfall. (Final EIR/EIS, p. 5.5-61.) Depending on the season, the Project will utilize treated wastewater flowing from the MIW Regional Wastewater Treatment Plant for mixing with brine discharges. (*Ibid.*) During the non-irrigation season (November through March), when the highest wastewater flows occur, brine would be combined and discharged with varying amounts of secondary wastewater. (*Ibid.*) During the irrigation season (April through October), when the secondary treated wastewater may be treated and distributed to irrigators, it is possible that only brine would be discharged from the Project. (*Ibid.*) Nevertheless, as described below, the Project would ensure that applicable water quality and salinity standards are met year-round. (*Id.* at p. 5.5-64.)

Due to the varying amount of wastewater available for mixing throughout the year, the Final EIR/EIS evaluated four discharge scenarios for water quality impact: brine only, brine with wastewater, high brine only, and high brine with wastewater. (*Id.* p. 5.5-61.) As expected, the worst case condition for dilution would be when only brine is discharged during the irrigation season. (*Id.* at p. 5.5-64.) In all scenarios modeled, the applicable Ocean Plan salinity limit would be met. (*Ibid.*) As discussed in detail in Section 4.3 of the Final EIR/EIS, brine generated at the desalination plant would flow through a 1,100-foot-long diffuser resting above the ocean floor at approximately 90 to 110 feet below sea level. (*Id.* at p. 4.3-70.) The diffuser would be equipped with 172 2-inch diameter ports through which the brine stream discharge. (*Ibid.*) As a result of this process, the diffuser would disperse the brine stream, "thereby minimizing differences in salinity and other water quality parameters between the discharged brine and the surrounding water." (*Id.* pp. 4.3-70 to 71.) Moreover, Project discharges, "would not violate water quality standards, waste discharge requirements, or otherwise degrade the water quality (including hypoxia) of receiving waters in Monterey Bay by increasing salinity levels." (*Ibid.*)

Furthermore, in order to comply with applicable monitoring and reporting requirements for operation of new desalination facilities, the project would implement Mitigation Measure ("MM") 4.3-5 (Implement Protocols to Avoid Exceeding Water Quality Objectives). (Final EIR/EIS, p. 4.3-104; see also Attachment A, Section C.) In addition to implementing routine monitoring and reporting, MM 4.3-4 also includes corrective actions that would be required to be implemented if data indicates deleterious effects to receiving water quality or marine biological resources. (*Id.* at 4.3-93.) Accordingly, any Project impacts relating to brine discharges have been thoroughly studied in the Final EIR/EIS and mitigated, where necessary, to the extent feasible.

Questions from Commissioner Escalante: Have the state agencies vested with authority over marine protected areas expressed any concerns about marine protected areas in the vicinity of the Project? What are the Project's impacts to marine protected areas, such as the Elkhorn Slough and the Pacific Grove? (See Transcript p. 333:16-23.)

Cal-Am Response: Aside from the Coastal Commission, state agencies vested with authority over the marine protected areas within the Project's footprint include the California Department of Fish and Wildlife (CDFW), the California Fish and Game Commission, the State Water Board and the California State Lands Commission (CSLC). (See Final EIR/EIS, pp. 4.5-37, 4.5-39, 4.5-42.) The CDFW, State Water Board, and CSLC each commented on the Draft EIR/EIS for the Project. (Final EIR/EIS, Ch. 8.4.)

In its comments on the Draft EIR/EIS, CDFW requested that "special status biological resources should be evaluated and addressed prior to Project implementation, in order to comply with State law[]." (*Id.* at p. 8.4-6.) As discussed in further detail below, the Final EIR/EIS evaluated such potential impacts in detail and concluded that the Project would not result in a significant impact on marine biological resources with implementation of the mitigation measures identified. (Final EIR/EIS, pp. 4.5-47, 5.5-134.) With respect to Project impacts on marine species, the State Water Board confirmed that "[s]lant wells are… the preferred intake technology in the Ocean Plan because they minimize or eliminate intake and mortality of marine life." (*Id.* at p. 8.4-22.) As such, State Water Board concluded that "CalAm's construction and maintenance plan for the slant wells appears to avoid impacts to marine life" and "[o]verall, it appears that the MPWSP has been sited and designed in a manner that would result in minimal impacts to marine life and is consistent with the intent of the Ocean Plan to protect marine life and water quality." (*Ibid.*) CSLC's comments did not concern Project impacts on marine resources. (*Id.*, pp. 8.4-17 to 8.4-20.)

As noted above, the Final EIR/EIS evaluated potential impacts to marine protected areas. (See Final EIR/EIS, Ch. 4.3, 4.5.) Significantly, the Final EIR/EIS was prepared jointly with the Monterey Bay National Marine Sanctuary ("MBNMS"), which served as the NEPA lead agency for the Project. (*Id.* at ES-2.) The MBNMS is the federal agency charged with overseeing specified marine area offshore of California's central coast, including areas impacted by the Project. As such, the Final EIR/EIS reflects the analysis and conclusions of MBNMS staff. The Final EIR/EIS concluded that the Project would not result in a significant impact on marine biological resources. (Final EIR/EIS, p. 4.5-47, 5.5-134.) For instance, with respect to special status marine species in these areas, Section 4.5.1.3 identified certain mammals, birds, turtles and fish that may be impacted by the Project. (*Id.*, pp. 4.5-10 to 4.5-25.) Impact 4.5-1 determined that the Project would not result in a substantial impact upon any such species or on any natural community or habitat identified in any applicable local or regional plans, policies or regulations. (*Id.*, pp. 4.5-47, 5.5-135.) Additionally, the Final EIR/EIS confirmed that there are no known marine species in Monterey Bay with population numbers suspected of dropping below self-sustaining levels (except for the California Sea otter). (*Id.*, p. 5.5-135.) Accordingly, Final EIR/EIS determined that the Project "would not cause a fish or marine wildlife population to drop below self-sustaining levels and would not interfere

with the movement of any native marine resident or migratory fish or marine wildlife species in MBNMS." (*Ibid.*)

F. Groundwater

Questions from Commissioner Brownsey: Is groundwater data missing that could impact how the Salinas Valley Groundwater Basin aquifers have been characterized? If so, does that impact the Project? (Transcript, pp. 327:23-329:13.)

Cal-Am Response: As explained above in Attachment A, Section D, the Commission has sufficient information regarding the Project's potential impacts to groundwater supplies in the SGVB to determine that the Project conforms to the groundwater protection provision of Coastal Act Section 30231. The EIR/EIS consultant team performed over six years of fieldwork, data analysis, and groundwater modeling, and the modeling and its results were subject to substantial peer review and public comment. (See, e.g., Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), at p. 3.) Based on the extensive data and peer-reviewed modeling, the Final EIR/EIS conservatively analyzed the Project's potential impacts to groundwater supplies in the SVGB, finding that such impacts would be less than significant. (See Final EIR/EIS, pp. 8.2-86, 8.2-97, 4.4-64, 4.4-90 to 4.492.) Any additional, non-peer reviewed modeling is unnecessary and would not change the Final EIR/EIS's conclusions. (See Staff Report Addendum, Ex. 7, pp. 19-20 [Weiss Associates confirmed the Final EIR/EIS's modeling was conservative].) Nonetheless, Cal-Am has consented to additional modeling work by Weiss Associates for purposes of moving the Project forward through the Commission process.

Questions from Commissioner Brownsey: How do the slant wells work? When the slant wells withdraw water, do they extract fresh water? What basin is that water coming from? What is the impact on Marina's water? (Transcript, pp. 327:23-329:13.)

Cal-Am Response: The Project's slant wells would extend from the wellheads (the surface components) located on the CEMEX site to beneath Monterey Bay at a fourteen-degree angle. (See Final EIR/EIS, pp. 3-9, 3-18.) The slant wells would withdraw water from the groundwater aquifers that extend beneath the ocean floor. (*Id.*, pp. 3-9, 3-20.)

As explained in detail in Attachment A, Section D, the Project will withdraw primarily seawater from the Salinas Valley Groundwater Basin. (See *id.*, pp. 4.4-4.4-92, 8.5-561.) This "feedwater" would be "a combination of brackish groundwater representing the ambient conditions in the water bearing sediments of the Dune Sand and 180-FTE Aquifers at the coast, and the seawater that is drawn in through the aquifer sediments to recharge the capture zone."[45] (*Id.*, p. 8.2-3.) As shown in Final EIR/EIS, Table 8.2.8-1, copied below, TDS and chloride concentrations in the Project's monitoring wells show

[45] "The capture zone is the localized region that would contribute source water to the slant wells." (Final EIR/EIS, p. 8.2-3; see also *id.*, p. 4.4-52.)

that the water within the capture zone is substantially exceeds applicable standards for human consumption or irrigation without treatment. (See Final EIR/EIS, p. 8.2-48.)

TABLE 8.2.8-1
TOTAL DISSOLVED SOLIDS CONCENTRATIONS IN MPWSP MONITORING WELLS LOCATED WITHIN THE SLANT WELL CAPTURE ZONE

Well Number	Sample Date	Aquifer	Total Dissolved Solids (TDS) (mg/L)	Chloride (mg/L)
			California Drinking Water Standard: 500 mg/L[a]	California Drinking Water Standard: 250 mg/L[a]
MW-1S	2/13/15	Dune Sand	26,600	14,504
MW-1M	2/14/15	180-FTE	30,900	16,037
MW-3S	2/25/15	Dune Sand	23,400	11,680
MW-3M	2/24/15	180-FTE	28,500	14,686
MW-4S	3/7/15	Dune Sand	11,900	5,497
MW-4M	3/6/15	180 FTE	17,900	9,751

NOTES:
[a] California Secondary Maximum Contaminant Level (Cal. Code Regs., tit. 22, § 64449)
SOURCE: Geoscience, 2015

As Project pumping continues, the ocean water percentage of the Project's feedwater will reach 96 to 99%. (*Id.*, p. 4.4-56.) Any fresh water (i.e., water with less than 500 mg/L TDS (Final EIR/EIS, p. 4.4-31)) will be returned to the Basin as part of Cal-Am's obligations under the Return Water Settlement Agreement and Monterey County Water Resources Agency Act. (See CPUC Decision D.18-09-017, pp. 104-105, 110; see also Attachment A, Section D.)

Further, Project pumping will not impact the City of Marina's water supplies. Marina's municipal wells are over 2 miles outside of the Project's capture zone. (See Final EIR/EIS, p. 4.4-75.) Further, Marina's municipal wells are screened in the Deeper Aquifer, but the Project will extract contaminated groundwater from the Dune Sands Aquifer and the 180-Foot Aquifer of the SVGB. (*Ibid.*) There are no known potable groundwater supply wells currently operating in the 180-Foot and 400-Foot Aquifers within the area of potential impacts of the Project's slant wells. (Final EIR/EIS, p. 8.5-633.) Therefore, the Project will not adversely impact Marina's municipal water supply.

G. Water Supply and Demand

Questions from Commissioners Brownsey and Gold: Why is there a divergence of views on water demand? (Transcript, p. 329:6-329:13.) How do we reconcile the differences in the water demand estimates put forth by various parties? (Transcript, pp. 334:21-335:6.)

Cal-Am Response: The estimates of supply and demand that diverge from the CPUC's conclusive supply and demand determination are being put forward by Project opponents in an attempt to derail the Project. These alternative supply and demand estimates all

suffer from significant flaws. Importantly, the CPUC is the agency charged by statute with exclusive jurisdiction to determine utility supply and demand and its determinations reflect a six year process. (See Attachment A, Section I.3; see also *Citizens Utilities Company of California v. Super. Ct.* (1976) 56 Cal.App.3d 399, 408; see also *City of Oakland v. Key System* (1944) 64 Cal.App.2d 427, 435.) Indeed, many of the entities now claiming to have re-calculated Peninsula supply and demand were parties to the CPUC's proceedings on the Project, and made substantially the same arguments in support of their positions then that they are now advancing before the Commission. (See Attachment A, Section I.3.a.) The CPUC considered the testimony of those parties and the evidence presented, and nevertheless determined that Cal-Am's future customer demand is 14,000 afy. *(Ibid.*; see also CPUC Decision D.18-09-017, p. 171.) Following the CPUC's decision, Project opponents, including MCWD, challenged that decision, including its findings on supply and demand, before the California Supreme Court—the Supreme Court wholly rejected those challenges and affirmed the CPUC's decision. Commission staff, MPWMD, and the various Project opponents lack authority to second-guess the binding supply and demand determinations handed down by the CPUC. (See CPUC Decision D.18-09-017, pp. 167-171, 194-195.) Moreover, many of the positions taken in the Stoldt Memo, upon which the Staff Report relies, directly contradict arguments put forward during earlier proceedings related to the Project before the State Water Board. (See Attachment A, Section I.3.d.) Accordingly, there is no need to reconcile the disparate estimates of supply and demand—rather, staff must utilize the supply and demand levels calculated by the CPUC.

As described in detail in Attachment A, each of the supply and demand estimates put forward by various entities and Project opponents is deeply flawed, and do not constitute substantial evidence to conclude that Peninsula supply and demand should be reassessed from the levels set by the CPUC. (See Attachment A, Section I.3.)

Question from Commissioner Escalante: Is there more room for water conservation in Cal-Am's service area? (Transcript, p. 333:3-333:15.)

Cal-Am Response: As a result of both the State Water Board CDO and long-standing drought conditions, water users in Cal-Am's service area are already burdened by "extreme conservation and moratorium measures." (See CPUC Decision D.18-09-017, pp. 52-53.) Indeed, the MPRWA has stated that "the Monterey Peninsula is already one of the most efficient water use communities in the state," and that the Cal-Am service area is already "drought hardened," a fact that the CPUC recognized in its decision on the Project. (*Id.*, p. 28.) Moreover, multiple entities, including MPWMD and the Monterey County Hospitality Association, have argued that additional conservation measures "would force economic stagnation upon the region, and can result in harm to the health and safety of the community." (See Final EIR/EIS, p. 5.5-358.) As such, "meaningful additional conservation will not be a reasonable option" to address the Monterey Peninsula's ongoing water crisis. (CPUC Decision D.18-09-017, p. 28 [quoting testimony provided by MPRWA].)

H. Agriculture

Question from Commissioner Groom: What are the Project's potential impacts to agriculture? (See Transcript, pp. 329:24-330:19.)

Cal-Am Response: The CPUC determined that the Project would boost the economic vitality of the agricultural industry in the region by improving long-term water supply reliability and water infrastructure. (CPUC Decision, D.18-09-017, Appx. C, pp. C-74 to C-75; see also *id.*, pp. 159 [Project "reflects community values . . . by supporting agriculture"].) Rather, without the Project, "the lack of water supply would adversely affect the region's economic vitality, including the County's 'four pillars' – agriculture, tourism, education, and research – by substantially reducing the reliability of water resources and water infrastructure" in the region. (*Id.*, p. 67.)

The Project specifically will provide desalinated product water to the Castroville Community Services Department ("CCSD") and Castroville Seawater Intrusion Project ("CSIP") as part of the CPUC-approved "Return Water Settlement Agreement." (See Attachment A, Section D, *supra.*) CCSD provides municipal and domestic water service to customers in the disadvantaged agricultural community of Castroville. (See, e.g., Ex. 11, Declaration of Eric Tynan, *MCWD v. County of Monterey*, Case No. 19CV003305.) CSIP similarly serves agricultural operations in the region to allow farmers to "safely irrigate their crops and reduce pumping of seawater-tainted groundwater."[46] Project water supplied to CCSD and CSIP will support and improve regional agricultural operations that are currently threatened by saltwater intrusion and a lack of reliable water supplies. (See, e.g., Final EIR/EIS, p. 8.6-414 [letter from Salinas Valley Water Coalition and Monterey County Farm Bureau stating that the Project, with implementation of the Return Water Settlement Agreement, would not cause agricultural impacts]; Ex. 11, p. 4 [describing CCSD's dire need for Project water].) The CCSD Manager has stated that "halting construction of the MPWSP will severely prejudice CCSD and the disadvantaged community of Castroville that despretately needs a new, reliable long-term water supply." (Ex. 11, p. 4.) The Monterey County Farm Bureau, which represents farmers and agricultural operations in the Salinas Valley, has explicitly supported the Project with implementation of the Return Water Settlement Agreement. In contrast, the Monterey County Farm Bureau has raised concerns that the PWM Expansion could capture water discharged in the Salinas Valley that could be used for agriculture and instead reuse it elsewhere, and has recommended that the PWM Expansion be put on hold. (SEIR for PWM Expansion, p. 4-593.) The City of Salinas, MCWRA, and private agricultural operators have raised similar concerns that the PWM Expansion would come at the expense of the Salinas Valley agricultural community. (See, e.g., *id.*, pp. 4-4 to 4-5; 4-42 to 4-44; 4-195.) Cal-Am will provide additional detail on potential impacts to the agricultural community from the PWM Expansion in an

---

[46] Monterey County Water Resources Agency, Monterey County Water Recycling Projects (CSIP/SVRP), https://www.co.monterey.ca.us/government/government-links/water-resources-agency/projects-facilities/castroville-seawater-intrusion-project-salinas-valley-reclamation-project-csip-svip.

Environmental Justice technical analysis that will be submitted separately to the Commission.

As for direct impacts, the EIR/EIS found that there would be no impacts to agriculture from construction of the slant wells. (See Final EIR/EIS, § 4.16.) The agriculture related concern raised by Project opponents is that alleged saltwater intrusion resulting from the Project's operations may impact regional agriculture. These concerns are not based in fact. All available evidence indicates that seawater intrusion will not occur. If anything, the CPUC concluded that the Project will work to prevent further saltwater intrusion. (See Final EIR/EIS, pp. 4.4-92, 8.5-561; HWG Response to Coastal Commission (Feb. 20, 2020), at p. 2; see also Section I.D, supra.)

Further, the Project will neither extract nor impact water that could otherwise be used for agricultural purposes. As fully discussed in Attachment A, Section D, the State Water Board has reviewed the existing groundwater record and the Weiss Report, and in its May 8, 2020 letter, concluded that the modeling "already conducted, revised, and relied upon by the [CPUC] . . . provide a conservative overprediction of the volume of shallow, inland water the Project would capture during operation." (See Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), p. 3.) The State Water Board further stated that the Project's groundwater impacts "have already been resolved by the Public Utilities Commission, after extensive environmental review and consideration of evidence and testimony over a multi-year adjudicative proceeding." Although MCWD and others have claimed that pockets of "fresh water" exist that may be impacted by the project, these pockets are either hydraulically disconnected from the Project's capture zone or are composed of water unfit for agricultural irrigation. (Final EIR/EIS, p. 8.2-61; CPUC Decision D.18-09-017, Appx. J, pp. 15, 19-21; see also Attachment A, Section D.) As determined by the CPUC, the enhanced water supply reliability provided by the Project will benefit agricultural operations in the region and there is no evidence that regional agriculture will be negatively impacted.

I. Coastal Act Section 30260 Override

Questions from Commissioner O'Malley: If the Commission finds that the Project is inconsistent with Coastal Act or LCP policies, but that the Project satisfies the tests of Section 30260, is approval of the Project mandatory or discretionary? Similarly, if the Commission finds that the PWM Expansion is feasible, does the Commission still have discretion to approve the Project under Section 30260? (See Transcript, pp. 324:21-325:19.)

Cal-Am Response: Section 30260 is discretionary. Section 30260 provides that "[c]oastal-dependent industrial facilities shall be encouraged to locate or expand within existing sites and shall be permitted reasonable long-term growth where consistent with [the Coastal Act]." (Pub. Resources Code, § 30260.) If a proposed coastal-dependent industrial facility is inconsistent with a Coastal Act or LCP policy, Section 30260 provides that the facility "***may nonetheless be permitted***" if three criteria are met: "(1) alternative locations are infeasible or more environmentally damaging; (2) to do otherwise would adversely affect the public welfare; and (3) adverse environmental

effects are mitigated to the maximum extent feasible." (Ibid. [emphasis added].) In MCWD's lawsuit challenging the Commission's approval of the test slant well under section 30260, the Sixth District Court of Appeal upheld the Commission's exercise of discretion to approve the test slant well notwithstanding potential impacts to ESHA. (See *MCWD v. Cal. Coastal Com.* (2016) 2016 Cal.App.Unpub.LEXIS 8028.)

Further, the Commission does not have the authority to consider the PWM Expansion as an alternative to the Project under Section 30260. As explained in Attachment A, Section J, the first test of section 30260 is whether "alternative ***locations*** are infeasible or more environmentally damaging." (Pub. Resources Code, § 30260 [emphasis added].) The PWM Expansion is not an alternative location to the Project components located within the Coastal Zone, but rather a wholly separate proposed project. The Final EIR/EIS evaluated alternative locations to the Project components located within the Coastal Zone and concluded, based on substantial evidence, that the proposed location of Project infrastructure, including the slant wells on the CEMEX site, is the environmentally superior alternative. (See Section C *supra*; see also Final EIR/EIS, Ch. 5.)

Acting as lead agency under CEQA, the CPUC also considered certain project alternatives outside of the Coastal Zone, like the PWM Expansion. The CPUC specifically rejected the PWM Expansion as infeasible for "myriad independent reasons." (CPUC Decision D.18-09-017, Appx. C, p. C-17.) The CPUC noted that by September 2018, the PWM Expansion was already far behind schedule and there was not "sufficient certainty concerning short- and long-term availability of source water supplies for the PWM Expansion." (*Id.*, p. C-71; see also Attachment A, Section I.2, for a discussion of the infeasibility of the PWM Expansion.) Further uncertainty has arisen since the CPUC's decision about the Original PWM Project's ability to deliver the amount of water it is obligated to provide, along with related technical issues, which substantially call into question the PWM Expansion's feasibility. Coupled with the fact that the M1W Board has denied certification of the PWM Expansion's Final SEIR, these issues further support the CPUC's conclusion that the PWM Expansion is not a feasible alternative to the Project.

ATTACHMENT C

PROPOSED SPECIAL CONDITIONS

1. **Outfall Construction.** PRIOR TO THE COMMENCEMENT OF PROJECT OPERATION, Permittee shall demonstrate that a Coastal Development Permit or Amendment has been obtained authorizing Project-related construction on the Monterey One Water outfall.

2. **Public Access Plan.** PRIOR TO ISSUANCE OF THE COASTAL DEVELOPMENT PERMIT, the Permittee shall submit to the Executive Director for review and written approval a Public Access Plan indicating the location of construction and maintenance areas, staging areas, and access corridors on the CEMEX site. The Public Access Plan shall indicate:

    a. The specific location of all construction areas, all staging areas, and all access corridors, to be used for both construction and ongoing maintenance for those Project components on the CEMEX site. All such areas within which construction or maintenance activities are to take place shall be minimized to the maximum extent feasible in order to have the least impact on public access, including by using, as feasible, inland areas for staging and storing heavy equipment and materials.

    b. Construction and maintenance equipment, materials, or activity shall not occur outside the staging area and construction corridors identified in the plan required by this condition.

    c. No overnight storage of equipment or materials shall occur on sandy beach or within public parking areas. In addition, no motorized equipment will be allowed on the sandy beach at any time. During the construction stages of the Project, the Permittee shall not store any construction materials or waste where it will be or could potentially be subject to wave, wind, rain or tidal erosion and dispersion.

    d. The specific area to remain as open space following completion of construction, showing how and where public access will be possible. Following completion of construction and during Project operations, the Permittee shall ensure the area enclosed by Project fencing does not occupy more than approximately 0.25 acres aboveground.

    e. Commitment to modify this plan, as required by the Executive Director, to minimize impacts on public access, in light of any future restoration and access plan prepared pursuant to the CEMEX Settlement Agreement.

3. **Dune Migration and Wind Blown Sand.** By acceptance of this permit, the Permittee agrees to monitor and report on the risk of impacts to the wellheads at the CEMEX site from dune migration and wind-blown sand to the Executive Director as follows and shall implement corrective measures as reviewed and approved by the Executive Director:

a. Permittee shall conduct annual monitoring of the rate of dune migration and risk from wind-blown sand to the wellheads at the CEMEX site. An annual monitoring report shall be provided no later than June 30 each year to the Executive Director.

b. As necessary, the annual monitoring report shall include recommendations for the implementation of dune restoration and/or stabilization efforts which could include, but are not limited to, measures such as: the removal of invasive non-native plants; the reestablishment of native dune species; recontouring and stabilization of blowout areas; redirecting/consolidating footpaths; and sand removal. Any proposed dune restoration and stabilization activities must be reviewed and approved by the Executive Director prior to implementation by the Permittee.

c. If based on the annual monitoring report it is determined that dune restoration and stabilization efforts will not eliminate impacts from dune migration and wind-blown sand during the useful life of the wellheads at the CEMEX site, and the Permittee determines that the at-risk well(s) are necessary for the continued operations of the project, beginning at least 5 years prior to the anticipated exposure of the wellheads to such risks, Permittee shall implement the planning and permitting necessary to propose one or more of the following measures:

    i. Sand fencing;

    ii. Constructing physical protective barriers;

    iii. Raising or relocating the impacted well head; or

    iv. Other measures as may be agreed upon with the Executive Director.

    If any of these measures employed would result in impacts to ESHA, ESHA impacts shall be fully mitigated at a 3:1 ratio consistent with the project's HMMP.

d. If the Permittee determines that an at risk wellhead is no longer necessary for the project, instead of permitting any of the measures identified in subsection (c), the Permittee may abandon the well in accordance with Mitigation Measure 4.2-10.

RE: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034; California American Water Company's Response to June 15, 2020 Monterey Peninsula Water Management District letter

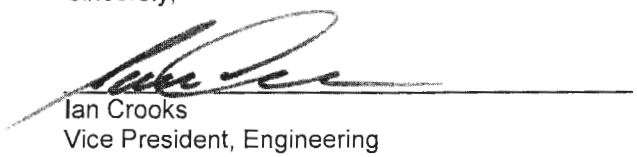
Dear Mr. Ainsworth,

We have recently become aware of a letter to you dated June 15, 2020 from the Monterey Peninsula Water Management District (MPWMD) Board of Directors, encouraging the Coastal Commission to deny California American Water's application for a coastal development permit for the slant wells and related infrastructure supporting Cal Am's proposed desalination facility. In that letter, MPWMD claims that expansion of the Pure Water Monterey recycled water project (Expansion Project) is a feasible alternative to desalination and can be constructed in about 20 months. MPWMD also states that the Expansion Project has less environmental impact than the desalination facility, is sufficient to lift the State Water Board's Cease and Desist Order (CDO), provides sufficient water for the next 20-30 years, and saves ratepayers about $1 billion compared to desalination over a 30-year lifecycle. These statements are inaccurate and must be corrected.

First, the Pure Water Monterey project is a facility owned and operated by Monterey One Water, not MPWMD. And in a letter from its Board chair, Monterey One Water explicitly informed Cal Am that Monterey One Water's Board denied certification of the Final Supplemental Environmental Impact Report (SEIR) for the Expansion Project, and denied conditional approval of the Project (see Attachment 1). In so doing, Monterey One Water also declined to respond to Cal Am's questions and concerns about the feasibility of the Expansion Project and the project's ability to lift the CDO. In light of Monterey One Water's statements, any assumption by MPWMD about the future viability of the Expansion Project, and especially that it feasibly could be approved and constructed in 20 months, is unfounded. Indeed, MPWMD's Board chair and general manager were both copied with the Monterey One Water letter, and MPWMD's failure to acknowledge the current status of the Expansion Project in its letter is a glaring omission.

Further, some of Monterey One Water's expressly stated reasons for refusing to certify the Expansion Project's Final SEIR include the SEIR's inadequate review of environmental impacts to the Salinas Valley Groundwater Basin and to agricultural water supplies. MPWMD's statement that the Expansion Project has less environmental impact than desalination is entirely speculative, if not false, and is not supported by any evidence. Moreover, as the water supplier

for the Monterey Peninsula, Cal Am must advance water supply projects that are feasible. Given the position of Monterey One Water, the Expansion Project is not feasible.



Second, substantial disagreement about rights to the source waters for the Expansion Project have been raised by the owners of those source waters, the Monterey County Water Resources Agency and the City of Salinas. The State Water Board's CDO is very clear that Cal Am must certify that a *permanent* water supply is in place to replace Carmel River withdrawals before the CDO can be lifted. With significant uncertainty over future source water availability, and Monterey One Water's inability to guarantee the amount of water produced by the Expansion Project, the Expansion Project cannot reasonably be considered to be a permanent water supply, and it is misleading to suggest that the State Water Board has suggested otherwise.

Third, Cal Am has repeatedly pointed out defects in the assumptions made in MPWMD's supply and demand analysis, as have city managers on the Peninsula, and many others. Although MPWMD continues to ignore these concerns, it is clear that the Expansion Project simply does not provide sufficient water to meet the needs of the Peninsula without continued and even more drastic restrictions on water use. This is made abundantly clear by the only unbiased determination about the Peninsula's water supply and demand—that by the California Public Utilities Commission in 2018 which, after six days of evidentiary testimony before three administrative law judges, determined that desalination was needed to provide sufficient water to meet the Peninsula's demand. The State Water Board has recently affirmed the CPUC's findings, after reviewing the available documents on Monterey Peninsula water supply and demand, finding that it had no basis to conclude that the CPUC's determinations regarding the water demand, sizing, reliability, or diversity of supply were unreasonable, invalid, or outdated. Moreover, the *only* contrary analyses are those proffered by parties with ulterior motives whose clear mission is to block desalination--MPWMD, the City of Marina and Marina Coast Water District. MPWMD is currently pursuing condemnation of Cal-Am's Monterey system, and board approval to send the June 15, 2020 letter to the Coastal Commission advocating denial of the desalination project permit was made by a narrow 4-3 vote of the Board of Directors. And, to date, the City of Marina and Marina Coast Water District have collectively filed eight lawsuits trying to stop Cal Am's project—five of which have been unsuccessful, three others are still pending. It is not surprising that they and their paid consultants support MPWMD's conclusions.

Finally, MPWMD provides no basis for its statement that the Expansion Project will save ratepayers $1 billion over 30 years. The initial phase of the Pure Water Monterey project is well behind schedule, underperforming, and substantially over budget. Additional funding is lacking to address the significant operational deficiencies, such as the need for new injection wells to replace existing wells that are failing to operate at expected capacity. Based on current operations, the Pure Water Monterey project would deliver only 2,030 acre-feet per year, or only 58% of the 3,500 acre-feet per year that was planned and allocated for Cal-Am's customers (see Attachment 2, excerpts from presentation by Monterey One Water staff at June 18, 2020 Recycled Water Committee meeting). This means that MPWMD's already deficient supply projections, which require a full 3,500 acre-feet per year from Pure Water Monterey, cannot be achieved. Further, while Monterey One Water has been able to provide water cost estimates only for the first three years of operation, and has not provided any estimates about the project's total capital cost, the cost per acre-foot will increase substantially if less than 3,500 acre-feet per year is delivered. According to Monterey One Water, at current production volumes, the cost per acre-foot of Pure Water Monterey water will be $3,678, more than double the initial estimates of $1,720 per acre-foot. And even if higher production objectives are achieved, Monterey One Water's most recent cost estimates are up to $2,933 per acre-foot, nearly 75% more than initial estimates. MPWMD's attempt to compare the cost of the Expansion Project to desalination, when the total cost of the first phase of Pure Water Monterey is unknown and subject to potentially severe fluctuation, is pure speculation.

For nearly twenty-five years, certain vocal factions on the Monterey Peninsula and surrounding communities have vigorously resisted and continue to resist development of a new water supply, leaving the Peninsula dependent on the Carmel River, and with a stagnant economy. The State Water Board has warned that there could be dire consequences if a reliable and sustainable water supply is not promptly developed. Desalination will supply the water the community needs to ensure that the threatened species who call the Carmel River home are protected, the existing moratorium on service connections and increases in use is lifted, economies may recover, and communities are able to address their severe housing issues. The Expansion Project will not.

Sincerely,

Ian Crooks

Re: Pure Water Monterey Project - Cost, Operational Performance and Status

Dear Mr. Svindland:

This letter is in response to your May 9, 2020 correspondence, providing clarification and corrections to certain misconceptions. It does not respond to the merits and/or potential feasibility of the proffered Expanded Pure Water Monterey Project in Section D. of that correspondence, given Monterey One Water Board's April 27, 2020 action [1] denying certification of *Final Supplemental Environmental Impact Report;* and, [2] denial of Conditional Project Approval.

We all agree that the Pure Water Monterey Project is a critical component of the overall Monterey Peninsula Water Supply Project and that it is in the best interests of all parties and their constituents to ensure its full operation at the earliest possible date – M1W is employing best commercial efforts toward that important objective. It was thus disheartening to learn, two months after a March 9, status meeting among representatives of California American Water ["Cal Am"]; the Monterey Peninsula Water Management District ["MPWMD"]; and M1W that Cal Am claims that it "has repeatedly requested detailed information about the current status of the project, anticipated start dates, and any issues that may further delay the project."

A. **Pure Water Cost Analysis** -- On April 29, 2020, M1W responded in writing[1] to your April 20, 2020 letter and provided additional financial information requested after the March 9, 2020 meeting between Cal Am, MPWMD, and M1W, where we provided back-up data supporting the 3-year summary of estimated costs. Apparently, it was not in the format desired by Cal Am. A revised financial table is attached which includes original projections from 2016.

B. **Pure Water Monterey Start Date** – We confirm that the Performance Start Date provided in the April 29, 2020 letter to Cal Am remains the same (on or about August 10, 2020).

[1] April 29, 2020; Letter from M1W and MPWMD to California American Water

c. **Pure Water Monterey Current Operations Status** – Within 60 calendar days following the Performance Start date, M1W will provide its Monthly Operations Report on Delivery Point Water Deliveries to Cal Am. Please note that this is not an enumerated requirement in the *Water Purchase Agreement* between Cal Am, MPWMD, and M1W. Reporting on source water percentages is not germane given that all waters are treated together before purification.

D. **Expanded Pure Water Monterey Project** – Discussed in first paragraph above.

E. **Conclusion** – M1W notes Cal Am's desire for an independent project audit of the Pure Water Monterey Project. An audit is not an enumerated requirement in the *Water Purchase Agreement* between Cal Am, MPWMD, and M1W; it necessarily would have to be accomplished at Cal Am's sole cost and expense. An audit could be performed reasonably after the Performance Start Date to avoid bogging down operations personnel during commencement of full operations. With concurrence of the MPWMD, M1W would be willing to enter into an amendment to the *Water Purchase Agreement* between Cal Am, MPWMD, and M1W for an audit, with the scope defined, and an auditor selected, by consensus.

M1W, however, is concerned that Cal Am apparently has not yet initiated the Tier 1 Advice Letter filing with the California Public Utilities Commission ["CPUC"]. Sufficient justification exists and has been provided to you to support the initial $1,720/acre-ft amount ["soft cap"]. Because the CPUC Division of Water and Audits (DWA) must receive (electronically only during COVID-19) a protest or response within 20 days of the date the Advice Letter is served on the Service List, it is prudent to begin this process as soon as possible. We request Cal-Am propose an effective date to implement the Tier 1 approval consistent with the current projected Performance Start Date. Insofar as the time for review by DWA staff is 30 days from the service date, it is best to complete this aspect of the process by June 12th. Such a date will enable approval and implementation by July 7th .

Immediately upon CPUC approval of such [the "soft cap"], we encourage Cal-Am to file a Tier 2 Advice Letter seeking approval of the actual 2020-21 Company Water Rate. This timing would result in submission by July 8th and certainly no later than July 10th. While a Tier 2 advice letter carries the same 20-day protest or response period, the requested effective date cannot occur before 30 days from the service date. We ask that Cal-Am take all steps needed to support implementation of this rate by the Performance Start Date. As an alternative, Cal-Am could tender both the Tier 1 and Tier 2 advice filings simultaneously. This approach would allow more response time in the event a protest is filed with respect to either request.

Lastly, in order to avoid future communication issues among the parties, we suggest a monthly meeting among the principals, with notes taken, be held to resolve any contractual or high-level operational issues.

Please contact me directly with your reply.

Pure Water Monterey
A Groundwater Replenishment Project

Sincerely,

Ron Stefani

Re: September 17, 2020, Special Meeting Agenda Items Th3a & 4a: Monterey Peninsula Water Supply Project, Coastal Development Permit Application No. 9-19-0918, and Appeal No. A-3-MRA-19-0034

Dear Chair Padilla and Honorable Commissioners:

On behalf of California-American Water Company ("Cal-Am"), this letter responds to Coastal Commission ("Commission") staff's August 25, 2020, Staff Report regarding the coastal development permit ("CDP") application for and local CDP appeal of the Monterey Peninsula Water Supply Project ("Project"), which are Agenda Items Th3a and 4a at the Commission's upcoming September 17, 2020, special meeting.

While we appreciate Commission staff's efforts in reviewing the Project and preparing the Staff Report, we fundamentally disagree with its overarching conclusion that the Pure Water Monterey Groundwater Replenishment Project ("PWM Expansion") is a feasible alternative to the Project. Staff's conclusion overlooks a number of viability issues with the PWM Expansion most significantly that ***a water supply with the PWM Expansion but without the Project simply will not provide sufficient water supply to the Monterey Peninsula even utilizing the most conservative demand estimates submitted to the Commission by the Monterey Peninsula Water Management District*** ("MPWMD"). Only the Project provides a long-term water supply for the Monterey Peninsula that will meet even MPWMD's low projections of customer demand, provide for the development of affordable housing, avoid water rationing and ongoing service connection moratoria, and boost the region's economic vitality by substantially enhancing the reliability of water resources and water infrastructure. The Monterey Peninsula needs this Project now, and we urge you to approve the Project.

The Staff Report's denial recommendation is based on its determination that the PWM Expansion is feasible. But without the PWM Expansion it is clear from the Staff Report that by imposing Special Conditions the Project would be consistent with the Coastal Act and the City of Marina's Local Coastal Program ("LCP"). While the Project would result in an inconsistency with some Coastal Act and LCP policies related to ESHA, Cal-Am is proposing Special Conditions over and above the already robust mitigation measures included in the Project's

EIR/EIS that will mitigate impacts to ESHA to the maximum extent feasible. Accordingly this inconsistency can be overcome with the override provision in Coastal Act section 30260, which allows coastal-dependent industrial facilities like the Project to be approved despite any Coastal Act or LCP inconsistencies.

To ensure that the Commission has an accurate record upon which to assess the Project in advance of the September 17, 2020, special meeting, and a mechanism to approve the Project at the meeting, we have provided an alternate Staff Report with proposed Special Conditions and Findings ("Applicant's Staff Report") as **Attachment A** to the this letter.[1] **Attachment A** also provides a series of proposed Special Conditions in an effort to help address several of Commission staff's stated concerns regarding the Project and Coastal Act consistency. We also have provided fulsome responses to the Staff Report and Marina Coast Water District's ("MCWD") August 14, 2020, submittal, which are provided as **Attachments B and C**, respectively, to this letter**.** **Attachment D** is a standalone document containing the Applicant's proposed motions and resolutions, recommending approval of the Project. Immediately on the following page we have summarized our positions on the major issue areas identified in the Staff Report.

We appreciate the Commission's consideration of Cal-Am's CDPs for this critically important Project. We respectfully request that the Commission examine Cal-Am's CDP application and Appeal No. A-3-MRA-19-0034 objectively and approve the CDPs at its special meeting on September 17, 2020 using the motions and resolutions in **Attachment D**. Thank you for your consideration and we look forward to presenting the Project to you next week.

Very truly yours,

Duncan Joseph Moore
of LATHAM & WATKINS LLP

Alison Dettmer, California Coastal Commission
Tom Luster, California Coastal Commission

[1] The Applicant's Staff Report is a redline against the August 25, 2020, Staff Report.

SUMMARY OF CAL-AM POSITIONS

The Staff Report reaches several incorrect conclusions regarding the Project's impacts and consistency with the Coastal Act and the City of Marina LCP, which are addressed in detail in the Attachments and summarized below.

- **Alternatives:** While Cal-Am disagrees with the position that the Commission can evaluate wholesale project alternatives located outside of its jurisdiction, the PWM Expansion is not a feasible alternative to the Project because (a) ***there is not an adequate supply of source water for the PWM Expansion*** to produce its promised 2,250 acre-feet per year; and (b) even with PWM Expansion operating at 100% capacity ***there is insufficient supply due to the unreliability of Aquifer Storage and Recovery ("ASR")***, particularly in drought years. If the PWM Expansion were constructed in the absence of the Project, the Peninsula would experience ***a significant water supply deficit***, even under the most conservative future demand estimates presented by MPWMD. This supply deficit would be staggering in drought periods, the implications of which are entirely overlooked by the Staff Report. Simply put, only the Project is capable of meeting the Peninsula's water demand needs.

  In concluding that the PWM Expansion is a feasible alternative, the Staff Report also ignores significant ongoing technical issues faced by the first phase of the Pure Water Monterey project that raise additional questions regarding the PWM Expansion's viability and timing. Further, the Staff Report ignores that the M1W Board of Directors' denied certification of the PWM Expansion's Final Supplemental Environmental Impact Report due to ***an inadequate environmental impacts analysis***, and work on the PWM Expansion has been ordered to halt. For all of these reasons, the PWM Expansion cannot meet the basic objectives set forth for the Project by the CPUC, and cannot constitute a feasible alternative to the Project.

- **Environmentally Sensitive Habitat Areas ("ESHA"):** The Staff Report concludes that the Project could impact 35 acres of ESHA. Based on a more detailed biological assessment including changes resulting from the California Public Utilities Commission's ("CPUC") approval of a smaller sized project than was studied in the Final Environmental Impact Report/Environmental Impact Statement ("EIR/EIS"), AECOM has confirmed Project construction and maintenance will permanently impact only 2.2 acres of ESHA and temporarily impact 15.3 acres, for a total of 17.5 acres—*half the amount* identified in the Staff Report. Further, Cal-Am has submitted a proposed Habitat Mitigation and Monitoring Plan ("HMMP") through which it proposes to restore approximately 23.7 acres on the CEMEX site, including 1.8 acres beyond the amount required to benefit the success of the restoration. Although staff determined that the Project would be inconsistent with Marina LCP's Habitat Protection Policies regarding development in primary habitat, with the implementation of the mitigation identified in the EIR/EIS, Cal-Am's HMMP, and the Special Conditions proposed in **Attachment A**, potential impacts to ESHA would be mitigated to the maximum extent feasible. Thus, the Commission may approve

the Project under Coastal Act section 30260, which allows for coastal-dependent industrial facilities like the Project to be approved despite potential LCP inconsistencies.

- **Wetlands and Vernal Ponds ESHA:** The Staff Report determines that Project pumping would "likely" impact vernal ponds in Marina, but staff's conclusion relies entirely on information provided by Marina. The Staff Report does not address the robust analysis that Cal-Am provided, which demonstrates that the vernal ponds at issue are unlikely to be impacted by Project pumping. Nonetheless, through a Special Condition set forth in **Attachment A**, Cal-Am proposes to implement a comprehensive Adaptive Management Program in which the ponds would continue to be evaluated before Project operations begin. If it is determined that there would be potential impacts from Project pumping, the Adaptive Management Program requires Cal-Am to implement wetland resiliency, enhancement, or restoration activities approved by the Commission to ensure that there would be no adverse effects associated with the Project.

- **Coastal Hazards:** The Staff Report determines that the existing test slant well site could be impacted by coastal erosion by 2060, but staff's conclusion fails to consider any reduction in coastal erosion as a result of the CEMEX site closure and an end to existing sand mining operations. Using reasonable estimates of reduction in coastal erosion, AECOM's analysis confirms that the *Project's slant wells, including the test slant well, will not be impacted by coastal erosion until near the 2120 planning horizon*. Moreover, AECOM's analysis of dune recession confirms that only two of the Project's seven slant wells could be at risk from sand burial within their economic lives of 20 to 25 years, but through a Special Condition proposed in **Attachment A**, that risk would be mitigated. Because the slant wells would be protected for their economic lives from both coastal erosion and dune recession, staff does correctly conclude that the Project is consistent with the LCP and Coastal Act policies. Further, although staff raises concerns about relocation of the wells after their expected economic lives, such speculation is premature and does not affect a finding of LCP and Coastal Act consistency.

- **Coastal Waters and Marine Resources:** The Staff Report wrongly characterizes the potential diffuser retrofit to the Monterey One Water ("M1W") ocean outfall, the Project's installation of monitoring buoys, and the replacement of clamps on the nearshore portion of the outfall as involving the placement of "fill" in coastal waters, providing no justification for this conclusion. As Cal-Am has repeatedly explained, potential modifications to the M1W outfall to retrofit its existing diffuser are not part of Cal-Am's CDP application and would be addressed through a separate CDP application to be submitted by M1W. Moreover, the proposed monitoring equipment and buoy would be temporarily attached to the seafloor by anchor and installation would be complete in a matter of hours, involving minimal seafloor disturbance. Further, the WEKO clamp replacement would occur roughly 100 feet from the shoreline and the Staff Report has not identified any aspect of the work that would occur in coastal waters. Accordingly, the Staff Report incorrectly determined that

these project components would involve placing fill in coastal waters. Additionally, the Staff Report erroneously contends that it is unclear what effects the desalination plant would have on water quality or marine life. These issues were extensively analyzed in the Final EIR/EIS and any potential environmental impacts would be less than significant with mitigation. Nonetheless, as a further precaution, Cal-Am proposes a Special Condition in **Attachment A** that would require Cal-Am to demonstrate that all discharges comply with the California Ocean Plan and applicable water quality requirements.

- **Groundwater:** The Staff Report's analysis of potential groundwater impacts is not properly focused on the requirements of Coastal Act Section 30231. Rather, staff alleges that because Project pumping could potentially capture a higher percentage of groundwater than was determined in the EIR/EIS, Cal-Am could be required to return more water to the Salinas Valley Groundwater Basin ("SVGB"), thereby increasing the costs of water and resulting in public welfare impacts. First, that conclusion is incorrect. The evidence demonstrates that under reasonable assumptions, the EIR/EIS' conclusions on the amount of return water were correct. Second, even in the unlikely scenario where larger amounts of return water are required, Cal-Am's customers would not be charged higher rates; pursuant to the CPUC's decision, Cal-Am would be required to absorb those added costs. With respect to the Project's potential environmental impacts to groundwater supplies in SVGB, the Project will both prevent further seawater intrusion in the SVGB and help protect water levels in the Seaside Groundwater Basin against seawater intrusion and the irreversible loss of basin storage. Further, the Staff Report confirms that "*neither the Final EIR/EIS nor the Commission's independent hydrogeologist found evidence that impacts [to MCWD's water supply wells] are reasonably foreseeable*." (Staff Report, p. 68 [emphasis added].) Because the Project will not adversely affect or deplete groundwater supplies in the SVGB—and in fact would *benefit* both the SVGB and Seaside Groundwater Basin—the Project is consistent with Coastal Act Section 30231.

- **Public Access:** The Staff Report asserts that Project operation could result in adverse effects to public access and recreation, but the Project footprint will be *de minimis* and would not impede beach use or access at any time. Specifically, under regular operations, Project infrastructure within fenced areas will occupy only about 0.06 percent (approximately 0.25 acres) of the CEMEX site (approximately 400+ acres) and during recommended maintenance activities (occurring approximately every five years over a period of 9 to 18 weeks) an additional approximately 0.25 acres would be occupied. Despite this *de minimis* presence, to further minimize any public access or recreation impacts, Cal-Am proposes a Special Condition in **Attachment A** requiring the preparation and approval of a Public Access Plan that would be subject to modification at the direction of the Executive Director, depending on the final approved use of the remainder of the CEMEX site.

- **Environmental Justice:** The Staff Report contends that the Project would disproportionately burden communities of concern through higher water rates and that

a feasible alternative could provide water without such impacts. Staff inappropriately disregards many Project benefits to low income communities—including the severely disadvantaged community of Castroville—and to the Monterey Peninsula generally. The Project will provide a reliable drought-proof water supply necessary for economic growth and much-needed affordable residential development to meet State-mandate housing goals. Moreover, staff does not consider that the CPUC carefully evaluated Cal-Am's water rates throughout its six-year administrative process and determined the rates to be just and reasonable. To further offset costs to low income customers, Cal-Am has proposed a Special Condition in **Attachment A** to increase the discount afforded to eligible low income Monterey Peninsula customers through its Customer Assistance Program ("CAP")[2] from 30% to 50%, to increase enrollment in the CAP by launching a pilot program to enroll residents of multi-family housing to ensure more eligible customers can participate in the CAP, and to contribute up to $250,000 to the United Way to assist customers in Cal-Am's Monterey service territory who may have financial difficulties paying monthly bills if the additional CAP discount is not approved before desalination facility costs affect Cal-Am's ratepayers. As conditioned, the Project is consistent with the Commission's Environmental Justice Policy.

- **Coastal Dependent Override**: Notwithstanding any potential inconsistencies with the City of Marina LCP or Coastal Act policies, the Commission can approve the Project under Coastal Act section 30260. The Project is a coastal-dependent industrial facility and, as demonstrated in **Attachment A**, (1) alternative locations of the Project are infeasible or more environmentally damaging; (2) to not permit the Project would adversely affect the public welfare; and (3) the Project's environmental impacts have been mitigated to the maximum extent feasible.

I. MOTIONS & RESOLUTIONS

A. DETERMINATION FOR APPEAL A-3-MRA-19-0034

Motion

I move that the Commission approve Coastal Development Permit A-3-MRA-19-0034 for the development proposed by the applicant subject to conditions.

Staff recommends a YES vote. Passage of this motion will result in conditional approval of the permit and adoption of the following resolution and findings. The motion passes only by affirmative vote of a majority of the Commissioners present.

Resolution to Approve with Conditions CDP on Appeal

The Commission hereby approves Coastal Development Permit A-3-MRA-19-0034 and adopts the findings set forth below on the ground that the development as conditioned will be in conformity with the City of Marina Local Coastal Program and Coastal Act access and recreation policies. Approval of the permit complies with the California Environmental Quality Act because either 1) feasible mitigation measures and/or alternatives have been incorporated to substantially lessen any significant adverse effects of the development on the environment, or 2) there are no further feasible mitigation measures or alternatives that would substantially lessen any significant adverse impacts of the development on the environment.

B. DETERMINATION FOR CDP 9-19-0918

Motion

I move that the Commission approve Coastal Development Permit Application No. 9-19-0918 for the development proposed by the applicant subject to conditions.

Staff recommends a YES vote. Passage of this motion will result in conditional approval of the permit and adoption of the following resolution and findings. The motion passes only by affirmative vote of a majority of the Commissioners present.

Resolution

The Commission hereby approves Coastal Development Permit 9-19-0918 and adopts the findings set forth below on the ground that the development as conditioned will be in conformity with the policies of Chapter 3 of the Coastal Act. Approval of the permit complies with the California Environmental Quality Act because either 1) feasible mitigation measures and/or alternatives have been incorporated to substantially lessen any significant adverse effects of the development on the environment, or 2) there are no further feasible mitigation measures or alternatives that would substantially lessen any significant adverse impacts of the development on the environment.

Note: These are not Commission staff's Recommended Findings

II. STANDARD CONDITIONS

1. Notice of Receipt and Acknowledgement. The permit is not valid and development shall not commence until a copy of the permit, signed by the Permittee or authorized agent, acknowledging receipt of the permit and acceptance of the terms and conditions, is returned to the Commission office.

2. Expiration. If development has not commenced, the permit will expire two years from the date on which the Commission voted on the application. Development shall be pursued in a diligent manner and completed in a reasonable period of time. Application for extension of the permit must be made prior to the expiration date.

3. Interpretation. Any questions of intent of interpretation of any condition will be resolved by the Executive Director or the Commission.

4. Assignment. The permit may be assigned to any qualified person, provided assignee files with the Commission an affidavit accepting all terms and conditions of the permit.

5. Terms and Conditions Run with the Land. These terms and conditions shall be perpetual, and it is the intention of the Commission and the Permittee to bind all future owners and possessors of the subject property to the terms and conditions.

III. SPECIAL CONDITIONS

1. Evidence of Other Agency Approvals. The Permittee shall provide to the Executive Director a copy of each of the following approvals or documentation from the relevant agency that such approval is not needed:

    a. PRIOR TO COMMENCEMENT OF PROJECT OPERATION, a negotiated agreement or memorandum of understanding between the Permittee and Monterey One Water regarding the connection, use, and repair and maintenance of the ocean outfall for discharge of water produced from the project.

    b. PRIOR TO COMMENCEMENT OF PROJECT OPERATION, an amendment to Monterey One Water's NPDES permit allowing discharges through the ocean outfall and, if necessary, any modifications to the outfall required to satisfy Ocean Plan water quality objectives.

    c. PRIOR TO COMMENCEMENT OF CONSTRUCTION BENEATH STATE TIDELANDS, a lease from the California State Lands Commission.

2. Final Plans. PRIOR TO COMMENCEMENT OF CONSTRUCTION, the Permittee shall submit to the Executive Director for review and approval final plans for the project components located in the coastal zone. The Permittee shall undertake development in accordance with the approved

Note: These are not Commission staff's Recommended Findings

plans and any changes shall be reported to the Executive Director. No material changes within the coastal zone shall occur without a Commission approved amendment to this coastal development permit unless the Executive Director determines that no amendment is necessary.

3. Outfall Construction. PRIOR TO THE COMMENCEMENT OF PROJECT OPERATION, Permittee shall demonstrate that discharges from the outfall would comply with the Ocean Plan and applicable water quality requirements by demonstrating that (1) a Coastal Development Permit or Amendment has been obtained and implemented for any necessary work on the Monterey One Water outfall; and/or (2) Permittee has implemented other measures consistent with Final EIR/EIS Mitigation Measure 4.3-5, as necessary, outside of the Commission's jurisdiction.

4. Outfall Lining. PRIOR TO THE COMMENCEMENT OF PROJECT OPERATION, Permittee shall demonstrate that it or its designee has obtained all approvals authorizing Project-related repair and maintenance work on the Monterey One Water outfall, including, but not limited to, excavation permits from the County, and has implemented such repair and maintenance work on the portion of the outfall within the coastal zone. Permittee shall ensure the installation of a protective liner within the Monterey One Water outfall by application of a spray liner throughout the pipeline's interior from an access point outside of the coastal zone and extending to the beach junction box. The work shall not involve any groundbreaking activities within the coastal zone or result in the discharge or disposal of waste through the Monterey One Water outfall. Permittee shall submit a complete application for a new or amended permit for any alternative installation method for the outfall liner that would involve groundbreaking activities or disturbance within the coastal zone, which must be reviewed and approved by the Commission prior to the commencement of operation of the Project.

5. CEMEX Site HMMP Implementation. PRIOR TO PERMIT ISSUANCE, Permittee shall prepare and submit a final plan providing for the implementation of the HMMP, which shall be reviewed and approved by the Executive Director. The final plan shall select one of the following options:

   a. Cal-Am shall develop, fund and cause the HMMP to be implemented on the CEMEX site. Cal-Am would begin to implement the HMMP's restoration and monitoring work prior to the transfer of the CEMEX site to a Commission-approved entity with the approval of CEMEX and the Executive Director. Once the CEMEX site is transferred to an entity approved by the Commission pursuant to the CEMEX Settlement Agreement, and subject to approval by that entity, Cal-Am may either continue to implement the HMMP restoration and monitoring work or may establish an endowment to fund the remaining HMMP restoration and monitoring work at the CEMEX site, including long-term mitigation efforts. If Cal-Am continues to implement the HMMP, as part of the Commission's approval of the future purchaser of the CEMEX site pursuant to the CEMEX Settlement Agreement, the Commission shall ensure that the future

Note: These are not Commission staff's Recommended Findings

purchaser consents to Cal-Am's continued implementation of the HMMP. If Cal-Am establishes an endowment to fund the remaining HMMP restoration and monitoring work, then as part of the Commission's approval of the future purchaser of the CEMEX site pursuant to the CEMEX Settlement Agreement, the Commission shall ensure that the purchaser continues implementation of the HMMP on the CEMEX site as a condition of purchase;

b. Cal-Am would fund the HMMP implementation, but actual HMMP implementation would be undertaken by a Commission-approved entity. Cal-Am funding would cover full implementation of the HMMP, inclusive of long-term mitigation efforts. As part of the Commission's approval of an entity to undertake HMMP implementation, the Commission shall ensure that the Commission-approved entity shall implement the HMMP on the CEMEX site. In addition, as part of the Commission's approval of the future purchaser of the CEMEX site pursuant to the CEMEX Settlement Agreement, the Commission shall ensure that the purchaser consents to implementation of the HMMP on the CEMEX site by the Commission-approved entity as a condition of purchase; or

c. Cal-Am would fund an endowment, equal to the cost of HMMP implementation (full implementation of the HMMP, inclusive of long-term mitigation efforts), to contribute to the purchase of the CEMEX site by a Commission-approved entity. As part of the Commission's approval of the future purchaser of the CEMEX site pursuant to the CEMEX Settlement Agreement, the Commission shall ensure that the purchaser implements the HMMP on the CEMEX site as a condition of purchase.

6. Agricultural Runoff Plan. PRIOR TO PERMIT ISSUANCE, Permittee shall prepare and submit a final plan for Executive Director review and approval providing for the discontinuation or alternative management for the agricultural runoff drainage on the CEMEX site to ensure such runoff does not adversely affect or interfere with restoration activities on the site.

7. Vernal Pond Adaptive Management Program: PRIOR TO PERMIT ISSUANCE, the Permittee shall submit to the Executive Director for review and approval a Vernal Pond Adaptive Management Program that includes the following:

a. Stage 1: Supplemental data collection and near-term monitoring to determine whether there is a connection between vernal ponds within the drawdown zone of the Project and the Dune Sand Aquifer. The results of Stage 1 shall be submitted to the Executive Director for review and approval;

b. Stage 2: If the results of Stage 1 determine that there is a connection between the vernal ponds within the drawdown zone of the Project and the Dune Sand Aquifer, the program would evaluate the degree to which the Project's pumping would affect the ponds. The results

Note: These are not Commission staff's Recommended Findings

of Stage 2 shall be submitted to the Executive Director for review and approval; and

c. Stage 3: Based on the results of Stage 1 and Stage 2, Stage 3 would develop a Wetland Resiliency, Enhancement, Restoration, and Monitoring Plan (Plan). If Stage 3 is necessary, the Permittee shall apply for and obtain the Commission's approval of the Plan in the form of an amendment to this permit. The Plan would require compensation for potential impacts and would include the following:

i. The Plan would provide no less that 1:1 mitigation if impacts can be mitigated on-site. If off-site mitigation is necessary the Plan would provide for 1:1 mitigation for wetland creation; 3:1 mitigation for wetland restoration; and 4:1 mitigation for wetland enhancement.

ii. The specific creation, restoration, or enhancement measures that will be used at each site, including grading and planting plans, the timing of the mitigation measures, monitoring that will be implemented to establish baseline conditions and to determine whether the sites are meeting the applicable site specific success criteria. The Plan shall also identify contingency measures that will be implemented should any of the sites not meet the site specific success criteria. The success criteria developed for specific sites will ensure that the mitigation ratios in Section (c)(i) are achieved.

iii. "As-built" plans for each site and annual monitoring reports for no less than five years or until the sites meet performance criteria.

iv. Legal mechanism(s) proposed to ensure permanent protection of each site – e.g., conservation easements, deed restriction, or other methods.

8. Dune Migration and Wind Blown Sand. By acceptance of this permit, the Permittee agrees to monitor and report on the risk of impacts to the wellheads at the CEMEX site from dune migration and wind-blown sand to the Executive Director as follows and shall implement corrective measures as reviewed and approved by the Executive Director:

a. Permittee shall conduct annual monitoring of the rate of dune migration and risk from wind-blown sand to the wellheads at the CEMEX site. An annual monitoring report shall be provided no later than June 30 each year to the Executive Director.

b. As necessary, the annual monitoring report shall include recommendations for the implementation of dune restoration and/or stabilization efforts which could include, but are not limited to, measures such as: the removal of invasive non-native plants; the reestablishment of native dune species; recontouring and

Note: These are not Commission staff's Recommended Findings

stabilization of blowout areas; redirecting/consolidating footpaths; and sand removal. Any proposed dune restoration and stabilization activities must be reviewed and approved by the Executive Director prior to implementation by the Permittee.

c. If based on the annual monitoring report it is determined that dune restoration and stabilization efforts will not eliminate impacts from dune migration and wind-blown sand during the useful life of the wellheads at the CEMEX site, and the Permittee determines that the at-risk well(s) are necessary for the continued operations of the project, beginning at least 5 years prior to the anticipated exposure of the wellheads to such risks, Permittee shall implement the planning and permitting necessary to propose one or more of the following measures:

   i. Sand fencing;

   ii. Constructing physical protective barriers;

   iii. Raising or relocating the impacted well head structures; or

   iv. Other measures as may be agreed upon with the Executive Director.

   If any of these measures employed would result in impacts to ESHA, ESHA impacts shall be fully mitigated at a 3:1 ratio consistent with the project's HMMP.

d. If the Permittee determines that an at risk wellhead is no longer necessary for the project, instead of permitting any of the measures identified in subsection (c), the Permittee may abandon the well in accordance with Mitigation Measure 4.2-10.

9. Slant Well Permit Amendment. In conjunction with Permittee's obligation to submit to the Executive Director an annual monitoring report as specified in Special Condition 8, the Permittee shall inform the Executive Director of the projected need to relocate or replace the slant wells due to risk from coastal hazards. An amendment to this Permit shall be required for relocation or replacement of the permitted slant wells. The Permittee shall return to the Commission for an amendment concerning well relocation or replacement 24 years from the commencement of operations, unless the Executive Director determines that no amendment is required. The amendment application shall identify the proposed plan for any replacement or relocation of the permitted slant wells.

10. Public Access Plan. PRIOR TO ISSUANCE OF THE COASTAL DEVELOPMENT PERMIT, the Permittee shall submit to the Executive Director for review and written approval a Public Access Plan indicating the location of construction and maintenance areas, staging areas, and access corridors on the CEMEX site. The Public Access Plan shall indicate:

Note: These are not Commission Staff's Recommended Findings

a. The specific location of all construction areas, all staging areas, and all access corridors, to be used for both construction and ongoing maintenance for those Project components within the Permittee's easement areas on the CEMEX site. All such areas within which construction or maintenance activities are to take place shall be minimized to the maximum extent feasible in order to minimize potential impacts on public access, including by using, as feasible, inland areas for staging and storing heavy equipment and materials.

b. Construction and maintenance equipment, materials, or activity shall not occur outside the staging area and construction corridors identified in the plan required by this condition.

c. Except for as specifically authorized by the plan, no overnight storage of equipment or materials shall occur on sandy beach or within public parking areas. During construction associated with the outfall clamps, for larger materials that would be too difficult to move off of the beach on a daily basis, the Permittee shall submit as part of the plan a list of all materials that would be too difficult to move. For such materials, the Permittee shall include within the Public Access Plan a contingency plan for moving the materials in the event of a tidal surge. The Public Access Plan will provide for tidal monitoring during construction associated with the outfall clamps. In addition, no motorized equipment will be allowed on the sandy beach at any time, except for as needed for construction associated with the outfall clamps. During the construction stages of the Project, the Permittee shall not store any construction materials or waste where it will be or could potentially be subject to wave, wind, rain or tidal erosion and dispersion (subject to the provision above regarding construction of the outfall clamps).

d. The specific area to remain as open space following completion of construction, showing how and where public access will be possible. Following completion of construction and during Project operations, the Permittee shall ensure the area enclosed by Project fencing does not occupy more than approximately 0.25 acres aboveground.

e. The requirement that the Permittee modify this plan, as may be required by the Executive Director, to address any future restoration and access plan prepared pursuant to the CEMEX Settlement Agreement and ensure that public access impacts are minimized to the maximum extent feasible while ensuring Project operations.

11. Visual Resources. PRIOR TO COMMENCEMENT OF CONSTRUCTION, the Permittee shall submit to the Executive Director for review and approval a Facility Design and Screening Plan. The Facility Design and Screening Plan shall include the following:

a. Identifies all structures and fencing in the coastal zone, including heights and dimensions. Project components within the coastal

Note: These are not Commission staff's Recommended Findings

zone shall be no taller than 10 feet in height;

b. Provides the color palette and material specifications for all structures and fences in the coastal zone, which shall conform to the following:

i. structures shall be muted in color with earth-tone finishes to reduce contrast with the ground surface and increase compatibility with the visual setting and ensure that that structures blend in with the surrounding landscape; and

ii. fencing shall be used to screen project components and shall be designed to be minimally intrusive, and blend in with the surrounding habitat;

c. Native plants, trees, or shrubs shall be used whenever practicable to screen views and shall be designed to be consistent with the Project's HMMP.

The Permittee shall implement the Facility Design and Screening Plan approved by the Executive Director.

12. Lighting Plan. PRIOR TO COMMENCEMENT OF CONSTRUCTION, the Permittee shall submit for Executive Director review and approval a Lighting Plan prepared by a qualified engineer that includes the following:

a. Identifies all lighting and associated infrastructure proposed for use during the project, such as towers, poles, electrical lines, etc. The Lighting Plan shall identify the locations, heights, dimensions, and intensity of the lighting and associated lighting infrastructure.

b. Evaluates the effects of project lighting and associated infrastructure on wildlife in the project area and describes proposed measures to avoid or minimize any adverse effects. These measures may include shielding project lighting from off-site locations, directing lighting downward, using the minimum amount of lighting necessary to ensure project safety, and other similar measures.

c. Affirms that all lighting structures and fixtures installed for use during the project and visible from public areas, including shoreline areas of Monterey Bay, will be painted or finished in neutral tones that minimize their visibility from those public areas.

The Permittee shall implement the Lighting Plan as approved by the Executive Director.

13. Enhanced Monterey Customer Assistance Program. PRIOR TO PROJECT CONSTRUCTION, the Permittee shall:

Note: These are not Commission staff's Recommended Findings

a. Develop and submit for approval to the California Public Utilities Commission an increase from the current 30% discount to a 50% discount on water bills for Permittee's Monterey Main Service Territory customers enrolled in the Permittee's Customer Assistance Program (previously known as the Low-Income Ratepayer Assistance program).

b. If the California Public Utilities Commission's approval of the increased discount described in Special Condition 13(a) is not granted by the time Permittee's customer bills are impacted by costs related to the Project, then Permittee shall make an additional contribution of up to $250,000 to the United Way to enhance the United Way's Hardship Benefit Program that assists Permittee's customers who face difficulties making water bill payments.

c. Seek approval from the California Public Utility Commission to participate in the Commission's multi-family pilot program that is designed to enroll residents of master-metered multi-family housing in qualifying customer assistance programs like Permittee's Customer Assistance Program.

14. Liability for Costs and Attorneys Fees. The Permittee shall reimburse the Commission in full for all Commission costs and attorneys fees – including (a) those charged by the Office of the Attorney General; and (b) any court costs and attorneys fees that the Commission may be required by a court to pay – that the Commission incurs in connection with the defense of any action brought by a party other than the Permittee against the Commission, its officers, employees, agents, successors, and assigns challenging the approval or issuance of this permit, the interpretation and/or enforcement of permit conditions, or any other matter related to this permit. The Commission retains complete authority to conduct and direct the defense of any such action against the Commission.

15. Assumption of Risk, Waiver of Liability and Indemnity by the Permittee.

a. By acceptance of this permit, the Permittee acknowledge and agrees: (i) that the site may be subject to hazards, including but not limited to waves, storms, flooding, landslide, erosion, and earth movement, all of which will worsen with future sea level rise; (ii) to assume the risks to the permittee and the property that is the subject of this permit of injury and damage from such hazards in connection with this permitted development; (iii) to unconditionally waive any claim of damage or liability against the Commission, its officers, agents, and employees for injury or damage from such hazards; (iv) to indemnify and hold harmless the Commission, its officers, agents, and employees with respect to the Commission's approval of the project against any and all liability, claims, demands, damages, costs (including costs and fees incurred in defense of such claims), expenses, and amounts paid in settlement arising from any injury or damage due to such hazards; and (v) that the mean high tide line is ambulatory in nature and may migrate inland

Note: These are not Commission Staff's Recommended Findings

due to sea level rise; thus, the development and associated shoreline protection may become located on public trust lands at some point in the future and, if so, may require a lease from the State Lands Commission and/or may need to be removed if it substantially interferes with public access or other public trust resources.

b. PRIOR TO ISSUANCE OF THE COASTAL DEVELOPMENT PERMIT, the Permittee shall submit a written agreement, in a form and content acceptable to the Executive Director, incorporating all of the above terms of this condition.

Note: These are not Commission staff's Recommended Findings

IV. FINDINGS & DECLARATIONS

A. PROJECT DESCRIPTION, LOCATION, AND OBJECTIVES

California American Water Company ("Cal-Am") proposes to construct and operate the Monterey Peninsula Water Supply Project ("MPWSP," or "Project") which would consist of a desalination facility, a well field, water transmission pipelines, pump station, and other related infrastructure to provide approximately 6,250 acre-feet per year (or about

6.4 million gallons per day)[2] of potable water to its customers in the Monterey Peninsula area (see Exhibit 1 – Project Location). The desalination facility itself would be located outside the coastal zone at a site about two miles inland within the jurisdiction of Monterey County. As described below in Section II.C – Jurisdiction and Consolidated Permit Review, these Findings include Commission consideration of several actions, including a consolidated CDP application for portions of the Project within the City of Seaside, the County of Monterey, and the Commission's retained jurisdiction within a portion of the County that does not have a certified Local Coastal Program ("LCP"), along with de novo review of an appeal of the City of Marina's decision to deny a CDP for portions of the Project within its certified LCP jurisdiction.

Project description

As described by Cal-Am and in the proposed Project's Final Environmental Impact Report/Environmental Impact Statement ("Final EIR/EIS") prepared by the California Public Utilities Commission ("CPUC") and Monterey Bay National Marine Sanctuary ("MBNMS"), the primary components of the proposed Project within the coastal zone include a well field that would be located at the site of the CEMEX sand mining facility on the shore of Monterey Bay within the City of Marina's LCP jurisdiction, several water transmission pipelines that would be located within the LCP jurisdictions of the Cities of Marina and Seaside and the County of Monterey, and an existing outfall that Cal-Am would modify, which is located within the City of Marina's LCP jurisdiction and the Commission's retained jurisdiction (see Exhibit 2 – Project Layout). All of these main components would be located in whole or in part within environmentally sensitive habitat areas ("ESHAs") or would result in effects on other coastal resources, as described in the Findings below.

Well field: The well field would consist of seven slant wells that would extract up to about 16 million gallons per day ("mgd") of a mix of seawater from beneath the bay floor, intruded seawater from beneath the shoreline, and brackish water that includes a blend of seawater and freshwater from the underlying aquifer system. The proposed well field is within an approximately 30-acre easement Cal-Am purchased within the CEMEX sand mining facility, which is located in an extensive area of coastal dunes along the shoreline of Monterey Bay in the northern portion of the City of Marina (see Exhibit 3 – Proposed Project Well Field). Parts of the site have been used for sand mining since 1906, though the site continues to provide **some** significant areas of sensitive habitat along with areas disturbed due to mining activities.

[2] Water planning documents generally refer to water use as measured in acre-feet per year or in gallons per day. A million gallons per day equals about 1,100 acre-feet per year. In the Monterey area, which has one of the lowest rates of residential water use in the state, water use averages about 0.2 acre-feet per year, or under 200 gallons per day, for a single-family home. For purposes of these Findings, water supply and demand figures will be presented in acre-feet per year and well field operations will be presented as million gallons per day.

Note: These are not Commission staff's Recommended Findings

The wells would be located on several fenced well pads, each containing one or two wells. Each location would include a concrete well pad, an enclosure for electrical equipment, mechanical piping, and a rip-rap basin for disposing of pumped water during maintenance activities. Each location would be within a graded area of between about 5,200 and 6,000 square feet. The well field would also include two surge tanks. The overall developed area for these components would total ~~up to just under an~~approximately 0.25 acre within the CEMEX site. The well field would also include about 2,000 linear feet of graded but unpaved access road providing access to each well pad from the existing CEMEX access road.

Desalination facility: Cal-Am would transport water from the well field through its proposed Source Water Pipeline to its desalination facility that would be located outside the coastal zone and adjacent to a regional wastewater treatment facility operated by Monterey One Water (formerly the Monterey Regional Water Pollution Control Agency). Cal-Am would treat the source water from the well field to create two main streams of potable water – the majority would be sent several miles south in new and existing pipelines to Cal-Am's customers in the Monterey Peninsula area, and up to several hundred acre-feet per year could be sent several miles north to the community of Castroville.[3] The facility would also create an approximately 10 mgd brine discharge that would be routed to an existing ocean outfall currently used by the wastewater treatment facility.

Water delivery pipelines: The proposed Project includes four new pipelines within the coastal zone:

- The Source Water Pipeline would extend east from the well field at the CEMEX site, which is within the City of Marina's LCP jurisdiction, and enter the County's LCP jurisdiction. It would run parallel to the CEMEX access road to the intersection with Lapis Road, where it would turn north to the intersection of Del Monte Boulevard, where it would turn to the southeast and run about 800 feet to the intersection of Charles Benson Road. Most of these pipeline segments would be within the ~~right-of-way~~right-of- way of the Transportation Agency for Monterey County ("TAMC"). The pipeline would then turn east and exit the coastal zone and continue to the desalination facility. A total of 5,365 linear feet of this 42-inch pipeline would be within the County's coastal zone.
- The Desalination Water Pipeline would be constructed along part of the same route as the Source Water Pipeline. Starting at the desalination facility, it would run west along Charles Benson Road and then enter the County's coastal zone at the same location described above and follow the same alignment as the Source Water Pipeline along Del Monte Boulevard and Lapis Road and continue further south to the City of Marina. About 7,207 linear feet of this pipeline would be within the coastal zone.
- The Transmission Main Pipeline would connect to the Desalination Water Pipeline to transport water further south to an existing pipeline in the City of Seaside that ~~Cal-Am~~Cal-Am would rely on to transport the water to its customers in the Monterey Peninsula area.[4] Several thousand feet of this Transmission Main Pipeline would be within the coastal zone.

[3] Part of the potable water would also be sent north through a new pipeline to the City of Castroville pursuant to a Settlement Agreement that ensures any "non-seawater" – i.e., the proportion of water the slant wells remove from the aquifer that is not fully seawater – is returned to the groundwater basin. This project component is described in more detail ~~in Sections II.J and II.O~~ below.

[4] A dispute exists over whether Cal-Am currently has approval to use this existing pipeline~~. The pipeline's majority owner, the Marina Coast Water District, has determined that the pipeline does not have sufficient capacity for Cal-Am's proposed use, though Cal-Am disagrees with that determination and asserts that it has the authority to use the pipeline. This issue is described further in the Assessment of Alternatives in Section II.O below~~, which is discussed in Section

Note: These are not Commission staff's Recommended Findings

- The Castroville Pipeline would connect to the Desalination Water Pipeline at Lapis Road and run to the north until it leaves the coastal zone. A portion of the pipeline would be attached to the Monte Road Bridge to cross the Salinas River. This location is just outside the coastal zone, though construction would occur within the coastal zone.[5]

Outfall modifications: Cal-Am would direct its brine discharge from the desalination facility through an outfall owned by Monterey One Water, a public agency in Monterey County. The outfall is currently used to discharge treated wastewater from Monterey One's regional wastewater treatment facility in northern Monterey County to about 11,000 feet offshore in Monterey Bay. The outfall terminates at a diffuser that is about 1,000 feet long and that has over 100 ports through which the discharge reaches ocean waters. Cal-Am may be required to modify the diffuser system so that its discharge conforms to Ocean Plan requirements~~.~~ **however, this modification is not currently before the Commission and would instead come before the Commission as part of an application from Monterey One Water**.[6] Cal-Am would also install monitoring buoys anchored to the seafloor to provide baseline and ongoing data related to water quality and biological resources in the area of the discharge.

Cal-Am must also install, prior to starting desalination facility operations, about 20 corrosion-resistant clamps within the nearshore portion of the outfall to replace existing clamps that would not provide sufficient protection to the outfall from the desalination brine. This installation would involve work on the beach ~~and possible placement of fill in coastal waters~~. Additionally, Cal-Am must install an approximately two-mile long liner within the existing wastewater outfall to prevent its facility's discharge from corroding the outfall line. Pursuant to an agreement between Cal-Am and Monterey One Water, the liner would be installed by Monterey One Water. The CPUC included this Project component as a required mitigation measure in its Final EIR/EIS and analyzed the foreseeable impacts of the liner work~~. However, Cal-Am did not include this aspect of the work needed for this Project in its~~**, however, this work is not under consideration in this** CDP application. ~~Because it is not certain how Monterey One would undertake this liner work, there is not a complete, final description of the work at this point. However, the~~**The** Final EIR/EIS **for the Project** described and analyzed the probable impacts of this **liner** work, ~~and~~**before concluding that it would result in less-than significant impacts with mitigation.** Cal-Am has since provided information to the Commission showing ~~another potential~~**an alternative, less-impactful** method for completing the **outfall liner** work. In order to ensure that these Findings describe all potential aspects of and impacts from the Project, the potential impacts of this work, ~~based on currently known information,~~ is generally described herein. The outfall liner ~~would~~**work may** need further approvals from Monterey One Water and possibly other agencies~~, including the City of Marina~~.

Project timing

IV.O. In any case, Cal-Am has indicated that, if needed, it could construct another pipeline parallel to this shared pipeline, in order to convey project water, which would be located outside of the coastal zone.

[5] The coastal zone boundary runs along the centerline of the bridge, and the pipeline would be installed inland of the boundary.

[6] The Regional Water Quality Control Board is reviewing Cal-Am's proposed project to determine whether it would be consistent with Ocean Plan requirements applicable to seawater desalination facilities. See Section ~~II~~**IV**.I of these Findings.

Note: These are not Commission staff's Recommended Findings

Project construction would occur over an approximately two-year period. Cal-Am anticipates that its desalination facility would have an operating life of about 60 years (until about 2080) and that the slant wells would have **economic/**operational lives of 20 to 25 years (until about 2040 to 2045)**, at which point Cal-Am anticipates drilling new. Near the end of the economic/operational lives of the** slant wells**, Cal-Am may need to pursue approval from the Commission of modifications to the existing wells or alternate wells** to continue supplying source water for its facility **as specified in Special Condition 9**. Coastal resource issues related to the slant wells' expected operating life are described below in Sections **II**IV.H and **II**IV.O of these Findings.

Project objectives

The Project's primary purpose is to provide Cal-Am a source of water to serve its customers' current and future demands while reducing Cal-Am's reliance on water from the Carmel River.

As stated in the Final EIR/EIS, the primary Project objectives are:

1) Develop water supplies for Cal-Am's Monterey District service area to replace existing Carmel River diversions in excess of Cal-Am's legal entitlement of 3,376 acre-feet per year, in accordance with SWRCB Orders 95-10 and 2016-0016;
2) Develop water supplies to enable Cal-Am to reduce pumping from the Seaside Groundwater Basin from approximately 4,000 to 1,474 acre-feet per year, consistent with adjudication of the groundwater basin, natural yield, and improvement of groundwater quality;
3) Provide water supplies to allow Cal-Am to meet its obligation to pay back the Seaside Groundwater Basin by approximately 700 acre-feet per year over 25 years as established by the Seaside Groundwater Basin Watermaster;
4) Develop a reliable water supply for the Cal-Am Monterey District service area, accounting for the peak month demand of existing customers;
5) Develop a reliable water supply that meets fire flow requirements for public safety;
6) Provide sufficient water supplies to serve existing vacant legal lots of record;
7) Accommodate tourism demand under recovered economic conditions;
8) Minimize energy requirements and greenhouse gas emissions per unit of water delivered; and
9) Minimize project costs and associated water rate increases.

The Final EIR/EIS also included the following Secondary Project objectives:

1) Locate key project facilities in areas that are protected against predicted future **sea-level**sea-level rise in a manner that maximizes efficiency for construction and operation and minimizes environmental impacts;
2) Provide sufficient conveyance capacity to accommodate supplemental water supplies that may be developed at some point in the future to meet build out demand in accordance with adopted General Plans; and
3) Improve the ability to convey water to the Monterey Peninsula cities by improving the existing interconnections at satellite water systems and by providing additional pressure to move water over the Segunda Grade.

Note: These are not Commission staff's Recommended Findings

B. PROJECT BACKGROUND

This section discusses two main components of the area's history and background relevant to the proposed Project – a recent history of water issues in the Monterey area and background on the site of Cal-Am's proposed well field at the CEMEX sand mining facility. It refers to several entities involved in the area's relatively complex water management and delivery systems, including the following:

- **California-American Water Company ("Cal-Am"):** Cal-Am, the applicant and one of the appellants in this matter, is a private, investor-owned company that supplies water for areas on and near the Monterey Peninsula. Its service area includes the Cities of Monterey, Seaside, Sand City, Carmel-by-the-Sea, and Del Rey Oaks, and nearby portions of Monterey County. Cal-Am's rates are regulated by the California Public Utilities Commission ("CPUC"), which in 2018 approved Cal-Am's request to include the costs of its proposed desalination project in its water rates.
- **Monterey Peninsula Water Management District ("MPWMD"):** MPWMD is a public agency whose main functions are to augment the regional water supply through integrated management of surface and ground water, conservation, and water reuse and reclamation. MPWMD's service area overlaps Cal-Am's to a large degree, and includes areas within the Cities of Carmel-by-the-Sea, Del Ray Oaks, Monterey, Pacific Grove, Seaside, and Sand City, along with other nearby areas. ~~**For purposes of these Findings, one of MPWMD's important functions is to assist Cal-Am in developing a legal water supply.**[7]~~
- **Monterey One Water:** Monterey One Water is a regional, public agency primarily involved with collection, conveyance, and treatment of waste water within its service area, which includes much of the region between Moss Landing to the north, Pacific Grove to the west, and Salinas to the east. For purposes of these Findings, one of Monterey One Water's important roles is its management of the Pure Water project, which ~~**provides the foundation for the Pure Water Expansion that the Commission has identified as a feasible alternative to Cal-Am's proposed Project**~~**was designed to provided 3,500 afy to Cal-Am**.
- **Marina Coast Water District ("MCWD"):** MCWD provides potable water to about 35,000 people in and near the City of Marina. Over the next several decades, it is projected to serve about twice that number of people, due to the expected development of the nearby former Fort Ord Army Base. MCWD obtains its water from wells within the Salinas Valley Groundwater Basin, ~~**the same aquifer system that**~~**but from deeper aquifers than the aquifers** Cal-Am would use as the source for its proposed well field.
- **Castroville Community Services District ("CCSD"):** CCSD provides water and sewer service, along with storm water management, street maintenance, and other services to the community of Castroville in northern Monterey County. It relies primarily on water provided by wells withdrawing water from the Salinas Valley Groundwater Basin. The CCSD is outside of Cal-Am's service area, but would be involved in Cal-Am's proposed Project because it would receive potable water from Cal-Am based on a Return Water Agreement developed among ~~Cal-Am~~Cal- Am and other entities within the Salinas Valley Groundwater Basin. This is more fully described in Sections ~~II~~IV.N ~~and II.O~~ of these Findings.

~~[7] See MPWMD's website at https://www.mpwmd.net (accessed August 6, 2020).~~

Note: These are not Commission staff's Recommended Findings

- **Monterey County Water Resources Agency ("MCWRA"):** MCWRA manages, protects, stores, and conserves water resources in Monterey County. It operates a number of facilities in the area to store and convey various water supplies and is involved in flood control, managing seawater intrusion, and stream maintenance programs.

- **Seaside Groundwater Basin Watermaster: The Seaside Groundwater Basin Watermaster was created by the decision, as amended, entered in the case of *California American Water Company v. City of Seaside*, et al. Monterey County Superior Court, filed February 9, 2007, Case No. M66343 (the "*Seaside* Decision"). The *Seaside* Decision was made for the purposes of managing and protecting the Seaside Groundwater Basin for the benefit of the businesses, individuals, and public agencies that overlie or extract groundwater from the Seaside Groundwater Basin. The primary mission of the Seaside Groundwater Basin Watermaster is to protect the basin from overdraft and to ensure that the basin is not irreparably damaged by seawater intrusion.[7] Cal-Am has rights to native groundwater in the Seaside Groundwater Basin. The Seaside Groundwater Basin also serves as the repository for reclaimed water from the Pure Water Monterey recycled water project, and the place of storage for Carmel River water diverted under the Aquifer Storage and Recovery program.**

Recent History of Water Issues in Monterey Area

The Monterey area has had long-standing difficulties with its water supply. The area has no imported water sources, and local supplies have sometimes been insufficient to provide the expected amount of water**, a problem the desalination Project is designed to address**. Over the past several decades, a number of water supply projects have been proposed, but for various reasons have not reached fruition.

Cal-Am has provided water to the Monterey Peninsula area since 1966. Its primary source of water has been a series of wells along the Carmel River that draw water from the aquifer underlying the river. Cal-Am also shares a network of wells in the Seaside Groundwater Basin with other water users.

In 1995, the State Water Resources Control Board ("State Water Board") issued an order (Order 95-10)[8] that substantially reduced the amount of water Cal-Am was able to legally withdraw from the Carmel River. Cal-Am had previously been pumping an annual average of about 10,370 acre-feet per year from the river, but the State Water Board determined that Cal-Am had a legal right to withdraw no more than 3,376 ~~acre-feet~~acre- feet annually. The State Water Board's Order required Cal-Am to take any of several steps to address this issue – obtain the necessary appropriative rights, obtain water from other sources that would allow it to reduce its use of Carmel River water, and/or obtain water from other entities that have the rights to use Carmel River water. The Order also directed Cal-Am to reduce its Carmel River Basin water use in part by maximizing its use of water from the Seaside Groundwater Basin.

Note: These are not Commission staff's Recommended Findings

[7] **October 4, 2019, Seaside Groundwater Basin Watermaster letter to Coastal Commission.**

[8] See State Water Resources Control Board, Order No. WR 95-10, Order on Four Complaints Filed Against the California-American Water Company, Carmel River, Monterey County, July 6, 1995.

Around the same time, ~~the Monterey Peninsula Water Management District (~~MPWMD~~)~~ proposed constructing a new dam on the Carmel River; however, local voters rejected the dam's financing plan and the dam was not built. Shortly thereafter, two species in the Carmel River watershed were listed as "threatened" under the federal Endangered Species Act – the red-legged frog in 1996 and the steelhead trout in 1997, which severely limited any future consideration of dams on the river.

In 1998, state legislation directed the CPUC to develop a water supply plan for the Monterey Peninsula that did not include a dam.[9] In 2002, the CPUC completed its plan, known as "Plan B", which included a 9,400 acre-foot per year desalination facility at Moss Landing and an Aquifer Storage and Recovery ("ASR") system that would store about 1,300 acre-feet per year of Carmel River water in the Seaside Basin. Plan B served as the basis for a 2004 application by Cal-Am to the CPUC for the proposed Coastal Water Project, which included a desalination facility at the Moss Landing Power Plant, transmission pipelines from Moss Landing to the Monterey Peninsula, a reservoir, pump stations, and ASR facilities. During the CPUC's review, the State Water Board's Division of Water Rights in 2009 issued a Cease-and-Desist Order to Cal-Am that required Cal-Am to significantly reduce its Carmel River withdrawals by 2016, thereby increasing the urgency of selecting and constructing a water supply project.[10] Nonetheless, several concerns were raised about the desalination facility's proposed use of a power plant open water intake and the resulting significant adverse effects on marine life, the distance of the facility from the service area, and the associated increased transmission costs, among others. These concerns led to the development of alternative water supply proposals, including one developed by regional stakeholders known as the "Regional Water Project, Phase I." This alternative**, which was a joint project between MCWRA, MCWD, and Cal-Am,** proposed moving the desalination facility closer to the Monterey Peninsula and using vertical and slant wells instead of an open water intake. In December 2010, the CPUC certified an Environmental Impact Report for this Regional Water Project**, which included intake wells in substantially similar locations on the CEMEX site as Cal-Am's currently pending Project,** and approved several agreements among stakeholders that established project partner responsibilities regarding construction, ownership, operations, maintenance, and payments. However, in 2012, the CPUC voted to end its review of the project due to several problems ~~and disputes.~~**, including a dispute over whether project-related agreements, including the project's Water Purchase Agreement, were void due to a MCWD Board Member's alleged conflict of interest. Ultimately, the California Court of Appeal found these agreements were void because the Board Member, who was also being paid as a consultant to advocate for these agreements, had a financial interest in the agreements when they were negotiated and entered into.[11]**

In ~~2013~~**2012**, Cal-Am and other stakeholders proposed the initial version of the currently proposed Project, the Monterey Peninsula Water Supply Project (MPWSP or Project) as a replacement for the defunct Regional Water Project. In April 2013, Cal-Am filed an application with the CPUC for the MPWSP, which included slant wells that would be located at the CEMEX site, a desalination facility to be located about two miles inland adjacent to a regional

[9] AB 1182 required the CPUC to consult with Cal-Am and a number of affected parties to prepare a contingency water supply plan that did not rely on a new dam.

[10] The Order established a schedule for Cal-Am to reduce its reduce its Carmel River well water withdrawals from its 2009 volume of 10,730 acre-feet per year to no more than 3,376 acre-feet per year by 2016.

[11] ***California-American Water Co. v. Marina Coast Water Dist.*, (2016) 2 Cal. App. 5th 748, 764-66.**

Note: These are not Commission staff's Recommended Findings

wastewater treatment facility, pipelines, and the other related facilities needed to produce and deliver water to Cal-Am's service area on the Monterey Peninsula. The CPUC, in conjunction with the Monterey Bay National Marine Sanctuary, prepared a joint Environmental Impact Review/Environmental Impact Statement ("Final EIR/EIS") to meet requirements of the California Environmental Quality Act and National Environmental Policy Act. In September 2018, the CPUC certified the Final EIR and issued its Certificate of Public Convenience and Necessity for the proposed Project (see Exhibit 4). **Throughout this process, the CPUC engaged federal, state, and local agencies, members of the public, and other stakeholders.**

After the CPUC issued the its decision, MCWD and Marina applied for rehearing of the CPUC decision. In January 2019, the CPUC denied the rehearing applications in full, concluding that MCWD and Marina had failed to demonstrate legal error. In February 2019, MCWD and the City of Marina petitioned for writs of review before the California Supreme Court, challenging the CPUC's decision and the Final EIR/EIS. On August 28, 2019, the Supreme Court denied the petitions for writs of review and affirmed the CPUC's decision.[12] The CPUC's decision and Final EIR/EIS are therefore final and valid and not subject to further challenge.

The **CPUC's** decision allowed Cal-Am to recover reasonable construction and operational costs of its proposed Project from ratepayers. It also required Cal-Am to construct a smaller desalination facility than it had initially proposed – a 6.4 mgd facility instead of a 9.6 mgd facility – and to purchase water from the Pure Water project, a water recycling and aquifer recovery and storage project that was being developed by two public water agencies, the Monterey Peninsula Regional Water District and Monterey One Water. This Pure Water project is now **technically** operating, **although at reduced capacity due to technical challenges with its deep and shallow injection wells,** and as described below in Section ~~II~~**IV**.O ~~– Assessment of Alternatives~~, would serve as the base project for the Pure Water Expansion ~~that the Commission has identified as a feasible and less environmentally damaging alternative to Cal-Am's proposed Project.~~**which is also described below. The Pure Water project was delayed about 8 months in its water deliveries.**

Cal-Am then submitted two CDP applications: one to the City of Marina for Project components proposed within the City's coastal zone, and another, consolidated CDP application for components of the proposed Project within the Commission's retained jurisdiction and those within the coastal zone of the County of Monterey and the City of Seaside. In March 2019, the City denied Cal-Am's request for a permit and Cal-Am and others appealed that decision to the Commission. In November 2019, the Commission found substantial issue existed with respect to the appeal, but continued both the de novo appeal and the consolidated permit review until a subsequent hearing, now scheduled for September 17, 2020.

Background and history of the CEMEX sand mining facility: As noted above, the location of Cal-Am's proposed well field has been used for sand mining for over a century, most recently by its current owner, CEMEX. The site includes sedimentation ponds, sand mining equipment and related infrastructure, accessways, and stockpile areas, some of which have remained in relatively the same location for several decades and some of which have moved within the site due to changing production levels, shifts in the surrounding dunes, changes in sand delivery to

[12] Order Denying Petitions for Writ of Review, *Marina Coast Water District, et al. v. Public Utilities Commission*, Case No. S253585 (Aug. 28, 2019).

Note: These are not Commission staff's Recommended Findings

the site from the Bay, and other factors. In the mid-1980s, the Monterey Peninsula Water Pollution Control Agency (now Monterey One Water) constructed the outfall Cal-Am proposes to now use along the southern portion of the CEMEX site.

In July 2017, the Commission, CEMEX, the City of Marina, and the State Lands Commission approved a Settlement Agreement that will result in an end to sand mining at the site, transfer of the site to another entity, ~~and development and implementation of a plan to conduct extensive~~removal and restoration ~~at the site to improve dune habitat and provide~~activities, and public access opportunities. This Agreement acknowledges that existing legal interests on the site would remain in effect, which at the time included Cal-Am's option to purchase or obtain an easement over the portion of the site needed for Cal-Am's proposed well field and pipelines. Cal-Am has since exercised its option and has obtained an approximately 30-acre easement on the CEMEX site.

Note: These are not Commission staff's Recommended Findings

C. JURISDICTION AND CONSOLIDATED PERMIT REVIEW

Project components would be located in several local jurisdictions both within and outside of the coastal zone, as well as within the Commission's retained permit jurisdiction. As noted above, the desalination facility and segments of the water transmission pipelines would be located outside the coastal zone within the County of Monterey's jurisdiction. The pipelines would be located within the certified LCP jurisdictions of Monterey County and the Cities of Seaside and Marina, and within an area of deferred certification where the Commission has permit jurisdiction. The Project's proposed well field would be located largely within the City of Marina's LCP jurisdiction, while those subsurface portions of the wells that extend seaward beyond the mean high tide line, along with modifications to the existing outfall, would be within the Commission's retained permit jurisdiction. All Project components within the coastal zone and outside the City of Marina are being evaluated herein pursuant to consolidated permit review, as provided by Coastal Act Section 30601.3. The standard of review for these components is Chapter 3 of the Coastal Act.

The other Project components that are within the City of Marina's LCP jurisdiction are evaluated herein pursuant to appeals of the City's decision denying Cal-Am's CDP application to construct and operate slant wells, a water transmission pipeline, and associated infrastructure that would be located within the City's LCP jurisdiction.[~~11~~13] On November 14, 2019, the Commission found that substantial issue existed with respect to these appeals. The standard of review for these Project components is the City's certified LCP, which consists of its Local Coastal Land Use Plan (LCLUP) and its Local Coastal Program Implementation Plan (LCPIP). The relevant policies and measures of these documents are codified in the Chapter 17.41 of the City's Municipal Code under "Coastal Zoning" and are implemented through requirements and development standards identified in the Ordinance.[14] In addition, the Commission analyzes whether Project components located between the first public road and the sea are consistent with the public access and recreation policies of the Coastal Act.

Cal-Am and some other commenters have questioned the Coastal Commission's jurisdiction to analyze, as part of its Coastal Act review, water rights, water supply and demand, the public need for the Project, and some related issues. Cal-Am asserts that "only the CPUC has the authority to make binding determinations as to the levels of supply and demand within Cal-Am's service area." It also asserts that "the issue of water rights is not for the Commission to decide," and that the Commission should defer to the State Water Board on questions related to water

[~~11~~13] On March 7, 2019, the City's Planning Department denied Cal-Am's CDP application. Cal-Am appealed the decision to the City Council, but then withdrew that appeal and instead appealed directly to the Commission. On May 13, 2019, the City issued its Final Local Action Notice, which started a 10-working day appeal period, during which the Commission received five valid appeals. Pursuant to Coastal ~~Acct~~Act Section 30621, the Commission must hear an appeal within 49 days of the date an appeal is filed, unless the applicant waives that 49-day period, which Cal-Am did on May 30, 2019.

[14] **Chapter 17.41 of the City's Municipal Code has never been certified by the Commission. In 2008, the City submitted an LCP amendment to repackage the LCP's existing ordinance chapters into a stand-along "Coastal Zoning" chapter, and modify specific LCP provisions for coastal development, referred to as LCP Amendment No. MAR-MAJ-1-06 Part 2. On April 10, 2008, the Commission extended the deadline to act for one year, to April 11, 2009. (https://documents.coastal.ca.gov/reports/2008/4/Th13c-4-2008.pdf.) On March 20, 2009, the City withdrew LCP Amendment No. MAR-MAJ-1-06 Part 2. See June 1, 2009, Letter from M. Watson to C. di Iorio.**

Note: These are not Commission Staff's Recommended Findings

rights and water quality. As explained below, the Commission, CPUC, and State Water Board all have separate, but sometimes overlapping roles, with regard to Cal-Am's proposed Project.

The Commission has the authority and duty to analyze whether aspects of the Project within the coastal zone are consistent with the Coastal Act and/or the City of Marina's LCP. As a responsible agency under CEQA, the Commission must also consider the Final EIR/EIS certified by the CPUC, analyze the environmental effects of the portions of the Project within the coastal zone, and consider whether there are feasible mitigation measures or alternatives available **within the Commission's jurisdiction** that would lessen or avoid any such significant impacts.[~~12~~15] As part of its Coastal Act review in this case, the Commission must consider whether the Project will have groundwater effects, whether there are feasible project alternatives, whether denial of the Project would adversely affect the public welfare, and whether the Project would cause an unequal distribution of environmental burdens. (See Coastal Act §§ ~~30231, 30233, 30260, 30604~~**30231, 30260, 30604**(h).) To make these findings—and particularly the public welfare and feasibility findings—**certain interested parties have argued that** the Commission needs to consider whether the Project's full water supply is needed and whether an alternative water supply project is feasible and would provide sufficient water. ~~It~~**These parties have argued that the Commission** also must consider whether there are uncertainties regarding Cal-Am's water rights or other issues that might cause Cal-Am's Project to be unsuccessful or significantly delayed, thereby affecting whether approval of the Project, versus an alternative, would truly benefit the public welfare.

In analyzing these issues, the Commission should consider, and may rely on, information and conclusions reached by the CPUC in its ratemaking proceeding for ~~Cal-Am~~**Cal- Am**, and on advice provided by the State Water Board. The CPUC has exclusive jurisdiction to set rates for regulated water utilities, and also has expertise in water supply and demand issues as well as the fairness of water customers' rates. ~~The~~ **However, since the CPUC issued its determinations of water supply and demand in Cal-Am's Monterey service area in 2018, various interested parties, including the MPWMD and MCWD, have put forward revised projections of supply and demand. As a result, the Commission considers these revised estimates of supply and demand for purposes of examining potential feasible alternatives to the Cal-Am Project.**

Further, the State Water Board has expertise in water rights and water quality issues, and it advised the CPUC on water rights issues during the CPUC's proceedings. The ~~**Commission, however, is not legally required to accept and use the CPUC's water supply and demand numbers; rather, the Commission has independent authority to review the issues above based on current evidence in order to make the necessary findings under the Coastal Act. Unlike some energy projects within the jurisdiction of the State Energy Commission,**~~

~~[12] On March 7, 2019, the City's Planning Department denied Cal-Am's CDP application. Cal-Am appealed the decision to the City Council, but then withdrew that appeal and instead appealed directly to the Commission. On May 13, 2019, the City issued its Final Local Action Notice, which started a 10-working day appeal period, during which the Commission received five valid appeals. Pursuant to Coastal Acct Section 30621, the Commission must hear an appeal within 49 days of the date an appeal is filed, unless the applicant waives that 49-day period, which Cal-Am did on May 30, 2019~~[15] **The Commission need not create a separate document to carry out its CEQA obligations; rather, the Commission uses its certified regulatory program in lieu of needing to adopt a separate environmental impact report or other CEQA document. (See Pub. Res. Code § 21080.5; 14 Cal. Code Regs. § 15251(c).) Thus, the analysis in these Findings satisfies the Commission's CEQA obligations**.

Note: These are not Commission staff's Recommended Findings

~~over which the Commission has a statutorily prescribed, and more limited, role (see Coastal Act § 30413), the Coastal Act does not limit the Commission's role with respect to projects that also fall under the CPUC's jurisdiction. The CPUC has exclusive jurisdiction to determine whether to issue a certificate of public convenience and necessity and permit Cal-Am to recover certain rates from its customers if it builds this project. However, other agencies, including the Commission, may conduct their own analyses of water demand and supply if it is pertinent to their own decision-making pursuant to their own authority.[13] The~~ Coastal Act does prescribe limits on the Commission's jurisdiction ~~vis-a-vis~~vis-à-vis the State Water Board, stating that the Commission may not act in a manner that conflicts with any determination by the State or a Regional Water Board "in matters relating to water quality or the administration of water rights." (Coastal Act § 30412(b).) ~~However~~**As such, the Commission generally defers to the State Water Board on matters of water quality and water rights. Therefore, the Commission's discussion of Cal-Am's ability to develop water rights for the Project is intended for informational purposes in developing a complete understanding of the Project. Similarly, the Commission's discussion of the Project's impact on water quality is intended to inform the Commission's findings regarding Project consistency with the Coastal Act and Marina LCP policies regarding coastal waters. Therefore**, the Commission's action here complies with ~~that provision~~**Coastal Act section 30412**, as it does not impose a conflicting water quality limit on Cal-Am's Project nor ~~deal with~~**contradict** the State Water Board's administration of water rights. ~~Indeed, as~~**As** the State Water Board acknowledged in its advice letter to the CPUC, the Board does not issue permits for projects that seek to obtain ocean water or percolating groundwater, nor does it adjudicate appropriative groundwater rights.[14]**[16]** At the CPUC's request, it did issue an opinion regarding Cal-Am's potential to obtain groundwater rights, but that was provided in an advisory capacity and "is not binding on any party or entity."[15] ~~In any event, the~~ **[17] The** Commission's ~~discussion of Cal-Am's potential ability to obtain groundwater rights does not conflict with~~**findings here are not intended to contradict** the State Water Board's ~~advisory opinion on that issue, as both agencies acknowledge there is uncertainty regarding the extent to which Cal-Am will be able to develop such rights.~~ **authority in this respect.**

The Regional Water Board also has not yet issued any permit that would authorize ~~Cal-Am's~~**Cal- Am's** proposed ocean discharge, so Commission ~~denial~~**approval** of the Project does not conflict with any such permit.

Other Agency Approvals & Consultations

The Project would be additionally subject to the following discretionary permits and approvals:

- **Monterey One Water:** Cal-Am will need to obtain authorization from Monterey One Water

---

~~[13] For example, the Monterey Peninsula Water Management District is responsible for water supply and demand planning on the Monterey Peninsula and has written a letter to the Coastal Commission encouraging it to deny Cal-Am's Project in part because it disagrees that the region's demand is as high as stated in the CPUC's proceedings.~~

[14]**[16]** See https://www.cpuc.ca.gov/Environment/info/esa/mpwsp/~~feir-eis/Individual_Appendices/Appendix_B2.pdf,~~ **feir-eis/Individual_Appendices/Appendix_B2.pdf,** pp. 33, 35, 53, 116.

~~[15] Id., p. 53.~~

[17] Id., p. 53.

Note: These are not Commission staff's Recommended Findings

for connection to, and use of, the agency's ocean outfall.

- **Monterey County:** Cal-Am obtained an encroachment permit from the County for construction of its pipelines within County jurisdiction. It also received a use permit from the County that allowed Cal-Am to start construction of the desalination facility; however, that permit has been stayed by the County Superior Court.
- **State Lands Commission:** Cal-Am will need to obtain a lease of state tidelands from the State Lands Commission. Cal-Am has submitted a lease application that is currently under review by State Lands Commission staff.
- **Central Coast Regional Water Quality Control Board ("Regional Water Board"):** Cal-Am will need to obtain a National Pollution Discharge Elimination System ("NPDES") Permit allowing it to discharge brine through the ~~MRWPCA~~Monterey One Water outfall and to modify that outfall to allow the discharge. Cal-Am will also need to obtain approval from the Regional Water Board to ensure Cal-Am's use of groundwater from the Salinas Groundwater Basin is consistent with the Regional Water Board's adopted Basin Plan.
- **California Department of Transportation ("CalTrans"):** Cal-Am has obtained encroachment permits from CalTrans for the segments of its pipelines that would be constructed within CalTrans rights-of-way.
- **Transportation Agency of Monterey County ("TAMC"):** TAMC has approved an Easement Purchase Agreement with Cal-Am for portions of the pipelines within TAMC rights-of-way.
- **Monterey Bay National Marine Sanctuary:** The Sanctuary has not yet issued a Record of Decision for its Final Environmental Impact Statement, though Cal-Am will also be subject to authorization from the Sanctuary to allow discharges into Sanctuary waters and drilling and disturbance of submerged lands within the Sanctuary.[~~16~~18]
- **Other landowners:** Cal-Am is negotiating with several private landowners along sections of its proposed pipeline routes, several of whom have stated that they would not consider providing approval until after the Coastal Commission's decision on the proposed Project.

Tribal consultation: During the Project's CEQA review, the CPUC requested information from the Native American Heritage Commission ("NAHC") regarding potential tribal cultural resources that the Project might affect. The NAHC did not identify any such resources, though it provided a list of Native American contacts that might have additional information about such resources. The Project area is within the traditional lands of the Ohlone/Costanoan-Esselen Nation. Coastal Commission staff contacted the Nation requesting consultation, though did not receive a response. The Final EIR/EIS notes, however, that consultation would be ongoing throughout the Project.

D. [OMITTED IN ORIGINAL]

E. FINDINGS ON COASTAL DEVELOPMENT PERMIT DETERMINATION AND DE NOVO HEARING

Because the Commission found, in November 2019, that the appeal of the City of Marina's denial of Cal-Am's CDP application for portions of the proposed Project within the City's LCP jurisdiction raises substantial issue, the Commission now reviews that portion of the Project de novo. Cal-Am has also applied for a consolidated CDP for portions of its proposed Project within the Commission's retained jurisdiction and within the certified LCP jurisdictions of the City of

[~~16~~18] The Sanctuary also served as lead agency under the National Environmental Policy Act ("NEPA") for the project's Environmental Impact Statement.

Note: These are not Commission staff's Recommended Findings

Seaside and the County of Monterey. The findings below address all portions of the Project within these jurisdictions, using the Coastal Act as the standard of review for those Project components within the Commission's consolidated permit jurisdiction and using the City of Marina's certified LCP and Coastal Act public access and recreation policies as the standard of review for Project components within the City's LCP jurisdiction.

Note: These are not Commission staff's Recommended Findings

F. ENVIRONMENTALLY SENSITIVE HABITAT AREAS – TERRESTRIAL

Coastal Act Section 30240 states:

> (a) Environmentally sensitive habitat areas shall be protected against any significant disruption of habitat values, and only uses dependent on those resources shall be allowed within those areas.
> (b) Development in areas adjacent to environmentally sensitive habitat areas and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade those areas, and shall be compatible with the continuance of those habitat and recreation areas.

Coastal Act Section 30107.5 states:

> Environmentally sensitive area" means any area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which could be easily disturbed or degraded by human activities and developments.

Relevant City of Marina LCP Provisions

LCLUP Policy 19:

> Promote reclamation and protection of native dune habitat and vegetation.

LCLUP Policy 25:

> Protect the habitat of recognized rare and endangered species found in the Coastal dune area.

LCLUP Policy 26:

> Regulate development in areas adjacent to recognized rare and endangered species or their habitats so that they will not threaten continuation of the species or its habitat.

LCLUP Policy 41:

> Give priority to coastal-dependent development on or near the shoreline and to ensure environmental effects are mitigated to the greatest extent possible.

LCLUP Exhibit A states:

> **Primary habitat.** This term includes all of the environmentally sensitive habitat areas in Marina. These are as follows:
>
> 1. ~~1.~~ Habitat for all identified plant and animal species which are rare, endangered, threatened, or are necessary for the survival of an endangered species. These species will be collectively referred to as "rare and endangered."
> 3. ~~3.~~ All native dune vegetation, where such vegetation is extensive enough to perform the special role of stabilizing Marina's natural sand dune formations.
> 4. ~~4.~~ Areas otherwise defined as secondary habitat that have an especially

Note: These are not Commission staff's Recommended Findings

valuable role in an ecosystem for sensitive plant or animal life., as determined by a qualified biologist approved by the City. [Resolution No. 2001-118 (October 16, 2001); approved by CCC November 14, 2001]

Secondary habitat. This term refers to areas adjacent to primary habitat areas within which development must be sited and designed to prevent impacts which would significantly degrade the primary habitat. The secondary habitat area will be presumed to include the following, subject to more precise determination upon individual site investigation:

1. ~~1.~~ The potential/known localities of rare and endangered plant species as shown on LUP p. 71 ("Disturbed Vegetation" map).
2. ~~2.~~ The potential wildlife habitats as shown on LUP p. 75 ("Potential Wildlife" map).
3. ~~3.~~ Any area within 100 feet of the landward boundary of a wetland primary habitat area.

Rare and endangered species. This term will apply to those plant and animal species which are rare, endangered, threatened or are necessary for the survival of such species. The Environmental Analysis Report prepared for the Marina Local Coastal Program identified such species in the dune habitat areas. While future scientific studies may result in addition or deletion of species, the list presently includes:

1. ~~1.~~ Smith's Blue Butterfly **(**Shijimiaeoides enoptes smithi**)**[~~17~~19]
2. ~~2.~~ Globose Dune Beetle **(**Coelus globosus**)**
3. ~~3.~~ Black Legless Lizard **(**Anniella pulchra nigra**)**
4. ~~4.~~ Salinas Kangaroo Rat **(**Dipodomys Heermanni Goldmani**)**
5. ~~5.~~ Seaside Painted Cup **(**Castilleja latifolia ssp. Latifolia**)**
6. ~~6.~~ Monterey Spine Flower **(**Chorizanthe pungens var. pungens**)**
7. ~~7.~~ Eastwood's Ericameria **(**Ericameria fasciculate**)**[sic][~~18~~20]
8. ~~8.~~ Coast Wallflower **(**Erysimum ammophilum**)**
9. ~~9.~~ Menzies' Wallflower **(**Erysimum menziesii**)**
10. ~~10.~~ Coastal Dunes Milk Vetch **(**Astragalus tener var. titi**)**
11. ~~11.~~ Dune Gilia **(**Gilia tenuiflora var. arenaria**)**
12. ~~12.~~ Wild Buckwheat **(**Eriogonum latifolium**)***
13. ~~13.~~ Wild Buckwheat **(**Eriogonum parvifolium**)***
14. ~~14.~~ Bush Lupine **(**Lupinus ssp.**)+**

~~*~~ * only within the range of Smith's Blue Butterfly.
+ only within the range of the Black Legless Lizard.

LCLUP Habitat Protection Policies include:

- Before any use or change in use, areas identified as potential habitat for rare and endangered plant or animal species shall be investigated by a qualified biologist to determine the physical extent of the primary habitat areas for the specific rare and endangered plants and animals on that site.

Note: These are not Commission Staff's Recommended Findings

[~~17~~19] This name has been updated since publication of the LCP – it is now *Euphilotes enoptes smithi*.

[~~18~~20] The correct spelling is *Ericameria fasciculata.*

- Primary habitat areas shall be protected and preserved against any significant disruption of habitat values and only uses dependent on those resources shall be allowed within those areas. All development must be sited and designed so as not to interfere with the natural functions of such habitat areas. Management and enhancement opportunities should be incorporated into use or development proposals; potential impacts shall be fully mitigated, including the assurance of long-term mitigation and maintenance of habitat through the use of appropriate acreage replacement/restoration ratios for any unavoidable direct impacts to habitat areas.

- Potential secondary or support habitat areas to the primary habitats identified on the site should also be defined. Secondary habitat investigation should include identification of the role and importance of the secondary area to the primary habitat area and should stress the impact of use or development in the secondary area on the primary habitat. All development in this area must be designed to prevent significant adverse impacts on the primary habitat areas. In concert with State law, City ordinances shall require environmental review and appropriate mitigation of identified impacts for all development in the ~~Coastal Zone~~coastal zone, including the assurance of long term mitigation and maintenance of habitat through the use of appropriate acreage replacement/restoration ratios for any unavoidable direct impacts to habitat areas.

- Available evidence indicates that dune vegetation is more resilient than previously thought, and areas damaged by illegal use or negligence shall be considered restorable and eligible for restoration.

- Where habitats of rare and endangered species are located on any parcel, owners and/or operators shall, at such time that development is proposed, develop and execute a Management Plan which will protect identified rare and endangered plant and animal communities. Each plan shall be drawn up by a qualified biologist in co-operation with the property owner/developer.

LCLIP Regulations for Coastal Conservation and Development District Policy (b)(2):

Regulations for coastal conservation and development uses shall be specified in the Coastal Development Permit. The permit-issuing body may approve Permit applications if the following factors, where relevant, are found to apply: …

b. ~~b.~~ Development is limited to already-disturbed areas.
c. ~~c.~~ Rare and endangered plant and animal habitats are adequately protected
d. ~~d.~~ Grading and roadway construction and are the minimum necessary for the development. **…**
g. All significant adverse environmental effects are either avoided or adequately mitigated.

~~**Summary**~~

Summary

Cal-Am's proposed Project would disturb up to ~~several dozen~~ **17.5**[21] acres of ESHA or would

[21] **Impact acreages have been updated since the Final EIR/EIS based on subsequent design drawings prepared for the smaller desalination project that was selected as well as the completion of more detailed design for the Project's components. In additional, subsequent biological resources assessments have been conducted as provided in the Habitat Mitigation and**

Note: These are not Commission staff's Recommended Findings

otherwise adversely affect, or have the potential to adversely affect, a number of sensitive plant and animal species (see Exhibit 5 – Special Status Species and Natural Communities That Could Be Significantly Impacted During Construction of the Proposed Facilities). The project's primary area of long-term ESHA disturbance would be at the site of Cal-Am's proposed well field on the CEMEX site within the City of Marina's LCP jurisdiction, where the initial construction activities would result in adverse effects to up to about ~~nine~~8.4 acres of coastal dune habitat (2.2 acres of permanent impacts and 6.2 acres of temporary impacts), all of which is considered ESHA. ~~There would also be~~Included within the 2.2 acres of permanent impacts are post-construction and operational impacts resulting from building concrete pads at the six well head locations ~~that would cover a total of about an acre of that habitat,~~ along with the ongoing activities needed to maintain those well sites every few years~~, which would disturb about six acres of ESHA~~. Cal-Am expects the wells to have economic/operating lives of about 20 to 25 years, as well operations generally result in lower yields over time. ~~They would also eventually be affected by coastal erosion and dune recession and would need to be relocated at that time, likely further from the shoreline, which~~At present, it is too speculative to assess where or how Cal-Am would replace or relocate its wells after their 25-year operating life. For example, technological advancements over the next 25 years could enable the location of alternative wells in locations that are not feasible today, such as further from the coast. At the time Cal-Am needs to decommission the wells authorized by this permit, Cal-Am would need to apply to the Commission for authorization to replace or relocate the wells, and the Commission would need to consider whether the proposal would result in additional ESHA impacts~~, as the ESHA at the site currently extends several thousand feet further inland. Changing the locations in response to lower yield could allow Cal-Am to move the wells close to their current positions, but parallel to the shoreline instead of further inland, but that, too, would result in additional ESHA impacts and would subject them to higher risk of coastal erosion and dune recession.~~ based on the proposed well locations (see Special Condition 9).

In other parts of the Project footprint within the Commission's consolidated permit jurisdiction in the County of Monterey, City of Seaside, and the area of deferred certification, Cal-Am's installation of its various pipelines could result in temporary construction-related impacts to up to about ~~two dozen~~9.1 acres of ESHA and other areas that include known or potential occurrences of sensitive plant and animal species, their habitats, and/or communities.[~~19~~22]

The Findings below first assess impacts to terrestrial ESHA within the City of Marina, where the standard of review for purposes of the appeal of the City's denial of Cal-Am's CDP application, is the City's LCP. The Findings next assess other affected areas within the coastal zone of Monterey County, the City of Seaside, and the Commission's retained jurisdiction, where the standard of review, under the Commission's consolidated permit review, is Chapter 3 of the Coastal Act and specifically Section 30240, which establishes allowable and prohibited uses in ESHA and areas adjacent to ESHA. The Findings then separately evaluate expected and

---

Monitoring Plan Monterey Peninsula Water Supply Project Part One – Coastal Zone, prepared by AECOM (June 2020) ("HMMP").

[~~19~~22] The project's Final EIR/EIS included mitigation measures meant to avoid ~~some of~~or reduce these impacts~~, but they allow for the impacts to occur if project activities cannot avoid affecting these sensitive areas and species that may be identified during~~. Some of the measures include pre-construction surveys~~. Until those detailed studies occur, it is not known how extensive the~~, which will inform the extent of actual impacts to ESHA ~~would be~~.

Note: These are not Commission staff's Recommended Findings

potential impacts to vernal ponds within the City of Marina, which the City's LCP includes in its definition of ESHA.

The Commission's Findings below show that the Project components both within the City of Marina and within the Commission's consolidated permit review jurisdiction are ~~not consistent~~inconsistent with Coastal Act and LCP provisions that require development within ESHA to be dependent on the protected habitat resources. ~~Proposed project components within the City are additionally not consistent with LCP provisions requiring that habitat of rare and endangered species be protected, that development be designed to avoid impacts to ESHA, and that the adverse effects of allowable development~~Through Special Conditions 5 and 6, the Project's potential impacts to ESHA would be mitigated to the ~~greatest extent possible~~maximum extent feasible, but the Project would nonetheless remain inconsistent with the habitat protection policies in the LCP and Coastal Act. However, because the proposed Project is a coastal-dependent industrial facility, the Commission finds that the Project can be considered for approval, despite its non-conformity to these ESHA policies, pursuant to Coastal Act Section 30260, which allows for approval of such facilities that are otherwise inconsistent with relevant Coastal Act policies. The LCP similarly allows for approval of otherwise non-consistent coastal-dependent industrial development if it is a use allowed pursuant to Coastal Act 30260.[~~20~~23] The Findings regarding ESHA are provided immediately below and Section II.P of these Findings provides the Commission's determination regarding Coastal Act 30260.

ESHA within the City of Marina
Cal-Am's proposed well field and a portion of its Source Water Pipeline would be located on a 30-acre easement and an access easement within the CEMEX site in the City of Marina (see Exhibit 3 – Proposed Project Well Field). The Commission's 2014 Findings regarding Cal-Am's test well project at this same location determined that this area consisted of Environmentally Sensitive Habitat Area ("ESHA"). More recent surveys conducted pursuant to the CPUC's CEQA review confirmed the continuing presence of several special-status species within the proposed well field, and a July 2017 site visit by the Commission's ecologist concluded with a recommendation that the full site be considered ESHA.

ESHA determination under the LCP: The City's LCP establishes two types of habitat – "primary" and "secondary" – and describes the different levels of required habitat protection and allowable uses in each. The LCP states that primary habitat "includes all of the environmentally sensitive habitat areas in Marina" and defines it as being the "potential locale for rare and endangered plan [sic] and animal species and identified, at the time of development, by a qualified biologist as supporting rare and endangered plant and animal species." The LCP further states that "primary habitat areas shall be protected and preserved against any significant disruption of habitat values and only uses dependent on those resources shall be allowed within those areas." The LCP's "primary habitat" definition and its related provisions are similar to the Coastal Act's definition of ESHA, which is "any area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which could be easily disturbed or degraded by human activities and developments."[~~21~~24] The LCP's use limitations in those primary habitat areas are also similar to

[~~20~~23] In an unpublished decision stemming from a challenge to the Commission's approval of Cal-Am's test wells, the Sixth District Court of Appeal upheld the Commission's finding that Section 30260 is incorporated in the City's LCP.

[~~21~~24] See Coastal Act Section 30107.5.

Note: These are not Commission staff's Recommended Findings

the Coastal Act's, in that both allow only those uses that are dependent on the habitat resources. Because the LCP's policies derive from the authority of the Coastal Act, we read its policies regarding primary habitat to be consistent with those of the Coastal Act.[~~22~~25]

The LCP's other category – secondary habitat – is defined as those areas "adjacent to primary habitat on which the primary habitat area is dependent or from which the primary area can be influenced by drainage, erosion, human, equestrian or vehicle use or other factors." The LCP requires that direct and potential impacts to both primary and secondary habitat be fully mitigated. While the LCP includes maps of areas presumed to be primary or secondary habitat, it notes that the actual determination of habitat type and category for a particular location must be based on a site-specific biological study.[~~23~~26]

For several reasons, the area of coastal dune habitat where the proposed well field would be located is **conservatively** considered an area of primary habitat, and therefore ESHA. First, and as detailed below, although it would be in a previously disturbed area of the CEMEX site that consists largely of compacted and sparsely vegetated sand dunes, it nonetheless provides habitat for at least three threatened or endangered species, as described below. Additionally, a number of other special-status species are known to exist or have the potential to exist within the footprint or in adjacent areas of the dunes. The presence of these special-status species confirms that the proposed Project footprint includes primary habitat and is therefore ESHA.

This type of dune habitat is easily disturbed by human activity. Nonetheless, and as described herein, even though this area is disturbed, degraded dune habitat generally has the ability to restore itself or be restored. The proposed well field area consists of the same substrate as the rest of the dune habitat and is contiguous to less disturbed or undisturbed areas. Barring ongoing disturbance or development, the well field site ~~would~~**could** soon be colonized by dune biota, either from the adjacent areas or from buried seed stock. The presence of the above-noted threatened or endangered species in the proposed Project area provides further evidence that this degraded and historically manipulated area still provides valuable coastal dune habitat and could likely support other rare or threatened species if not further disturbed.

Further, the City's LCP acknowledges that disturbed dune habitat is resilient and relatively easy to restore.[~~24~~27] The LCP also requires that the reclamation and protection of native dune habitat be promoted, and that habitat for rare and endangered species, such as this dune habitat, be protected (see LUP Policies 19 and 25). The Commission, too, has previously found that even degraded dunes can provide habitat for rare and threatened dune species and that degraded

---

[~~22~~25] The LCP derives its statutory authority from the Coastal Act, and all of its provisions, including the policies above, must be read consistent with and understood to conform to the Coastal Act as a matter of law (McAllister v. California Coastal Commission (2009) 169 Cal.App.4th 912, 931).

[~~23~~26] The LCLUP policies regarding Rare and Endangered Species – Habitat Protection includes the following statement: "In Marina's Coastal Zone, the foredune, dune and grassy inland areas all contain potential habitat for rare and endangered plants and animals. The precise range for each plant and animal is not known because intensive site-specific study throughout the area was not financially possible. However, the potential for various rare and endangered habitats has been identified and mapped (see Environmental Capability section) to provide a guide to the locations where more intensive study is required. Because site-specific study is needed in many areas before any development can take place the following policies apply to all of the areas indicated on the map or meeting the definitions of Exhibit "A" as being potential habitats for rare and endangered plants and animals."

[~~24~~27] See the fourth paragraph of the LCLUP Habitat Protection Policies.

Note: These are not Commission Staff's Recommended Findings

dune areas can constitute ESHA.[25][28] Thus, interpreting the LCP's definition of primary habitat consistent with the Coastal Act, the Commission finds that the coastal dune area in which the well head portions of the proposed Project would be located ~~constitutes~~**could constitute** ESHA and **generally** meets the description of primary habitat under the LCP.

As noted above, the LCP limits uses within primary habitat to those dependent on the resources,[26][29] and any development within those areas is limited to that which is sited and designed to not interfere with the natural functions of the habitat. The LCP also requires that all adverse effects in primary habitat be fully mitigated. Although the project is proposed to be located in portions of the CEMEX site that have been subject to disturbance, the entire area in which the well field would be located ~~is~~**could be considered** primary habitat and ESHA under the LCP. ~~The~~**Although the** proposed Project is not a resource-dependent use, ~~**so it cannot be approved consistent**~~**as described below, Cal-Am would implement the CPUC's Mitigation Monitoring and Reporting Program and the Habitat Mitigation and Monitoring Plan required by Mitigation Measures 4.6-1n. The Habitat Mitigation and Monitoring Plan for the Coastal Zone prepared by AECOM (June 2020) ("HMMP") would ensure that the proposed Project would not result in substantial adverse effects on sensitive natural communities in the Coastal Zone, including ESHA, during Project construction and operation. Nonetheless, the proposed Project remains inconsistent** with the LCP's habitat protection policies. Importantly, the Final EIR/EIS identified the project's inconsistency with these LCP provisions as a significant and unavoidable impact.[27][30] **As described in Section IV.P of these Findings, the proposed Project can be considered for approval, despite its non-conformity to these ESHA policies, pursuant to Coastal Act Section 30260.**

Site background and habitat characteristics: The CEMEX site consists primarily of central foredune habitat, which is one of the most important, vulnerable, and geographically constrained environmentally sensitive habitat types in California. The California Natural Diversity Database ("CNDDB") classifies it as "critically imperiled," this qualifying it as ESHA.[28][31] Dunes form only under certain conditions where adequate sand supply and appropriate wind energy and direction allow. They are a dynamic habitat subject to extremes of physical disturbance, drying, and salt spray. The winds and shifting sands in dune habitat can cause the habitat characteristics and the species at any given location to change on a relatively short or shifting timescale, so a particular area of dune habitat may have relatively higher or lower resource values over time. The changing and often harsh conditions found in coastal dune habitat support plant and animal species that have evolved strategies adapted to these conditions – for example, many dune plants have seeds that can remain dormant for extended periods of time until conditions allow for them to germinate. Many of the plant and animal species adapted to these geographically constrained and relatively harsh conditions have become uncommon and are considered rare, endangered, or have a similar special status. At the same time, their ability to withstand these conditions or to remain dormant for long periods, allows dune habitat, even severely disturbed dune habitat, to either be restored or to restore itself relatively easily. The

[25][28] See, for example, Commission actions in the Asilomar Dunes system (including Youssef (CDP ~~3-11-068~~**3-11-68**) and Goins (CDP 3-11-020)), City of Grover Beach LCP Amendment 1-12, Part 1 (Grover Beach Lodge), Koligian (Commission denial of CDP application A-3-PSB-10-062), and California Department of Parks and Recreation (CDP 3-11-003).

[26][29] LCLUP Habitat Protection Policy, paragraph 2.

[27][30] See Final EIR/EIS, Section 4.6 – Terrestrial Biological Resources.

[28][31] The CNDDB ranks this habitat type as G1 S1.2, which makes it "critically imperiled" both globally and within the state.

Note: These are not Commission staff's Recommended Findings

habitat values in dune areas are therefore best understood in terms of the overall complex of dunes of which they are a part, and the Commission has typically found coastal dune habitat to be ESHA even when it is disturbed, due to its rarity, its important ecosystem functions, and its support of sensitive species.[29][32]

Despite more than 100 years of active sand mining, the coastal dune habitat at the CEMEX site provides habitat for over two dozen sensitive species, including several listed as endangered or threatened. The habitat within and adjacent to ~~Cal-Am's~~Cal-Am's proposed well field and pipeline route primarily includes the Central Dune Scrub vegetation community, which also qualifies as ESHA in part due to its CNDDB ranking,[30][33] and which includes a number of plant and animal species of special concern that have evolved and adapted to the desiccating, salt-laden winds and nutrient poor soils of this area. Between 2012 and 2016, consultants for Cal-Am and the CPUC conducted several biological surveys of the site.[31][34] These biological investigations, along with a 2017 site visit by the Commission's ecologist, identified several special-status plant and animal species present within or adjacent to the proposed Project area.[32][35] Species present on the site that are listed as threatened or endangered include:

- **Monterey spineflower** (*Chorizanthe pungens* var. *pungens*) an annual herb listed as federally-threatened under the Endangered Species Act (ESA). It also has a California Rare Plant Rank of 1B.2. It has been observed throughout the CEMEX site, including the proposed well field area.
- **Smith's blue butterfly** (*Euphilotes enoptes smithi*), a ~~federally endangered~~federally-endangered species, also ranked by CDFW as S1, is obligate to two host plant species throughout its life cycle – coast buckwheat (*Eriogonum latifolium*) and seacliff buckwheat (*E. parvifolium*) – that grow in these coastal dunes. While the butterfly's flight season is only from mid-June to early September each year, larvae consume the plants' flowers and seeds and pupate directly on or beneath the plants, where they overwinter until the following flight season. The surveys identified both the butterfly and coast buckwheat within the CEMEX site, including along the access road where Cal-Am's Source Water Pipeline would be built.
- **Western snowy plover** (*Charadrius nivosus nivosus*), is listed as threatened under the federal ESA and is considered a Species of Special Concern and ranked S2 by the CDFW. The shoreline along the CEMEX site is within designated critical habitat for the species and much of the site provides nesting, roosting, or foraging habitat. Nests are more common in the foredunes or on the beach, but also have been found inland of the foredune area where the well field would be located and where they may become more common as shores continue to erode and succumb to sea level rise.

---

[29][32] This has been the Commission's approach to dune protection at other locations, for example, in the Asilomar Dunes area in Pacific Grove and the in the Del Monte Forest.

[30][33] The CNDDB ranks this habitat type as G2 S2.2, which is "imperiled" at both the global and state levels.

[31][34] See survey dates and findings in Section 4.6 – Terrestrial Biological Resources of the project's Draft EIR/EIS.

[32][35] Along with direct observation during site visits, the presence of sensitive species was supported by historical documentation describing the presence of various sensitive species and communities at the site.

Note: These are not Commission Staff's Recommended Findings

The site also serves as habitat for a number of other special-status species, including several plants on California's Rare Plant Inventory. The sand-loving wallflower (*Erysimum ammophilum*) is eligible for state listing and is considered rare, with a moderate to high degree and immediacy of extirpation (California Rare Plant Rating [CRPR] of 1B.2). It has been observed within the proposed well field area. The site also includes ocean bluff milkvetch (*Astragalus nuttallii* var. *nuttallii*; CRPR 4.2) and branching beach aster (*Corethrogyne leucophylla*; CRPR 3.2), which are included on the California Rare Plant Inventory as species of concern. Other special-status species are known to occupy nearby areas or have the potential to occur at the project site, though they were not identified within the project footprint during these surveys. Plant species include the federally-endangered Robust spineflower (*Chorizanthe robusta* var. *robusta*; CRPR 1B.1), the state- and federally-endangered Menzies' wallflower (*Erysimum menziesii*; CRPR 1B.1), the federally-endangered and state-threatened Sand gilia (*Gilia tenuiflora* ssp. *arenaria*; CRPR 1B.2), and the state-endangered Seaside bird's-beak (*Cordylanthus rigidus* var. *littoralis*; CRPR 1B.1). Two reptiles – the California legless lizard (*Anniella pulchra*; S2) and the coast horned lizard (*Phrynosoma coronatum*; S3), which are considered Species of Special Concern – could also be present. Most recently, Cal-Am reported occurrences of Peninsula coast range shoulderband snail (*Helminthoglypta nickliniana awania – S1*), globose dune beetle (*Coelus globosus – G1G2/S1S2*), and American badger [burrows] (*Taxidea taxus – S3; CDFW SSC*).[~~33~~36]

Native plants found within the area include California sagebrush (*Artemisia californica*), coast buckwheat (*Eriogonum latifolium*), deerweed (*Acmispon glaber*), California lilac (*Ceanothus* spp.), mock heather (*Ericameria ericoides*), silver dune lupine (*Lupinus chamissonis*), and sandmat manzanita (*Arctostaphylos pumila*; CRPR 1B.2). The site also includes native foredune species, such as beach evening primrose (*Camissonia cheiranthifolia*), yellow sand verbena (*Abronia latifolia*) and beach bur (*Ambrosia chamissonis*). The access road to the CEMEX site has adjacent stands of Coyote Brush Scrub (*Baccharis pilularis* Shrubland Alliance), which is not necessarily considered a rare plant community though particular vegetation associations within it can meet that designation. Ongoing sand mining and processing operations appear to have contributed to invasive vegetative species dominating several areas within the CEMEX site, particularly iceplant (*Carpobrotus* spp.). In some areas, a thick cover of iceplant has helped prevent establishment or re-establishment of native species.

Location and impacts of proposed Project components within ESHA: Cal-Am's well field would be located on an area of this coastal dune habitat immediately landward of the foredunes that separate the well sites from the shoreline. This habitat had been disturbed during earlier sand mining activities at CEMEX when this area had been used for storage. The mining activities are now confined to a much smaller area and are scheduled to end this year, pursuant to provisions of a 2017 Settlement Agreement between CEMEX, the Coastal Commission, State Lands Commission, and the City of Marina (Order CCC-17-CD-02, or "Settlement Agreement").

This Settlement Agreement requires CEMEX to stop sand mining by December 31, 2020, conduct reclamation activities **in specified areas of the site**, and transfer the property to a non-profit or government entity with a deed restriction that ensures protection of the site for public access, open space, and habitat. The future uses anticipated at the site are restoration, low-impact passive recreation, public access, and public education. The Settlement Agreement also recognized existing legal rights at the site, which included a recorded easement and option for Cal-Am to use and eventually purchase or acquire an easement over the approximately 30-acre area on which it planned to build the well field, along with a 30-foot wide easement along the

[~~33~~36] See Exhibit 8 – Cal-Am's proposed Habitat Mitigation and Monitoring Plan, June 2020.

Note: These are not Commission staff's Recommended Findings

CEMEX access road for the Source Water Pipeline. In 2018, Cal-Am exercised this option to obtain a permanent 30-acre easement and the access easement.

Within this 30-acre easement, Cal-Am would disturb about ~~nine~~8.4 acres during construction of six separate well pads, an access road, and part of the Source Water Pipeline, which would continue inland along the easement. Cal-Am expects that ~~several~~6.2 of these acres – those that would be used for staging and materials storage – would be ~~restored within five years after~~areas where restoration work would begin concurrent with Project construction ~~is complete~~. Cal-Am has suggested these be considered temporary impacts and be subject to a reduced mitigation requirement. ~~However, the~~The Commission generally considers ~~such~~ impacts to be temporary ~~only~~ where 1) the vegetation is recovered to a comparable age, size, structure, and cover relative to pre-construction conditions within 12 months of disturbance, and 2) the proposed activities do not include significant ground disturbance such as grading, trenching, or others that would kill vegetation, disrupt native seedbanks, alter topography or soil horizons, etc. Cal-Am proposes that temporary impacts be defined as construction impacts that can be fully restored to pre-disturbance conditions for most species following completion of construction, such as impacts from construction staging, laydown, trenching areas, and other work space that will not be occupied by permanent facilities during Project operation. Due to the type of proposed activities and the ~~expected five-year recovery period,~~fact that restoration will begin concurrent with Project construction, sequencing work to ensure that impacts are temporally limited, in this particular instance the Commission finds that these impacts would ~~not~~ be considered temporary. ~~Additionally, the~~The well head sites and the expected need to conduct maintenance at the well sites every few years would ~~result in ongoing impacts to about six of these acres, which could lead to ongoing disturbance during the expected recovery periods. Further, there would likely be more future losses due to the need to relocate the wells after their expected 20- to 25 year operating lives or due to sea level rise and coastal erosion~~occur within areas identified as permanent impacts which would occur over 2.2 acres. These impacts are further detailed below:

- **Well and access road construction:** This work would involve use of heavy equipment, including drill rigs and motor vehicles, that ~~would~~could cause soil compaction, noise effects, potential for fuel spills, crushing of native vegetation, and disturbance of seed banks within the work site. Each well site would be developed within a graded area of a few thousand square feet and would include concrete pads, electrical equipment, and other similar project components. Cal-Am would grade, but not pave, a road to allow access to the well sites. As noted above, ~~the Commission generally considers impacts to be temporary if the affected area is restored within about 12 months; however,~~ in this instance, ~~these~~ adverse construction-related effects that are not in areas of permanent impacts would be ~~more than~~considered temporary, ~~as they are expected to take about 15 months, with the follow-up restoration expected to take up to five years.[34]~~because restoration will begin concurrent with Project construction and work will be sequenced to ensure that impacts are temporally limited.[37]

~~[34] Mitigation measures in the Final EIR/EIS would require temporary impacts to be restored within a five-year period following the impact.~~

[37] Mitigation measures in the Final EIR/EIS require temporary impacts to be restored within a five-year period following the impact.

Note: These are not Commission staff's Recommended Findings

Additionally, ~~because~~although the drilling work for each well needs to be done continuously, ~~Cal-Am would likely need to meet its expected project deadlines by doing some of this~~ well construction has been designed to occur outside of western snowy plover critical habitat. The Final EIR/EIS concluded that Project construction would not result in direct impacts to such habitat.[38] Further, Cal-Am cannot perform construction or maintenance work during ~~all or parts of~~ the breeding and nesting season of the Western snowy plover~~, thereby disturbing individuals that may be close to the construction area or preventing individuals from using nearby areas for nesting. While these direct and indirect impacts to plovers could be avoided by conducting all work during non-breeding/nesting season (i.e., from October 1 to February 28), the Final EIR/EIS anticipates that Cal-Am would be conducting work during breeding/nesting seasons and includes a number of mitigation measures meant to reduce potential impacts that could occur to nearby plovers or active nest sites.[35]~~ without first obtaining approval from the U.S. Fish and Wildlife Service and subject to conditions.[39] If Cal-Am applies for and obtains that approval, the Commission anticipates that the U.S. Fish and Wildlife Service would condition the proposed Project construct and maintenance work to avoid or minimize impacts to western snowy plover.

~~—~~Smith's blue butterflies similarly ~~stand to~~could be subjected to disturbance and impacts across all stages of their life history (larvae, pupae and adult) given their obligation to their sessile host plants. However, the Final EIR/EIS identifies Mitigation Measure 4.6-1f to avoid and minimize potential impacts to Smith's blue butterflies during proposed Project construction and maintenance.

- **Spoils from well drilling:** Cal-Am expects to remove about 1,000 cubic yards of spoils during well drilling and its CDP application had initially proposed spreading the spoils evenly in an approximately two-inch thick layer throughout eight nearby acres of ESHA. However, Commission staff identified this spoils spreading as an avoidable impact and recommended that Cal-Am consider transporting the spoils offsite to an appropriate disposal location. Cal-Am's June 30, 2020 letter to Commission staff modified this spoils spreading approach and confirmed that ~~Cal-Am~~Cal- Am would dispose of these spoils at the nearby Monterey Peninsula Landfill. This would represent a de minimus reduction in the Landfill's capacity, as Cal-Am has calculated the 1,000 cubic yards as being less than two one-thousandth of one percent of the Landfill's remaining capacity. This modification would require additional truck trips, though Cal-Am estimates no more than one trip every two to three days during the expected seven-month well construction period, for a total of between 70 and 105 total trips.

[38] See Final EIR/EIS, p. 4.6-197.

~~[35] The Final EIR/EIS provides that well construction should be conducted during non-breeding season unless otherwise allowed by the U.S. Fish and Wildlife Service. It presumes, though, that construction will occur during that season and includes a number of mitigation measures such as conducting nesting surveys, providing visual barriers between construction and any nests, etc.~~

[39] The Final EIR/EIS provides that well construction should be conducted during non-breeding season unless otherwise allowed by the U.S. Fish and Wildlife Service. It presumes, though, that construction will occur during that season and includes a number of mitigation measures such as conducting nesting surveys, providing visual barriers between construction and any nests, etc.

Note: These are not Commission staff's Recommended Findings

- **Maintaining ~~or relocating~~ well sites:** Cal-Am anticipates having to conduct maintenance at the well sites about every five years and that the area of disturbance – for access, staging, presence of construction equipment, etc. –would ~~total about six acres for each event. This is the same area that would be significantly disturbed and characterized as a permanent impact during the initial construction phase. And even if the latter were not the case, although each maintenance event could be considered relatively short-term, the overall effect would be ongoing, re-disturbance of the area that would prevent adequate restoration and natural community successional processes from occurring between events, which would represent a greater than temporary adverse effect to these areas of habitat~~**be located within a 1.2 acre area—which is included within the 2.2 acres identified as an area of permanent impacts.**

An additional ~~adverse~~ impact ~~would~~**could** result from the need for Cal-Am to protect or relocate its well sites due to the effects of sea level rise and coastal erosion. As the nearby shoreline erodes inland, the beach and foredunes at the CEMEX site ~~would~~**could** also move inland and ~~would be expected to~~**could** maintain approximately the same profile as they now have. In response to a study done early during the CPUC's CEQA review that showed coastal erosion likely affecting the proposed well sites during their operating life, Cal-Am located them several hundred feet further inland than initially proposed. However, because that study was based on earlier versions of state guidance and science on sea level rise, Commission staff requested that Cal-Am provide an updated study using currently applicable guidance and projections. This more recent study, which Cal-Am provided in October 2019, showed that the well sites would likely be protected from the direct effects of coastal erosion over their proposed 25-year operating**/economic** life~~, though it also showed that those well sites could be affected by the~~**. The risk from** inland recession of the foredunes occurring in response to erosion and sea level rise **is expected to be relatively minor** (this is further detailed in these Findings' Section ~~II~~**IV**.H~~ – Coastal Hazards). Essentially, as~~**). As** the shoreline erodes inland, the beach profile, including the foredunes, ~~would~~**could** also move inland, resulting in the well sites being **potentially** buried beneath the dune sands. ~~When or before this occurs, Cal-Am would need to protect those sites by erecting barriers around the well pad, conduct grading to keep the sands away from the well pads, or relocate the wells further inland to areas that also constitute ESHA. Those areas inland of the currently proposed well sites are also within the area slated for restoration under the above-referenced CEMEX Settlement and are outside of Cal-Am's 30-acre easement, so relocation would require Cal-Am to obtain additional legal interest to any sites further inland—which is something it is not clear that Cal-Am will be able to do – and would likely interfere with restoration efforts expected in those areas as part of the CEMEX Settlement. As noted above, Cal-Am could possibly move the wells parallel to their currently proposed locations, which could allow them to maintain their expected yield, but would also result in additional ESHA impacts, as well as subject them to higher risks from coastal erosion and dune recession. Either of these approaches – protection or relocation – would therefore cause additional and longer-term, though unquantified, disturbance of ESHA.~~**However, because expected dune recession due to sea level rise would not impact the well sites during their 25-year operating/economic life, Cal-Am would not need to relocate the wells further inland during that period. As discussed above, at present it is too speculative to assess where or how Cal-Am would replace or relocate its wells after their 25-year operating/economic life. Potential future ESHA impacts would need to be assessed when Cal-Am seeks approval from the Commission for well replacement or relocation based on the selected alternative well locations. Such locations may depend on**

Note: These are not Commission staff's Recommended Findings

technological advancements for subsurface intakes that could occur over the next 25 years and enable alternative wells in alternate locations that are not feasible today.

In May 2020, the Commission adopted new principles that direct regulatory agencies to consider, for planning purposes, a scenario of 3.5 feet of sea level rise occurring by 2050. ~~**This is about 25% higher than the highest of the Commission's other sea level rise scenarios and would likely result in the wells being buried or subject to erosion several years sooner than previously anticipated**~~**Using those projections and recommendations, the slant wells will be unaffected by 3.5 feet of sea-level rise in 2050 and therefore the Project is consistent with the new state principle** (see also the coastal hazards analyses provided in Section ~~II~~**IV**.H of these Findings).

Other terrestrial ESHA within the City of Marina: As noted above, Cal-Am would construct a Source Water Pipeline from the well field to the desalination facility. This pipeline would be installed mostly within undeveloped lands along the CEMEX access road and Lapis Road. The Final EIR/EIS notes that this construction could result in temporary impacts to up to about 11.8 acres of ESHA. Cal-Am would also construct a Desalination Water Pipeline from the desalination facility to its Transmission Main Pipeline to the south. The Final EIR/EIS states that the Desalination Water Pipeline could result in construction impacts in the City of up to 16.9 acres of ESHA in the coastal zone, though some of this area of impact would likely overlap with some of the areas affected by the Source Water Pipeline construction. **Cal-Am's further evaluation of potential ESHA impacts within the City based on subsequent design drawings and additional biological resource assessments that were reviewed for the HMMP determined that the impact areas had been reduced in size and determined that pipeline construction within the Marina coastal zone could impact up to 4.5 acres of ESHA (an additional 4.6 acres of ESHA could be impacted associated with pipeline construction outside of the City of Marina for a total temporary impact from pipeline construction of 9.1 acres).** Details of these ESHA impacts are further described below as part of a fuller description of the various pipeline routes and their effects.

ESHA within the Commission's consolidated permit jurisdiction

Project components within the coastal zone but outside of the City of Marina (and therefore within the Commission's consolidated permit review jurisdiction) consist primarily of sections of Cal-Am's several water distribution pipelines, most of which would be built in undeveloped areas along existing transportation routes in the City of Seaside and the County of Monterey. ~~**The**~~**In the absence of a more detailed assessment of ESHA, the** Final EIR/EIS ~~**notes**~~**assumed** that all of ~~**these**~~**the** undeveloped areas within the coastal zone ~~**should be assumed to be considered**~~**were potential** ESHA, due to the known or potential presence of rare or sensitive species or due to their habitat types.[~~36~~40] **Subsequently, more detailed biological assessments were prepared, which were utilized for the HMMP and show the specific areas of ESHA in these undeveloped areas.** The Findings below describe these areas more specifically to better characterize locations of ESHA within these areas likely to be disturbed during pipeline construction.

The Final EIR/EIS evaluated biological resources within the pipeline route corridors and mapped areas of sensitive species and communities or special habitats within those corridors. The mapped corridors include a "project area" in which construction-related activities would be

[~~36~~40] **Final EIR/EIS p. 4.6-36.** Additionally, the County of Monterey's LCP, which the Commission may use for guidance, also identifies some of the habitat types that ~~**would**~~**could** be affected by pipeline construction as sensitive habitats – for example, maritime chaparral, coastal dunes, and others.

Note: These are not Commission Staff's Recommended Findings

expected to occur, and a "study area," which is a 50-foot buffer around the project area. Depending on the location, the full mapped corridor could be up to about 250 feet wide. Many of the habitats within these areas ~~readily~~ qualify as ESHA – for example, the Commission has generally found that areas of central dune scrub, silver dune lupine-mock heather scrub, dune mat, sandmat manzanita chaparral, and oak woodland are ESHA. **As noted above, subsequent to the completion of the Final EIR/EIS additional biological assessments, surveys, and reports were prepared which were utilized for the HMMP.** These pipeline segments and the expected effects on habitat and terrestrial biological resources within the pipeline ~~study~~ areas **based on the HMMP acreages** are described below~~. The acreage figures provided below are based on potential impacts to areas of ESHA within those corridors, and while the actual location of the pipelines would not necessarily affect all the areas of ESHA within the full Study Area corridor width, there are some segments where the ESHA characteristics extend across the entire corridor, making direct impacts unavoidable~~. Additionally, most of the pipelines would be installed using conventional open trench methods, which due to equipment access, sidecasting or stockpiling of soil, and other factors, ~~would~~**could** result in a larger area being affected than just the width of the pipeline trenches. ~~Some pipeline components, such as access or egress pits, would be wider than the trenches – up to about 35 feet in width. The Final EIR/EIS identifies some, but not all, of the effects expected from these associated activities, which in some areas of the corridors, would result in greater direct and indirect adverse effects on ESHA than just the actual pipeline location.~~**Accordingly, the Project area provided for in the HMMP includes the locations were pipelines and facilities will be installed, proposed staging areas, access routes, and a 25-foot work area on both sides of the centerline of most pipelines and around facilities. The Project work area limits along the proposed Castroville pipeline segment are larger and set at 30 feet from the centerline on each side.**

Four pipeline segments would be within the County of Monterey's coastal zone, ~~including:~~**as described below. Cal-Am's further evaluation of the potential ESHA impacts within the County's coastal zone as part of its HMMP determined that pipeline construction could impact up to a total of 4.6 acres of ESHA within this area.**

- **Source Water Pipeline:** About 5,365 linear feet of this pipeline would be within the County's coastal zone, including sections along the easternmost portion of the CEMEX access road, and along Lapis Road, Del Monte Boulevard, and part of Charles Benson Road. ~~Pipeline~~**Portions of pipeline** construction along the CEMEX access road and Lapis Road would be within areas of disturbed coastal dune habitat and has the potential to disturb several special-status species, including Monterey spineflower, branching beach aster, ocean bluff milkvetch, and coast buckwheat. ~~The Final EIR/EIS identifies ESHA impacts of up to 11.8 acres during construction, though some of these overlap with areas within the City of Marina's LCP jurisdiction.~~

- **Desalination Water Pipeline:** About 7,207 linear feet of this pipeline would be within the County's coastal zone, including sections along Charles Benson Road, Del Monte Boulevard, and Lapis Road, where it would enter the City of Marina. The route traverses areas of disturbed coastal dunes, including areas of central dune scrub and coyote brush scrub as well as ruderal habitat and developed areas. The Final EIR/EIS notes that pipeline construction could adversely affect at least three special-status species

Note: These are not Commission staff's Recommended Findings

observed along the route – Monterey spineflower, Kellog's horkelia,[37][41] and coast buckwheat~~. The Final EIR/EIS identifies construction impacts of up to 16.9 acres of ESHA, though similar to the Source Water Pipeline above, some of this would occur within the City of Marina's LCP jurisdiction~~. The Final EIR/EIS also states that the Source Water and ~~the~~ Desalinated Water pipelines could potentially impact ~~about 0.2 acres of this~~ Smith's blue butterfly habitat, which it notes would be a significant adverse effect.

- **Transmission Main Pipeline:** Several thousand linear feet of this pipeline would be located within the coastal zone. It would traverse areas of coastal dune that include stands of central dune scrub, coyote brush scrub, coast live oak woodland, and northern coastal scrub. The Commission generally recognizes oak woodlands as ESHA. Construction could adversely affect a number of special-status species observed along the route, including sandmat manzanita, the federally-threatened Monterey spineflower, Menzies' wallflower, Kellogg's horkelia, Monterey Coast paintbrush, branching beach aster, south coast branching phacelia, Michael's rein orchid, and Monterey ceanothus.[38]~~The Final EIR/EIS identifies pipeline construction as resulting in up to about 5.4 acres of ESHA impacts (including some within the City of Marina).~~[39][42]

- **Castroville Pipeline:** A short segment of this pipeline would be located within the County's coastal zone. Most of the area traversed by the pipeline consists of agricultural land, non-native grassland, developed areas, and ruderal habitat, though it also includes areas of central dune habitat and coyote brush scrub. The Final EIR/EIS notes that construction could adversely affect Monterey spineflower and branch beach aster~~, and could result in construction impacts to about 0.4 acres of ESHA~~.

In the City of Seaside, about 320 linear feet of the Transmission Main Pipeline would be located within the City's coastal zone. The habitat along the route includes relatively small and discontinuous areas of coyote brush scrub, silver dune lupine-mock heather scrub, and Monterey pine woodland, along with areas of landscape plantings and ruderal vegetation.

Within the Commission's retained jurisdiction, there would be about 1,290 linear feet of the Transmission Main Pipeline bordering the Fort Ord Dunes State Park, which is an area of deferred certification within Monterey County and an area for which the Commission has

---

[37][41] Kellog's horkelia (*Horkelia cuneata* var. *sericea*) has a California Native Plant Society Rare Plant Ranking of 1B.1, meaning that it is rare throughout its range and seriously threatened.

~~[38] Monterey Coast paintbrush (Castilleja latifolia ssp. latifolia) has a California Rare Plant Ranking (CRPR) of 4.3; south coast branching phacelia (Phacelia ramosissima var. austrolitoralis) ranks 3.2; Michael's rein orchid (Piperia michaelii) ranks 4.2; and Monterey ceanothus (Ceanothus rigidus) ranks 4.2. These species are currently either on the California Native Plant Society's Review or Watch Lists.~~

~~[39] The Final EIR/EIS also describes an optional alignment for this Transmission Main Pipeline that would affect up to 5.7 acres of ESHA~~[42] Monterey Coast paintbrush (Castilleja latifolia ssp. latifolia) has a California Rare Plant Ranking (CRPR) of 4.3; south coast branching phacelia (Phacelia ramosissima var. austrolitoralis) ranks 3.2; Michael's rein orchid (Piperia michaelii) ranks 4.2; and Monterey ceanothus (Ceanothus rigidus) ranks 42. These species are currently either on the California Native Plant Society's Review or Watch Lists.

Note: These are not Commission Staff's Recommended Findings

previously determined to be ESHA.[40][43] The Final EIR/EIS identified areas of ESHA within this Study Area corridor.

As part of pipeline installation, Cal-Am would establish several construction staging areas ~~covering a total of 6.6 acres~~. Most of ~~these~~the staging areas ~~are~~would occur in paved areas but ~~are adjacent to~~some staging would also occur within the 9.1 acres of pipeline construction areas that ~~have~~Cal-Am's HMMP identified as having the potential to provide habitat for special-status species~~, though they have not yet been described as ESHA~~. Exhibit 6 (which is Table 4.6-3 from the Final EIR/EIS) provides a description of ~~these~~construction staging areas and the potentially affected species.

In sum, a total of up to about ~~two dozen~~4.6 acres of ESHA could be affected by pipeline construction within areas of the Commission's consolidated permit review jurisdiction~~. The actual area of direct and indirect impact would likely be less, though, as noted above, some areas would unavoidably be subject to direct impacts resulting from pipeline construction. Cal-Am has since provided a June 2020 Habitat Mitigation and Monitoring Plan ("HMMP")[41] that suggests the Project's ESHA impacts would be somewhat lower – approximately two acres of permanent impacts and about 15 acres of temporary impacts, though as noted elsewhere herein, the actual extent of impacts would likely require additional field investigation closer to project implementation. Additionally, while some of the construction impacts might be able to qualify as temporary – i.e., not be subject to significant ground disturbance and able to be restored adequately within 12 months – many areas would not meet these criteria, including those affected by trenching and other areas including more mature vegetation that would not be fully restored within that period. Such impacts would therefore be considered "greater than temporary" or permanent. The HMMP, for example, uses a different threshold to distinguish between the two categories, so it is likely the actual permanent impacts would be greater than it describes~~ and 4.5 acres within the City of Marina's jurisdiction for a total of 9.1 acres of temporary impacts. Similar to the well field described above, these pipelines are not dependent on the habitat resources within the ESHA and are therefore inconsistent with the Coastal Act's Section 30240 ESHA provision that requires development within ESHA be dependent on those resources. However, because the proposed Project is a coastal-dependent industrial facility, the Commission may consider approving the project despite this non-conformity, if it meets the three-part test of Coastal Act Section 30260. This review is provided in Section ~~II~~IV.P of these Findings.

~~Additional project impacts~~

Additional project impacts

Replacement of WEKO seal clamps: One other aspect of the Project is the replacement of some clamps ~~on~~located at joints in the nearshore portion of the existing outfall line, which is necessary to protect the offshore portion of the outfall from corrosion. The clamp

[40][43] See CDP 3-14-1613, California Department of Parks and Recreation. The Commission's Findings (at page 28) stated: "…three habitats [central foredune, central dune scrub & central maritime chaparral] and the areas occupied or likely to be occupied by the various rare or otherwise sensitive species described occur within the proposed project area, which as a whole constitutes ESHA under the Coastal Act. Despite a legacy of past military use and the presently degraded state, the site continues to demonstrate significant ecological value."

~~[41] See AECOM, Habitat Mitigation and Monitoring Plan – Monterey Peninsula Water Supply Project, Part One – Coastal Zone, prepared for California American Water, June 2020.~~

Note: These are not Commission staff's Recommended Findings

replacement is included as one of the mitigation measures required by the Final EIR/EIS and must occur before Cal-Am begins its facility operations. This work is proposed to occur during the treatment facility's low flow period in the summer, when most of its discharge is treated and used for agricultural irrigation. However, this ~~would~~could be during the Western snowy plover breeding and nesting season and ~~would~~could occur within the plover's critical habitat area on the beach. **But as described in Cal-Am's local CDP application, the work would be performed late in the snowy plover nesting season when eggs would have already hatched.** As described in the Final EIR/EIS **and Cal-Am's local CDP application**, the installation work would likely require ~~heavy~~ equipment on the beach and foredune area, excavation of some amount of beach and dune habitat, installation of temporary fencing to protect the work area, and other activities that would result in temporary noise, disturbance, and occupancy of this ~~critical~~ habitat area for a 6 – 8 week period ~~during a critical time period for the species~~. The activities could **temporarily** disturb ~~approximate~~**approximately** a half acre between the dunes and the beach. **However, beach access would remain open, except during extreme high tide events. Any clamp replacement materials and equipment placed on the beach would be removed by sunset each day that work occurs, with the exception of limited larger equipment for which daily removal would be impracticable. All accessways impacted by construction activities would be restored to pre-construction condition or better within 3 days of construction completion.**

The Final EIR/EIS analyzed the potential secondary impacts of the clamp replacement work. The Final EIR/EIS identified all feasible mitigation measures, the implementation of which would reduce each potential impact of the clamp replacement work to less-than-significant levels. These mitigation measures include, for example, utilization of a lead biologist to oversee the implementation of protective measures, environmental awareness training for construction workers, and additional measures to protect a variety of local species, including the Western Snowy Plover. The mitigation measures avoid or limit the proposed Project's potential impacts to Primary and Secondary Habitats by avoiding or minimizing the amount and duration of habitat disturbance, and the work would not conflict with existing adjacent land uses. Such activities would not conform to Coastal Act Section 30240 (if the work is done in the Commission's retained jurisdiction) or LCP provisions that mirror that Section (for any work in the City's permitting jurisdiction) because it would be non-resource-dependent activity that would occur in ESHA. **Nonetheless, because the proposed Project is a coastal-dependent industrial facility, the Commission may approve the Project under Coastal Act Section 30260. This review is provided in Section IV.P of these Findings.**

~~**One necessary Project component that Cal-Am did not include in its**~~**Installation of protective outfall liner: Although it is not a part of this** CDP application ~~**and that it has not yet fully described is**~~**, a related Project component involves the installation of** an approximately two-mile long liner ~~**that must be installed**~~ within the existing ocean outfall pipeline to prevent the desalination facility discharge from corroding the outfall line (see description in Section ~~II~~**IV.**~~I~~**A**). The liner is included as one of the mitigation measures required by the Final EIR/EIS and must be installed before Cal-Am begins its facility operations.[~~42~~44] Pursuant to an agreement between Cal-Am and Monterey One Water, the operator of the wastewater treatment plant, the liner is to be installed by Monterey One Water~~; however,~~

[~~42~~44] The Final EIR/EIS imposed Mitigation Measure 4.13-5b requiring Cal-Am to install the liner to protect the outfall from corrosion, described some of the potential impacts that might occur during installation, and noted that the work would be subject to other mitigation measures meant to reduce impacts to terrestrial biological resources.

Note: These are not Commission staff's Recommended Findings

~~neither entity has committed to a final design or applied for the needed permits for this work~~.

~~Although not yet fully described or evaluated, preliminary analysis provided in the~~The Final EIR/EIS anticipates that part of the liner installation would be done from the beach (and at or near the boundary between the City of Marina's LCP jurisdiction and the Commission's retained jurisdiction). Draft information provided by Cal-Am shows that work could require digging access pits at two sites along the outfall route within the City of Marina that consist of ESHA. Work is proposed to occur during the treatment facility's low flow period in the summer, when most of its discharge is treated and used for agricultural irrigation. The excavation pit at each access point would be located directly above the outfall pipe and would not exceed a size of 12 feet by 25 feet. Soils would be stockpiled within the existing outfall right-of-way, and topsoil would be stored in a separate pile for use in restoration following installation. Because the work would need to occur during low-flow times for the wastewater plant, it would need to happen in late summer, which would be during the Western ~~snowy plover~~Snowy Plover breeding and nesting season and might occur within the plover's critical habitat area on the beach. The installation work would likely require heavy equipment on the beach and foredune area, excavation of some amount of beach and dune habitat, installation of temporary fencing to protect the work area, and other activities that would temporarily result in noise, disturbance, and occupancy of this ~~critical~~ habitat area ~~during a critical time period~~. However, the work at any given portion of the pipeline would not exceed 7 to 10 days.

~~for the species. Such activities~~As part of the proposed Project's CEQA review, the Final EIR/EIS analyzed the potential secondary impacts of the outfall liner work. The Final EIR/EIS identified all feasible mitigation measures, the implementation of which would reduce each potential impact of the outfall liner work to less-than-significant levels. These mitigation measures include, for example, utilization of a lead biologist to oversee the implementation of protective measures, environmental awareness training for construction workers, and additional measures to protect a variety of local species, including the Western Snowy Plover. The mitigation measures avoid or limit the proposed Project's potential impacts to Primary and Secondary Habitats by avoiding or minimizing the amount and duration of habitat disturbance, and the work would not conflict with existing adjacent land uses. Nonetheless, the Commission finds that the outfall liner work considered in the Final EIR/EIS would not conform to Coastal Act Section 30240 (if the work is done in the Commission's retained jurisdiction) or LCP provisions that mirror that Section (for any work in the City's permitting jurisdiction) because ~~they~~ it would be non-resource-dependent activity that would occur in ESHA. However, because the proposed Project is a coastal-dependent industrial facility, the Commission may approve the Project under Coastal Act Section 30260. This review is provided in Section IV.P of these Findings.

~~On~~Nevertheless, on August 18, 2020, ~~Commission staff received a letter from Cal-Am describing a possible~~Cal-Am provided information to the Commission regarding a feasible, less-impactful alternative method for completing the outfall liner work. The alternative liner installation method ~~that~~ would be done almost entirely within the outfall pipe and would involve no ground disturbance within the coastal zone of the City or the County. Cal-Am has obtained preliminary engineering and design work for this option, which would involve digging an access pit outside of the coastal zone and having workers enter the 60- inch diameter pipeline from there, with no need to access the pipeline anywhere within the coastal zone. Workers would install a smaller, bypass pipeline inside of the main pipe, clean the pipe and replace existing seals with concrete, and then spray on a resin coating. They would vacuum

Note: These are not Commission staff's Recommended Findings

out any waste product so that it would not enter the ocean through the outfall. ~~Because Monterey One Water has not chosen a final design for lining the outfall, nor has it applied for or received any necessary permits, it is unknown whether this option will ultimately be feasible. If it was feasible, it would appear to avoid any impacts related to ESHA and would avoid having the liner work cause a non-resource dependent use in ESHA.~~**Under this proposed spray-lining method, Cal-Am would not build or expand any existing structure related to the outfall pipeline.**

Because there is a less impactful feasible alternative, Special Condition 4 requires Cal-Am to implement the proposed spray-lining method prior to the commencement of Project operations or to obtain an amendment to this CDP or a new CDP should Cal-Am need to implement a different method to install the outfall liner. Because operation of the proposed Project may not commence until Cal-Am has obtained all authorizations and approvals for work on the outfall, Special Condition 4 guarantees that approval of the current CDP application will not result in any adverse impacts to ESHA from the installation of the outfall liner.

Mitigation measures

The Final EIR/EIS includes a number of mitigation measures meant to avoid or reduce ~~some of~~ these known or potential impacts to ESHA (see Exhibit 7 – Summary of Final EIR/EIS Terrestrial Biology Mitigation Measures). ~~However, they would not result in mitigation "to the greatest extent possible," as required by the LCP.~~ They include several commonly required measures, such as requiring the presence of a biologist to oversee implementation of protective measures, conducting environmental awareness training and education to construction personnel, conducting pre-construction surveys and ongoing monitoring, and numerous best management practices. They also include Mitigation Measure 4.6-1n that requires Cal-Am to submit, prior to construction, a comprehensive Habitat Mitigation and Monitoring Plan ("HMMP") that describes ~~Cal-Am's~~**Cal- Am's** proposed mitigation, including providing mitigation success criteria, implementation plans, maintenance, monitoring, and reporting plans, and contingency measures needed to address restoration and compensatory mitigation on all sensitive habitats and species affected by the project. It also anticipates that Cal-Am would coordinate with several resource agencies (including staff of the Commission, California Department of Fish and Wildlife, Regional Water Quality Control Board, U.S. Army Corps of Engineers, and U.S. Fish and Wildlife Service) to determine the full suite of mitigation measures that would ultimately be needed.

To ensure mitigation "to the greatest extent possible," as required by the LCP, Cal-Am submitted in June 2020 a draft HMMP (see Exhibit 8 – Cal-Am proposed Habitat Mitigation and Monitoring Plan, June 2020)[~~43~~**45**] that describes several alternative proposed mitigation approaches, including:

- restoration to be conducted by Cal-Am prior to property transfer to a Commission-approved entity, and, subsequent to transfer, funding an endowment to continue the restoration work;
- funding for a Commission-approved entity to implement the HMMP; or,
- funding an endowment comparable to HMMP implementation cost to put towards

[~~43~~**45**] Cal-Am previously submitted an October 2, 2019 "Mitigation Strategy Overview for CalAm Monterey Peninsula Water Supply Project," which provided a preliminary proposal of mitigation measures proposed for its expected impacts at the CEMEX site. The current HMMP supersedes this previous document.

Note: These are not Commission staff's Recommended Findings

purchase of the site with implementation of the HMMP a requirement of the purchase.

~~Elements of these alternatives could provide some acceptable mitigation for Cal-Am's Project impacts, but at this time, they involve a number of uncertainties that make it difficult to evaluate potential mitigation success. For example, it is not clear whether any mitigation actions that occur before the upcoming property transfer would coordinate appropriately with the expected site-wide restoration program contemplated in the Settlement Agreement. Similarly, neither the timing nor the funding needed for these proposed future mitigation approaches can be predicted at this time.~~

Because the CEMEX site has not yet been purchased by an approved entity, Cal-Am proposed alternatives for HMMP implementation. Each of these alternatives provides acceptable mitigation for Cal-Am's Project impacts. Because there is some uncertainly at this time regarding the closure of the CEMEX site and subsequent transfer to a purchaser, Special Condition 5 requires that Cal-Am prepare and submit a final plan selecting one of the alternatives to implement the HMMP at the CEMEX site. Selection of the final implementation approach shall occur in consultation with the Executive Director.

More specifically, the HMMP ~~proposes a number of measures that are not consistent with past Commission-approved mitigation plans. For example, along with the above-referenced concerns about many of Cal-Am's proposed "temporary" impacts actually falling within the Commission's category of "permanent" or "long-term" impacts, it does not include adequate mitigation for those impacts – e.g., it treats the loss of woody vegetation such as oaks and manzanita as temporary rather than permanent. It also proposes 1:1 restoration of sensitive plants, such as spineflower, despite the lack of demonstrated success in restoring that species. Additionally, instead of proposing the use of relevant reference sites to determine whether the proposed mitigation is meeting success standards, it proposes using a success criterion of 70% of site baseline conditions. This is problematic, since the site is already somewhat disturbed and not providing the habitat values that would be expected of a fully functioning reference site. The HMMP also proposes what are primarily "semi-quantitative" monitoring methods that are presented without a statistical framework and are based on relatively lenient performance criteria.~~ provides for approximately 6.6 acres of restoration for 2.2 acres of potential permanent impacts, at a 3:1 mitigation ratio, and in-kind and in-place mitigation at a 1:1 ratio for approximately 15.306 acres of potential temporary impacts. In addition, Cal-Am has proposed to remove an additional 1.825 acres of iceplant on the CEMEX site and restore the area with native vegetation. The HMMP further provides that restoration at the CEMEX site would include re-establishment, rehabilitation, and enhancement of habitats through the removal of existing invasive species populations and reintroduction of native species indigenous to dune habitat. The HMMP also requires Cal-Am to implement long-term management activities to remove newly emerging invasive vegetation and protect the restored and existing native habitats.

~~Importantly, the HMMP proposes that most of the restoration activities take place within the CEMEX North Mitigation Area, which is already expected to benefit from preservation~~

Note: These are not Commission staff's Recommended Findings

~~pursuant to the aforementioned Settlement Agreement. While Cal-Am's proposed mitigation in that area would result in restoration of degraded dune habitat and could provide significant improvements to that area of dune ecosystem, its location in an already preserved area would result in a net loss of dune habitat footprint.~~

Some commenters suggest that the areas in which the HMMP proposes restoration activities – that is, the CEMEX North Mitigation Area – is already expected to benefit from preservation pursuant to the aforementioned Settlement Agreement. Cal-Am's proposed mitigation in this area would result in restoration of degraded dune habitat and would provide significant improvements to that area of dune ecosystem because no restoration or enhancement of the area is otherwise proposed, required or funded under the Settlement Agreement. The Settlement Agreement requires CEMEX to transfer title to a Commission-approved entity to either manage the property for conservation uses or use the property for allowable activities, such as the proposed Project. The Settlement Agreement does not require the future purchaser to use or manage the property for ESHA preservation or restoration. However, in its HMMP, Cal-Am has proposed areas for restoration that have not been identified for restoration under the Settlement Agreement.

Another key concern is the proposed restoration of an area described as a "valley" within the dunes, which is primarily covered by invasive species such as iceplant and non-native grasses supported by soils high in organics, and surrounded by more typical dune habitat with the potential to support sensitive native species. This valley's invasive species appear to be a result of, and supported by, sustained agricultural runoff being pumped through a pipeline from a nearby farm into the dunes, which has created a nearly foot-deep layer of organic soil on top of the dune habitat. ~~The HMMP proposes that it would use this water supply as necessary to irrigate the dune vegetation it plants as part of its dune restoration; however, this raises concerns about using that water (and any contaminants that may be in it) to restore dune ESHA, an ecosystem that has evolved to function with minimal hydrologic input in a low-nutrient substrate. The HMMP does not provide adequate support for such a proposal and it is not clear that, if used, it would be sustainable. It may also bring with it adverse impacts of its own, including the potential presence of contaminants in the water and continual support for non-native or invasive species in the restoration area.~~ In a memorandum dated August 19, 2020, AECOM provided some additional information regarding the valley and agricultural runoff.[46] As explained in AECOM's memorandum, the HMMP proposes that the agricultural runoff into the dunes be discontinued, that all the invasive vegetation associated with the agricultural runoff be removed, and the entire dune area impacted by the agricultural runoff by restored with coastal dune habitat. AECOM notes that discontinuation or alternative management strategies for the agricultural runoff would occur as part of implementation of the HMMP. Because there is some uncertainty regarding the discontinuation or alternative management strategies for the agricultural runoff, Special Condition 6 requires Cal-Am to submit a plan for Executive Director review and approval prior to permit issuance, which will detail the

[46] Monterey Peninsula Water Supply Project: CEMEX North Dunes – Agricultural Runoff Drainage System Observations and Options. AECOM (August 19, 2020).

Note: These are not Commission staff's Recommended Findings

plan for the discontinuation or alternative management for the agricultural runoff.

~~Were it not for the Coastal Act and LCP nonconformity noted above, the Commission could require additional mitigation to allow the project to conform to other relevant LCP policies and Coastal Act requirements. However, because this nonconformity results in no ability for the project to be fully consistent with the LCP's ESHA provisions, there is no need to identify special conditions in this section of the Findings that would allow it to be only partially consistent~~Although the Commission has identified and imposed all feasible mitigation measures to avoid or reduce impacts to ESHA to the maximum extent feasible, the City's LCP and Coastal Act Section 30240 limit uses within ESHA, including primary habitat, to those dependent on the resources. As described throughout these Findings, the proposed Project is not a resource-dependent use, so it cannot be approved consistent with the City's LCP habitat protection policies and Coastal Act Section 30240. Nonetheless, because the proposed Project is considered a coastal-dependent industrial facility, the Commission has the discretion to apply the three tests of Coastal Act Section 30260 and approve the project notwithstanding its inconsistencies with ~~Coastal Act and~~the City's LCP provisions. ~~However, as~~As described in the section of these Findings regarding Section 30260, the Commission has concluded that the project ~~does not meet~~meets the ~~first two~~ tests of Section 30260~~;~~, and thus, ~~there is no need to~~determine whether the ~~project's ESHA impacts could, pursuant to the third test on that section, be mitigated to the maximum extent feasible~~can be approved under Section 30260.

Conclusion

Based on the discussion above, the Commission finds that, with Special Conditions 5 and 6, the Project components, as proposed in the City's jurisdiction, ~~do not conform to~~remain inconsistent with provisions of Habitat Protection policies in the City's LCLUP, including LCLUP Policies 25, 26, and 41 and those requiring that only uses dependent on habitat resources be allowed within primary habitat areas. The Commission also finds that, with Special Conditions 5 and 6, the Project components, as proposed in the Commission's consolidated permit jurisdiction, ~~do not conform to~~remain inconsistent with the Coastal Act's ESHA policies.

However, with implementation of the HMMP, potential impacts to ESHA would be mitigated to the maximum extent feasible. Further, because the proposed Project is considered a coastal-dependent industrial facility, the Commission has discretion to approve the project notwithstanding its inconsistencies with the City's LCP under Coastal Act Section 30260.

G. WETLANDS AND VERNAL POND ESHA

Section 30231 Biological productivity; water quality

> The biological productivity and the quality of coastal waters, streams, wetlands, estuaries, and lakes appropriate to maintain optimum populations of marine organisms and for the protection of human health shall be maintained and, where feasible, restored through, among other means, minimizing adverse effects of waste water discharges and entrainment, controlling runoff, preventing depletion of ground water supplies and substantial interference with surface waterflow, encouraging waste water reclamation, maintaining natural vegetation buffer areas that protect riparian habitats, and minimizing alteration of natural streams.

LCLUP Exhibit A states:

> **Primary habitat.** This term includes all of the environmentally sensitive habitat areas in Marina. These are as follows:
>
> ~~2~~1. Habitat for all identified plant and animal species which are rare, endangered, threatened, or are necessary for the survival of an endangered species. These species will be collectively referred to as "rare and endangered."
>
> 2. Vernal ponds and their associated wetland vegetation. The Statewide Interpretive Guideline for Wetlands and Other Wet Environmentally Sensitive Habitat Areas (California Coastal Commission, February 14, 1981) contains technical criteria for establishing the inland boundary of wetland vegetation...
>
> **Secondary habitat.** This term refers to areas adjacent to primary habitat areas within which development must be sited and designed to prevent impacts which would significantly degrade the primary habitat. The secondary habitat area will be presumed to include the following, subject to more precise determination upon individual site investigation:
>
> ~~2~~1. The potential/known localities of rare and endangered plant species as shown on LUP p. 71 ("Disturbed Vegetation" map).
>
> 2. The potential wildlife habitats as shown on LUP p. 75 ("Potential Wildlife" map).
>
> 3. Any area within 100 feet of the landward boundary of a wetland primary habitat area.
>
> **Rare and endangered species.** This term will apply to those plant and animal species which are rare, endangered, threatened or are necessary for the survival of such species. The Environmental Analysis Report prepared for the Marina Local Coastal Program identified such species in the dune habitat areas. While future scientific studies may result in addition or deletion of species, the list presently includes:
>
> 1. Smith's Blue Butterfly (Shijimiaeoides enoptes smithi)[~~44~~47]
> 2. Globose Dune Beetle (Coelus globosus)
> 3. Black Legless Lizard (Anniella pulchra nigra)
> 4. Salinas Kangaroo Rat (Dipodomys Heermanni Goldmani)
> 5. Seaside Painted Cup (Castilleja latifolia ssp. Latifolia)
> 6. Monterey Spine Flower (Chorizanthe pungens var. pungens)

Note: These are not Commission staff's Recommended Findings

[~~44~~47] This name has been updated since publication of the LCP – it is now Euphilotes enoptes smithi.

7. Eastwood's Ericameria (Ericameria fasciculate)[sic][45][48]
8. Coast Wallflower (Erysimum ammophilum)
9. Menzies' Wallflower (Erysimum menziesii)
10. Coastal Dunes Milk Vetch (Astragalus tener var. titi)
11. Dune Gilia (Gilia tenuiflora var. arenaria)
12. Wild Buckwheat (Eriogonum latifolium)*
13. Wild Buckwheat (Eriogonum parvifolium)*
14. Bush Lupine (Lupinus ssp.)+

* only within the range of Smith's Blue Butterfly.
+ only within the range of the Black Legless Lizard.

LCLUP Habitat Protection Policies include:

> Before any use or change in use, areas identified as potential habitat for rare and endangered plant or animal species shall be investigated by a qualified biologist to determine the physical extent of the primary habitat areas for the specific rare and endangered plants and animals on that site.
>
> Primary habitat areas shall be protected and preserved against any significant disruption of habitat values and only uses dependent on those resources shall be allowed within those areas. All development must be sited and designed so as not to interfere with the natural functions of such habitat areas. Management and enhancement opportunities should be incorporated into use or development proposals; potential impacts shall be fully mitigated, including the assurance of long term mitigation and maintenance of habitat through the use of appropriate acreage replacement/restoration ratios for any unavoidable direct impacts to habitat areas.

LCP Policy 24 states:

> To protect and encourage the restoration of the vernal ponds to their original state and allow only those uses adjacent which will reinforce and conserve the unique habitat qualities of these ponds.

Summary

The Coastal Act and the City's LCP include provisions that require protection of wetlands. Coastal Act Section 30231, for example, requires that biological productivity in wetlands and other coastal waters be maintained and restored through various means, including preventing the depletion of groundwater. Vernal ponds are generally considered wetlands for purposes of the Coastal Act;[1] however, the City's LCP further specifies that vernal ponds are a type of primary habitat and are thereby considered ESHA. Vernal ponds are relatively rare and often biologically important seasonal wetlands used during avian migration and amphibian breeding seasons. The LCP also includes wetland areas associated with vernal ponds as primary habitat, and therefore ESHA.

The LCP requires that these vernal ponds and their associated wetland areas be protected against any significant disruption, that development be sited and designed to prevent significant degradation of those areas, and that all development be sited and designed to not interfere with the natural functions of these habitat areas. Further, the City's Comprehensive Management Plan, which it developed in conjunction with the Commission as part of developing its Local

[45][48] The correct spelling is Ericameria fasciculata.

Note: These are not Commission staff's Recommended Findings

Coastal Program, clarifies the importance of these areas by stating: “Seasonal and permanent wetlands are critical habitat for a variety of wildlife species, and the near-coastal proximity of the ponds promotes use by species associated with the bay shoreline and other coastal wetlands.”[2]

The LCP and other City and County planning documents identify several areas within the expected groundwater drawdown zone of Cal-Am’s well field as vernal ponds and wetlands (see Exhibit 9 – Map of Area Wetlands). Among the closest, approximately 1,000 feet from the nearest the well field, are several dozen acres on either side of Highway One south of Lapis Road, known as the Armstrong Ranch Ponds. They are within the County’s coastal zone and are designated “Habitat Reserve and Other Open Space.” This complex of vernal ponds is generally dry at the surface for part of the year and floods in the spring during periods of precipitation, though they are occupied ~~year-round~~year- round by marsh vegetation species. They also represent an important habitat feature for a number of avian species, particularly during migration season, and provide breeding habitat for any of several amphibian species. Other smaller biologically important vernal ponds are in the drawdown zone and within the City of Marina, though somewhat further from the well field.

The Final EIR/EIS identified several vernal ponds and wetlands at and near the CEMEX site and near the various project pipeline routes. It acknowledged that some construction activities, such as inadequate runoff or dust control measures, could adversely affect some of ~~these~~the vernal pond/wetland areas, but noted that the document’s mitigation measures would reduce potential adverse impacts to less than significant. It also presumed that, while several of ~~these areas~~the vernal ponds and wetlands were in areas that would experience a drawdown of groundwater levels resulting from Cal-Am’s pumping from its well field, ~~these areas~~the vernal ponds and wetlands were “hydrologically disconnected” from the underlying groundwater and would therefore not be affected by the pumping.

After the conclusion of the CEQA review, and after the Commission’s November 2019 hearing, Commission staff received an April 2020 analysis provided by the City of Marina that described many of these wetland areas as “groundwater dependent ecosystems” (“GDEs”) and identified potential adverse effects to them due to the groundwater drawdown.[3] GDEs include various types of wetland areas with hydrology supported entirely or in part by underlying groundwater. They include permanent, seasonal, and temporary wetlands (including vernal ponds) that change in extent and depth in response to changes in underlying groundwater elevations.

The City’s GDE review identified several previously unknown potential adverse effects on several nearby vernal ponds and their associated wetlands. It included data and analyses indicating that several of these areas do not appear to be the “perched” wetlands presumed during CEQA review, but appear to be connected to the underlying groundwater within the shallow Dune ~~Sands~~Sand Aquifer that underlies this area. The GDE review described data collected from Cal-Am’s monitoring wells closest to some of these areas during Cal-Am’s approximately two-year pump test, which included about two dozen events where groundwater drawdown and recovery was correlated with the start and stop of pumping activities. At the Armstrong Ranch vernal pond complex, the City’s review identified a relatively immediate groundwater drawdown/response of about one foot. The review also notes that the groundwater underlying these areas has variable salinity levels (from slightly brackish to nearly the same as seawater), suggesting it has sources other than the primarily fresh water that would be expected from precipitation. It also notes that the overlying habitat includes vegetative species that have adapted to this range of salinity variation.

Note: These are not Commission staff’s Recommended Findings

Later, in June 2020, Commission staff received a report from the Commission's independent hydrogeologist that described additional groundwater modeling conducted in addition to that done previously as part of CEQA review and by Cal-Am (this report is more thoroughly described in Section ~~II~~IV.J of these Findings). Part of the additional modeling was meant to identify expected groundwater drawdown levels beneath nearby vernal ponds and wetlands that could result from Cal-Am's longer-term pumping operations. This report identified such drawdowns of between about two to four feet beneath the closest of these features – at the Armstrong Ranch Ponds – and attenuating at more distant features – for example, to just under one foot drawdown at the Lake Drive Pond within the City. These drawdown levels appear to be fairly consistent with those the City identified in its above-referenced GDE review; for example, Cal-Am's test well pumping at about three mgd showed a one-foot drawdown at the Armstrong Ranch vernal pond complex, whereas modeling based on Cal-Am's full proposed 16 mgd shows about a four-foot drawdown.

The City then provided a July 2020 report updating the 1994 CVCMP with a current assessment of hydrologic conditions and biological resources at six of the seven vernal ponds within or adjacent to its jurisdiction.[~~46~~49] While the report did identify some ~~limited~~ changes to the ponds including new pockets of wetland vegetation supported by freshwater runoff and expanded willows, it also concluded that all six areas revisited have remained approximately as described in the original CVCMP. ~~Importantly, it~~The report also determined that they should all be considered GDEs on the basis of a suite of ecological indicators accounting for source water quality, growth patterns, and vegetation condition in summer months, and that as GDEs, these sensitive habitats would be vulnerable to any significant changes in groundwater levels.

Finally, Cal-Am provided an August 2020 report that analyzed the vernal ponds and concluded that the vernal ponds are likely not groundwater dependent or if they are groundwater dependent they are supported from a perched source and not from the Dune Sand Aquifer from which the Project will pump source water.[50] The analysis evaluated existing monitoring wells, conducted water quality sampling, researched surface water conditions, examined historical aerial imagery, and reviewed previously prepared analyses regarding the vernal ponds. The analysis explained that the urban development that has occurred adjacent to many of the vernal ponds has altered the existing functions of the ponds. The analysis also described how the Armstrong Ranch Ponds have been affected by agricultural irrigation and historic use as a cattle pasture. In addition, the analysis found that none of the vernal ponds showed any influence of tidal changes, which would be expected if the ponds were hydrologically connected to the Dune Sand Aquifer. Based on this analysis, the August 2020 report concludes that the source of water for the vernal ponds is most likely surface water and not the Dune Sand Aquifer.

While the August 2020 report submitted by Cal-Am concludes that the vernal ponds are unlikely to be dependent on the Dune Sand Aquifer and therefore unlikely to be affected by Project pumping, the report nevertheless proposes an Adaptive Management Program that would include ongoing evaluation of the ponds to more conclusively determine

---

[~~46~~49] See WRA Environmental Consultants, Biological Resource and Groundwater Dependency Analysis of Marina Vernal Ponds, prepared for City of Marina, July 30, 2020.

[50] See Geoscience and AECOM, Understanding the Influence of Subsurface Aquifer Drawdown Upon Surface Waters and Wetlands for the Proposed Monterey Peninsula Water Supply Project, prepared for Cal-Am, August 18, 2020.

Note: These are not Commission staff's Recommended Findings

whether the ponds are hydrologically connected to the Dune Sand Aquifer and to what extent Project pumping might affect the ponds. Under the Adaptive Management Program, if Project pumping were determined to have an impact on the vernal ponds, the program proposes a Wetland Resiliency, Enhancement, Restoration, and Monitoring Plan that would mitigate and/or offset for any potential adverse effects to the ponds.

~~Effects of drawdowns~~

Conclusion

~~These~~The recent analyses~~, although not comprehensive, strongly suggest that the identified drawdowns~~ are inconclusive regarding whether groundwater drawdowns from Project pumping could adversely affect the functions and values ~~at up to several dozen acres of these~~of the vernal ponds and wetlands~~, primarily at the Armstrong Ranch Ponds, and possibly at other nearby wetlands. It~~. If drawdowns were to adversely affect the vernal ponds, it is difficult to ~~precisely~~ determine the specific nature and magnitude of expected effects, as they would vary by vegetation and wildlife species, by temporal changes in precipitation and natural variation in groundwater levels, by the location in the landscape of the wetland features, and various other factors. ~~Nonetheless, the~~If there were a hydraulic connection between the Dune Sand Aquifer and the vernal ponds, groundwater drawdowns would most likely result in the following types of adverse effects:

- Reduction of surface water extent and depth. This would reduce the habitat functions and values that would be present absent Cal-Am's pumping.

- Temporal losses of vernal pond functions and values, including shifts in the timing of surface flooding as well as reduced durations of flooding. ~~Drawdown would likely result in a groundwater-supported vernal pond that normally would exist for six or eight weeks during breeding and nesting season might instead last for two or four weeks, and/or shift to later in the season, thereby reducing available habitat and food sources during periods that many resident and migratory species would otherwise rely on.~~

- Reduction of wetted area around the root zones of marsh or aquatic vegetation. Some vegetative species in these areas may have relatively shallow roots and may rely on groundwater being available within a certain elevation range. Others may have deeper roots but be dependent on natural and gradual fluctuations in groundwater elevations. ~~More rapid declines in groundwater elevations may leave some root systems "stranded" and lead to reduced plant vitality or even death.~~

- Reduction in species diversity. Less surface area and more confined root zones could also lead to fewer microhabitats and niches for associated plant species to occupy, contributing to increased competition for limited resources and likely, reduced opportunities for dependent wildlife species as well.

- Reduction in habitat resilience. When a system is already stressed, it becomes less capable of absorbing further stress including environmental change. For example, drought could have devastating effects on a compromised system that is already suffering from reduced water availability.

~~Cal-Am has suggested that it could monitor some of these areas to determine first, whether they were groundwater dependent, and if so, what changes might be associated with any pumping-related drawdowns. However, and importantly, it would be difficult to monitor the actual effects the expected drawdown would have on these wetland and vernal pond areas, in part due to the complex interactions among changing groundwater~~

Note: These are not Commission staff's Recommended Findings

~~elevations, different amounts of precipitation and other water sources, the presence of different species with different responses to those changes, as well as the lack of adequate reference sites or baseline data for many of these areas.[5] It would likewise be difficult to provide adequate mitigation for any adverse effects, in part due to the potential extent of the effects – which could cover up to several dozen acres of wetlands and vernal ponds – and also due to the difficulty in identifying sites where creating or restoring wetland or vernal ponds could be successful and would not result in the conversion of other sensitive habitats.~~

~~With these likely impacts resulting from Cal-Am's pumping of groundwater, the proposed Project cannot be found consistent with the provisions of Coastal Act Section 30231 and the above-referenced provisions of the LCP. Specifically, due to the reasonably foreseeable groundwater drawdowns, the evidence does not demonstrate that the Project would ensure that "[p]rimary habitat areas [will] be protected and preserved against any significant disruption of habitat values," or that it will ensure the maintenance of the biological productivity and the quality of coastal wetlands.~~

To address potential wetland and vernal pond impacts, Special Condition 7 requires Cal-Am to implement an Adaptive Management Program that would ensure the monitoring of the vernal ponds to determine first, whether they are groundwater dependent, and if so, what changes might be associated with any Project pumping-related drawdowns. If the additional analysis determines that there would be adverse effects from pumping-related drawdowns, Special Condition 7 requires Cal-Am to implement a Wetland Resiliency, Enhancement, Restoration, and Monitoring Plan to mitigate and/or offset those effects to the vernal ponds. For each stage of the Adaptive Management Program, Cal-Am would be required to submit the required analysis to the Executive Director for review. In addition, if the Wetland Resiliency, Enhancement, Restoration, and Monitoring Plan is necessary Cal-Am would be required to apply for and obtain the Commission's approval of an amendment to this Coastal Development Permit prior to implementation of the Wetland Resiliency, Enhancement, Restoration, and Monitoring Plan. If possible the Wetland Resiliency, Enhancement, Restoration, and Monitoring Plan would address impacts entirely on-site. On-site measures could include providing supplementary water, supplementing infiltration, modifying pond outlet or overflow to encourage deeper ponding, or enhancing the ponds with a vegetation management program. If it is not possible to entirely mitigate and/or offset potential effects on-site (e.g. lack of access or site control, site constraints, etc.) Cal-Am would implement measures off-site to mitigate and/or offset any remaining impacts that could not be addressed on-site. For off-site mitigation the following mitigation ratios would apply depending upon whether creation, restoration, or enhancement is proposed: off-site wetland creation 1:1 ratio; off-site wetland restoration 3:1 ratio; and/or off-site wetland enhancement 4:1 ratio.

While implementation of Special Condition 7 ensures that any impacts to vernal ponds are mitigated to the maximum extent feasible, at this time it cannot be concluded whether mitigation could be implemented that would entirely avoid impacts to the vernal ponds. As noted as part of the Adaptive Management Program, it is possible that impacts would need to be mitigated off-site. Therefore, the Project could be inconsistent with the Coastal Act and LCP's provisions that require the protection of existing vernal ponds and wetlands. Accordingly, for the reasons described above, the Commission finds that the Project, as conditioned, will be inconsistent with the provisions of Coastal Act Section 30231 and the above-referenced provisions of the LCP. Nevertheless, because the proposed Project is a coastal-dependent industrial facility, the Commission finds that

Note: These are not Commission staff's Recommended Findings

the Project can be considered for approval despite its potential non-conformity to these Coastal Act policies, pursuant to Coastal Act Section 30260, which allows for approval of such facilities that are otherwise inconsistent with relevant Coastal Act policies. The LCP similarly allows for approval of otherwise non-consistent coastal-dependent industrial development if it is a use allowed pursuant to Coastal Act 30260. Section IV.P of these Findings provides the Commission's determination regarding Coastal Act 30260.

Note: These are not Commission staff's Recommended Findings

H. COASTAL HAZARDS

Coastal Act Section 30253 states, in relevant part:

> New development shall do all of the following:
> (a) ~~(a)~~ Minimize risks to life and property in areas of high geologic, flood, and fire hazard.
> (b) ~~(b)~~ Assure stability and structural integrity, and neither create nor contribute significantly to erosion, geologic instability, or destruction of the site or surrounding area or in any way require the construction of protective devices that would substantially alter natural landforms along bluffs and cliffs~~...~~ ...

The LCLUP states:

> Before development is permitted in the Coastal Zone, a geotechnical report appropriate to the specific proposal shall be prepared for that development in the dunes or in the vicinity of any vernal pond. The report shall include at least geologic and seismic stability, liquefaction potential, identification of an appropriate hazard setback to protect the economic life of structures, and specific recommendations on drainage, irrigation and mitigation of identified problems.
>
> Report contents shall comply with guidelines of the California Division of Mines and Geology.
>
> ~~...~~ ...
>
> No new development shall be permitted which will require the construction of shoreline protection structures unless such development is in accordance with the provisions of the "Small Boat Harbor" section of this Land Use Plan, or when such structures are necessary to serve coastal dependent uses (as defined in the Coastal Act) or to protect publicly owned beaches from erosion.

The LCLUP states:

> Tsunami Hazard: Tsunamis are seismic sea waves, often erroneously called "tidal waves." Because of the height and depth of the Coastal dunes in Marina, inland areas are not within the tsunami hazard zone. The areas most subject to tsunami in Marina are the sandy beaches and dunes. With an adequate tsunami warning system, there is no significant tsunami threat to beach users. Since there is little development within the tsunami run-up zone, there is little present threat. Future development should not occur in the tsunami run-up zone (on the sandy beaches and foredune area).

The LCP's North of Reservation Road Planning Area requires proposed development consider:

> Public safety and vulnerability to wave erosion.
>
> Tsunami and other coastal hazards.

Note: These are not Commission staff's Recommended Findings

The LCLIP states:

> **Standards for Coastal Protection Structures:** Except for a few facilities associated with sand mining, there currently is little capital investment to be threatened by erosion along Marina's shoreline. The face of the dunes is subject to wave erosion, so future development shall be placed beyond the area vulnerable both to wave erosion and tsunami hazard. This setback shall be great enough to protect the economic life of the proposed development (at least 50 years) and be east of the tsunami hazard zone. The exact extent of this setback shall be determined by a qualified geologist, selected from an approved list compiled and maintained by the City. Because of variation from site to site, the setback line shall be determined at the time development of a site or parcel is proposed.
>
> Protective structures are not recommended in Marina; however, if they should ever be necessary, standards shall be established to insure that the type of protection, location, design and other factors are considered. In determining if it is suitable to issue a coastal permit for a shoreline structure, the following shall be addressed: (1) alternatives to a protective structure shall be determined and evaluated by appropriate specialists first; and (2) an EIR/EIS shall be required on the proposed structure. The EIR/EIS shall address specific issues of Local Coastal Land Use Plan concern, construction and maintenance. The environmental evaluation and mitigations shall be prepared by qualified specialists and shall address at a minimum the following specific issues and design considerations.

Summary
Both the Coastal Act and the LCP generally require that development be sited and designed to avoid and minimize risks associated with coastal hazards, and specifically requires that development be sited with the setback needed to provide protection from these hazards for the full expected economic life of any structures. Although Cal-Am's desalination facility would be located outside of the coastal zone and away from these hazards, Cal-Am's proposed wells could be subject to several of them, including coastal erosion and dune recession, both of which would be exacerbated by sea level rise and climate change. However, with the wells' limited 20- to 25-year expected operating**/economic** lives **and distance from the shoreline**, the risk from these hazards would be expected to be relatively minor. These hazards are addressed below.

Coastal erosion and sea level rise
Background: The well field would be just inland of the actively eroding shoreline of Monterey Bay, with the existing test well located about 600 feet inland and the other proposed wells to be located about 800 feet inland. The Bay shoreline near Cal-Am's proposed well field has exhibited **some of** the highest annual erosion rates in the state, due in part to relatively high levels of wave energy and the easily erodible sand that makes up most of the Bay shoreline. The area has experienced, and will likely continue to experience, storm-driven erosion that results in losses of as much as 100 feet of beach during a single event. Erosion along this stretch of shoreline also results in the recession inland of the dune system located adjacent to the beach. As the beach erodes, the dune profile moves inland, though not necessarily at the same rate as the shoreline or with the same dune profile.

Along with the natural shoreline processes that drive coastal erosion in this area, a substantial additional contributor has been the sand mining that has occurred at the CEMEX facility for many decades. CEMEX's removal of more than 100,000 cubic yards of sand annually from the

Note: These are not Commission staff's Recommended Findings

nearshore area served to reduce the sand supply along the shoreline, thereby exacerbating the ongoing natural erosive processes. ~~As detailed below, although the~~**In 2017, the Commission approved the CEMEX Settlement which will result in the end of** sand mining operations ~~have ended, the shoreline is expected to continue having a relatively high erosion rate.~~**at the site in 2020. A major factor in seeking to end sand mining operations at the site was based on the Commission's finding that the rate of shoreline retreat and dune erosion within the area would likely reduce significantly once sand mining operations ceased.**

In recognition of the area's **historically** high erosion potential, the LCP requires that development be located inland of areas near the shoreline that are vulnerable to erosion. The Final EIR/EIS included an assessment of the effects of sea level rise and coastal erosion on the proposed well field and the most seaward sections of the Source Water Pipeline.

Coastal erosion studies during early stages of the project's environmental review showed that the then-proposed well field could be affected by coastal erosion expected during the project's operating life. Cal-Am then relocated the proposed well heads about 400 feet further inland to their currently proposed location. For these new locations, the Final EIR/EIS modeled "stand-alone" expected erosion rates as well as those same rates when accompanied by 100-year storm events. It found that expected erosion by 2060 would remove about 300 feet of the beach and dune profile and that adding a 100-year storm event would remove an additional 130 feet for a total of 430 feet. This analysis showed that most of the well field would escape erosion until 2060, although the existing test well that Cal-Am proposes to convert to a permanent well would likely be affected sooner, as it is about 200 feet closer to the current shoreline than the other wells.

To address the anticipated erosion hazard, the Final EIR/EIS included a mitigation measure requiring Cal-Am to monitor the rate of coastal retreat and to determine, based on the identified and expected annual erosion rate, when there are no more than five years before the wells would become exposed due to erosion.[~~47~~51] At that point, Cal-Am would be required to start the planning and permitting needed to abandon the wells in accordance with state well destruction requirements, and upon receipt of the necessary approvals, Cal-Am would remove the wells. As noted above, Cal-Am expects its wells to have useful lives of only about 20 to 25 years before they need to be **replaced or** relocated, so it does not expect that they would be affected by erosion.[~~48~~52]

However, this analysis was done in 2016 and was based on sea level rise guidance and scenarios that have been superseded by more recent state and Commission guidance that anticipates more rapid, and greater, sea level rise.[~~49~~53] For example, the projections used in the Final EIR/EIS anticipated sea level rise of 15 inches by 2040 and 28 inches by 2060, whereas the currently applicable projections for the Monterey Bay area anticipate a range of sea level rise in 2040 of between about 15 and 20 inches and a 2060 range of 31 and 46 inches (increases of up to 33% and 64%, respectively). The assessments were also done before completion of the CEMEX Settlement, which requires CEMEX to permanently stop its sand

[~~47~~51] See Final EIR/EIS Mitigation Measure 4.2-10.

[~~48~~52] The limited operating life is due to wells such as these experiencing reduced yields due to a slow build-up of fine sediments in or near the screened intake portion of the well casing.

[~~49~~53] See the Ocean Protection Council's State of California Sea-Level Rise Guidance 2018 Update and the Coastal Commission's 2018 Sea Level Rise Policy Guidance and November 7, 2018 Science Update.

Note: These are not Commission staff's Recommended Findings

mining operations by the end of 2020, so they do not reflect what the expected erosion rates will be after CEMEX ceases removing large amounts of sand from this stretch of shoreline.

Prior to the Commission's November 2019 hearing on this proposed Project, Commission staff requested that Cal-Am provide an updated assessment of expected sea level rise and coastal erosion based on current state guidance and projections and on site conditions expected without sand mining. In response, Cal-Am provided an October 2, 2019 technical memorandum – *Updated Coastal Erosion Hazard Analysis for CalAm Monterey Peninsula Water Supply Project*, prepared by AECOM. This technical memorandum assesses expected sea level rise and coastal erosion effects on Cal-Am's proposed well field and Source Water Pipeline using low, medium-high, and extreme risk aversion scenarios for the years 2040, 2060, and 2120. It includes the high GHG emission scenario for each to provide a more conservative assessment of expected effects. It also considers the effects of both a 100-year and 500-year storm event on site erosion to provide additional conservatism. To reflect the expected site conditions resulting from the closure of the CEMEX sand mining operations, it assumed a 60% reduction in the historical retreat rate along the stretch of shoreline.[~~50~~54] For each of the several scenarios, the memorandum separately describes the expected effects on the test slant well, which Cal-Am proposes to convert to a long-term well for the project and is located about 600 feet from the current shoreline, and on the rest of the well heads that would be constructed about 800 feet from the current shoreline. **Using the extreme risk aversion scenario and the 500-year storm event, the most conservative of the approaches in the analysis, the memorandum concluded that the slant wells (including the test slant well) would not be at risk from coastal erosion until near the 2120 planning horizon.**

The Commission's coastal engineer reviewed the Final EIR/EIS and Cal-Am assessments and prepared a technical memorandum describing that review and its conclusions (see Exhibit 10 – Coastal Hazards Technical Memorandum). The review concluded that under the above **extreme** scenarios, both the test well site and the other well sites would likely be safe from erosion through 2040, that the test well site could be at risk by 2060 **from a 100-year storm event**, and that both the test well site and other well sites would likely be at risk by 2120. **The Commission's technical memorandum did not account for any reduction in coastal erosion from the end of sand mining at the CEMEX site. When factoring in a reasonable reduction in coastal erosion due to the fact that large amounts of sand will no longer be exported from the site, as provided in the October 2, 2019 technical memorandum prepared by AECOM, the well field is projected to be safe using the extreme risk aversion scenario and 500-year storm event until near the 2120 planning horizon.**

Since ~~then, however~~**these analyses were prepared**, California has developed a new principle calling for permitting agencies to consider, for planning purposes, an increase in sea level of 3.5 feet by 2050.[~~51~~] ~~Compared to the Commission's above-referenced current sea level rise~~

[~~50~~54] This assumed 60% reduction is derived from studies and a sand budget analysis presented in two documents prepared, in part, to identify the effects of those mining operations on erosion along the Monterey Bay ~~Shoreline~~**shoreline**. See ~~Environmental~~**environmental** Science Associates and Phillip Williams and Associates~~,~~ Evaluation of Erosion Mitigation Alternatives for Southern Monterey Bay, prepared for the Monterey Bay Sanctuary Foundation and the Southern Monterey Bay Coastal Erosion Working Group, May 30, ~~2020~~**2012**, and Young, Robert, An evaluation of the ongoing impacts of sand mining at the CEMEX Lapis Sand Plant in Marina, California on the Southern Monterey Bay Shoreline, 2017.

~~[51] See Ocean Protection Council, Strategic Plan to Protect California's Coast and Ocean 2020 – 2025, February 2020.~~

Note: These are not Commission staff's Recommended Findings

~~guidance, this would result in expected sea level rise projections occurring several years sooner than previously anticipated. For example, instead of reaching the above-referenced 31- to 46-inch range of increase by 2060, it would be expected by about 2045 to 2050. Commission staff requested Cal-Am provide additional analysis showing the expected site conditions under this most recent state guidance. Essentially, using these projections, the well field could be at risk by 2045 to 2050 instead of 2060. However, with Cal-Am's~~ [55] As the Executive Director stated in the May 22, 2020 letter endorsing this new principle, this is not a new sea level rise projection and is, in general, accounted for by utilizing and implementing the projections and recommendations in the Commission's Sea Level Rise Policy Guidance, which was used by AECOM and staff to evaluate the potential impacts to the Project. Using those projections and recommendations, the slant wells will be unaffected by 3.5 feet of sea-level rise in 2050, and therefore the Project is consistent with the new state principle. Further, with Cal-Am's reliance on an expected 20- to 25-year operating life for the wells, this accelerated timeline is not likely to result in a substantial change to the expected risks from coastal erosion.

~~With the test well site~~In addition, when accounting for reductions in coastal erosion from the cessation of sand mining at the CEMEX site, none of the well sites would be at risk from ~~these expected long-term~~coastal erosion ~~scenarios, the project could include development in an area subject to wave erosion during~~within the next 50 years. ~~This presents some tension~~ Accordingly, the Project is consistent with LUP and IP policies that generally require setbacks adequate to protect new development for "the economic life of the proposed project (at least 50 years)." ~~The LUP has an exception to this policy allowing construction of shoreline protection structures when necessary to serve a coastal-dependent industry, which might apply to the test well portion of this project. However, Cal-Am is not proposing any such structures, and the LCP's standards for approving such structures require several analyses not included as part of the proposed Project, including an assessment of alternatives to any such protective structure and review of any proposed protective structure through an Environmental Impact Report. Without an adequate setback to allow for 50 years of protection, and without these analyses being completed, this component of the proposed~~ Even without accounting for reductions in coastal erosion from the cessation of sand mining the wells sites would not be at risk during their 20-25 year economic life.

The Project ~~could be inconsistent~~is also consistent with LCP policies related to coastal erosion ~~unless~~because there is a requirement to remove the ~~test well when it becomes threatened.~~slant wells when they become threatened. Mitigation Measure 4.2-10 requires Cal-Am to monitor and remove the slant wells five years prior to any anticipated exposure. For reliability purposes, the Project will be constructed with seven wells, but does not need all seven to be operating in order to maintain the Project's permitted water deliveries. Operation of five is sufficient. Thus, in the event that wells need to be decommissioned early due to coastal hazards, the Project could continue to supply water to the Monterey Peninsula.

Cal-Am expects that its wells would operate for ~~no more than~~about 20 to 25 years and then may need to be replaced or relocated, which would ~~presumably~~ allow them to avoid coastal hazards related to erosion. ~~Although this~~This allows for conformity with the LCP's coastal hazards provision related to the expected economic life of the development~~, it creates a~~

[55] See Ocean Protection Council, Strategic Plan to Protect California's Coast and Ocean 2020 – 2025, February 2020.

Note: These are not Commission staff's Recommended Findings

~~concern that Cal-Am's desalination facility may not be able to operate for its expected 60-year operating life because Cal-Am does not currently have a legal interest in locations further inland where Cal-Am might be able to relocate its wells. Additionally, much of that inland area is expected to be restored as a result of the above-referenced Settlement Agreement. These issues are described in more detail below and in Section II.O – Assessment of Alternatives.~~.

The Commission also considered the effects of expected dune recession on the well sites.[52] As noted above, the site's foredunes will recede inland as a consequence of shoreline erosion and at some point will occupy the same area as the well sites. The initial review, conducted in October 2019, concluded that the risk of this occurring would be low before 2040, but would increase thereafter. Additionally, dune height is likely to increase along with the increases in sea level – for example, as sea level elevates by its expected 15 to 20 inches by 2040, the duneface could experience a similar height increase and an inland migration of the profile. The issue of well site burial was examined not as a risk in itself, but since it could lead to the need for greater maintenance of the well heads and thus greater site disturbance. It is difficult to estimate exactly when these backshore adjustments would occur as there would very likely be a lag time between changes in sea level and changes to the beach and then changes to the back shore. With these uncertainties it is difficult to estimate when the dune profile might shift inland; however, the well sites have been located inland of and at a lower elevation than the dune crests, and inland migration of the profile could eventually cover the well sites. The review concluded that risk is low that any of the well sites could be buried by 2040 but that the risk would increase over time. **This review did not consider that the risk of dune recession will be reduced by the cessation of sand mining at the CEMEX site, did not include any modeling of the back profile, and covered the potential for burial only in general terms.** Because of differences in the elevations of the well heads and variations in the dune profile – i.e., the dunes seaward of some well sites are higher or contain greater volumes of sand than those seaward of other well sites – the timing and amount of burial would likely vary among the well sites. The review ~~concludes~~**concluded** that the test well head would experience the greatest risk from dune erosion; however, since the more inland well field is 12 to 15 feet lower than the frontal dune, the well field might be more at risk from the inland shift of the dune profile.

Overall, **when considering reductions in coastal erosion from the end of sand mining at the CEMEX site,** no appreciable erosion risks are anticipated to occur at the test well or the well ~~field areas by 2040. There are small risks to the test well site from storm-related erosion between 2040 and 2060. There are also~~**fields until near 2120. Based on the Commission's initial review, there are** small risks to the test well site and the well field site from possible sand burial that would be minimal through 2040. There is a small chance that **some of** the well field site might experience ~~several feet of~~ sand burial between 2040 and 2060. Beyond 2060, it becomes more likely that significant burial could occur. ~~Again, however, this October 2019 review was completed before the state's adoption of the recent planning principle of expecting 3.5 feet of sea level rise by 2050, so any expected risks would happen several years sooner.~~**These effects may be much less severe after sand mining operations at the CEMEX site end.**

~~In June 2020, Cal-Am~~**To supplement the Commission's initial analysis of sand burial, AECOM** provided an updated analysis of expected dune recession that **further** details **and**

---

[52] ~~Neither the Final EIR/EIS nor the AECOM technical memorandum assessed risk from this hazard.~~

Note: These are not Commission staff's Recommended Findings

clarifies the various mechanisms involved in this type of sand movement.[56] It concluded that the primary mechanism – dune blowouts, which involves the wind being funneled through gaps in the dune and causing higher rates of erosion in and near those gaps – could result in two of the seven proposed well head sites being affected by sand burial within about 20 to 25 years. It also found, though, that this effect could be reduced or delayed through measures such as removal of invasive vegetation and re-establishment of native dune vegetation to stabilize the dunes, installing sand fences or elevating the well head sites, either of which would likely require additional CDP review and approval. S~~Cal-Am also proposed a special condition that would include~~pecial Condition 8 is included to require the "soft" measures referenced above – removal of invasive species and re-establishment of native vegetation – along with annual monitoring of the dunes and well heads to identify the rate of dune recession. Once the identified rate of recession showed that the well heads could be buried within five years, Cal-Am s~~would~~hall return to the Commission with any proposed development, such as sand fencing, elevating or relocating the wells, etc., for additional review and permitting.

Similar to the above coastal erosion scenarios, the risk to the wells from this erosive process of dune recession could create some tension regarding conformity to the LCP provision that requires identification of an adequate hazard setback to protect the economic life of the structures (for a 50 year minimum) and specific recommendations to mitigate any identified problems. However, Cal-Am has estimated that these proposed wells would operate for about 25 years (i.e., until about 2045) but ~~would~~could then need to be replaced or relocated further inland. Importantly, and as noted above, Cal-Am does not have legal interest in property further inland, so it has no locations available to site the wells after this expected initial 25 years of operations. This expected operating life of 20-25 years allows for conformity to the above-referenced LCP requirement that development include setbacks adequate to protect it during its expected operating life~~, but as noted above, this limited operating life raises concerns about whether Cal-Am would be able to operate its desalination facility for only 20-25 years instead of its proposed 60-year operating life (this is discussed further in Section II.O – Assessment of Alternatives). It also makes the currently proposed locations inconsistent with the previously-referenced Final EIR/EIS project objective to "locate key project facilities in areas that are protected against predicted future sea-level rise in a manner that maximizes efficiency for construction and operation and minimizes environmental impacts," which is also described Section II.O below.~~.

~~It is not clear that Cal-Am would be able to obtain the additional legal interest needed to move its wells further inland. However, the areas of CEMEX inland of Cal-Am's current proposed well sites are largely slated for reclamation and restoration as dune habitat. With~~At present, it is too speculative to assess where or how Cal-Am may relocate its wells after their 25-year operating life. Within this 25-year operating period ~~and no~~, technical advancements may be made that would allow the replacement of the wells or development of alternative wells in alternative locations ~~known to be available~~that are not feasible today. Thus, with this 25-year operating period, future well sites and operations beyond that period would be considered speculative. However, to ensure that the Project remains consistent with the LCP's coastal hazards provisions, Special Condition 9 requires Cal-Am to return to the Commission for a permit amendment should there be a

[56] Response to Coastal Commission Comments on Inland Dune Migration, Profile Shifts, and Wind-Blown Sand as a Coastal Hazard at Cal-Am's Proposed Wellhead Sites in the City of Marina Coastal Zone, p. 3 (Exhibit 9 in Latham and Watkins Letter to Tom Luster, dated June 30, 2020).

Note: These are not Commission staff's Recommended Findings

need to replace or relocate any slant wells, no later than 24 years from the commencement of operations, unless the Executive Director deems it unnecessary.

Regarding tsunami hazards, the LCP recognizes the area's high erosion potential and requires that development be located inland of areas near the shoreline that are vulnerable to tsunami runup. Cal-Am has proposed locating the well heads inland of the tsunami runup zone identified in the LCP and at an elevation of approximately 30 feet (NAVD88), which would be above the most recently identified maximum tsunami runup estimate of about 18 feet, both now and under projections of several feet of sea level rise.[5357]

Conclusion

The above-referenced analyses show that the proposed well site locations would allow the wells to avoid hazards from coastal erosion during their expected operating/economic life and are therefore consistent with the above-referenced LCP provisions. However, ~~the currently proposed locations are near the most inland extent of Cal-Am's easement and could not be moved out of the hazard zone unless Cal-Am was able to obtain additional legal interest for areas further inland. The terms of the above-referenced CEMEX Settlement may prevent Cal-Am from obtaining additional legal interest on the CEMEX lands, which include the area immediately inland of Cal-Am's property at the site. Thus, although the Project is consistent with the hazard policies of the LCP, this uncertainty about the Project's long-term feasibility is considered in the analysis of alternatives and the Section 30260 override analysis regarding the public welfare finding.~~two of the wells could be subject to sand burial from the erosive process of dune recession due to blowouts. Special Condition 8 would avoid any potential sand burial by requiring Cal-Am to implement various soft measures as well as a monitoring program.

For the reasons described above, the Commission finds that the Project, as conditioned, will be carried out in a manner that is consistent with the relevant coastal hazards provisions of the LCP.

Note: These are not Commission staff's Recommended Findings

I. PROTECTION OF COASTAL WATERS AND MARINE RESOURCES

Coastal Act Section 30230 states:

> Marine resources shall be maintained, enhanced, and, where feasible, restored. Special protection shall be given to areas and species of special biological or economic significance. Uses of the marine environment shall be carried out in a manner that will sustain the biological productivity of coastal waters and that will maintain healthy populations of all species of marine organisms adequate for long-term commercial, recreational, scientific, and educational purposes.

Coastal Act Section 30231 states:

> The biological productivity and the quality of coastal waters, streams, wetlands, estuaries, and lakes appropriate to maintain optimum populations of marine organisms and for the protection of human health shall be maintained and, where feasible, restored through, among other means, minimizing adverse effects of waste water discharges and entrainment, controlling runoff, preventing depletion of ground water supplies and substantial interference with surface waterflow, encouraging waste water reclamation, maintaining natural vegetation buffer areas that protect riparian habitats, and minimizing alteration of natural streams.

Coastal Act Section 30233 states, in relevant part:

> **(a)** ~~**(a)**~~ The diking, filling, or dredging of open coastal waters, wetlands, estuaries, and lakes shall be permitted in accordance with other applicable provisions of this division, where there is no feasible less environmentally damaging alternative, and where feasible mitigation measures have been provided to minimize adverse environmental effects, and shall be limited to the following:
> (1)New or expanded port, energy, and coastal-dependent industrial facilities~~...~~**...**

LCLUP Policy 16:

> To insure the protection of marine resources for long-term commercial, recreational, scientific and educational purposes.

LCLUP Policy 17:

> To insure protection and restoration of the ocean's water quality and biological productivity.

These Coastal Act and LCP policies require generally that development protect marine resources, ocean water quality and biological productivity. These findings separately address the proposed Project's expected effects on coastal waters and marine biological resources resulting from its source water intakes and its discharges. ~~**Additionally, because the proposed Project would involve placement of structures in coastal waters, these Findings address the Project's conformity to the alternatives analysis required pursuant to Coastal Act Section 30233.**~~

Effects of intake on coastal water quality and marine biology

Note: These are not Commission staff's Recommended Findings

Cal-Am has specifically selected subsurface slant wells to obtain source water for its proposed desalination facility. The state's Ocean Plan includes provisions applicable to seawater desalination facilities that require, where feasible, that those facilities use wells or other types of subsurface intakes instead of open water intakes to avoid the adverse entrainment and impingement effects on marine life caused by open water intakes.[5458]

Cal-Am's proposed slant wells would extend beneath coastal dunes and the beach to extract primarily seawater from the underlying aquifers. ~~Cal-Am's~~The hydrogeological modeling conducted as part of the ~~site~~CPUC's EIR/EIS for the Project and its proposed wells shows that the expected area of drawdown from ~~its wells~~Project pumping would extend some distance offshore and would be expected to induce seawater to be drawn into the wells through the overlying sand and sediments. The depth of the wells – down to about 200 feet below the seafloor – and the relatively large area from which they would induce this drawdown, along with the maximum pumping rate of about 2,500 gallons per minute from each well, would result in the seawater being drawn through the seafloor at an essentially undetectable rate, so any effects that might occur to marine life in the overlying ocean water column or benthic habitat would be imperceptible (see Section ~~II~~IV.~~I~~J for a separate discussion on the proposed Project's expected effects on nearby groundwater resources).[5559] Importantly, staff of the Central Coast Regional Water Quality Control Board has determined that Cal-Am's proposed slant well system meets the Ocean Plan requirement that the proposed Project's intakes constitute the "best intake technology feasible to minimize the intake and mortality of all forms of marine life."[5660]

Effects of discharge on coastal water quality and marine biology

Cal-Am would direct the brine discharge from its desalination facility through an outfall owned by Monterey One Water. The outfall is currently used to discharge treated wastewater from Monterey One's regional wastewater treatment facility in northern Monterey County to about 11,000 feet offshore in Monterey Bay. The outfall terminates at a diffuser that is about 1,000 feet long and that has over 100 ports through which the discharge reaches ocean waters.

For its proposed discharge, Cal-Am would first route the brine from its facility to an approximately three-million-gallon mixing tank at the wastewater treatment facility where it would blend with treated wastewater before being discharged through the outfall. The current rate of discharge of treated wastewater through the outfall varies significantly over the course of a year – from close to zero gallons per day during the summer months to up to about 17 mgd in the winter – as the treatment facility uses the wastewater to produce recycled water that is

---

[5458] Entrainment occurs when small organisms, such as plankton, fish eggs, larvae, etc., are pulled into an open-water intake. It results in essentially 100% mortality due to the organisms being subjected to filters and high pressures within the ~~facilities~~facility's pre-treatment or treatment systems. Impingement occurs when larger fish or other organisms are caught on an intake's screening system and are either killed or injured.

[5559] See State Water Resources Control Board, Water Quality Control Plan – Ocean Waters of California, revised 2019. Available at: ~~https://www.waterboards.ca.gov/water_issues/programs/ocean/docs/oceanplan2019.pdf (assessed~~ https://www.waterboards.ca.gov/water_issues/programs/ocean/docs/oceanplan2019.pdf (accessed August 10, 2020).

[5660] See January 15, 2019 letter from John Robertson, Executive Officer of the Central Coast Regional Water Quality Control Board to Coastal Commission's Tom Luster regarding Cal-Am's conformity to Ocean Plan provisions Chapter III.M.2.b and III.M.2.d(1) and Water Code section 13142.5(b) regarding intakes.

Note: These are not Commission staff's Recommended Findings

routed to agricultural operations for irrigation during much of the growing season. At the desalination facility's expected production capacity of 6.4 mgd of potable water, it would contribute about ~~10~~9 mgd of brine to these discharge flows. Depending on the time of year, that volume would represent anywhere from about not quite half to 100% of the volume of total effluent conveyed through the outfall. **Nevertheless, the Final EIR/EIS confirmed that both the "brine only" discharges and the combined discharges would comply with Ocean Plan water quality objectives for all assessed constituents.**

The treatment facility's discharge is currently regulated through a National Pollutant Discharge Elimination System ("NPDES") permit that would need to be amended to allow Cal-Am to use the outfall for its discharge.[~~57~~61] Regional Water Board staff is currently reviewing Cal-Am's proposed discharge to determine what requirements are needed to ensure that the characteristics of the combined discharges under the various flow regimes would meet water quality objectives and be protective of water quality and marine life. Regional Water Board staff is also reviewing what measures are needed for the discharge to be consistent with the state's Ocean Plan Amendment applicable to discharges from seawater desalination facilities. ~~**One potential requirement still being evaluated is whether Cal-Am or Monterey One Water would need to modify the outfall's existing diffuser**~~ **Mitigation Measure 4.3-5, discussed in further detail below, presents multiple potential strategies[62] that may be employed** to ensure that the expected salinity concentrations from both the stand-alone brine discharge and the combined brine and treatment plant discharges conform to the Ocean Plan standard that requires seawater desalination facility discharges into ocean waters **to** not exceed two parts per thousand over natural background salinity levels as measured no further than 100 meters from the discharge points.[~~58~~63] Modeling conducted to date shows that this area would likely be much smaller, with the 100% brine discharge expected to meet this salinity standard just a few dozen feet from the discharge points, well within the allowable distance.[64]

The discharge would also be limited in its allowable concentrations of other constituents, such as metals, dissolved oxygen, and various contaminants. The Final EIR/EIS identified potential exceedances of several contaminants under certain operational scenarios and uncertainty about whether some constituents would meet the necessary Ocean Plan objectives.[~~59~~] ~~**It is therefore unclear at this time as to what effects the proposed desalination facility would have on water quality and marine life and what structural or operational changes might be needed to ensure Cal-Am's discharge would meet the relevant Ocean Plan objectives, and**~~

[~~57~~61] Order No. R3-2018-0017, approved on December 6, 2018 by the Central Coast Regional Water Quality Control Board, acknowledges that Monterey One Water anticipates discharging Cal-Am's brine waste through its outfall, but states that Monterey One Water will need to submit a new application for the Board's consideration and approval prior to any such discharge.

[62] **One potential strategy under consideration is retrofitting the existing outfall diffuser.**

[~~58~~63] Natural background salinity in ocean water generally ranges from about 30 to 35 parts per thousand.

[64] **See Final EIR/EIS, p. 4.3-79 ("In all cases, the Ocean Plan salinity limit of 2 ppt is met at the edge of the ZID, the length of which ranges from approximately 10 to 39 feet for the dense discharge scenarios… well within the Ocean Plan receiving water limitation for salinity of 2 ppt at a distance of 328 feet from the diffuser.").**

[~~59~~] ~~**The Final EIR/EIS noted that under certain operating scenarios, the project could result in exceedances of water quality standards for ammonia and cyanide, along with possible exceedances for up to 10 other constituents of the brine discharge.**~~

Note: These are not Commission staff's Recommended Findings

~~thereby minimize its potential adverse effects. It is also not clear at this time as to the type and extent of mitigation that may be needed to~~ [65]

To address these potential ~~adverse effects.~~exceedances~~Cal-Am, in its June 30, 2020 letter, acknowledges that~~ the Final EIR/EIS ~~determined that the brine discharge could result in exceedances of several of the state's water quality standards, though Cal-Am also contends that the Final EIR/EIS's~~imposes Mitigation Measures 4.3-4 and 4.3-5. Consistent with Ocean Plan requirements, Mitigation Measure 4.3-4 requires Cal-Am to implement a monitoring and reporting plan that will ensure that operational discharges from the Project are in compliance with applicable Ocean Plan water quality objectives and salinity standards. The plan will be approved by the Regional Water Board and MBNMS prior to implementation. Additionally, monitoring will be conducted for one year prior to the commencement of operational discharges and will continue until at least five years after operational discharges commence. A draft of this Plan is currently under review by the Regional Water Board, as discussed further below. As a further precaution, Mitigation Measure 4.3-5 ~~would ensure that the discharge meets those standards. This mitigation measure~~ prevents Cal-Am from discharging brine into coastal waters until it can demonstrate that it has implemented any additional design features, engineering solutions, and/or operational measures needed to ensure compliance~~, which Cal-Am notes could include additional design features, operational changes, diffuser retrofits, or other similar measures. Cal-Am's letter also notes that any potential structural changes are not included in this CDP application, but would be addressed through a separate CDP application to be submitted by Monterey One Water, the owner of the outfall.~~ with Ocean Plan water quality objectives. With implementation of these mitigation measures, the Final EIR/EIS determined that impacts relating to water quality standards, waste discharge requirements, or ocean water quality, as a result of brine discharges from the Project, would be less than significant.

~~The Ocean Plan requires dischargers to prepare for Regional Board approval a~~As noted above, a draft of the monitoring and reporting plan is under review that describes measures that would be implemented to ensure ~~the~~that discharges are meeting all relevant requirements. ~~A draft of this Plan is currently under review, along with consideration of~~ In addition, the Regional Water Board is considering what operational or design changes might allow the discharges to meet the required objectives. Potential operational changes include modifying the treatment methods, treating the discharges before they are routed to the outfall, or augmenting the flows to increase dilution prior to discharge (although the Ocean Plan Amendment generally prohibits flow augmentation for seawater desalination discharges). Potential design changes include retrofitting the existing diffuser system to allow additional dilution of the discharge, which would involve adding one or more additional structures to the existing outfall. Construction impacts associated with these changes are expected to be minor and temporary. The Final EIR/EIS described these changes to the diffuser as the most effective and reasonable strategy for ensuring compliance. The Final EIR/EIS additionally concluded that secondary construction and operational impacts of the diffuser retrofit would be less than significant.

Potential retrofitting of the existing diffuser, which may be necessary to implement Mitigation Measure 4.3-5, is not included in this CDP application, but would be addressed

[65] The Final EIR/EIS noted that under certain operating scenarios, the project could result in exceedances of water quality standards for ammonia and cyanide, along with possible exceedances for up to 10 other constituents of the brine discharge.

Note: These are not Commission staff's Recommended Findings

through a separate CDP application to be submitted by Monterey One Water, the owner of the outfall. In order to ensure that construction of the outfall complies with applicable Coastal Act requirements, the Commission imposes Special Condition 3, which requires, prior to operation of the Project, that the applicant demonstrate that discharges from the outfall would comply with the Ocean Plan and applicable water quality requirements through obtaining and implementing a Coastal Development Permit or Amendment for work on the Monterey One Water outfall, and/or implementing other measures consistent with Final EIR/EIS Mitigation Measure 4.3-5, as necessary, outside of the Commission's jurisdiction.

~~Determining whether~~Ensuring that the proposed Project ~~can~~would conform to Ocean Plan requirements would also require that Cal-Am install several monitoring buoys offshore before Cal-Am starts discharging its effluent. This is needed to establish baseline conditions on which to evaluate potential effects of the discharge. The currently proposed plan would include four buoys to be located at different distances from the outfall to measure salinity and other water quality parameters. They would include a seafloor anchor, a package of sensors, floats, and other equipment, all of which would extend about ten feet above the seafloor. Cal-Am would also install a telemetry buoy consisting of a seafloor mooring, ballast chain, a cable riser, and necessary instrumentation, which would extend through the water column to the water surface. It would transmit data from the other buoys to allow near real-time monitoring.

Cal-Am ~~is~~would also ~~required to~~ replace the existing clamps within the nearshore portion of the outfall with corrosion-resistant clamps that would prevent its brine discharge from damaging the outfall. Although these clamps would be inside the outfall, Cal-Am would need to conduct installation activities on the beach ~~and possibly within coastal waters~~, at a distance of roughly 100 feet from the shoreline. Work is expected to involve heavy equipment on the beach, as well as a generator, 20-foot container box for equipment storage, a staging and work area, temporary fencing, and possibly excavation around the outfall's existing junction box on the beach. Work would be scheduled during the outfall's low flow summer season, but would require installation of a bypass line that would reroute outfall flows at the junction box for discharge into the nearby coastal waters for the 6 – 8 week period of time that the work would take. ~~Although this installation is generally described in~~According to the Final EIR/EIS, ~~it is not clear what effects the concentrated direct discharge would have in the~~flows in the outfall during this period would be *de minimis*. As such, any adverse impacts to nearshore waters~~, as the discharge would normally be routed through the outfall's numerous offshore diffusers. However, that discharge would occur for only 6 – 8 weeks during the treatment plant's lowest flow time of year~~ resulting from temporary discharge during the 6-8 week construction period would be negligible. The Final EIR/EIS additionally includes a mitigation measure to ensure that impacts from clamp replacement would be less than significant.[66] The mitigation measure includes generally avoiding construction work seaward of the mean high water line and keeping construction vehicles as high on the upper beach as possible to avoid contact with ocean waters and intertidal areas. As a further precaution, construction activities that result in a discharge of materials, polluted runoff, or wastes to the beach of the adjacent marine environment would also be prohibited. The need to conduct work during the low flow summer period would also coincide with the end of the Western snowy plover ~~breeding and nesting season. As noted previously, this area of beach is designated as critical habitat for the plover, and work would represent a significant disturbance during a critical period~~

[66] See Final EIR/EIS Mitigation Measure 4.13-5a.

Note: These are not Commission staff's Recommended Findings

~~of the plover's life cycle. Finally, and although specific work plans have not been provided, the installation may include placement of fill in coastal waters via grading, placement of the bypass discharge line, or other components of the installation activities.~~nesting season. Construction is designed to occur during late summer/early fall, when snowy plover eggs are expected to have hatched. This timing would limit the extent to which construction work would interfere with the snowy plover's breeding and nesting season, and minimize any associated adverse impacts.

~~Any of these Project aspects – a potential diffuser retrofit, the~~In light of the foregoing, the Commission concludes that neither the proposed buoy installation~~, or~~ nor the WEKO clamp replacement ~~–~~would involve placing fill in coastal waters ~~in~~ .[67] Public Resources Code section 30108.2 defines "fill" as "earth or any other substance or material, including pilings placed for the purposes of erecting structures thereon, placed in a submerged area." In considering whether Coastal Act Section 30233 applies, the Commission typically considers projects installing permanent structures or placement of sediment or similar material on the seafloor, not temporary anchors, and assesses whether those structures can be modified or arranged differently to avoid impacts on the chosen project site.[68] Of particular relevance, the Commission previously elected not to invoke Coastal Act section 30233 under similar circumstances when considering the use of temporary anchors for the recommissioning of the Charles E. Meyer Desalination Facility in Santa Barbara.[69] As described above, the work required for each of these Project aspects is temporary in nature and limited in scope, and potential impacts to receiving coastal waters, if any, would be minimal. Accordingly, the Commission concludes that diffuser retrofit, buoy installation, and the WEKO clamp replacement would not involve placing fill in coastal waters.

~~the form of new or modified structures~~Even if these Project aspects were to involve the placement of fill in coastal waters, as some commenters have suggested, they would be consistent with applicable Coastal Act requirements. Pursuant to Coastal Act Section 30233, ~~any such~~ fill is allowed only if it meets a three-part test: 1) that there is no feasible less environmentally damaging alternative; 2) that feasible mitigation measures have been provided to minimize adverse environmental effects, 3) and that it be for certain specified purposes, including a new or expanded port, energy, or coastal-dependent industrial facility. The two tests related to alternatives and mitigation are similar to tests found in Coastal Act Section 30260, which is applied in Section ~~II~~IV.P of these Findings. ~~Those Findings include the analysis and conclusions needed to determine conformity to these Section 30233 tests. For the reasons described in those Findings, the Project does not conform to Section 30233 because there is a~~As discussed therein, there is no feasible ~~and~~ less environmentally

---

[67] Any other work on the M1W outfall within the Commission's retained jurisdiction, including potential diffuser retrofit, would be subject to a separate CDP process through M1W.

[68] See, e.g., Staff Report, Application No. 5-10-293, available at https://documents.coastal.ca.gov/reports/2011/6/W10b-6-2011.pdf [applying Section 30233 to installation of new piles, pier, gangway, and platform and assessing alternative configurations of the piles]; Staff Report, Consistency Certification No. CC-0006-14, available at https://documents.coastal.ca.gov/reports/2014/12/F11b-12-2014.pdf [applying Section 30233 to the placement of riprap and excavated sediments and assessing alternative dredging and structural improvements at the proposed project site].

[69] See Staff Report, Application No. 9-14-1781 (Jan. 30, 2015), available at https://documents.coastal.ca.gov/reports/2015/2/f12b-2-2015.pdf.

Note: These are not Commission staff's recommended Findings

damaging alternative ~~project that will not require fill in coastal waters and because not all mitigation has been identified and imposed.~~**available and the Project has identified and implemented all feasible mitigation measures to minimize adverse environmental effects. Further, the Project aspects are for certain specified purposes in support of a coastal-dependent industrial facility. Therefore, even if Project aspects were considered fill as argued by some commenters, the Project would comply with Coastal Act Section 30233.**

Conclusion

Based on the analyses above, and on those in Section ~~II~~**IV**.P of these Findings, the Commission finds that**, with implementation of Special Condition 3,** the proposed Project components within the Commission's retained jurisdiction ~~do not~~ conform to Coastal Act Section 30233~~. Were it not for the other Coastal Act and LCP nonconformities noted elsewhere herein – e.g., the Project's nonconformity with Coastal Act and LCP ESHA policies and its nonconformity with Coastal Act Section 30231's provisions for groundwater protection – the Commission could consider adopting special conditions to bring this component of the proposed Project into conformity with Section 30233's requirement for mitigation. However, because the Project is being denied for other reasons, there is no need to identify special conditions that would be needed to ensure conformity to the above-referenced provision regarding placement of fill in coastal waters~~ **and applicable LCP provisions**. Because the Project would be required to meet water quality objectives and be protective of water quality and marine life, per state Ocean Plan standards, the Project is consistent with Sections 30230 and 30231~~.~~[60]

as well as applicable LCP provisions.[70]

Note: These are not Commission staff's Recommended Findings

~~[60] The Commission would also defer to the Regional Water Board with regard to effluent limitations (see Coastal Act Section 30412), though if the Board required changes to the outfall, it might trigger the need for a CDP amendment or new CDP to address those changes.~~

[70] The Commission would also defer to the Regional Water Board with regard to effluent limitations (see Coastal Act Section 30412).

J. PROTECTION OF GROUNDWATER RESOURCES

Coastal Act Section 30231 states, in relevant part:

> The biological productivity and the quality of coastal waters, streams, wetlands, estuaries, and lakes appropriate to maintain optimum populations of marine organisms and for the protection of human health shall be maintained and, where feasible, restored through, among other means, minimizing adverse effects of waste water discharges and entrainment, controlling runoff, **preventing depletion of ground water supplies** ... ...[emphasis added]

Summary

This Coastal Act provision requires that biological productivity and water quality be maintained, in part, by preventing depletion of groundwater supplies. Cal-Am's proposed Project would extract water from beneath an area near the shoreline that includes several aquifer systems that extend from areas further inland and that contain a blend of intruded seawater and fresh or brackish water. The aquifers are within the Salinas Valley Groundwater Basin ~~and provide drinking water supplies, support extensive agricultural operations, and serve the nearby wetlands and vernal pool complexes described in Section II.C of these Findings~~("SVGB"). The coastal areas of these aquifers ~~from which Cal-Am~~have been heavily intruded by seawater for decades. Project pumping would extract ~~its source water are largely seawater intruded~~primarily seawater, though ~~they include areas of predominantly~~Cal-Am may extract some brackish water~~, including some areas that may be considered useful for~~ that nonetheless requires treatment before use in irrigation or as ~~potential drinking water sources~~potable use.

~~Although~~Extensive studies ~~done~~have been performed as part of ~~Cal-Am's~~the Project's CEQA review before the CPUC. Those studies, incorporated into the Final EIR/EIS, concluded that the proposed Project's wellfield would have relatively limited effects on nearby groundwater ~~resources, subsequent evaluations and updated studies have identified some more potential and substantial adverse project impacts, including likely impacts to nearby vernal ponds (described in Section II.F – ESHA). The updated modeling also shows an increased likelihood~~conditions in the SVGB, and negligible or no effect on regional groundwater supplies. Subsequent evaluations and studies recently performed by the Commission's independent hydrogeologist are generally consistent with the conclusions reached in the studies and groundwater modeling in the Project's Final EIR/EIS. The subsequent studies confirm that Cal-Am would be required to return ~~more~~ water to the ~~basin than~~SVGB in the range previously anticipated in the Final EIR/EIS and the Project's Return Water Agreement described elsewhere in these Findings~~. This would substantially increase costs to Cal-Am's ratepayers, as described in Section II.N – Environmental Justice and Section II.O – Assessment of Alternatives~~. Although some commenters have expressed concern that the Project would adversely affect the water supply wells of the Marina Coast Water District, which are located about two miles from the Project's proposed well field, neither the Final EIR/EIS nor the Commission's independent hydrogeologist found evidence that such impacts are reasonably foreseeable~~, though the Commission's consultant has recommended additional modeling and data may be needed to more fully~~

Note: These are not Commission staff's Recommended Findings

~~characterize the Project's likely effects on groundwater.~~[71] Therefore, no adverse effects to Marina Coast Water District's water supply wells would occur.

Background and Analysis: The CEQA review of Cal-Am's proposed Project included extensive groundwater monitoring and modeling, along with installation and operation of a test well, to determine what effects its proposed well field would have on the area's underlying aquifers. The CEQA review included establishment of a ~~Hydrologic~~Hydrogeologic Working Group ("HWG") to help develop these monitoring and modeling methods and to assess the resulting studies.[61] ~~Those~~ [72] As part of the CPUC's CEQA process, the EIR/EIS consultant team performed over six years of fieldwork, data analysis, and groundwater modeling. The EIR/EIS consultant team's groundwater modeling was peer-reviewed by the Lawrence Berkeley National Labs ("LBNL") and revised in response to LBNL's comments. Further, the HWG's modeling and conclusions were subject to peer review by certified hydrogeologists from Environmental Science Associates and hydrogeologists/groundwater modelers from HydroFocus, Inc. The resulting studies and pump tests at the test well identified a relatively limited "zone of influence" around Cal-Am's proposed well field, and **the CEQA review concluded that Cal-Am's proposed extraction of ~~groundwater~~source water from ~~this area~~Project pumping would have less than significant effects ~~with regards to~~to groundwater supplies, including groundwater depletion or recharge**. These findings and conclusions were incorporated into the CPUC's Final EIR/EIS and its final decision regarding the proposed Project.

Other interested parties conducted additional studies or reviewed the studies conducted during the CEQA review. Some of these studies and reviews reached competing conclusions about the type and extent of the likely effects that Cal-Am's intake wells would have on area groundwater supplies. Some conclusions asserted that Cal-Am's proposed ~~use of groundwater from this area~~Project would have substantially greater adverse effects on groundwater than had been identified during the CEQA review. A key area of concern was whether Cal-Am's ~~groundwater extraction~~proposed Project would remove greater volumes of "non-seawater" – that is, ~~fresh or brackish water in the Basin that may be of~~groundwater in the SVGB that could be put to beneficial use ~~to others~~by other groundwater users – than ~~Cal-Am's~~the EIR/EIS's models had predicted.[73]

---

[71] The Project will withdraw seawater and brackish groundwater from the water-bearing sediments of the Dune Sand and 180-Foot Equivalent Aquifers along the coast, which are hydraulically connected to the Pacific Ocean. (Final EIR/EIS, pp. 3-7, 4.4-16.) Marina's production wells are screened in the 400-Foot and Deeper Aquifers. (Final EIR/EIS, p. 4.4-75.)

The HWG is comprised of two hydrogeologists working on behalf of Cal-Am and one each working for the Salinas Valley Water Coalition and the Monterey County Farm Bureau.~~

[72] See documentation provided on Cal-Am's MPWSP website at https://www.watersupplyproject.org/test- well (accessed August 14, 2020). The HWG is comprised of two hydrogeologists working on behalf of Cal-Am and one each working for the Salinas Valley Water Coalition and the Monterey County Farm Bureau.

[73] Cal-Am does not need a permit or water right for its withdrawal of seawater. However, Cal-Am would need to develop appropriative rights for the percentage of groundwater that is not intruded seawater that it would extract and export from the SVGB. To obtain those rights, Cal-Am would have to establish that its use of that water does not harm other existing lawful water users in the

Note: These are not Commission staff's Recommended Findings

Groundwater **modeling and** studies, by their very nature, involve some level of uncertainty, as their assumptions and conclusions rely on partial data about the hydrogeologic characteristics of aquifer systems. The set of studies and reviews developed as part of this Project ~~presented a relatively~~**included a** wide range of ~~interpretations – ranging from Cal-Am's Project expected to have little or no effect on the local or regional~~**reasonably foreseeable scenarios. Based on substantial evidence in the CPUC's record, the Final EIR/EIS concluded that the Project would have a less than significant impact on** groundwater supplies ~~to the Project having substantial and extensive effects on water in the Basin that could be useful to others.~~**in the SVGB. As described below, subsequent studies performed by the Commission's independent hydrogeologist confirm the Final EIR/EIS's conclusions, particularly as to the projected makeup of the proposed Project's source water extracted from the SVGB.**

Other key areas of concern or disagreement ~~were~~**are**: 1) whether the data used in ~~Cal-Am's~~**the Final EIR/EIS's** modeling and studies were adequate to characterize conditions of the affected aquifers or the likely or potential effects of Cal-Am's water extractions from those aquifers; 2) whether Cal-Am's proposed extractions would induce seawater intrusion or adversely affect any water in those aquifers that may be suitable to treat as fresh water or drinking water; and 3) whether ~~design changes – such as extending~~ Cal-Am's slant wells **could extend** further offshore than currently proposed ~~– would eliminate or reduce all or some of any identified adverse effects.~~

. Some of the main reasons for disagreement among the studies were their use of different baseline standards, data collection methods, and modeling approaches. ~~For example, Cal-Am's studies were~~ **As described below, the data and analytical framework used in the EIR/EIS's modeling sufficiently characterizes the SVGB and its aquifers for purposes of evaluating the Project's potential impacts to groundwater resources. Further, Cal-Am's proposed Project would not exacerbate seawater intrusion or otherwise adversely affect groundwater in the SVGB. Finally, Cal-Am's proposed slant wells do not need to be relocated in order to potentially capture more seawater.**

Ocean Water Percentage

The Final EIR/EIS's analysis was focused in part on determining how much ~~"non-seawater"~~**seawater** Cal-Am's wells would extract **("ocean water percentage" or "OWP"), as opposed to "non-seawater"** – that is, what proportion of the water withdrawn through Cal-Am's wells would not be fully seawater, but would include ~~fresh or~~ brackish ~~water~~**groundwater** that could be considered an element of the treatable groundwater within the ~~Salinas Valley Basin. The Basin has a prohibition of exporting such water~~**SVGB. Under the Monterey County Water Resources Agency Act ("Agency Act"), the SVGB has a restriction on exporting groundwater** outside the ~~Basin~~**SVGB** boundaries~~, and Cal-Am would essentially have~~**. As such, pursuant to an agreement reached during the CPUC's review, Cal-Am**

SVGB. See Final EIR/EIS, Chapter 2 – Water Demand, Supplies, and Water Rights. The State Water Resources Control Board has determined that Cal-Am could lawfully obtain the necessary groundwater rights to operate the proposed Project.

Note: These are not Commission Staff's Recommended Findings

agreed to return to the SVGB any such portion that is not considered seawater.[62] Cal-Am's ("return water").[74]

The Final EIR/EIS estimated OWP after one year of Project pumping to be 87 to 95%. After two years of Project pumping, the OWP estimate increases to 92-97%. Long-term equilibrium OWP would ultimately fall between 96-99%. In other words, from year one to long-term, the Project's OWP could range from 87 to 99%.[75]

The EIR/EIS's modeling efforts described itsanalyzed Cal-Am's expected "fresh"OWP and return water withdrawals using a threshold of 500 milligrams per liter ("mg/l") of Total Dissolved Solids ("TDS") – that is, the model considered watergroundwater in the aquifers that had TDS concentrations below that threshold as an indicator of how much non-seawater Cal-Am would extract.[63][76] Some of the other studies conducted by third parties such as the Marina Coast Water District used a different threshold – (3,000 mg/l TDS[64] – and a [77]), a different data collection method – Airborne Electromagnetic ("AEM")[78] – and different

---

[62] A Return Water Agreement established during the CPIC's review provides that Cal-Am would have to monitor the water extracted from its wells, determine the proportion that is not fully seawater (by calculating the salinity of its extracted water as compared to that of seawater), and then return that volume to the Basin at substantially reduced prices, in the form of potable water to be supplied to the Castroville Community Services District. See CPUC Final Decision 18-09-17, Appendix H – Return Water Settlement.

[74] A Return Water Agreement established during the CPUC's review requires that Cal-Am monitor the water extracted from its wells, determine the OWP and corresponding return water component, and then return that volume to the SVGB, in the form of potable water to be supplied to the Castroville Community Services District ("CCSD") at CCSD's avoided cost of groundwater pumping. See CPUC Final Decision 18-09-17, Appendix H – Return Water Settlement.

[75] Final EIR/EIS, p. 4.4-56; see also Final EIR/EIS, Appx. E3.

[63][76] This threshold was established by MCWRA during the CPUC process and is based on California's recommended drinking water objective of no greater than 500 mg/L. See California Code of Regulations, title 22, division 4, chapter 15, article 16, section 64449, Table 64449-B (Consumer Acceptance Contaminant Level Ranges).

[64] This threshold is based on the State Water Board's Resolution 88-63 – Sources of Drinking Water, which identifies groundwater with TDS concentrations of less than 3,000 mg/L to be suitable for drinking water, if treated.

[77] This threshold is based on the State Water Board's Resolution 88-63 – Adoption of Policy Entitled "Sources of Drinking Water," which targets water quality control plans and identifies all surface and groundwaters of the State as "suitable, or potentially suitable," for municipal or domestic water supply, with certain exceptions, including groundwater with TDS concentrations greater than 3,000 mg/L. The policy does not protect groundwater with TDS levels of 3,000 mg/L TDS as actually suitable for agricultural or domestic use, and groundwater with such TDS levels is unfit for beneficial use without treatment. The CPUC therefore evaluated the Project's potential impacts to groundwater and its OWP using regulations under the Safe Drinking Water Act, as described above in footnote 76.

[78] The CPUC considered the AEM studies as part of its CEQA review and found the studies to be technically flawed. (See CPUC Final Decision 18-09-017, Appendix J, pp. 15, 19-21.) The AEM studies identify claimed "fresh" water that could be extracted by the Project, but a comparison of groundwater monitoring well data and the AEM data shows that the "fresh" water that the studies claim exist is unfit for use without treatment because it exceeds applicable water quality standards. Marina Coast Water District has suggested that a 2019 AEM study fixes any concerns with the prior AEM studies. As described below, the Commission finds the 2019 AEM study is

Note: These are not Commission Staff's Recommended Findings

groundwater gradients that slope toward the Pacific Ocean to conclude that Cal-Am's wells would extract substantially greater volumes of "non-seawater" – and, thus, a lower OWP – than ~~Cal-Am's~~the EIR/EIS's models had shown.

Some of these issues and areas of disagreement would not be fully resolved without additional modeling, and some won't be determined unless and until Cal-Am actually undertook pumping. Cal-Am does not need a permit or water ~~right~~rights for its withdrawal of seawater. However, Cal-Am would need to obtain appropriative rights for the percentage of groundwater that is not intruded seawater that it would extract and export from the Basin. To obtain those rights, it would have to establish that its use of that water was not harming other existing lawful water users in the Basin.[65][79] Nonetheless, ~~and~~ with the intent of ~~reducing the existing uncertainties and~~ evaluating some of these areas of concern to determine whether the proposed Project would conform to the groundwater protection provision of Coastal Act Section 30231, Commission staff contracted with an independent licensed hydrogeologist to review some of these studies and conclusions, to conduct additional analyses, and to reach independent conclusions about these issues. The initial review, prepared in November 2019,[66][80] concluded that there were several ~~substantial~~ remaining uncertainties about how Cal-Am's extraction of groundwater would affect the groundwater basin and the amount of potentially usable groundwater within the area (see Exhibit 11 – November 2019 Independent Hydrogeological Review). That review concluded that ~~the prior modeling did not adequately characterize some aspects of the underlying aquifers and some of Cal-Am's potential effects on those aquifers. It also concluded that~~ while Cal-Am's proposed groundwater extraction would likely have limited to negligible effects on the rate of seawater intrusion in the area, it appears that Cal-Am's wells ~~would~~could, under certain limited scenarios, extract greater volumes of ~~non-seawater~~return water than had been previously identified~~. It also~~ in the EIR/EIS. The initial review recognized that any predictions from its proposed modeling would likely be in the range already evaluated in the Final EIR/EIS. Using a larger capture zone assumption, the initial review conservatively determined that the low end of the OWP estimates could be 85 to 90%, and that this low value is likely to underestimate the true OWP. Further, the initial review concluded that changes in groundwater gradients would not likely result in an OWP outside the 90-99% range, and thus, the Project will not extract greater amounts of non-seawater than identified in prior modeling. Nonetheless, the initial review recommended that additional data collection and modeling were needed to further reduce the degree of uncertainty about expected impacts, though it also suggested that some of ~~that~~the uncertainty could be reduced by ensuring that the screened areas of Cal-Am's wells extended further seaward so that there would be a shorter flow path between the wells and the seawater beneath the floor of Monterey Bay.

After the Commission's November 2019 hearing, Cal-Am agreed to fund some of these additional recommended analyses to allow for further reduction in the uncertainties about the proposed Project's effects on groundwater and to better determine the ~~amount of "non-seawater" likely to be extracted by Cal-Am's wells~~proposed Project's OWP. The second review, provided in June 2020 (see Exhibit 12 ~~–~~ Independent Evaluation, Modification, and Use of the North Marina Groundwater Model to Estimate Potential Aquifer Impacts, July 2020)

---

flawed in its interpretation and use of the AEM data. (See Exhibit 14 – HWG Critique of 2019 AEM Study.)

[65][79] See Final EIR/EIS, Chapter 2 – Water Demand, Supplies, ~~and~~ Water Rights.

[66][80] See Weiss Associates, Independent Hydrogeological Review of Recent Data and Studies Related to California American Water's Proposed Monterey Regional Water Supply Project, November 1, 2019.

Note: These are not Commission staff's Recommended Findings

~~included additional~~, evaluated modeling ~~and~~results for various hypothetical scenarios. The second review concluded the following:

- The additional modeling suggests the amount of recharge into the aquifers – from precipitation, irrigation water percolating downward, etc. – ~~would~~may affect the percentage of seawater extracted by the wells. The previous modeling ~~did not include this~~included a recharge component and showed that the wells would initially pump about 85-90% seawater after one year and that the percentage would increase to about 96-99% after the first three years of operation. ~~This updated modeling shows that the amount of seawater withdrawn would not reach that expected steady state of 95-99%, but would vary based on whether it was a wet or dry season, how much irrigation occurred, etc. As described below, this aquifer characteristic is likely to result in Cal-Am needing to return more water to the Salinas Valley Groundwater Basin during wet years, pursuant to the aforementioned Return Water Agreement.~~The additional modeling included scenarios with various recharge assumptions. The scenarios using reasonable assumptions, including recharge, resulted in OWP estimates of 88% or greater.

- This most recent modeling also concluded that the amount of seawater extracted would vary due to the direction and slope of the groundwater gradient in the Dune Sand and 180-Foot Aquifers; that is, ~~an aquifer~~a gradient from the shoreline to inland areas, which is currently the most common condition, would result in extraction of a higher ~~percentage of seawater~~OWP, while a flat ~~gradient~~ or shoreward gradient would result in extraction of a ~~higher percentage of non-seawater. This latter condition could be developed through the upcoming implementation of the Salinas Valley Groundwater Management Plan; however, even with a flat or shoreward gradient~~lower OWP. The Final EIR/EIS assumed landward gradients in both the Dune Sand and 180-Foot Aquifer in evaluating OWP based on data trends. The additional modeling evaluated different combinations of gradients in the Dune Sand and 180-Foot Aquifers.

- A seaward gradient in the Dune Sand Aquifer does not result in OWP ranges that are significantly different from those evaluated in the Final EIR/EIS. Using the most reasonably foreseeable inputs and assumptions for the groundwater modeling, the additional modeling shows that OWP exceeds 88% even for scenarios in which the Dune Sand Aquifer gradient is seaward.

- While the amount of seawater extracted would vary due to the direction and slope of the groundwater gradient in the 180-Foot Aquifer, the modeling showed that ~~it could~~assuming a flat or seaward groundwater gradient in the 180-Foot Aquifer is achieved at some point in the future it would still take several decades to ~~increase the percentage of non-seawater~~centuries to decrease OWP to 75% or lower, due to the large volumes of seawater that have already intruded to inland areas of the aquifer system. The modeling confirmed that, until such time as all the seawater is flushed from the 180-Foot Aquifer, the resulting average OWP would be greater than 91.5%.

- Further, the additional modeling confirmed that it would take decades to centuries to achieve a flat or seaward groundwater gradient in the 180-Foot Aquifer through the implementation of the Salinas Valley Groundwater Management Plan pursuant to the Sustainable Groundwater Management Act ("SGMA"), if at all. "The

Note: These are not Commission staff's Recommended Findings

landward gradient due to inland pumping that has caused seawater intrusion into the 180-Foot Aquifer is quite steep and has been for more than 60 to 80 years. It is highly unlikely that a similarly steep seaward gradient could be achieved under SGMA. If it could, it would take a similar period of 60 to 80 years to reverse seawater intrusion impacts and bring fresh water from the 180-Foot Aquifer to the Project wellfield. Under a more realistic flat or gentle seaward gradient, it would take far longer than 60 to 80 years to reverse seawater intrusion impacts." (Exhibit 12, Independent Evaluation, July 2020, p. 4-4, fn. 7.)[81]

- The additional modeling results demonstrate OWP exceeds 88% for the assumed seaward gradient in the Dune Sand Aquifer using reasonable assumptions for rainfall recharge. Average annual rainfall for the area is 14.8 inches. However, only a fraction of total annual rainfall actually becomes groundwater recharge – typically 30%. While the additional modeling included scenarios in which annual rainfall recharge inputs were 10-15 inches per year, the scenarios using reasonable assumptions of less than 50% of average total rainfall resulted in OWP ranging from 88-99%.

- The modeling determined that the "capture area" from which Cal-Am's wells could capture non-seawater from the upper Dune Sand Aquifer could cover up to about 2.5 square miles~~.~~ under certain assumed groundwater gradient scenarios. The proposed Project's capture zone is influenced by the slope and direction of the groundwater gradient.

- The recent modeling also identified areas of expected groundwater drawdown beneath several nearby wetland and vernal pond areas. As described in Section ~~II~~IV.G of these Findings, ~~this represents a previously unknown and unanalyzed potential impact of the proposed Project that could result in the spatial and/or temporal loss of up to several dozen acres of those wetland areas.~~these wetlands and vernal pond areas have not been conclusively determined to be dependent on the Dune Sand Aquifer.

- This second review also ~~recommended~~suggested that additional modeling could be done to further refine ~~and describe potential groundwater impacts. For example, some of these conclusions are derived from use of a "steady state" model rather than a "transient" model that incorporates more dynamic modeling aspects, such as relatively short-term aquifer changes that result from seasonal changes in rainfall or irrigation, and can better account for the amount of groundwater storage in the aquifers. The review also includes several specific recommendations on various components of that transient model to help adequately capture some of the expected reduction in uncertainty.~~Cal-Am's expected return water obligations if deemed necessary.

In ~~July~~August 2020, the above-referenced ~~Hydrogeologic Working Group~~HWG submitted ~~a critique~~an evaluation of this most recent review (see Exhibit 13 – ~~Hydrogeologic Working Group~~HWG Comments on Weiss Report, ~~July 10~~August 13, 2020). Although this

[81] It should be noted that SGMA does not require seaward gradients in the SVGB aquifers. Rather, SGMA requires that the extent and magnitude of existing seawater intrusion not be exacerbated. (See Cal. Water Code, §§ 10721, 10727.2, 10727.4.)

Note: These are not Commission staff's Recommended Findings

~~critique~~evaluation identified several concerns related to this recent modeling, it concurred that the Commission's independent reviewer reached a reasonable conclusion that the amount of seawater in the water withdrawn from Cal-Am's well field would range from about 88 to 99% and would vary in response to precipitation, agricultural pumping rates further inland, and other considerations. ~~As noted above, the modeling done during Cal-Am's CEQA review concluded that Cal-Am's water withdrawal would reach a steady state of 96-99%. Pursuant to the above-referenced Return Water Agreement, this would result in Cal-Am needing to return no more than about 700 acre-feet of water per year to the Salinas Valley Groundwater Basin. The updated modeling, however, shows that during years with higher precipitation rates, lower inland pumping rates, or other reasonably foreseeable conditions, Cal-Am would need to return up to about 2,100 acre-feet per year to the Basin.~~

~~From a perspective of protecting groundwater resources, the CPUC's requirement that Cal-Am return any non-seawater to the Basin through the Return Water Agreement is meant to ensure that groundwater is not exported. In addition, if any party was harmed by Cal-Am's pumping of larger than expected quantities of non-seawater, they could challenge Cal-Am's ability to obtain appropriative rights to that groundwater. However, for purposes of these Findings, this increased return water requirement would affect Project feasibility and cost, as described in Section II.N – Environmental Justice and Section II.O – Assessment of Alternatives. Essentially, because any higher return water volumes would either be subsidized by Cal-Am's ratepayers or would result in additional costs to Cal-Am that it may cover through additional cost recovery requests to the CPUC, the increased need to return water could substantially increase the costs to members of disadvantaged communities and to all Cal-Am ratepayers. If one or two wet years result in Cal-Am's return water requirements increasing from the expected 700 acre-feet per year to a possible 2,100 acre-feet per year, this would represent a need to subsidize about a third of Cal-Am's total proposed water production of 6,250 acre-feet per year. That subsidy, which could range from about $3,000 to $5,000 per acre-foot, would substantially increase the costs for Cal-Am to produce and distribute each unit of water it provides. As described in Section II.N – Environmental Justice – the CPUC required that Cal-Am's investors, not its ratepayers, take on some of the risk that the Project would pump higher volumes of non-seawater; however, its analysis was based on lower assumptions regarding the probable volumes of non-seawater that would be pumped, and the CPUC acknowledged that Cal-Am would be able to ask for rate adjustments in the future if conditions were different than anticipated. Presumably, this higher return water volume would also reduce the water Cal-Am and its customers would be able to use for future growth.~~

Moreover, the additional modeling results for scenarios that used reasonable assumptions and model inputs are consistent with the ranges evaluated in the Final EIR/EIS of 87-99%. The Final EIR/EIS modeling appropriately accounted for rainfall recharge and recognized that "seasonal changes in rainfall will result in a non-steady (i.e., fluctuating) increase in salinity from year-to-year, with some higher rainfall years showing a decrease in salinity and some lower rainfall years showing an increase in salinity."[82] Thus, the EIR/EIS presented a range of estimated OWPs to account for varying inputs of 87-99%.[83] Because the second review confirmed this range under the

[82] Final EIR/EIS, Appx. E3, p. 65.

[83] Final EIR/EIS, p. 4.4-56.

Note: These are not Commission staff's Recommended Findings

most reasonably foreseeable scenarios with reasonable assumptions, no additional modeling is necessary to refine the Project's estimated OWP and Cal-Am's corresponding return water obligation.

Even if Cal-Am's proposed Project withdraws greater volumes of non-seawater than predicted in the EIR/EIS and confirmed by the updated modeling, the Commission finds that there are no resulting environmental impacts to the SVGB under Coastal Act section 30231. Cal-Am's return water obligations are not mitigation measures designed to reduce or avoid environmental impacts. Cal-Am's return water obligations derive from the Agency Act, which restricts the exportation of groundwater for any use outside the SVGB, and the Return Water Agreement approved by the CPUC and agreed to by CCSD and other stakeholders, as described in Section IV.N of these Findings. The Monterey County Water Resources Agency will implement and enforce Cal-Am's compliance with the Agency Act. Moreover, the CPUC determined that Cal-Am would incur the costs for meeting its return water obligation if "increased due to a greater OWP than that estimated in the FEIR/EIS."[84] As described in Section IV.N, the CPUC required that Cal-Am's investors, not its ratepayers, assume much of the risk that the Project would pump higher volumes of non-seawater.

Adequacy of the EIR/EIS Data and Modeling

The groundwater modeling for the Final EIR/EIS involved a multi-year, peer-reviewed effort that conservatively analyzed the proposed Project's potential impacts to groundwater supplies in the SVGB.

Beginning in 2013, as part of the CPUC's CEQA review, subsurface soil and groundwater investigations were performed to better understand the hydrogeology of the SVGB and proposed slant well locations. This investigation included installing monitoring wells and Cal-Am's test slant well, subsurface lithologic logging, soil and groundwater sampling and analyses, aquifer testing, and aquifer condition modeling.[85] Long-term pump testing of Cal-Am's test slant well commenced on April 22, 2015, and ran until February 2018. The results of this testing informed the CPUC's review of the proposed Project, including the EIR/EIS's groundwater modeling. The salinity in the test slant well was also monitored to inform the CPUC's evaluation of the proposed Project's OWP. The EIR/EIS determined that there was generally good agreement between the modeling and test slant well data.[86]

To evaluate the Project's potential impacts to groundwater levels and supplies, the EIR/EIS consultant team used the "superposition" approach to isolate the impact of the proposed Project's pumping on the SVGB. The superposition approach used in the groundwater model is a well-established analytical tool that allows modelers to isolate the effects of a single action, removing all other stressors from the model.[87] Under the superposition approach, certain inputs – initial groundwater levels and background groundwater recharge – are set to zero to isolate the impact of the proposed Project's

[84] CPUC Final Decision 18-09-017, p. 192.

[87] Final EIR/EIS, p. 4.4-55.

Note: These are not Commission staff's Recommended Findings

pumping on the SVGB. This allowed the CPUC to "determine the incremental drawdown due solely to the proposed groundwater extraction by the slant wells. In other words, superposition is employed to isolate the expected change in groundwater levels and fluxes due solely to the project."[88] Changes to regional groundwater aquifers from Project pumping become "independent of the effects from the other stresses on the basin such as seasonal climate and agricultural pumping trends, other pumping wells, injection wells, land use, or contributions from rivers."[89]

As noted in the Final EIR/EIS, the superposition method increases the reliability of groundwater modeling. By using the superposition method, the CPUC's consultant team could isolate discrepancies and unquantifiable stresses introduced by initial water levels, boundary conditions, and bias attributed to certain groundwater recharge and pumping.[90] "In this case, pumping and recharge are not well quantified for the [SVGB], and future climate, pumping, and recharge are predicted with even less accuracy. Thus, superposition is a superior approach compared to attempts at calibrating a regional model because the simulation of these unquantified stresses is unnecessary."[91] The Commission agrees with the CPUC's use of the superposition approach to evaluate the proposed Project's groundwater impacts.

Some commenters have further suggested that the Commission needs to consider and incorporate the AEM data, as well as Fort Ord salinity data from 2019, into groundwater modeling for the Project. As described below, the AEM studies – a 2017 AEM study submitted to and rejected by the CPUC, and a 2019 AEM study – are flawed in their characterization of SVGB groundwater, and the Fort Ord data came from monitoring wells outside the Project area and, thus, are not relevant to the Commission's evaluation of the proposed Project's groundwater impacts. The HWG reviewed the AEM studies and Fort Ord data and submitted critiques to the CPUC, City of Marina, and the Commission.[92] The HWG concurred that the AEM studies conducted in the Marina area do not identify or quantify the occurrence of fresh water, and that the Fort Ord data is irrelevant to the proposed Project.

- 2017 and 2019 AEM Studies: The 2017 and 2019 AEM studies evaluate the SVGB using AEM data to define TDS levels and areas of claimed "fresh water" in the study area. The CPUC evaluated the 2017 AEM study as part of the proposed Project's CEQA review. The CPUC determined that the 2017 AEM study did not demonstrate that fresh or potable water exists in the Project area and that the 2017 AEM study incorrectly relied on a 3,000 mg/L TDS standard to delineate fresh

[91] Final EIR/EIS, p. 8.5-750.

[92] See HWG Comments on Technical Appendices/Attachments to Letters Submitted by MCWD and City of Marina, August 15, 2018; HWG Comments on Technical Presentations and Letters/Memorandum Prepared by HGC, EKI, and MCWD, January 25, 2019; HWG Responses to Dr. Knight Letter Addressed to HWG, March 6, 2019; HWG Comments on Remy Moose Manley Letter Attachments Prepared by HGC, EKI, and AGF, April 12, 2019; Exhibit 14 – HWG Comments on AGF Final Report on the 2019 AEM Survey, June 26, 2020.

Note: These are not Commission Staff's Recommended Findings

water.[93] The CPUC further concluded that the 2017 AEM data collection effort represented a single snapshot in time (May 2017) with maximum input of fresh water following a record wet year (2016-2017), and, therefore, was not representative of existing SVGB conditions. Finally, the CPUC found that the 2017 AEM study was not calibrated with data collected from groundwater monitoring wells in the area, and that the study's control points were not made public or provided to the CPUC for review. As a result, the CPUC concluded that the "lack of adherence to standard protocols for the presentation, data analysis, and technical peer review calls into question whether the report can be used as a reliable, unbiased technical source."[94] The Commission agrees with the CPUC's conclusions regarding the reliability and sufficiency of the 2017 AEM study.

The Commission further finds that there are uncertainties in the 2019 AEM study, as it does not incorporate all valid monitoring well data. The study uses only seven of 36 geophysical logs from the MPWSP monitoring wells. In addition, the study estimates chloride and TDS concentrations in the area based on measured data for only 12 of 24 MPWSP monitoring wells. Therefore in both cases, an incomplete set of available data is used. Further, the study does not describe the lithology and potential ranges of water quality that impact groundwater conductivity and resistivity. This creates uncertainty in the distribution of water quality in aquifers with widely varied salinity levels due to seawater intrusion. Moreover, the study uses data from the in-situ transducers that only measure electrical conductivity without accounting for the depth setting within the well. (See Exhibit 14 – HWG Comments on AGE Final Report on the 2019 AEM Survey, June 26, 2020.) Because the use and interpretations of data in the 2019 AEM study is severely flawed, the Commission finds that additional modeling to account for the AEM data is not required or appropriate.

- Fort Ord Data: The Fort Ord salinity data is not relevant to the analysis of the proposed Project's potential groundwater impacts. The data is collected from monitoring wells outside the Project's potential impact area. Therefore, the Commission finds that additional modeling to incorporate the Fort Ord data is not required or appropriate.

Some commenters also suggest that CEMEX's operations during the test slant well pumping could have impacted the Final EIR/EIS's modeling of OWP by increasing the predicted OWP. These comments were considered and rejected during the CPUC's CEQA review of the proposed Project. The HWG's Final Report (2017), incorporated into the EIR/EIS, included and analyzed regional groundwater data and the impact of CEMEX's operations on the modeling.[95] Dredge pond salinity is similar to groundwater salinity along the coast – both are near seawater salinity – including beneath the CEMEX percolation ponds near Cal-Am's test slant well. However, CEMEX well water was approximately half the salinity of seawater and was used to wash sand during CEMEX operations. That well water was then discharged to the percolation ponds, thereby

[93] See footnote 77 above.

[94] See CPUC Final Decision 18-09-017, Appendix J.

[95] See also HWG Comments on MCWD/Marina Technical Appendices/Attachments, August 25, 2018, pp. 30-31.

Note: These are not Commission staff's Recommended Findings

lowering the overall salinity of the water in the ponds. The net effect of the percolation pond water was to lower salinity in the test slant well.

The Final EIR/EIS's data and modeling accurately characterized the SVGB and the proposed Project's potential impacts to groundwater supplies in the SVGB. Therefore, additional data collection and monitoring are not necessary or appropriate.

Preventing Further Seawater Intrusion

Cal-Am's proposed Project will benefit the SVGB by halting further seawater intrusion into the Basin. As a result of extensive pumping of groundwater from the SVGB since the 1940s, the SVGB has experienced significant seawater intrusion. The proposed Project's pumping will draw seawater and contaminated groundwater from the coastal aquifers of the SVGB, halting or reversing the current landward movement of seawater intrusion further into the SVGB. Based on the Final EIR/EIS and CPUC's record, the CPUC's final decision determined that Cal-Am's proposed Project would "be expected to regard future inland migration of the seawater intrusion front, by intercepting and capturing some of the seawater that currently migrates inland across the coastline."[96] The Commission's independent hydrogeologist confirmed that the proposed Project would prevent, rather than exacerbate, further seawater intrusion beyond the Project's capture zone.[97]

Relocation or Extension of the Slant Wells

A number of commenters have suggested that many of the above-referenced effects could be reduced or eliminated by having Cal-Am install longer slant wells that would draw water almost entirely from beneath the seafloor instead of from the proposed location within the aquifer system. However, while other types of wells can be drilled to greater distances, the drilling technology involved in installing slant wells generally limits them to a maximum length of several hundred feet. ~~As~~ Further, locating or extending the slant wells further seaward would not make a material difference to the QWP, and would have no effect on regional groundwater conditions. The ocean provides a significant volume of seawater at the recharge boundary in the Dune Sand Aquifer, making wells screened just beneath the beach as effective in extracting high volumes of seawater as those screened hundreds of feet further under the seafloor.[98] Moreover, as noted elsewhere in these Findings, the proposed well head locations were selected to reduce potential effects of coastal erosion and sea level rise, so moving them closer to the shoreline to allow the wells to reach beneath the seafloor would increase the risks from those hazards.

Some commenters suggest that the slant wells could be moved further inland and outside of the Coastal Zone. At the coast, seawater entering the slant wells has the shortest and least restricted pathway through the overlying seafloor deposits. Further, in their proposed location, the slant wells would have a cone of depression with a western extent just offshore where the drawdown would be deepest, creating more flow of seawater to the slant wells. In other words, the slant wells would experience a higher

[96] CPUC Final Decision 18-09-017, p. C-75.

[98] Final EIR/EIS, Appx. E3, p. 23; Final EIR/EIS, p. 8.5-730.

Note: These are not Commission Staff's Recommended Findings

yield of seawater if located near the coast.[99] The CPUC also determined that the current location and configuration of the proposed Project's slant well network is the environmentally superior design to capture groundwater contaminated by seawater intrusion and prevent further inland migration of seawater.[100]

Conclusion

Based on the analysis set forth above, in the Commission's record, and in the Final EIR/EIS, the Commission has determined that ~~additional modeling and analysis is needed to identify the extent of~~ Cal-Am's ~~likely or potential effects on possible~~proposed Project will not result in significant depletion of groundwater supplies, ~~including the effects of the expected depletion on nearby wetlands and vernal ponds~~and that additional modeling is unnecessary to refine further Cal-Am's return water obligations under the Return Water Agreement. The Commission therefore finds ~~that current evidence does not support a finding~~ that Cal-Am's proposed Project is consistent with the groundwater protection provision of Coastal Act Section 30231.

Note: These are not Commission staff's Recommended Findings

K. ENERGY CONSUMPTION & CLIMATE CHANGE

LCP Policy 39 states that the City's intent is:

> To encourage development which keeps energy consumption to the lowest level possible.

Coastal Act Section 30253 states, in relevant part:

> New development shall do all of the following:
>
> ...
>
> c) Be consistent with the requirements imposed by an air pollution control district or the State Air Resources Board as to each particular development.
>
> d) Minimize energy consumption and vehicle miles traveled.

Constructing and operating major water, energy, telecommunication, and transportation projects can use a significant amount of energy, thereby significantly increasing emissions of greenhouse gases ("GHGs").[67][101] These emissions exacerbate climate change caused by global warming, which, in turn can cause significant adverse impacts to coastal resources of California. The Coastal Act has a number of provisions that provide authority to take steps to reduce causes and effects of climate change and to adapt to the effects of global warming. These include the Coastal Act's public access and recreation policies (Sections 30220 and 30211), marine resource and water quality policies (Sections 30230 and 30231), the environmentally sensitive habitat area protection policy (Section 30240), and the coastal hazards policy (Section 30253(1) and (2)). Further, Section 30253 requires, in part, that development be consistent with the state's air pollution control requirements and that it minimize energy consumption.

The state has long recognized the threats of climate change and the importance of taking steps to reduce those threats. In 2006, for example, the California Legislature adopted the state's 2006 Global Warming Solutions Act and found:

> Global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California. The potential adverse impacts of global warming include the exacerbation of air quality problems, a reduction in the quality and supply of water to the state from the Sierra snowpack, a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, damage to marine ecosystems and the natural environment, and an increase in the incidences of infectious diseases, asthma, and other human health-related problems. (California Health & Safety Code, Division 25.5, Part 1).

---

[67][101] Greenhouse gases are any gas, both natural and anthropogenic, that absorbs infrared radiation in the atmosphere and include water vapor, carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). These greenhouse gases lead to the trapping and buildup of heat in the atmosphere near the earth's surface. Carbon dioxide is the major anthropogenic greenhouse gas. All greenhouse gases are quantified collectively by the carbon dioxide equivalent ("CO_2e"), or the amount of CO_2 that would have the same global warming potential, when measured over a specific time period.

Note: These are not Commission staff's Recommended Findings

Climate change covers a broad range of impacts that can occur due to GHG emissions, such as increased sea level rise, changes in the frequency, intensity or occurrence of heavy precipitation and droughts, changes in the frequency and intensity of extreme temperature events, and changes in ocean water chemistry. California's and the Coastal Commission's current guidance documents – *Rising Seas in California: An Update on Sea-Level Rise Science*, the *State of California Sea-Level Rise Guidance: 2018 Update*, and the Commission's *Sea Level Rise Policy Guidance* – build on several previous assessments and projections[~~68~~102] that describe and recognize that within the coming century potentially severe impacts will likely occur in the areas of sea level, water resources, agriculture, forests and landscapes, and public health. Many of these effects will impact the coastal zone and resources specifically protected by the Coastal Act, including impacts to air quality, species distribution and diversity, agriculture, expansion of invasive species, increase in plant pathogens, alteration of sensitive habitat, wildfires, rising sea level, coastal flooding, and coastal erosion. In addition, absorption of carbon dioxide by the ocean leads to a decrease in ocean pH with concomitant consumption of dissolved carbonate ions, which adversely impacts ~~calcite-secreting~~calcite- secreting marine organisms (including many species of phytoplankton, zooplankton, clams, snails, sea stars, sea urchins, crabs, shrimp, and others). The most direct impacts of global warming focused on the coastal zone are sea level rise and its associated impacts, ocean warming, and ocean acidification.

Expected Direct and Indirect CO2e Emissions

Cal-Am's Project would result in direct GHG emissions during Project construction, primarily due to use of motorized equipment, and would result in ongoing indirect GHG emissions during facility operations due to its use of purchased electricity. Regarding Project construction, the Final EIR/EIS calculated expected construction-related emissions based on the presumed equipment use over a 24-month construction period. It determined that total direct construction emissions would be about 13,680 tonnes CO2e, which when annualized over the then-expected 40-year Project life, would equal about 342 tonnes CO2e per year.[~~69~~103] This does not include emissions that would result from the required installation of the outfall liner described in Section ~~II~~IV.A above, which ~~would~~could potentially make these total and annualized emissions somewhat higher. ~~As described elsewhere in these Findings, if the Project operates for just 25 years due to Cal-Am being unable to relocate its wells after their expecting operating life, the annualized emissions would be about 547 tonnes CO_2e per year.~~

Regarding Project operations, the facility would be expected to use approximately ~~63,000~~38,000 megawatt-hours of electricity per year, which would be an increase of almost ~~52,000~~27,000 megawatt-hours per year over Cal-Am's existing baseline electrical use for its water portfolio (based on the 2015 baseline used in the Final EIR/EIS). The total indirect annual emissions resulting from that electrical use would depend on what sources of energy (fossil fuels, wind, sun, etc.) are used to generate the electricity supplied to the Project. These indirect emissions would be expected to decrease over time as PG&E and the energy producers it purchases electricity from are able to institute emission reduction measures required pursuant to AB 32 and other state laws, such as increasing the use of lower emitting energy sources, such as solar

---

[~~68~~102] See, for example, California's 2006 Climate Change Impacts Assessment, 2009 Climate Adaptation Strategy and 2013 Indicators of Climate Change in California reports, and reports by the Intergovernmental Panel on Climate Change (IPCC Reports in 1990, 1995, 2001, 2007 and 2013) and various climate research centers (such as the Pew Center on Global Climate Change and the Heinz Center), and the Commission's own 2015 Sea-Level Rise Policy Guidance.

[~~69~~103] Note: Standard guidance for air districts includes annualizing construction emissions over the expected operating life of the project.

Note: These are not Commission staff's Recommended Findings

or wind instead of natural gas. Additionally, and as stated in the Final EIR/EIS, there would also be some emissions – in the range of about **63 to** 490 tonnes per year – resulting from the release of carbon dioxide caused by pulling seawater and groundwater from depth, where atmospheric pressure is much higher that at the ground surface. There would **be** also be other emissions resulting from vehicle use needed for Project operations and maintenance, use and testing of an emergency generator, etc. The Final EIR/EIS amortized these emissions over an expected 40-year operating life for the facility to determine that these operationally-related emissions would total just over 5,188 tonnes per year, which would be well above the 2,000-tonne per year significance threshold identified in the Final EIR/EIS.[70][104]

Cal-Am's desalination facility, which would use the great majority of the overall Project's energy, would be located outside of the coastal zone. Coastal Act Section 30604(d) states that "[n]o development or any portion thereof which is outside the coastal zone shall be subject to the coastal development permit requirements of this division." Accordingly, this analysis only considers whether the portions of the Project inside the coastal zone comply with the relevant LCP and Coastal Act policies, though the Findings discuss overall Project energy use for context. The portions of the Project within the coastal zone would use energy for construction of those components and would use electricity for running the slant well pumps.

To address the Project's emissions, the Final EIR/EIS includes a mitigation measure meant to ensure that Cal-Am's proposed GHG Emissions Reductions Plan results in net zero operational emissions. This measure requires Cal-Am to identify state-of-the art energy recovery and conservation technologies that it can include as part of its Project**, and requires Cal-Am to use. The measure provides the following loading order: 1) obtain** renewable energy **to the extent possible and to****from on-site solar panels and/or the an adjacent landfill-gas-to-energy facility; 2) purchase renewable energy from off-site sources within California such as PG&E or Monterey Bay Community Power; 3)** procure and retire Renewable Energy **Credits, Carbon Offsets, and other similar instruments that are meant to offset emissions and that are acceptable to any of several state-approved carbon registries.[71]Certificates for projects or activities in California; and 4) procure and retire Carbon Offsets.[105] Based on the loading order, Cal-Am is most likely to purchase renewable energy since it is a less expensive option than purchasing and retiring carbon offsets.** The measure also includes reporting requirements to ensure that Cal-am achieves net zero emissions for each year's operations. In addition, the Final EIR/EIS and Project design include other measures to address energy usage. For example, piping system materials and sizing would be designed to limit pressure losses and reduce pumping and energy requirements, and electrical and treatment equipment would include variable frequency drives to reduce the operating speed of pumps to match the pump discharge pressure requirements and reduce energy usage. With the

---

[70][104] The Final EIR/EIS used a threshold of 2,000 tonnes of CO2e per year to determine if the proposed project's emissions would represent a significant adverse environmental effect.

[71] **Per the Final EIR/EIS, these include the Climate Action Reserve, the American Carbon Registry, the Verified Carbon Standard, or the Clean Development Mechanism; or (ii) any other entity approved by the California Air Resources Board to act as an "offset project registry" under the state's Cap-and-Trade Program.**

[105] **Per the Final EIR/EIS, these include the Climate Action Reserve, the American Carbon Registry, the Verified Carbon Standard, or the Clean Development Mechanism; or (ii) any other entity approved by the California Air Resources Board to act as an "offset project registry" under the state's Cap-and-Trade Program.**

Note: These are not Commission staff's Recommended Findings

designs and mitigation measures incorporated in the EIR/EIS and the Project, the Project would minimize energy consumption, consistent with the LCP and Coastal Act requirements.

Conclusion

~~The~~ **For the reasons described above, the Commission finds that the** portions of the Project in the coastal zone appropriately minimize energy consumption, consistent with LCP and Coastal Act policies. ~~**However, as described in Section II.O of these Findings regarding alternatives, there is a feasible alternative to the Project that would use significantly less energy than Cal-Am's proposed Project, albeit while producing only about a third of the water, and would operate entirely on renewable energy, as opposed to Cal-Am's proposal to use renewable energy, purchase emission credits, or a combination of both. As a recent court opinion described, purchasing offsets and carbon credits does not necessarily result in real, permanent, verifiable, and enforceable greenhouse gas mitigation. *Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467. If Cal-Am was not able to operate entirely on renewable energy, it would result in higher GHG emissions than the alternative project.**~~

Note: These are not Commission staff's Recommended Findings

L. PUBLIC ACCESS AND RECREATION

LCLUP Policy 1 is:

> To insure access to and along the beach, consistent with the recreational needs and environmental sensitivity of Marina's Coastal area.

LCLUP Policy 2 is:

> To provide beach access and recreational opportunities consistent with public safety and with the protection of the rights of the general public and of private property owners.

LCLUP Policy 3 is:

> To provide beach access in conjunction with the new development where it is compatible with public safety, military security and natural resources protection; and does not duplicate similar access nearby.

The LCLUP's "North of Reservation Road Planning Area" requires that proposed development consider:

> Retention of uninterrupted lateral access along the sandy beach frontage.
>
> Protect and continue to provide public access from the nearest public roadway to the ocean.
>
> Structures necessary for the functioning of any Coastal Conservation and Development use (e.g., dredgelines, sewer outfall lines) may cross the sandy beach designated Park and Open Space provided lateral beach access is not significantly blocked.

Coastal Act Section 30210 states:

> In carrying out the requirement of Section 4 of Article X of the California Constitution, maximum access, which shall be conspicuously posted, and recreational opportunities shall be provided for all the people consistent with public safety needs and the need to protect public rights, rights of private property owners, and natural resource areas from overuse.

Coastal Act Section 30211 states:

> Development shall not interfere with the ~~public's~~public's right of access to the sea where acquired through use or legislative authorization, including, but not limited to, the use of dry sand and rocky coastal beaches to the first line of terrestrial vegetation.

Coastal Act Section 30212(a) states:

> Public access from the nearest public roadway to the shoreline and along the coast shall be provided in new development projects except where: (1) It is inconsistent with public safety, military security needs, or the protection of fragile coastal resources, (2) Adequate access exists nearby, or, (3) Agriculture would be adversely

Note: These are not Commission staff's Recommended Findings

affected. Dedicated accessway shall not be required to be opened to public use until a public agency or private association agrees to accept responsibility for maintenance and liability of the accessway.

Coastal Act Section 30214 states, in relevant part:

> ***(a)*** ~~(a)~~ The public access policies of this article shall be implemented in a manner that takes into account the need to regulate the time, place, and manner of public access depending on the facts and circumstances in each case including, but not limited to, the following:
>
> **(1)** ~~(1)~~ Topographic and geologic site characteristics.
>
> **(2)** ~~(2)~~ The capacity of the site to sustain use and at what level of intensity.
>
> **(3)** ~~(3)~~ The appropriateness of limiting public access to the right to pass and repass depending on such factors as the fragility of the natural resources in the area and the proximity of the access area to adjacent residential uses.
>
> **(4)** ~~(4)~~ The need to provide for the management of access areas so as to protect the privacy of adjacent property owners and to protect the aesthetic values of the area by providing for the collection of litter.

Coastal Act Section 30221 states:

> Oceanfront land suitable for recreational use shall be protected for recreational use and development unless present and foreseeable future demand for public or commercial recreational activities that could be accommodated on the property is already adequately provided for in the area.

Because most Project components in the coastal zone, including the well field and portions of the Source Water Pipeline, would be located between the first public road and the sea, the Coastal Act's public access and recreation provisions apply to all such development in both the consolidated permit action as well as the de novo permit in the City's LCP jurisdiction.

LCP and Coastal Act policies require generally that development located adjacent to the shoreline in areas with public use not interfere with that use and that they provide access to the shoreline. Most Project components – including the desalination facility and most of the pipelines – would be located some distance from the shoreline or even outside the coastal zone and would cause few, if any, effects on public access to the shoreline or public recreation. There would likely be short-term effects resulting from temporary traffic closures or detours needed during pipeline construction in some of the rights-of-way Cal-Am plans to use, but those effects would be relatively temporary and minimal. However, Project construction and operations at the well field and outfall area on the CEMEX site ~~would~~**could** potentially have greater adverse impacts, as described below.

Effects during construction

The CEMEX site is currently an active industrial facility that does not provide vertical access to the shoreline. Coastal access at the site is primarily available as lateral access along the beach from access points to the north and south. During construction, work to develop the well field and the Project's Source Water Pipeline would occur several hundred feet from the shoreline and would not be expected to affect access to or along the beach and would have little, if any, effect on public access or recreational use. Cal-Am's installation offshore of the modified diffuser components needed to allow its use of the existing wastewater outfall would involve boats and divers working in coastal waters and would result in temporary and minor effects to use of those coastal ~~waters~~**water** for fishing or other uses. These construction-

Note: These are not Commission staff's Recommended Findings

related activities would be expected to be consistent with, and not conflict with, the above policies, as they would not require activities or structures on the beach that would inhibit public access or impede beach users.

One component of the Project's construction – replacement of some clamps on the nearshore area of the outfall line – would occur on the beach at the CEMEX site and ~~would likely~~could result in temporary ~~adverse~~ effects on public access during the six to eight week construction period. Installation would involve heavy equipment operating on the beach, placement of barriers and protective work zones around the installation, and other measures ~~that could prevent lateral access along the shoreline during extreme high tide events for a period of six to eight weeks during the summer. The aforementioned installation of an outfall liner, if done as described in the Final EIR/EIS, could also involve these types of activities and effects on the beach.~~. Lateral beach access would remain open during the six to eight weeks of construction with the potential exception of extreme high tide events. The Final EIR/EIS includes a mitigation measure to ensure that impacts from clamp replacement would be less than significant.[106] Specifically, the mitigation measure requires that all construction materials during daylight hours would be stored beyond the reach of tidal waters, and all construction materials and equipment would be removed in their entirety from the beach area by sunset each day that work occurs. The mitigation measure provides that any larger materials too difficult to move on a daily basis could remain on the beach area if placed beyond the reach of tidal waters, if approved by the Commission subject to a contingency plan for moving materials in the event of a tidal surge.[107] Cal-Am would also be required to restore all accessways affected by construction activities to their pre-construction condition or better within three days of completion of construction. With implementation of the mitigation measure and Special Condition 10, which would require Cal-Am to prepare a Public Access Plan to further minimize public access impacts from construction and would include a contingency plan for moving construction materials in the event of a tidal surge, the clamp replacement would not significantly affect lateral access to the beach and would be consistent with applicable LCP and Coastal Act policies.

Effects during Project operations

The existing sand mining operations at the CEMEX site will end within a few years and the site will generally be made available for public access, habitat restoration, and passive recreational uses. Pursuant to the above-referenced CEMEX Settlement Agreement, the CEMEX site will be transferred to another owner at some point, though this is expected to take several years, and may be after Cal-Am's well field construction would be complete.

~~During Project operations, Cal-Am's Project could result in adverse effects to public access and recreation, depending on the eventual restoration and access plan that emerges from implementation of the CEMEX Settlement Agreement.~~ The site is currently privately owned and operated for purposes of sand mining, and there is not public access at the site of the proposed wellheads. Project operations therefore would not cause public access or recreation impacts compared to currently existing conditions. ~~However, the~~The CEMEX Settlement Agreement ~~anticipates that most of~~approved by the Commission restricts future development on the CEMEX site ~~will be used for~~to habitat restoration, public access,

[106] See Final EIR/EIS Mitigation Measure 4.13-5a.

[107] This requirement has been incorporated into Special Condition 10.

Note: These are not Commission staff's Recommended Findings

~~and~~low-impact passive recreation opportunities~~. Because this is a known change in environmental conditions that would occur before or during Project construction and operation, it is also appropriate to consider how the Project would affect public access under those future conditions. Cal-Am has a 30-acre permanent easement within the CEMEX site and its well field would include fencing to protect about a quarter-acre of the several well heads and associated equipment. Cal-Am's ongoing maintenance of the well field would result in access and use of heavy equipment and vehicles over an area of up to about six acres over the Project's lifetime, though not all of that acreage would be used at once.~~, public education, and activities consistent with Cal-Am's existing 30-acre permanent easement. Prior to the site becoming open for public access, a government agency or non-profit entity must purchase the property and the purchase must be approved by the Commission. There is no current timeline for such a purchase. Further, while the CEMEX Settlement Agreement requires CEMEX to transfer title in the property to the purchaser to either manage for conservation uses, or use the property for other allowable activities; the Settlement Agreement does not require the purchaser to use and manage the property for a specific level of public accessibility or for certain activities such as ESHA restoration and does not provide funding for such activities. As noted above, the CEMEX Settlement Agreement also provides for uses consistent with Cal-Am's existing easement, which remains binding on any future owner or manager of the CEMEX site. The proposed Project's well field and maintenance activities would be located entirely within Cal-Am's 30-acre easement area.

Thus, although the Commission may adopt a restoration and access plan for the entire CEMEX site pursuant to the CEMEX Settlement Agreement in the future, it is uncertain when that would occur or what exact scope of uses would be permitted on various components of the site.

~~It is unclear at this time how these aspects of the Project would affect or prevent public access over this part of the CEMEX site in the future. Until the Commission approves a restoration and access plan pursuant to the Agreement, it is difficult to know exactly how much of an effect Cal-Am's Project would have on future public access and recreation within the CEMEX site or along the shoreline. However, the Project would, at a minimum,~~Regardless, the Project's proposed development on the site and operations would remain the same. The Project would fence off a quarter-acre around the wellheads and some other equipment, occupy another quarter-acre for a period of nine to 18 weeks ~~each year for~~approximately every five years for recommended maintenance, and result in use of vehicles and other equipment over an approximately ~~6~~2.2 acre area over ~~time. This would prevent at least some portion of the overall area used by Cal-Am from being restored and used for public access or recreation. This~~the Project's lifetime on the 400+ acre CEMEX site, though not all of that acreage would be used at once. The area is a relatively small portion of the overall CEMEX site, and there is significant beach and coastal area available nearby for coastal access and recreation. ~~However, allowing an industrial use to occupy and use up to six acres of prime coastal land that could otherwise be used for coastal~~Although there are no expected impacts to public access and recreation ~~does not maximize public access, as required by the Coastal Act. As noted elsewhere in these Findings, any adverse effects on access and recreation would likely be experienced disproportionally by members of the nearby communities described in Section II.N – Environmental Justice.~~from the proposed operations, Special Condition 10 would ensure no interference with public access, and allow the Commission to require Cal-Am to make changes to the Public Access Plan depending on the final approved use of the remainder of the CEMEX site.

Note: These are not Commission Staff's Recommended Findings

~~In a letter it submitted to the Coastal Commission on June 30, 2020, Cal-Am asserts that the Commission should not consider Cal-Am's use of this area to be a public access impact because the Commission's Settlement Agreement anticipated that Cal-Am might use this area for its Project. It is true that the Settlement Agreement acknowledges that Cal-Am has rights to its easement area and permits uses consistent with Cal-Am's anticipated operations in that area. However, the Settlement Agreement merely stated that it did not interfere with any existing property rights that Cal-Am had on the CEMEX property; it did not guarantee Commission approval of a later CDP for the desalination project or state or imply that it would not analyze or require mitigation for public access or other impacts of any future Cal-Am project on the CEMEX property. Thus, there would not be public access impacts from Project operations compared with existing conditions, nor compared to one set of possible future conditions as allowed for in the Settlement Agreement, but there would be a reduction in access and recreational opportunities compared to what would occur without the Project.~~

Conclusion

~~Conclusion~~

The development, as proposed, ~~would~~**could** result in **minor** temporary adverse impacts to public access and recreation during construction **related to clamp replacement**. It would also result in ~~relatively modest, but by no means insignificant, long-term loss of public access and recreation opportunities. Were it not for the Coastal Act and LCP nonconformities noted elsewhere in these findings – e.g., the Project's nonconformity with Coastal Act and LCP ESHA policies – the Commission could require special conditions requiring Cal-Am to implement measures to reduce and mitigate for public access impacts and ensure its proposed Project would be consistent with the above-referenced Coastal Act and LCP provisions related to public access and recreation~~**a small permanent project footprint on the CEMEX site during operations. To address potential public access related impacts during construction and operations, Special Condition 10 requires Cal-Am to prepare a Public Access Plan for Executive Director review and approval, which will: (1) minimize construction and maintenance activities to the maximum extent feasible in order to minimize potential impacts on public access; (2) prohibit construction and maintenance equipment or any related activity outside an identified staging area and construction corridors; (3) limit impacts to the sandy beach area and provide a contingency plan for moving large materials associated with the outfall clamp work in the event of a tidal surge; (4) maintain the limited permanent project footprint of approximately 0.25 acres; and (5) commit Cal-Am to modification of the Public Access Plan as required by the Executive Director in light of any future restoration and access plan prepared pursuant to the CEMEX Settlement Agreement. With these conditions, there would not be public access impacts from Project construction or operations**.

~~However, because those areas of nonconformity do not allow the Project to be fully consistent with the relevant Coastal Act or LCP provisions, there is no need to identify special conditions in this section of the Findings that would result in it being only partially consistent with the Coastal Act and LCP. Because the proposed Project is considered a coastal-dependent industrial facility, the Commission has the discretion to apply the three tests of Coastal Act Section 30260 and approve the Project notwithstanding its inconsistencies with Coastal Act and LCP provisions. However, as described in Section II.P of these Findings~~**For the reasons described above**, the Commission finds that the Project ~~does not meet any of those three tests and therefore denies the CDP application and appeal. As a result, there is no need to identify special conditions that may be needed to ensure conformity to the above-referenced~~**, as**

Note: These are not Commission staff's Recommended Findings

conditioned, will be carried out in a manner that is protective of public access and recreation **and is therefore consistent with the relevant LCP and Coastal Act** provisions.

Note: These are not Commission staff's Recommended Findings

M. VISUAL RESOURCES

The LCP's Preservation and Enhancement of Coastal Views policy states:

> Views of the dunes from Highway 1 and the beach shall be protected by keeping development off of the primary ridgeline. Development below the ridgelines shall be limited in height and mass to blend into the face of the dunes: generally structures should be hidden from public view where physical and habitat constraints allow. Where this is not possible, structures shall be clustered and sited to be as inconspicuous as possible.
>
> In areas where mining activity or blowouts have removed sand dune landforms, new development shall not extend above the height of the nearest adjacent sand dunes and shall be clustered so as to preserve access views across its site from Highway One.

The LCP's North of Reservation Road Planning Area requires proposed development consider:

> Visibility of new uses from Highway 1 and from the water's edge.

Coastal Act Section 30251 states:

> The scenic and visual qualities of coastal areas shall be considered and protected as a resource of public importance. Permitted development shall be sited and designed to protect views to and along the ocean and scenic coastal areas, to minimize the alteration of natural land forms, to be visually compatible with the character of surrounding areas, and, where feasible, to restore and enhance visual quality in visually degraded areas. New development in highly scenic areas such as those designated in the California Coastline Preservation and Recreation Plan prepared by the Department of Parks and Recreation and by local government shall be subordinate to the character of its setting.

Project components within the coastal zone would consist primarily of pipelines and subgrade components that would have little, if any, visual impact once construction and installation would be completed. Within the City of Marina, the Project's well field would include above-grade well heads and electrical boxes surrounded by fences, with no completed Project components exceeding about ten feet in height. The City's LCP generally requires that permitted development protect views to and along the coast and specifically requires that views of the dune area from Highway 1 and the beach be protected by keeping development below the dune ridgelines, limiting its height, and clustering structures to the extent allowed by physical and habitat constraints.

Some Project construction would occur on or near the Monterey Bay shoreline and would be visible from other nearby publicly accessible shoreline areas, including the highly scenic Marina Dune Complex. These areas are valued in part for their views of the Bay, for wildlife and bird watching, and for recreational activities. During construction, the main Project activities that would affect visual resources would be staging and operating the drilling equipment needed to install the wells. These activities would result in visual impacts over the approximately 15 months of well installation. Most of these activities, such as the use of large construction equipment, are similar to those currently occurring as part of the sand mining activities at the site and are expected to be visually equivalent to those of the mining operations. Some of the Project's activities – e.g., ingress and egress, and the higher drill rigs – may be viewed by passing motorists on Highway 1 or by beach users, though most would have distant views that

Note: These are not Commission staff's Recommended Findings

would be partially blocked by intervening dune formations and vegetation. The most visible construction activities would be the lighting associated with the Project~~,~~ and ~~construction of~~**replacement of clamps on** the outfall liner~~, which would be on the beach during summer months of higher public use~~.

During operations, the visual impacts of the well heads, surge tanks, and fences at the site would be relatively minimal~~, though their effects would depend in part on the eventual surrounding uses at the site~~. Preliminary site designs show that most of these components would be completed in muted tones to blend into the appearance of the ~~dune habitat. For example, the infrastructure could look relatively innocuous in an area used for public access but could look out of place in the midst of an area of restored~~ dune habitat. Visual impacts would be more substantial during Cal-Am's ongoing maintenance at the well field, which would involve vehicles, heavy equipment, and maintenance activities at a time when similar industrial uses on the rest of the CEMEX site have ended.

To address potential visual impacts of the well heads, the Final EIR/EIS includes a mitigation measure requiring that the well heads be treated with earth-tone finishes to reduce contrast with the ground setting and increase compatibility with the visual setting (see MM 4.14-3a). Further, to address potential lighting impacts associated with construction of the Project, the Final EIR/EIS includes a mitigation measure to prevent exterior lighting from affecting nighttime views, including use of low-intensity exterior lighting, and ensuring lighting fixtures are cast downward and shielded to prevent light spillage (see MM 4.14-2). This measure applies to both the construction and operation of the Project in the coastal zone, including the well heads and pipelines.

Conclusion

The development, as proposed, would not be on prominent ridgelines, and permanent development would mainly be hidden from public view. Although ongoing maintenance activity at the well head sites might be visible from nearby public locations, it would ~~likely~~ be limited in extent so that it would not conflict with the LCP's requirement that development below the ridgelines be limited in height and mass to blend into the face of the dunes. Construction activities would have several temporary adverse visual impacts, but none that conflict with the LCP's or Coastal Act's visual resource policies. ~~Were it not for the Coastal Act and LCP nonconformities noted elsewhere in these Findings, the Commission could adopt special conditions requiring that Cal-Am implement any additional measures needed to ensure its proposed Project would conform to the above-referenced visual resource-related provisions. These could include special conditions that would limit the height of Project components, require muted color tones that blend with the surrounding habitat, and others.~~

~~Because those areas of nonconformity do not allow the Project to be fully consistent with the relevant Coastal Act or LCP provisions, there is no need to identify special conditions in this section of the Findings that would result in it being only partially consistent with the Coastal Act or LCP. However, because the proposed Project is considered a coastal-dependent industrial facility, the Commission has the discretion to apply the three tests of Coastal Act Section 30260 and approve the Project notwithstanding its inconsistencies with Coastal Act and LCP provisions. As described in Section II.P of these Findings, the Commission finds that the Project does not meet any of those three tests and therefore denies the CDP application and appeal. As a result, there is no need to identify special conditions that may be needed to ensure conformity to the above-referenced visual resource provisions.~~

Note: These are not Commission staff's Recommended Findings

To address potential visual resources related impacts, Special Condition 11 requires Cal-Am to prepare a facility design and screening plan for Executive Director review and approval, which limits the height of Project components to 10 feet within the coastal zone and requires muted color tones that blend with the surrounding habitat. In addition, to address potential lighting related impacts, Special Condition 12 requires Cal-Am to produce a lighting plan for Executive Director review and approval that identifies all lighting to be used during the Project and describe all measures that will avoid or reduce effects of lighting on nearby public areas, such as using the minimum lighting necessary for safety purposes, directing all necessary lighting downward, ensuring light fixtures and poles are painted or colored to blend in with the area, and others.

For the reasons described above, the Commission finds that the Project, as conditioned, will be carried out in a manner that is protective of scenic and visual resources and is therefore consistent with the relevant LCP provisions and Coastal Act Section 30251.

Note: These are not Commission staff's Recommended Findings

N. ENVIRONMENTAL JUSTICE

Coastal Act Section 30604(h) states:

> When acting on a coastal development permit, the issuing agency, or the Commission on appeal, may consider environmental justice, or the equitable distribution of environmental benefits throughout the state.

Section 30604(h) provides for the Commission to evaluate environmental justice considerations when making permit decisions. As defined in Section 30107.3 (a) of the Coastal Act, "environmental justice" means "the fair treatment and meaningful involvement of people of all races, cultures, incomes and national origins, with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies."[~~72~~108] Section 30107.3(b)(4) states that environmental justice includes, "[a]t a minimum, the meaningful consideration of recommendations from populations and communities most impacted by pollution into environmental and land use decisions."[~~73~~109]

In March 2019, the Commission adopted an environmental justice policy ("EJ Policy") to guide and inform its implementation of Section 30604(h) in a manner that is fully consistent with the standards in, and furthers the goals of, Chapter 3 of the Coastal Act and certified local coastal programs. The EJ Policy further articulates environmental justice as the following:

> The term 'environmental justice' is currently understood to include both substantive and procedural rights, meaning that in addition to the equitable distribution of environmental benefits, underserved communities also deserve equitable access to the process where significant environmental and land use decisions are made.

Ensuring access to the Commission's proceedings means making sure that those who are affected by proposed development have a meaningful and equitable opportunity to voice concerns in an open and transparent public process. Substantively, the EJ Policy describes how the Commission will work to ensure equitable access to the coast, support measures that protect existing affordable housing, and ensure that disadvantaged communities are not disproportionately affected by water contamination or overuse.

Opponents of the proposed Project have raised both procedural and substantive concerns about the Project's impacts on communities of color and low-income communities located near the proposed Project in the City of Marina, as well as on those who presently purchase water from Cal-Am in the Cal-Am service area. Project proponents have asserted the Project would benefit ~~one~~**the region's water supplies, including protecting supplies from seawater intrusion and providing supplies to one particularly** underserved community**, as well as provide for economic growth and much-needed residential development, including State-mandated affordable housing**. The Commission addresses these concerns in this section.

[~~72~~108] Coastal Act Section 30013, which provides that the Commission is to advance the principles of environmental justice and equality, references California Government Code section 65040.12(e), which defines "environmental justice" as "the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies."

[~~73~~109] Added by AB 1628 (Rivas), Chapter 360, Statutes of 2019.

Note: These are not Commission Staff's Recommended Findings

Identifying Communities of Concern

In order to evaluate the distribution of the project's environmental burdens and benefits and cumulative impacts on communities of concern, it is critical to understand the existing socioeconomic and demographic profiles of those communities as well as the environmental burdens among them. Here, the term "communities of concern" refers to low-income communities, communities of color, and other populations with higher exposure and/or sensitivity to adverse project impacts due to historical marginalization, discriminatory land use practices, and/or less capacity to mitigate adverse impacts. To identify these communities, staff evaluated various quantitative and qualitative sources of information for the City of Marina, which is where the ~~physical project is~~**project's slant wells are physically** located**, as well as some of the proposed pipelines**; jurisdictions in the Cal-Am service area (Seaside, Sand City, Carmel-by-the-Sea, Del Monte, Pacific Grove, and Monterey); and the inland ~~city~~**community** of Castroville, which is part of a water rights settlement agreement and will be affected by the Project outcomes. Quantitative indicators used to identify communities of concern include the percentage of low-income households, housing burdened low-income households, population of color,[~~74~~110] and linguistically isolated households. Staff also used the SB 535 [~~75~~111] disadvantaged community metric by CalEPA, which are census tracts in the top 25 percent of the CalEnviroScreen 3.0 index with multiple sources of pollution and a population with high sensitivity to pollution.

The demographic and socioeconomic indicators establish a high percentage of communities of concern in Castroville, Seaside, Sand City, and Marina that would be affected by the proposed Project. More than half the population in Castroville, Marina, and Seaside identifies as a person of color, and in Castroville a large portion of the population does not speak English very well (see Table 1 below). While all of the jurisdictions in Cal-Am's service area have individuals living under 200 percent of the federal poverty level, Castroville, Marina, Seaside, and Sand City have a much higher proportion of their population living under this threshold (see Table 1). These communities have median household incomes below the Department of Housing and Community Development's (HCD) state income limit for a low-income household[~~76~~112] in Monterey County, which is $69,750 for a family of three[~~77~~]**~~. A number of low-income~~**

[~~74~~110] Population of color refers to anyone that identifies as Hispanic (of any race) and anyone who identifies as non-Hispanic but as a race other than white on the Census, such as Black or African American, Asian, or American Indian.

[~~75~~111] SB 535 (De Leon) Chapter 830, Statutes of 2012, required that 25% of available monies from the Greenhouse Gas Reduction Fund be allocated to disadvantaged communities, as defined. Although the focus of SB 535 was to ensure the equitable distribution GGRF investments, the criteria used to determine the location of these communities is instructive for the purposes of this analysis.

[~~76~~112] This definition of low-income households is from AB 1550 (Gomez) Chapter 369, Statutes of 2016, which identifies low-income households according to the definition below: "Low-income households" are those with household incomes at or below 80 percent of the statewide median income or with household incomes at or below the threshold designated as low-income by the Department of Housing and Community Development's (HCD) State Income Limits adopted pursuant to Section 50093. A household would also be considered low-income if it had a household income at or below 80% of the state median household income for California, which is $56,982 based on the state median household income from most recently available data presented in Table 1. However, staff used HCD's 2020 State Income Limits since it provides a more regionally specific assessment of median household income and is more recent.

[~~77~~] **~~Since the average household size in Monterey County is 3.30, staff used the thresholds for a household of three. See U.S. Census Bureau Monterey County Quick Facts.~~**

Note: These are not Commission staff's Recommended Findings

~~households in Marina, Seaside, and Monterey pay more than 50% of their .~~[113] In particular, Castroville has a median household income ~~towards housing (see Table 1 below).~~ of between $35,000 and $52,846.[114] Increasing utility rates ~~would~~could exacerbate these existing cost burdens, unless programs are implemented to assist low-income ratepayers. For a more detailed explanation of methodologies and standards considered for this analysis, see Exhibit ~~14~~15 – Methodology for Identifying Communities of Concern.

In addition to gathering and evaluating quantitative information from online sources, staff traveled to the area in September 2019 to understand the lived experiences of residents, and to ground truth quantitative information. Staff met with residents from Marina and Seaside, including subsistence fishers, single parents living in Section 8 (federally subsidized) housing, retirees on fixed incomes, recent immigrants caring for extended families and head-of-household wage earners working multiple jobs to support their families. In early 2020, because COVID-19 travel restrictions made travel infeasible, staff conducted outreach by email and phone with Castroville residents including Community Services District staff, social justice advocates, a county representative, water experts, and other stakeholders.

[78][115] The total population in Table 2 does not include individuals for whom poverty status cannot be determined, which includes people living in institutional group quarters (i.e. prisons, nursing homes), college dormitories, military barracks, and living situations without conventional housing (and who are not in shelters). See U.S. Census Bureau for more information: ~~https://www.census.gov/topics/income-poverty/poverty/guidance/poverty-measures.html~~ https://www.census.gov/topics/income-poverty/poverty/guidance/poverty-measures.html

[116] According to the Rural Community Assistance Corporation, Castroville has a mediation household income of $35,000. (See Exhibit 16 – Rural Community Assistance Corporation Letter to State Water Resources Control Board – Division of Financial Assistance, Subject: Castroville Community Services District Median Household Income Survey Results, March 30, 2017.)

Note: These are not Commission Staff's Recommended Findings

The City of Marina, located eight miles north of Monterey, includes a modest downtown dotted with Asian and Mexican markets and family-owned restaurants. In linguistically isolated households within this area, the top three non-English languages spoken include Spanish, Vietnamese, and Korean. The ~~city has a disproportionate amount of nearby industrial development including~~City is near a regional landfill, regional composting facility, and regional sewage plant~~, all of which serve areas~~. However, this industrial development is outside ~~of Marina~~the City's boundaries, adjacent to the City's municipal airport. Nearby Fort Ord is a contaminated site listed on the U.S. EPA's national priorities list.[79], but the City is working to develop Fort Ord with housing.[117] Marina is also home to the CEMEX sand mining facility, the last coastal sand mining operation in the country, which is now scheduled to close later this year pursuant to Coastal Commission Consent Order CCC-17-CD-02. ~~In spite of bearing the greatest amount of industrial development of any coastal community in the Monterey area,~~ Marina also has a thriving culture of committed public engagement, and many residents care deeply about the future of their town.

Although not within Cal-Am's service area, Marina's residents ~~would be adversely~~could be affected by the project because the proposed slant well field is within city limits at a site that ~~would otherwise~~has generally been proposed to be set aside for public access, passive recreation, and coastal resource protection, ~~and the~~though the project would only involve permanent development on 0.25 acres of the approximately 400-acre site (0.06 percent). The proposed Project ~~may~~ also ~~have an adverse effect on Marina's groundwater resources, by lowering ground water tables and potentially affecting the City's important~~could potentially have an effect on wetland and vernal pond areas ~~and inviting salt water intrusion.~~within the City. As described elsewhere in these Findings, impacts to public access, wetlands, and vernal pond areas are projected to be minimal, as the Commission has identified Special Conditions 5, 6, 7, 9, and 10 to compensate for any impacts to the maximum extent feasible (see Sections IV.L-IV.G).

Seaside is a city on the southern end of the Monterey Bay, similar in many ways to neighboring Marina, with a modest downtown and housing stock primarily consisting of small, older homes, despite its proximity to the ocean. Over two thirds (69%) of its residents are non-white, and slightly more than a third (36%) have income below 200 percent of the federal poverty level. Seaside is home to the largest population (7%) of African American residents in the project area or the region. Many Black soldiers came to Seaside for training at Fort Ord, and over time Seaside became a center for African American settlement.[80][118] Over the years, other non-white and Latino populations have settled in Seaside as well. Hospitality and food service is the

Note: These are not Commission staff's recommended Findings

largest employment sector (22.5%)[81],[119] which was part of why Seaside was hit hard economically by the military base closures in the 1990s. **Some** Seaside residents say they would be impacted by the project's increased water rates, resulting in part from subsidizing Castroville's lower rates.

Castroville is an agricultural area, known in particular for artichoke production. Much of its economic activities center around agricultural support services, and many of its residents work directly or indirectly in agricultural production. Farms, farm stands, and restaurants specializing in locally produced food demonstrate the direct connection between growers and consumers. Castroville's population is 92% non-white, 56% living under 200 percent of the federal poverty level, and slightly less than half of the population has a high school education. With a total population of 6,481, the entire community is contained within a single census tract, the entirety of which is classified as disadvantaged according to the Department of Water Resources.[82][120]

The groundwater aquifer system beneath Castroville is the town's main source of its drinking water and has been overdrafted by decades of intensive agricultural use. The Castroville Community Services District ("CCSD") was able to secure a long-term source of new water through a Return Water Agreement developed during the CPUC's review of Cal-Am's Project. **The development of the Return Water Agreement was a long and collaborative effort by many parties to the CPUC's review of the Project, including Cal-Am, Coalition of Peninsula Businesses, Landwatch Monterey County, the Monterey County Farm Bureau, the Monterey County Water Resources Agency, the Monterey Peninsula Regional Water Authority, MPWMD, Monterey Regional Water Pollution Control Agency (now Monterey One Water), Planning and Conservation League Foundation, and the Salinas Valley Water Coalition.**[121] Through this agreement, Cal-Am would return a portion of the water it extracts and exports from the Salinas Valley Groundwater Basin back into the Basin via pipeline in the form of reduced-cost potable water for the CCSD.[83][122] As a result, Castroville would benefit from the Cal-Am project because the agreement will help to maintain existing low water rates (approximately $**20**45 per month[123]) and stakeholders say it would also help with the development of critical affordable housing projects and agricultural jobs. **That is important because the community of Castroville relies heavily on the agricultural industry; according to data from the US Census Bureau, approximately 29.4% of employed residents in Castroville work in agriculture, which is much higher than both the state (2.3%) and national (1.8%) average.**[124]

Note: These are not Commission staff's Recommended Findings

While **the Monterey Peninsula, and** Castroville **in particular,** would benefit from the desalination project, Marina and Seaside are **potentially** at ~~high~~ risk for bearing disproportionate burdens associated with it. Additionally, although other jurisdictions do not have a high proportion of low-income households, there are still many low-income households throughout the service area that ~~would be adversely~~**could be** impacted by increasing water rates. Potential impacts to those communities and the Commission's ability to mitigate those impacts warrant additional consideration pursuant to Section 30604(h) of the Coastal Act. **As described below, Cal-Am has existing mechanisms in place to assist low-income ratepayers and, pursuant to Special Condition 13, will be required to take action to secure additional ratepayer assistance programs to address potential environmental justice concerns.**

Environmental Justice Coastal Act Analysis

Procedural Concerns

Some Marina residents also raised procedural environmental justice concerns, including that Cal-Am did not fully engage with them because they are not ratepayers. They expressed a sense of being excluded by the CPUC proceeding because they felt that it analyzed only the proposed Project's effects on ratepayers, not on the impacts to communities living near the proposed Project. Seaside residents have received notices and flyers from Cal-Am letting them know about upcoming rate increases, but ~~they~~**some residents** also felt the company did not do enough to engage with them about the proposed Project through community meetings. Cal-Am disputes these concerns because they say residents from Marina and the service area actively participated via comment letters, organizing, and formal participation in the CPUC administrative hearings and NEPA/CEQA EIR process. **Cal-Am maintained a dedicated project website with information and updates for the public, sent bill inserts and direct mail pieces to customers, and engaged in a social media awareness campaign regarding the proposed Project. In addition, since 2013, Cal-Am has published a quarterly newsletter that discusses project status and need, the permitting process, financing, and schedule. The newsletter was advertised in local print media and circulated via email. Cal-Am also contributed guest editorials to help inform the public on issues of concern and interest.**[125]

A number of Marina and Seaside residents have also told Commission staff that they felt they were at a disadvantage engaging in the project development and permitting process. For example, many said they could not take a day off of work to make the 100- mile journey to and from their communities to the Coastal Commission's November 2019 meeting location in Half Moon Bay. In some cases, these residents said they work multiple jobs in order to make rent, so they felt they would need to choose between having a place to live or testifying before the Commission.

In response to these concerns and to a written request from the City of Marina requesting greater avenues for public engagement, the Commission agreed to several additional approaches to encourage the widest possible involvement from underserved members of the public in consideration of the current project. Commission staff scheduled the Cal-Am matter early on the November 14, 2019 agenda so members of the public would have more certainty about when, if they were able to attend, they should plan to participate. Commission staff also provided an opportunity for livestream testimony to the Commission from the City of Marina's

[125] See Exhibit 1 in Latham and Watkins Letter to Tom Luster, dated August 13, 2020.

Note: These are not Commission staff's Recommended Findings

City Hall so members of the public who could not travel to Half Moon Bay could still participate. More recently, because the COVID-19 pandemic has shut down in-person hearings, Commission staff has engaged with community members by phone to try to accommodate concerns about the move to online meetings.

The Commission recognizes that a core component of its Environmental Justice Policy, and of the Coastal Act more broadly, is to maximize public participation, and claims that such participation is inadequate or being hampered are given careful consideration. Indeed, public participation is a cornerstone of California's coastal management program. As described above, based on the actions the CPUC, Cal-Am, and the Commission have taken to foster participation and outreach, the Commission finds that the proposed Project's procedural aspects are not in conflict with the Coastal Act's environmental justice objectives.

Substantive ~~concerns~~Concerns

Along with the quantitative data collected, qualitative information and the lived experience of the community members is key to understanding existing environmental justice burdens on a community and the potential for new development to inadvertently exacerbate those impacts. Staff toured the affected area and spoke with residents and city officials from both Marina and Seaside, as part of the Commission's ongoing commitment to foster meaningful involvement consistent with 30107.3(a) and increase outreach consistent with its environmental justice policy. Following the November 2019 hearing, staff reached out to community members and public officials in Castroville and Seaside. Residents from these communities shared various environmental concerns and community burdens, providing additional relevant information to consider.

The main substantive issues identified relate to three main areas: 1) increased costs for water, 2) benefits to Castroville's water supply through the return water agreement, 3) direct and indirect environmental burdens that will contribute to cumulative impacts to the City of Marina.

1) ~~**1)**~~ **Water costs:** One of the primary concerns residents had is the disproportionate burden that low income ratepayers in Cal-Am's service would experience as a result of increasing water rates due to the construction and operation of the proposed Project. Affordable water is critical for people on limited incomes and is a critical component in the state's Human Right to Water strategy that identifies access to safe, clean, and affordable drinking water as a public health imperative.[84][126] According to a 2017 Food & Water Watch survey,[85][127] ratepayers in Cal-Am's service area on the Monterey Peninsula currently pay among the highest water rates in the country, which Cal-Am disputes.~~[86]A 2019 Monterey Peninsula Water Management District~~

~~[86] See Latham and Watkins Letter to T. Luster, June 30, 2020, page 92.~~

Note: These are not Commission staff's Recommended Findings

as being based on an inflated average water use and inconsistent with actual figures.[128] A 2019 MPWMD report found that costs of the proposed Project's water and other expected rate increases from Cal-Am could nearly double an average residential ratepayer's water bill by 2023.[87][129] However, after Project implementation, based on current information, the average monthly cost for water for a single-family residence would increase by approximately $37 to $40.[130] Although a final determination of rates will be made by the CPUC when the Project goes into service, the Commission last year approved a project that would result in a $41 increase in water bills – the Morro Bay Water Reclamation Facility (CDP App. No. 3-19-0463).[131]

Currently, ratepayers in Cal-Am's service area are paying new water rates approved in 2018 by the CPUC (Decision D. 18-12-021), which increased monthly service charge rates 12.3% cumulatively and increased water usage rates 11.9% cumulatively from 2018 to 2020. In 2019, Cal-Am applied for a general rate case increase for 2021 to 2023,[88][132] which the CPUC is still reviewing. The CPUC's Public Advocates Office ("PAO"), an independent organization within the agency that advocates on behalf of utility ratepayers, protested this recent rate case. The PAO identifies that Cal-Am has been adding additional surcharges through alternate rulemaking procedures, and thus, the rates approved in general rate cases do not reflect the true cost that ratepayers will have to pay in their final water bills.[89][133] Over the course of 10 years, surcharges accounted for an average of 41% of the total water bill paid by residential ratepayers in the Monterey region.[90][134] The PAO identified that the surcharge percentage of the residential monthly bill in Cal-Am's Monterey Service Area has been anywhere from 19% to as high as 53% from 2008 to 2018. Resolution on this issue is likely to be reached in November 2020. It should be noted that these surcharges are part of the current base water rates and are specifically identified on customer bills for transparency. Certain surcharges will also be expiring in the next few years.

---

[128] See Latham and Watkins Letter to T. Luster, June 30, 2020, page 92; Latham and Watkins Letter to T. Luster, August 13, 2020.

[87][129] See ~~Monterey Peninsula Water Management District~~MPWMD, *Supply and Demand for Water on the Monterey Peninsula*, September 2019.

[130] See Dudek's Environmental Justice Analysis for the Monterey Peninsula Water Supply Project, pg. 3 (Exhibit 1 to Latham and Watkins Letter to T. Luster, August 13, 2020).

[131] In July 2019, the Commission approved the Morro Bay Water Reclamation Facility even though the project would result in a $41 monthly surcharge to Morro Bay ratepayers. The Commission found that, although the project would be expensive and disproportionately impact low-income ratepayers, the project was nonetheless consistent with the Commission's EJ Policy and needed to provide a safe and reliable water supply to Morro Bay.

[88][132] CPUC Application No A.19-07-004 - Application of California-American Water Company (U210W) for Authorization to Increase its Revenues for Water Service by $25,999,900 or 10.60% in the year 2021, by $9,752,500 or 3.59% in the year 2022, and by $10,754,500 or 3.82% in the year 2023.

[89][133] Surcharges can be approved and added to customer bills in between general rate cases, and as a result, the full impact of rate increases are not reflected in general rate case proceedings. See CPUC Office of Public Advocates ~~Report on Recommendations on Rates and Surcharges,~~ Report on Recommendations on Rates and Surcharges, protest of Application 19-07-004.

[90][134] See Attachment 2 in Office of Public Advocates ~~Report on Recommendations on Rates and Surcharges,~~ Report on Recommendations on Rates and Surcharges, protest of Application 19-07-004.

Note: These are not Commission staff's Recommended Findings

Although rates will increase for all ratepayers in the service area, **the implementation of Special Condition 13 will minimize the potential for** higher rates ~~**resulting from the proposed desalination facility would**~~**to** disproportionately impact low-income ratepayers in Seaside and other jurisdictions in the service area. Cal-Am **currently** offers several customer assistance programs to offset cost burdens for low income ratepayers,[~~91~~135] including its ~~**Low Income Ratepayer**~~**Customer** Assistance ~~**("LIRA") program**~~**Program**, where eligible customers can apply for a monthly discount of up to 30% on their charges.[~~92~~] ~~**LIRA**~~ [136] **The Customer Assistance Program** has several eligibility requirements including having an individually metered or flat-rate residential meter, having the water or sewer bill held in the name of program participants, and having household income below the required thresholds for participation in other assistance programs.[~~93~~137] Cal-Am has stated that it extends its ~~**LIRA program**~~**Customer Assistance Program** to Migrant Farm Worker Housing Centers and nonprofit group living centers. Cal-Am also offers payment arrangement plans and a Hardship Benefit Program in partnership with United Way Monterey County to help qualifying customers facing financial hardship cover an outstanding balance on their water bill.[138] Finally, Cal-Am provides water conservation assistance that can also help ratepayers reduce consumption.[~~94~~139] **To mitigate the adverse effects of increased costs on disadvantaged communities within its service area, Special Condition 13 would require Cal-Am to (a) seek approval from the CPUC to increase Cal-Am's Customer Assistance Program discount for its Monterey Main Service Territory from 30% to 50%, and (b) contribute up to an additional $250,000 in funds to the United Way to assist customers in Cal-Am's service territory who are having difficulties paying monthly bills if the CPUC does not approve the additional Customer Assistance Program discount before customer bills are affected by Project costs.**

However, while Cal-Am's ~~**LIRA**~~**Customer Assistance Program** follows CPUC's recommendation for rates, it **currently** has not reached all low-income customers and has not fully offset the ~~**disproportionate**~~ burden they bear from rate increases. Cal-Am states that as of June ~~**30,2020, 18**~~**30, 2020, 18**% of its residential customers in the City of Seaside and 6% of all customers in its overall service area use its ~~**LIRA program. However,**~~ **Customer Assistance**

[~~91~~135] The CPUC EIR also identifies this as an environmental justice concern, but in their analysis identify these measures as sufficient to offset burdens to low income rate payers and make the impact less than significant. The Office of Public Advocates also supports Cal-Am's ~~**LIRA program**~~**Customer Assistance Program** and implementation to provide additional protections for low income ratepayers.

~~**[92] The LIRA program does not discount water usage in excess of 17,200 gallons in a single month. See Latham and Watkins Letter to T. Luster, 6/30/2020, pg 39.**~~

[136] The Customer Assistance Program does not discount water usage in excess of 17,200 gallons in a single month. See Latham and Watkins Letter to T. Luster, 6/30/2020, pg 39.

Note: These are not Commission staff's Recommended Findings

Program. Cal-Am publicizes the Customer Assistance Program by sending physical mailers, bill inserts, and email notices to all of its customers. Cal-Am also reported that the program is advertised on Cal-Am's website and customer web portal. Additionally, notice of the program is provided to customers who have bill payments 30 days or more outstanding. Customers can opt into the Customer Assistance Program by filling out an application, and enrollment lasts for two years. Prior to expiration, customers receive a renewal letter informing them that they need to reenroll if they are still eligible for participation. In addition, a CPUC order requires that Pacific Gas & Electric ("PG&E") share data with Cal-Am every six months regarding customers enrolled in PG&E's corresponding program for electrical service.[140] Cal-Am uses this data to determine whether customers within its service district would qualify for Cal-Am's Customer Assistance Program. Cal-Am automatically enrolls customers who match or likely match the PG&E data in Cal-Am's Customer Assistance Program, sending those customers opt-out letters. For matches that are not complete, Cal-Am provides the customers the ability to opt-in to the Program. However, despite these substantial outreach efforts, many eligible customers do not participate in the program.[95] ~~The eligibility requirements themselves create barriers to access. Many~~ [141]

With the implementation of Special Condition 13, Cal-Am would be required to seek to expand the number of eligible customers who can be enrolled in its low-income assistance programs. These efforts would include seek approval from the CPUC to participate in the CPUC's pilot program to enroll residents of master-metered multi-family housing that have not previously been able to enroll. After Project implementation, monthly water costs may rise to between approximately $37 to $40 per month. With the increased 50% discount provided in Special Condition 13, average bills for eligible customers would only be expected to increase $10 to $12 per month for desalination facility costs and financing, as compared to $37 to $40 per month for non-CAP customers.

Unfortunately, many otherwise eligible ratepayers live in multi-family structures, where the water bill is in the name of a landlord or management company and not individually metered. ~~Some landlords of single-family residences that rent to low-income tenants prefer to keep the water and sewer bill in their own name. In both cases~~ In such a case, increases in ~~utilities are~~ utility costs may be passed through from the landlord to the tenants, without any options for the tenants to request assistance. As stated above, Special Condition 13 would require Cal-Am seek approval from the CPUC to participate in a pilot program that would seek to enroll such residents who are currently unable to participate in the Customer Assistance Program.

---

[140] See CPUC Decision D.09-12-017 (issued May 10, 2011).

[95] ~~According to a Dudek analysis of CalEnviroScreen and EPA EJSCREEN data prepared for Cal Am, the numbers of residents who are eligible for the LIRA program are higher: approximately 43% of residential customers in Seaside, 16% in Carmel-by-the-Sea, 20% in Del Monte, 16% in Pacific Grove, and 20% in Monterey. See Exhibit 1 in Latham and Watkins Letter to Tom Luster, dated August 13, 2020.~~

[141] According to a Dudek analysis of CalEnviroScreen and EPA EJSCREEN data prepared for Cal Am, the numbers of residents who are eligible for the Customer Assistance Program are higher: approximately 43% of residential customers in Seaside, 16% in Carmel-by-the-Sea, 20% in Del Monte, 16% in Pacific Grove, and 20% in Monterey. See Exhibit 1 in Latham and Watkins Letter to Tom Luster, dated August 13, 2020.

Note: These are not Commission Staff's Recommended Findings

While individuals may qualify as low income based on the standards set by other similar programs, they do not necessarily meet the eligibility criteria for Cal-Am's ~~LIRA program.[96]~~ **Customer Assistance Program.[142]** For example, using an average household of three,[97][143] state income limits set by Housing and Community Development (HCD) in 2020 identifies low income households with a median household income of below $69,750 and very low income households with a median income below $43,650 in Monterey County.[98][144] The Department of Water Resources identifies disadvantaged households as those with a median household income below $51,026 and severely disadvantaged households as those with a median household income of $38,270.[99] ~~The LIRA~~ **[145] The Customer Assistance Program** threshold for a household of three, however, is $43,440, which means there are households experiencing housing or rent burden that may not benefit from the program.

Staff spoke to various ratepayers in the area to understand concerns with the proposed Project. Some Seaside residents are concerned that the economic hardship caused by these rate increases would eventually push them out of this currently affordable coastal community. Ratepayers say they have gone to great lengths to save water over the years including using their dishwashers only to dry dishes, flushing toilets only once a day, taking showers at municipal facilities instead of at home, not washing clothes as often, removing gardens, or using graywater for irrigation, but their bills have continued to increase. Residents participating in the ~~LIRA program~~**Customer Assistance Program** who were interviewed also stated the discount does not offset the impacts of increasing rates still. **However, because there is a fixed cost to operate the existing water system, it should be noted that increased conservation does not necessarily result in reduced monthly water bills.**

Based on a review of the available programs for low-income ratepayers and meetings with local residents, the Commission believes that **without special conditions,** the project ~~will~~**could** exacerbate the disproportionate burdens on low-income ratepayers as a result of rising rates from the construction and operation of the ~~proposed Project. As described in Sections II.N and II.O of these Findings, these burdens would be reduced by the identified feasible alternative – the Pure Water Expansion project – that would provide water at about one-third to one-half the cost of water from Cal-Am's~~ proposed Project. For low-income households experiencing the burden of high housing costs and now COVID-related job insecurity, increased water rates could make it ~~infeasible~~**challenging** to continue living on the

---

~~[96] Eligibility thresholds for the LIRA program is based on whether household income is below 200 percent of the federal poverty level.~~

Note: These are not Commission Staff's Recommended Findings

Monterey Peninsula. If an unintended, but foreseeable consequence of the project is to displace existing residents from their homes in formerly affordable coastal communities, this raises serious coastal access questions. Although coastal access is typically viewed through the lens of providing and protecting recreational infrastructure and other amenities for the public to visit and enjoy, viewing it through an environmental justice lens illustrates that an affordable cost of living is a fundamental part of coastal access for nearby residents. In this case, Seaside residents' coastal access hinges on their ability to economically ~~survive~~**remain** in their communities. The Commission would not achieve maximum consistency with the Coastal Act's Chapter 3 public access policies if it only implemented these policies to protect the amenities that enhance visitor access to the coast without also considering how permitting decisions might negatively affect community-wide affordability for those living within the coastal zone. Historically, communities of color have been excluded from or driven out of coastal areas by intimidation, exclusionary lending practices, racist covenants, eminent domain and other instruments. Because of this troubling history, it is incumbent on the Commission to scrutinize the project with a focused perspective grounded in this wider context. **The implementation of Special Condition 13 would prevent the Project from having such unintended effects on vulnerable communities, by offering reduced rates to the disadvantaged communities and improving Cal-Am's ability to enroll eligible customers. As a result of this Special Condition, many residents in these communities could see their rates drop rather than increase after the Project begins operations.**

~~**Cal-Am has asserted that the Commission may not consider the affordability of housing in its decision because the Legislature removed the Commission's prior authority—which used to be contained in Section 30213 of the Coastal Act—to regulate affordable housing in the coastal zone. However, the Commission remains under a mandate "to encourage the protection of existing and the provision of new affordable housing opportunities for persons of low and moderate income in the coastal zone." (Coastal Act §30604(g).) It may also consider questions of affordability pursuant to its mandate to maximize access to the coast, consider environmental justice issues, and decide whether the public welfare would be harmed by denial of this Project.**~~

Cal-Am, some Monterey businesses, and others have ~~**also asserted that**~~**described the necessity of the Project to the Peninsula. Without the Project** there will be insufficient water to construct affordable housing and to allow the hospitality industry to rebound on the Monterey Peninsula if Cal-Am's desalination plant is not constructed. ~~**They say this**~~**This**, in turn, could drive up housing costs on the Peninsula and affect employees in the service industry, many of whom come from disadvantaged communities. ~~**However, as described elsewhere in these Findings, there is a feasible alternative method (the Pure Water Expansion recycled water project) to supply Cal-Am's customers with sufficient water with fewer ESA impacts. This alternative is scaled to provide adequate water supply for planned affordable and market rate housing starts, protect the Carmel River, provide a more affordable**~~

As described elsewhere in these Findings, burdens related to water costs would not be reduced by the Pure Water Expansion project. Projections of Pure Water Expansion water costs are entirely speculative at this time. Expected water costs from the initial phase of the Pure Water project have recently increased drastically due to technological difficulties and needed repairs. Monterey One Water estimates that initial Pure Water costs may range between $2,508 and $3,678 per acre foot – at minimum, more than double the rate of $1,720 per acre-foot approved by the CPUC. The projected costs for Pure Water Expansion water could see similar increases.

Note: These are not Commission staff's Recommended Findings

Moreover, as described in Section IV.O, the Final Supplemental Environmental Impact Report for the Pure Water Expansion was denied certification by the Monterey One Water. Notably, the Pure Water Expansion could fall short of meeting water demand, and will result in its own significant environmental justice impacts.[146] Local groups representing farmers and communities of concern, such as the Monterey County Farm Bureau, the City of Salinas, and others, have voiced concerns regarding these significant environmental justice issues related to the Pure Water Expansion, including its proposed use of Salinas Valley water sources to benefit the Monterey Peninsula. For example, as explained further below, the community of Castroville has raised concerns that the Pure Water Expansion would take wastewater treatment plant flows from the Castroville Seawater Intrusion Program, which would in turn disproportionately affect the disadvantaged residents of Castroville. (See also Section IV.N.) Similarly, the City of Salinas, a community of concern with approximately 20.5% of its residents living below the federal poverty level and 49% qualifying as low-income, has taken serious issue with the potential for the Pure Water Expansion to take water belonging to the City and provide it to the Peninsula at the expense of the Salinas Valley agricultural community.[147] Further, without adequate water supply, the Monterey Peninsula could face potential severe rationing of and restrictions on water usage that would necessarily and disproportionately be borne by disadvantaged communities. Without sufficient water, the Peninsula's affordable housing goals would remain unmet and workers would be forced to live further from the communities they serve. This would reduce coastal access by preventing workers from living on the Peninsula, forcing them to live in less expensive jurisdictions further inland, and result in continued economic burdens in the form of gas and transportation costs necessary to make a longer commute. For those reasons, among others, the Pure Water Expansion is not a feasible alternative.

~~water supply for residents who are at risk of economic displacement, avoid harm to~~Ultimately, as the CPUC recognized in its final decision to approve the proposed Project's Final EIR/EIS, it is important to recognize that desalinated water is relatively expensive. However, when balancing the potential costs and alternatives against the need to achieve a sufficient supply of reliable potable water for the Peninsula, the Commission finds that the proposed Project is the best option for all residents – including those living in communities of concern~~, and also better protect public access and sensitive dune habitat. As such, that alternative is more fully~~. As such, the proposed Project, as conditioned, is consistent with the Commission's Environmental Justice Policy as well as Coastal Act Sections 30604(h), and 30107.3.

2) ~~2)~~ **Return Water Agreement to Castroville Community Services District (CCSD)** ~~Part~~ As described above, part of Cal-Am's proposed Project would provide up to about 690 acre-feet of potable water, at a discounted price, to Castroville, which would constitute a benefit to a community of concern. ~~The cost of providing the water would be recovered through ratepayer fees in Cal-Am's service area.~~ In order to address a prohibition against exporting groundwater from the Salinas Valley Groundwater Basin, as part of the Return Water Agreement agreed to by many parties and approved by the CPUC, Cal-Am agreed to provide potable water to Castroville at about $110 per acre-foot for the return water.[148] If CCSD wants to purchase additional desalinated water, the cost would be about $580 per

[146] See Exhibit 1, pp. 12-17 in Latham and Watkins Letter to Tom Luster, dated August 13, 2020.

Note: These are not Commission Staff's Recommended Findings

acre-foot.[149] The Agreement also contemplates that return water in excess of that provided to Castroville would be directed to the Castroville Seawater Intrusion Program ("CSIP") at a cost of about $~~110~~102 per acre-foot to help reduce seawater intrusion in the Basin.[150] Without this Return Water Agreement, the ~~project~~proposed Project could ~~not~~ be considered ~~consistent~~inconsistent with Basin management requirements, since it would export groundwater to communities throughout the Monterey Peninsula that are outside the Basin boundaries. ~~The~~Although the prices per acre-foot for Castroville and CSIP would be far less ~~– i.e., no more than several hundred per acre-foot –~~ compared to the ~~$6,000 per acre-foot~~per-acre-foot cost that Cal-Am's ratepayers are likely to pay for water from Cal-Am's Project~~.~~, the CPUC approved the rates for both CCSD/CSIP and Cal-Am's ratepayers. As stated above, CCSD and CSIP's return water costs represent their avoided costs to produce groundwater from the SVGB to meet customer demands.[151] This would keep Castroville's water rates affordable (at approximately $~~20~~45 per month according to stakeholders), while providing a new source of water for affordable housing projects, agricultural jobs, and other types of new development. Depending on the amount of water Cal-Am returns to the Basin, the agreement could partially replenish Castroville's over drafted groundwater basin that has been depleted in part by decades of agricultural pumping.

~~However, as noted in Section II.J above, recent groundwater modeling shows that the amount of water Cal-Am may need to return to the Basin could be substantially higher than anticipated in previous modeling and in the Return Water Agreement. Instead of a relatively steady rate of up to about 700 acre-feet per year, Cal-Am may need to return up to about 2,100 acre-feet per year during years with higher recharge to the Basin.[100] This would represent about a third of its desalination facility's overall production volume and could result in Cal-Am needing to return to the CPUC for approval of additional rate recovery for the increased expenses. The cost of this additional return water could be as much as $3,000 to $6,000 more per acre-foot than currently anticipated, which, if added to the rates, would represent an even greater burden on all of Cal-Am's ratepayers and especially members of these disadvantaged communities.~~

As noted above in Section IV.J, to limit liability and costs to ratepayers, the CPUC imposed any costs associated with noncompliance with the Return Water Agreement on Cal-Am. In its decision, the CPUC acknowledged that higher return water percentages could affect rates, stating: "The cost of the MPWSP desalinated water is relatively expensive and becomes more so the greater the return water obligation. The authorized plant is reasonable as long as the desalination plant does not become a vehicle for unreasonable amounts of return water at increasing costs to Cal-Am ratepayers." To address this risk, it required Cal-Am's shareholders, not ratepayers, to pay excess costs if return water obligations exceeded certain percentages identified by the ~~Hydrologic Working Group~~HWG, which had advised the CPUC on hydrologic issues. However, the CPUC acknowledged that return water amounts could vary and that the CPUC could revisit the issue, and Cal-Am's rates, in the future as necessary. ~~Additionally, and as~~As described above in Section ~~II~~IV.J, ~~given~~ the new analysis provided by the Commission's independent hydrogeologist regarding ~~the likelihood of higher~~estimated

[151] See CPUC Final Decision 18-09-017, Appendix H.

~~[100] As noted in Section II.J above, the Hydrogeologic Working Group, which conducted the previous modeling, concurs that this range of potential return water requirements is reasonable.~~

Note: These are not Commission staff's Recommended Findings

return water percentages (and with which the HWG agrees), ~~it appears that there is a significant risk that~~confirms the return water ~~obligations will further increase the costs of Cal-Am's water.~~

percentages estimated in the CPUC's Final EIR/EIS. Castroville residents would therefore be afforded a discounted rate on the desalinated water~~. But~~ to represent their avoided costs to produce groundwater from the SVGB.

Some commenters suggest that other Cal-Am ratepayers, many of whom are similarly disadvantaged, would absorb ~~that cost. Those~~the costs of providing discounted water to Castroville, and that those higher rates would disproportionately burden low-income ratepayers in Cal-Am's service area, including Seaside. The commenters also suggest that the discount to Castroville would ~~also~~ not offset impacts to ~~the underserved communities of~~ Marina, as well as Seaside~~,~~ and others throughout the service area. ~~Although~~ However, the CPUC reviewed the proposed rates during its six-year long review of the proposed Project and determined that Cal-Am's proposed rates were reasonable.

Further, potential impacts to Cal-Am ratepayers from providing return water to Castroville would be offset as described below.

- Pursuant to the Return Water Agreement, CCSD's costs for the return water generally represent CCSD's avoided costs to produce groundwater from the SVGB in response to customer demand – that is, approximately $110 per acre-foot. Further, if CCSD wants to purchase desalinated water in excess of Cal-Am's return water obligations, the cost per acre-foot is $580, which incorporates Project infrastructure costs.

- If CCSD did not agree to purchase the return water, Cal-Am would be required to build or use the infrastructure necessary to inject excess desalinated water into the SVGB in order to comply with the Agency Act because the return water could not be sent to the Peninsula. This could result in additional Project costs. CCSD's agreement to purchase the return water avoids those costs for Cal-Am and its ratepayers.

- By reducing Castroville's need to pump groundwater from the SVGB, the return water component benefits the entire region in the form of additional water to Castroville and CSIP and reduced potential for seawater intrusion from inland groundwater pumping.

Moreover, pursuant to the Return Water Agreement approved by the CPUC, Cal-Am shareholders, not ratepayers, would absorb any costs associated with Cal-Am's return water obligations if the proposed Project extracts more non-seawater than the Final EIR/EIS estimates. Additionally, Castroville has 3,742 individuals with income below 200 percent of the federal poverty level~~, the~~—approximately 56% of Castroville's population. The number of individuals with income below the same poverty guideline in ~~Marina and the Cal Am~~Cal-Am's service area is ~~27,525, or approximately 7 times greater~~20,655—ranging from 12% to 36% of those communities' populations (see Table 2). Similarly, ~~while~~ Castroville has a larger proportion of people of color living in its jurisdiction~~, a greater number of people of color live throughout the~~ (92%), as compared to other communities in Cal-Am's service area ~~and Marina combined~~(ranging from 18-69%) (see Table 1). ~~In other words,~~Nonetheless, as described above, Cal-Am offers several customer assistance

Note: These are not Commission staff's Recommended Findings

programs to offset cost burdens for low-income ratepayers in its service area. Because the proposed Project would benefit Castroville, and because Cal-Am has mechanisms in place to assist low-income ratepayers in its service area, the Commission finds that the benefits of this project going to one community of concern would not come at the expense of the other underserved communities. ~~For comparison, the feasible alternative would reduce the cost burdens to Seaside, Marina, and other Cal-Am ratepayers, though would not include the above-referenced benefits to Castroville.~~

3) ~~3)~~ Cumulative Environmental Impacts

The proposed Project ~~results~~could result in environmental impacts in the City of Marina's coastal zone that will increase the overall cumulative environmental burdens in the area. The City of Marina and many of its residents believe the desalination proposal places some of the burdens of the proposed Project on their community but provides none of the benefits. The slant wells for this desalination project would be placed ~~within~~on a quarter-acre of the soon-to-be-shuttered, 400+ acre CEMEX sand mining property in Marina's coastal zone and ~~would~~its construction could affect several acres of ~~beach and~~ dune habitat that currently supports a variety of rare or sensitive plant and animal species. ~~If not for this project, this area would be available for public access, habitat restoration, and passive public recreational use after the CEMEX closure. Cal-Am asserts that it is improper for the Commission to consider such impacts when its Consent Settlement Agreement acknowledged that Cal-Am had certain rights on the CEMEX property that might allow it to build this project. However, nothing in the Settlement guaranteed that Cal-Am would be able to construct this project, nor did the Settlement state or imply that the Commission would not analyze public access or other impacts associated with a desalination facility if and when such a facility was proposed.~~The CEMEX site has been used for industrial sand mining for over a century. Pursuant to the CEMEX Settlement Agreement, future development on the CEMEX site is restricted to habitat restoration, public access, low-impact passive recreation opportunities, public education, and activities consistent with Cal-Am's 30-acre permanent easement. The CEMEX Settlement Agreement, which was approved by the Commission, expressly provides for uses consistent with Cal-Am's easement. This permanent easement would remain regardless of any future restoration plan for the site.

Marina is already located near several industrial uses both within and outside of the coastal zone. According to CalEnviroScreen 3.0 data, Marina has one census tract designated as an SB 535 Disadvantaged Community and ranks above the 75th percentile among other tracts in the state for groundwater threats, impaired water, solid waste, pesticides, and cleanups (see Table 3 and Figure 1 below).

Within the coastal zone, industrial uses include the CEMEX sand mining site (which will cease operations in 2020). ~~Some~~When compared to these existing conditions, the Project's permanent footprint is fractional, representing only 0.06% of the CEMEX site. However, some members of the community raised concerns that some of the access to the site anticipated through the Settlement Agreement could be lost due to limitations Cal-Am may impose around its well field ~~(Section II.K of these Findings provides a more detailed assessment of the proposed Project's effects on public access)~~. Although Marina has about four miles of shoreline, it currently has just two points of public access along that stretch of coast. ~~While the project's adverse~~If the site is eventually purchased and made available for public access, the Project's quarter-acre permanent footprint will not significantly impact the public's ability to access the shoreline. Recommended maintenance activities would occupy an additional quarter-acre for a period of nine to 18 weeks approximately every five years. The result in periodic use of vehicles and other equipment for

Note: These are not Commission staff's Recommended Findings

maintenance could disturb approximately 2.2 over the Project's lifetime, though not all at once. These impacts are expected to be relatively minor. Nonetheless, Special Condition 10 would require Cal-Am to prepare a Public Access Plan that would, among other things, allow the Executive Director to require further public access protections once a restoration and access plan is adopted for the CEMEX site some point in the future. Thus, the Project's presence, on a 400+ acre site that may eventually be made available for public use, will be limited (Section IV.L of these Findings provides a more detailed assessment of the proposed Project's effects on public access ~~are likely to be relatively limited, they would affect Marina residents' ability to fully access this section of the coast~~).

Although the community's concerns regarding cumulative impacts are understandable, the Project is consistent with the Commission's Environmental Justice Policy and applicable Coastal Act provisions.

Note: These are not Commission staff's Recommended Findings

(Modified graphics)

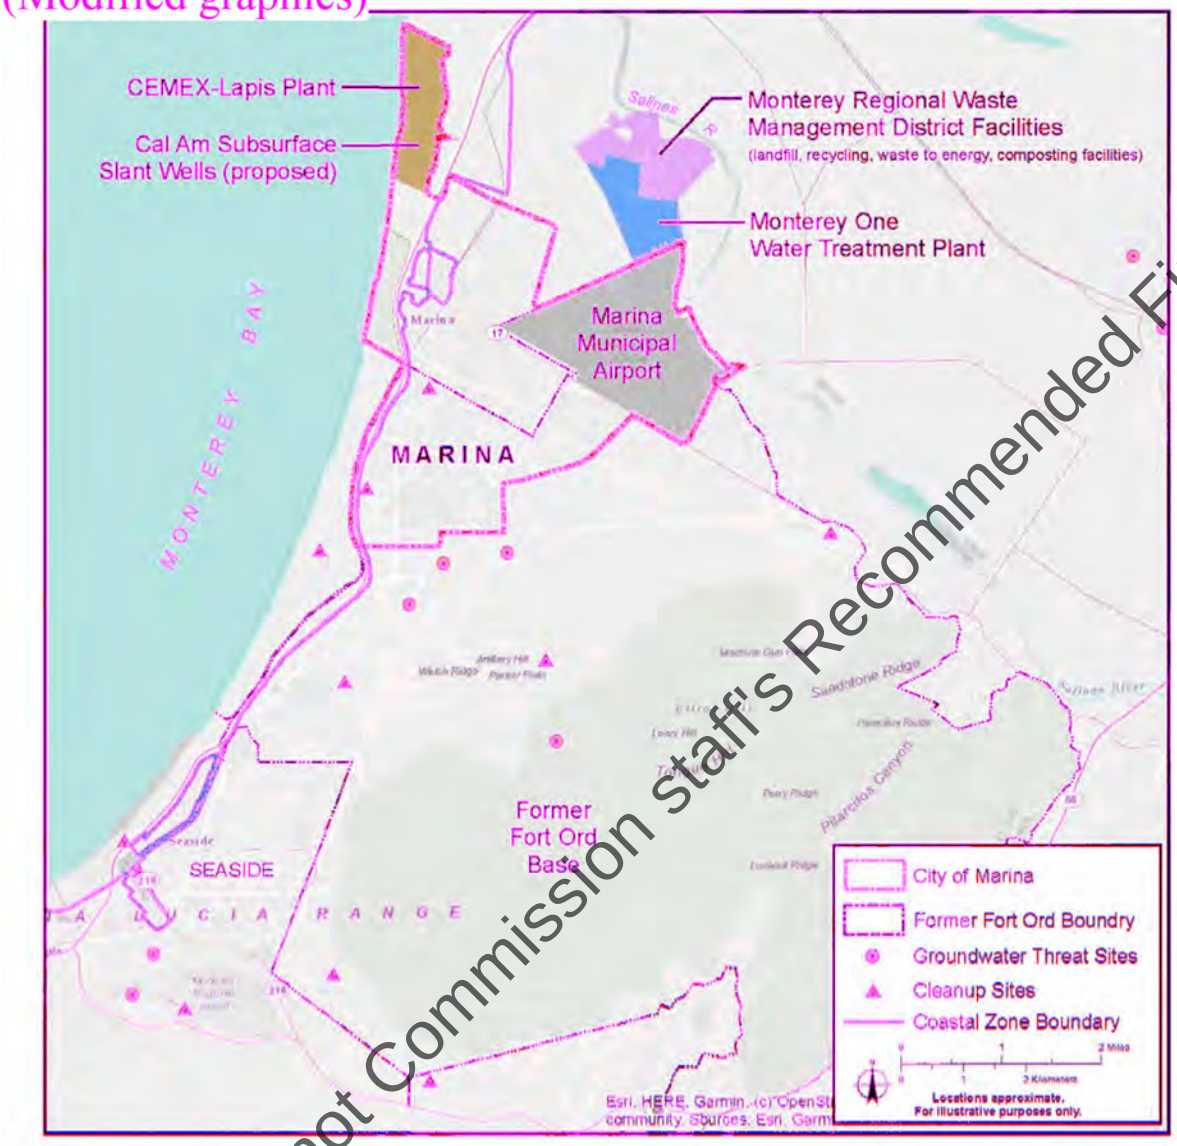

Figure 1 – Map of industrial uses/existing sites of pollution

Outside of the coastal zone, existing industrial facilities near Marina include a regional wastewater treatment plant, the Marina Municipal Airport, and Monterey Regional Waste Management District facility, which includes a landfill, materials recovery facility, food and yard waste composting facilities, a landfill gas-to-energy conversion facility, and a hazardous waste collection site. Marina is also near the former Fort Ord military base, which is on the Superfund National Priorities List. ~~While~~**However,** Cal-Am's slant well won't ~~– on its own –~~ cause the level of pollution as existing facilities, ~~this project would be one more industrial development in a community already dealing with the cumulative impacts of a disproportionate number of industrial facilities. The Cal Am project would be another industrial development that~~**and** would take up **only a quarter-acre of** land **on the 400+ acre CEMEX site** that could otherwise be used for public access or environmental stewardship purposes.

Note: These are not Commission staff's Recommended Findings

The City of Marina and its residents also are concerned about the potential impacts of the proposed slant wells on their own aquifer and groundwater supply. ~~These are detailed in Section II.J of these Findings. It remains inconclusive whether these potential impacts would occur or what their extent would be should they occur, as neither the Final EIR/EIS nor the Commission's independent hydrogeological analysis provided evidence showing such impacts were reasonably foreseeable. However, the~~The City has staunchly opposed the proposed Project due in part to the potential that the impacts would be extensive enough to adversely affect its current and future water supply and could require the City to construct new water supply facilities. However, as described in Section IV.J of these Findings, the analysis provided in Final EIR/EIS, the analysis from the HWG, and the Commission's independent hydrogeological analysis all reach the conclusion that no adverse groundwater impacts would occur, including impacts to Marina's wells, and none of those analyses provided evidence that such impacts would be reasonably foreseeable. The State Water Board agreed that the Project's groundwater impacts have been resolved by the CPUC.[152]

Additionally, the Project will provide much needed protections to the Seaside Groundwater Basin, which is another critical water supply source for the Peninsula. The Seaside Groundwater Basin provides groundwater storage for ASR and Pure Water Monterey. Cal-Am is currently obligated to replenish approximately 700 afy of water to the Seaside Basin over a 25-year period, and the Seaside Basin Watermaster expects Cal-Am to deliver this replenishment water from the proposed Project. In addition, the Seaside Basin Watermaster has provided evidence to the Commission that an *additional* 1,000 afy of replenishment is necessary to achieve and maintain protective water levels for the Seaside Basin to prevent seawater intrusion and irreversible loss of basin storage. The Seaside Basin Watermaster has determined that the Project is the only possible water supply project capable of supplying the water needed to allow the Watermaster to sustain water levels in the Seaside Basin. If Seaside Basin storage is lost or reduced as a result of seawater intrusion, other existing water supplies – that is, ASR and Pure Water Monterey – would be in jeopardy because seawater intruded aquifers cannot be used for groundwater storage.[153]

While government has long allowed industrial development to be clustered in underserved communities over their objections, the Commission's EJ Policy was created in part to allow these communities in California to have a greater voice on land use decisions that impact the health, safety, and welfare of their residents. As described throughout these Findings, the Commission has evaluated the proposed Project's potential impacts to the City of Marina and finds that the proposed Project will not adversely affect or disproportionately burden the City.

~~Importantly~~Further, ~~and~~ as discussed in Section ~~II~~IV.O ~~– Alternatives Analysis,~~ the Pure Water Expansion project would not provide a feasible ~~project~~ alternative ~~exists that would avoid or reduce these~~to Cal-Am's proposed project, and the Pure Water Expansion raises its own environmental justice concerns ~~and would reduce the general public cost burdens while providing ratepayers with an adequate water supply. For the impacts to~~

[152] Letter from Eileen Sobeck, State Water Resources Control Board, to John Ainsworth, Coastal Commission, May 8, 2020.

[153] See Exhibit 26 – Letter from Seaside Groundwater Basin Watermaster to John Ainsworth, Coastal Commission, August 12, 2020.

Note: These are not Commission Staff's Recommended Findings

~~communities of concern in Marina, the feasible alternative would avoid all of the above-referenced impacts. Regarding the disproportionate burdens on low-income residential rate payers and costs to all ratepayers, this alternative is projected to provide water at about $2,000 to $3,000 per acre-foot in comparison to the $6,000 or more per acre foot for the proposed Project, resulting in a significantly lower rate increase. This would reduce the burden on low-income ratepayers in the service area and provide cost savings to all ratepayers. This alternative will also meet water supply needs for regional economic and population growth, including affordable housing.~~discussed above.

Conclusion

For the reasons described above, the Commission finds that ~~although the~~as conditioned, the proposed Project, both procedurally and substantively, aligns with the goals of the Environmental Justice Policy, the Commission's environmental justice authority, and Coastal Act Sections 30604(h) and 30107.3. Cal-Am's proposed Project would benefit the communities on the Monterey Peninsula by providing a reliable, drought-proof water supply, preventing further seawater intrusion in the Salinas Valley Groundwater Basin, and protecting the Seaside Groundwater Basin. In addition, the proposed Project would particularly benefit one underserved community, Castroville, ~~it will~~by providing potable water at a discounted rate pursuant to the Return Water Agreement and Agency Act. With the implementation of Special Condition 13, the proposed Project will not disproportionately burden ~~a greater number of~~ residents within communities of concern in Seaside and elsewhere within Cal-Am's service area ~~by increasing potable~~because Cal-Am has low-income ratepayer assistance programs to help defray increased water costs ~~significantly more than the identified alternative water supply project. The~~. Further, the proposed Project ~~also results in adverse~~would not adversely affect coastal ~~resource effects~~resources within the community of Marina~~, that is already disproportionately burdened by many other industrial uses and would receive none of the project benefits. There is a long history of government institutions allowing unwanted industrial development to be concentrated in underserved communities of color without their consent. Approving yet another would perpetuate this discriminatory land use practice in Marina.~~

. As described elsewhere in these Findings, any potential Project impacts to coastal resources would be mitigated to the maximum extent feasible.

Note: These are not Commission staff's Recommended Findings

~~As addressed in Section II.O this report, the Commission finds that the Pure Water Expansion Project is a feasible alternative to the proposed Project with fewer environmental justice impacts than Cal-Am's Project. It would provide adequate current and future water supplies to meet the area's water needs in a more affordable manner and would also eliminate adverse coastal impacts and reduce environmental justice concerns consistent with the Commission's Environmental Justice Policy and Coastal Act Sections 30604(h) and 30107.3.~~

O. ASSESSMENT OF ALTERNATIVES

Coastal Act Section 30233 states, in relevant part:

> (a)The diking, filling, or dredging of open coastal waters, wetlands, estuaries, and lakes shall be permitted in accordance with other applicable provisions of this division, where there is no feasible less environmentally damaging alternative, and where feasible mitigation measures have been provided to minimize adverse environmental effects, and shall be limited to the following:
>
> (1)New or expanded port, energy, and coastal-dependent industrial facilities~~...~~ ...

Coastal Act Section 30260 states:

> Coastal-dependent industrial facilities shall be encouraged to locate or expand within existing sites and shall be permitted reasonable long-term growth where consistent with this division. However, where new or expanded ~~coastal-dependent~~coastal- dependent industrial facilities cannot feasibly be accommodated consistent with other policies of this division, they may nonetheless be permitted in accordance with this section and Sections 30261 and 30262 if (1) alternative locations are infeasible or more environmentally damaging; (2) to do otherwise would adversely affect the public welfare; and (3) adverse environmental effects are mitigated to the maximum extent feasible.

Summary

As noted previously, **Coastal Act Section 30233 does not apply to the proposed Cal-Am Project because the Project does not propose diking, filling, or dredging of coastal waters. Nevertheless,** the proposed Project is subject to ~~two~~ Coastal Act ~~provisions~~**Section 30260** and an LCP provision that explicitly require the Commission to determine whether there are feasible and less environmentally damaging alternatives to the proposed Project. As described below, the Commission has evaluated an alternative project – the Pure Water Expansion project – to determine whether it would be feasible, whether it would conform to the same project objectives and criteria applied to Cal-Am's proposed Project during its CEQA review, whether it would provide adequate water, and whether it would have fewer adverse environmental effects. Based on the analysis provided below, the Commission concludes that the Pure Water Expansion project ~~provides~~**is not** a feasible ~~and less environmentally damaging~~ alternative to the proposed Project.

The Commission also considered another potential alternative – a smaller desalination facility that would produce about half as much drinking water as Cal-Am's currently proposed facility. However, a smaller facility would result in only slightly reduced impacts to ESHA and potentially reduced impacts to nearby wetlands and vernal ponds due to less groundwater drawdown **if it is determined that those wetlands and vernal ponds are hydraulically connected to the**

Note: These are not Commission Staff's Recommended Findings

Dune Sand Aquifer. It is also likely that a smaller facility would have higher costs for each unit of water produced.

Overview

~~The~~ **While the** proposed **Project is not subject to Coastal Act Section 30233, the** Project is subject to ~~two~~ Coastal Act ~~provisions~~**Section 30260 and an LCP provision** requiring an assessment of alternatives. One of the tests of Coastal Act Section 30233 is to determine, for ~~proposed Projects such as this~~**projects** that involve filling coastal waters or wetlands, whether there is a feasible and less environmentally damaging alternative.[101][154] The first test of Coastal Act Section 30260 requires a similar, though slightly different test: a coastal-dependent industrial project that does not comply with other Coastal Act policies may be approved if alternative locations are infeasible or more environmentally damaging. In addition, the second test of Section 30260 requires a finding that denial of a ~~coastal-dependent~~**coastal-dependent** industrial facility would adversely affect the public welfare. ~~As detailed herein, the question of whether there is a feasible alternative is relevant to the Commission's finding that denial of the project would not adversely affect the public welfare~~**The third and final test of Section 30260 requires a finding that adverse environmental effects are mitigated to the maximum extent feasible**. Furthermore, and as noted in Section ~~II~~**IV.** of these Findings, the City of Marina LCP includes provisions that incorporate Coastal Act Section 30260. The alternatives assessment herein applies to the proposed Project components both in the Commission's consolidated permit jurisdiction (i.e., components in its original jurisdiction and in areas within the County's and Seaside's jurisdiction that the Commission is reviewing pursuant to the consolidated permit) and in the City's LCP jurisdiction (i.e., components that are now before the Commission on appeal).

The California Environmental Quality Act ("CEQA") provides additional guidance regarding consideration of alternatives. The Commission's regulations require staff reports to include findings evaluating the conformity of a proposed development with the requirements of Public Resource Code (CEQA) section 21080.5(d)(2)(A), which, in turn, requires that "an activity will not be approved or adopted as proposed if there are feasible alternatives or feasible mitigation measures available that would substantially lessen a significant adverse effect that the activity may have on the environment." **As a CEQA responsible agency, the Commission's role is more limited than that of the CEQA lead agency, in that the Commission is responsible "for mitigating or avoiding only the direct or indirect environmental effects of those parts of the project which it decides to carry out, finance, or approve."[155]**

As part of its consideration of Cal-Am's Project under its own authority, the CPUC acted as the lead agency in drafting and certifying an Environmental Impact Report (EIR) under CEQA. Pursuant to both its CEQA authority and its authority to determine whether to issue a certificate of public convenience and necessity to Cal-Am for the proposed Project, the CPUC defined the project objectives and analyzed various alternatives.[102][156] As the CPUC explained:

---

[101][154] Coastal Act Section 30108 defines "feasible" ~~as:~~ **accordingly:** "Feasible" means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors.

[155] CEQA Guidelines, § 15096, subd. (g)(1); Pub. Resources Code, § 21002.1, subd. (d).

[102][156] See the following for the ~~PUC's~~**CPUC's** decision and CEQA documents: https://www.cpuc.ca.gov/Environment/info/esa/mpwsp/comms_n_docs.html**.**

Note: These are not Commission staff's Recommended Findings

> The primary purpose of the MPWSP is to replace existing water supplies that have been constrained by legal decisions affecting the Carmel River and Seaside Groundwater Basin water resources. SWRCB Order 95-10 requires CalAm to reduce surface water diversions from the Carmel River in excess of its legal entitlement of 3,376 acre-feet per year (afy), and SWRCB Order 2016-0016 (~~"~~"Cease and Desist Order~~"~~") requires CalAm to develop replacement supplies for the Monterey District service area by December 2021. In 2006, the Monterey County Superior Court adjudicated the Seaside Groundwater Basin, effectively reducing ~~CalAm's~~CalAm's yield from the Seaside Groundwater Basin from approximately 4,000 afy to 1,474 afy.[~~103~~157]

The CPUC analyzed a variety of alternatives to the project that would meet most of the basic project objectives. One alternative that the ~~PUC~~CPUC analyzed in detail was the Pure Water project. As described more fully below, the Pure Water project is a water recycling and aquifer storage and recovery project that will treat existing streams of wastewater and inject the water into the ground for later use. Cal-Am initially proposed constructing a 9.6 mgd desalination facility; however, as an alternative to the 9.6-mgd desalination facility, Cal-Am's application also included a 6.4-mgd desalination facility coupled with a water purchase agreement for 3,500 acre-feet per year of treated water from the Pure Water project. The CPUC found that it would be feasible, less expensive, and less environmentally damaging for Cal-Am to build the smaller desalination plant and purchase 3,500 acre-feet per year of treated water from the Pure Water project. It therefore required that Cal-Am implement that project alternative.

Alternatives Analysis and the Public Trust Doctrine

Underlying the Commission's consideration and decision on this proposed Project are its responsibilities to protect public trust resources and to ensure any approved use of those resources does not harm them. For this proposed Project, public trust resources to be considered are those held in common by society and are associated with tidal and submerged lands, including the seawater this desalination facility proposes to use, the fish and wildlife that rely on those lands, public access to the beach and public trust lands, as well as the quality of, and the ecological and aesthetic values associated with, these resources.[~~104~~158] When considering whether to approve projects that may affect public trust lands, agencies must consider the effects that the projects will have on interests protected by the public trust, and attempt, so far as feasible, to avoid or minimize any harm to those interests. Because the Coastal Act requires protection of public access, coastal habitats, recreation, and other public trust-related resources, analysis of a project's consistency with the Coastal Act (and, by extension, an LCP) generally serves as an adequate analysis of a project's consistency with public trust principles. However, these Coastal Act and LCP policies should be interpreted

[~~103~~157] See https://www.cpuc.ca.gov/Environment/info/esa/mpwsp/PD.html

[~~104~~158] The Public Trust Doctrine is a long-held legal construct of American property law. The essence of the Public Trust Doctrine is that the public has the right to use and enjoy lands underlying navigable waterbodies. Its most common historic uses have been to ensure the public has access to navigable waters and tidelands for navigation, commerce, fishing, and shellfish harvest. However, the doctrine is flexible enough to encompass changing public needs, and over time courts have recognized that the doctrine encompasses other resources and uses, including boating, swimming, fishing, hunting, and all recreational purposes, as well as other ecological and aesthetic values.

Note: These are not Commission staff's Recommended Findings

consistent with public trust principles, and given the resources at stake in this case, it is appropriate to briefly address public trust issues directly here.

Cal-Am's proposed Project would entail the use of seawater, a public trust resource, in a manner that would not harm that particular resource~~, but could result in adverse effects to others. For example, the proposed Project's construction is likely to adversely affect several~~. Further, with the implementation of the Final EIR/EIS mitigation measures and the Commission's Special Conditions, Cal-Am's Project is protective of other public trust resources as well. For example, adequate measures have been taken to protect sensitive species ~~(particularly Western snowy plovers)~~ and their habitat along the shoreline~~, both of which are public trust resources. It is not clear at this point whether~~ during construction. Additionally, the discharge from Cal-Am's facility will adequately protect ocean water quality, another public trust resource, ~~although~~which the Regional Water Board will regulate ~~that discharge and is also required to consider the public trust in its decisions~~. Cal-Am's Project will not take up space on, or affect, tidelands that provide public access, except perhaps for short-term impacts during some work on the wastewater outfall. Its proposed method of intake for seawater appropriately protects marine water and wildlife public trust resources, as well.

Importantly, Cal-Am's proposed Project is intended in part to correct an ongoing harm to other public trust resources – the fish, water flows, and water quality of the Carmel River. Cal-Am's Project would end the ongoing overwithdrawal of water from the Carmel River that have reduced the value and benefits of those resources for several decades~~.~~ as required by the CDO from the State Water Board. Therefore, for the reasons discussed herein, Cal-Am's proposal ~~therefore requires consideration of how to balance the harm and benefits to the public trust from this Project. As described in this Alternatives section and 30260 Override section, however, there is an alternative project that would protect the~~would not harm and instead would benefit public trust resources ~~in the Carmel River and that would not involve as many impacts to coastal and public trust resources as this proposed Project~~.

Background on the Pure Water project: The Pure Water project is operated by Monterey One Water and was funded by Monterey One Water, along with Cal-Am and ~~the Monterey Peninsula Water Management District (“~~MPWMD~~”)~~. It has also received support from both the state and federal governments, including $88 million in grants from the U.S. EPA and a $15 million construction grant from the State Water Resources Control Board.

The Pure Water project has been designed and built to recycle and treat water from several sources, including treated wastewater, stormwater, agricultural runoff, and food processing water. It includes four separate treatment methods – ozone, membrane filtration, reverse osmosis (similar to that done in desalination facilities)~~,~~ and disinfection with ultraviolet and hydrogen peroxide. These treatments occur after most of its source water has already undergone primary and secondary treatment at the Monterey One Water wastewater treatment facility.

After treatment, the Pure Water project injects the water into the Seaside Groundwater Basin for use by Cal-Am and for longer-term storage in the event of drought. The project was designed to have up to eight wells – up to four deep injection wells and up to four shallower wells – with initial production of up to about 1,000 acre-feet per year, short-term (i.e., first three years of operation) production of 3,950 acre-feet per year, and longer-term production of about 3,700 acre-feet per year. The Pure Water project started operating in March 2020 with two deep and

Note: These are not Commission Staff's Recommended Findings

two shallow wells and is now injecting approximately 170 acre-feet per month of water into the Basin for later use by Cal-Am's customers.

On June 18, 2020, Monterey One Water provided a project status report that described operations and production to date, which include lower than expected injection volumes. The report also recommended several modifications to increase those injection volumes and to repair small surface sinkholes at two of the well sites. The expected corrective work involves well cleaning and sinkhole-related repairs, expected to be completed by this upcoming winter and installing an additional deep well, which would be done by the end of 2021. ~~These types of initial issues are not unusual for water treatment and desalination facilities, as they must contend with, and adjust to, variations in water sources, chemical treatments, processing methods, and other concerns. For example, during its first year of operations, the Orange County Water District's Groundwater Replenishment System – one of the world's largest and most advanced – produced about 55% of its expected yield.[105] Similarly, the Carlsbad desalination facility produced about 80% of its expected production during its first year of operations and about 72% of its expected production during its first three years of operations.[106]~~ At this time, it is not clear whether these proposed measures will enable the Pure Water project to perform as planned, and it is speculative to assume that the project will be able to provide its promised production. Monterey One Water estimates that the Pure Water project is currently capable of annual injection rates of 2,030 acre-feet per year, amounting to less than 58 percent of the 3,500 acre-feet per year allocated to Cal-Am under its existing Water Purchase Agreement with Monterey One Water and MPWMD for Pure Water project water.

Relatively late in the CPUC's multi-year hearing process, some parties to the proceeding raised the possibility that the Pure Water project could be further expanded to supply an additional 2,250 acre-feet per year of water beyond the 3,500 acre-feet per year originally proposed. The CPUC declined to open a new phase of the proceeding to consider this alternative in detail, citing the need to complete the already-lengthy ~~PUC~~CPUC process, the then-existing uncertainties about the proposed Pure Water Expansion, and the need for Cal-Am to meet mandatory deadlines for ending its excess withdrawals from the Carmel River and Seaside Groundwater Basin. Nonetheless, the CPUC ~~briefly considered~~evaluated the Pure Water Expansion alternative, and ~~found, based on the information available at the time, that the~~determined that the proposed Expansion was not developed in enough detail and did not yet provide enough certainty for the CPUC to determine that it was a reliable, affordable, and concrete alternative that could be implemented in a timely fashion. It also found that the Pure Water Expansion would not produce enough water to obviate the need for some desalination, and that a smaller desalination facility (that would have produced 4.8 mgd) was not reasonable, in part because it would have virtually the same costs as a larger plant and would not avoid or substantially lessen any significant impacts. Although it did not require Cal-Am to pursue the Pure Water Expansion as part of its project, the CPUC required Cal-Am to provide later updates on the progress of the Pure Water Expansion and stated that purchase of water from the Expansion might be required if the desalination project was delayed. The baseline Pure Water project was designed and built so that it could readily accommodate the additional equipment and components needed for the Pure Water Expansion.

Consideration of Alternatives – Pure Water Expansion

The Coastal Commission, as part of its duties to analyze the project's conformity with the Coastal Act and LCP, as well as its duties as a responsible agency pursuant to CEQA, now ~~has an independent obligation to consider~~considers alternatives to the project based on current information. Notably, during the approximately two years since the CPUC last collected water supply and demand data and the CPUC issued its Final EIR, there is new information about the Pure Water Expansion, including available source water for the Expansion, and about water demand in Cal-Am's service area ~~that support the Commission's consideration of a feasible and less environmentally damaging alternative.~~ Recent analyses of water supply in Cal-Am's Monterey District service area demonstrate that Cal-Am's supply, with implementation of the Pure Water Expansion, but without the additional supply to be provided by the Project, cannot meet even the most conservative demand scenarios proposed to the Commission.

~~Cal-Am has contended, in a June 30, 2020 letter to Commission staff, that the above-referenced Coastal Act provisions do not allow the Commission to consider whether the Pure Water Expansion is a feasible alternative to its proposed Project. It states that~~As noted above, because the proposed Project would not include any "fill"[~~107~~159] for purposes of Section 30233, ~~and that~~ the Commission ~~therefore has no ability to conduct the~~is not conducting an alternatives analysis ~~required by that section~~ to determine whether there are alternatives to placing fill in coastal waters. ~~Cal-Am contends that the~~The anchors of the temporary monitoring buoys required for the project do not constitute fill and ~~further notes that these~~the anchors would not be permanent. ~~However, these concrete anchors clearly fall within the Coastal Act's "fill" definition, as they are a "substance or material" that would be "placed in a submerged area." Further, the definition does not distinguish between temporary and permanent fill, though in this case, the anchors would be in place for at least six years, which the Commission generally considers to be more than a "temporary" period of time. Additionally, the proposed retrofit of the existing outfall, involving the placement of inclined nozzles to up to 172 diffuser ports on the outfall and replacing the existing outfall end gate with a check valve, would similarly constitute fill, as these represent a "substance or material" to be "placed in a submerged area" (and further, would represent permanent fill, needed for the operational life of the proposed Project).~~ When considering the use of temporary anchors for the recommissioning of the Charles E. Meyer Desalination Facility in Santa Barbara, the Commission did not invoke Coastal Act section 30233 at all.[160] This issue is discussed further in Section IV.H above.

With respect to any potential fill associated with potential modifications to the Monterey One Water diffuser, as described above, the potential modifications to the Monterey One Water outfall are not part of Cal-Am's CDP application, and will be separately considered when Monterey One Water seeks to complete that work.

~~Cal-Am also contends that~~In addition, the alternatives analysis required under Section 30260 allows the Commission to only consider alternative locations for ~~its project~~the proposed Project, not entirely different alternative projects. ~~Cal-Am states that it is not aware of instances when the Commission has interpreted Section 30260 to allow consideration of~~

Note: These are not Commission staff's Recommended Findings

[~~107~~159] Coastal Act Section 30108.2 defines "fill" as: "earth or any other substance or material, including pilings placed for the purposes of erecting structures thereon, placed in a submerged area."

[160] See Staff Report, Application No. 9-14-1781 (Jan. 30, 2015), available at https://documents.coastal.ca.gov/reports/2015/2/f12b-2-2015.pdf.

~~alternative projects. However, the~~Although the Commission has previously interpreted Section 30260 to allow consideration of a wide variety of different alternatives, including alternative technologies and methods for accomplishing a project's objectives~~. Examples include the Commission's consideration of alternative intake technologies for a desalination facility[108] and alternative methods to obtain information related to seismic risks.[109] Allowing the Commission to broadly consider various types of alternatives helps carry out Section 30260, which is an override provision that permits construction of development that has impacts that are inconsistent with Coastal Act protection standards. If there is another way to fulfill the main objectives of a coastal-dependent industrial facility—whether it is through an alternative location or alternative technologies or facilities—then the override should not be used.~~, it has not previously interpreted Section 30260 to allow consideration of wholly separate alternative projects outside of the Coastal Zone.[161]

~~Cal-Am also incorrectly asserts that the Commission, as a responsible agency under CEQA, may only consider alternative project locations within the coastal zone. First, this is incorrect, as courts emphasize that, pursuant to CEQA, agencies "may not ignore the regional impacts of a project proposal, including those impacts that occur outside of its borders; on the contrary, a regional perspective is required." *Citizens of Goleta Valley v. Bd. of Supervisors* (1990) 52 Cal. 3d 553, 575. Although an agency *may* consider jurisdictional issues in determining whether an alternative is feasible and could actually be approved by that agency, agencies are not precluded from considering potentially feasible alternatives that are outside of their jurisdiction. Of course, a responsible agency could not itself *approve* an alternative that is outside of its jurisdiction or otherwise not within its power to approve. But that fact is not relevant here, where the Commission is only determining whether a potentially feasible alternative exists and whether denial of the project would not harm the public welfare.~~

~~Second, the Commission's duty to consider alternatives in this case does not arise solely due to CEQA, and Cal-Am cites no Coastal Act provision that limits the Commission's consideration of alternatives to those inside the coastal zone.[110] In practice, the Commission has often considered alternatives that are outside of the coastal zone. Examples include the Commission's findings for the three spent nuclear facilities located within the coastal zone at Humboldt Bay, Diablo Canyon, and San Onofre. In each instance, the Commission evaluated whether there was an alternative onsite location, but also whether there was an alternative storage facility elsewhere, including outside the coastal zone and, in fact, outside of California. In each instance, the Commission found that there were no feasible alternatives to the proposed projects that~~

~~[109] https://documents.coastal.ca.gov/reports/2012/11/W13b-11-2012.pdf~~

[161] See, e.g., Staff Report for Test Slant Well, App. No. 9-14-1735, A-3-MRA-14-0050, pp. 3, 57 (evaluating on- and off-site alternative locations for the test slant well).

~~[110] Cal-Am cites Sierra Club v. Cal. Coastal Com. (2005) 35 Cal.4th 839, 860, claiming that it holds that neither the Coastal Act nor CEQA allow the Commission to consider impacts of projects located outside the Coastal Zone. But that case is not on point; it merely held that development outside of the coastal zone is not subject to CDP requirements and that the Commission may not deny a CDP for development in the coastal zone due to effects it will have outside of the coastal zone. See Pub. Res. Code § 30604(d). These situations are not present here.~~

Note: These are not Commission staff's Recommended Findings

~~could be located elsewhere, which was a determination it could only reach by conducting the analysis Cal-Am contends the Commission cannot do.~~

~~Further, Cal-Am bases part of its contention on the CPUC's previous, but now outdated, determination that the Pure Water Expansion was too speculative. As noted elsewhere in these Findings, the Pure Water Expansion has been designed to be integrated into the existing Pure Water project and has undergone significant CEQA review, so it has advanced sufficiently to be considered an adequately reliable water supply project.~~

Nevertheless, the parties have engaged in extensive alternative analyses of the Pure Water Monterey Expansion project, and an alternatives assessment of the Pure Water Monterey Expansion is being provided herein.[162] The Findings below describe the Pure Water Expansion **and demonstrate that the Expansion is not a feasible** alternative ~~and its feasibility, ability to meet~~**capable of meeting** project objectives~~, and ability to protect~~ **or protecting** the public welfare.

Fundamentally, Cal-Am's proposed Project is a water supply project that, when combined with the other water sources in Cal-Am's water supply portfolio, would allow Cal-Am to reduce its withdrawals from the Carmel River to no more than its maximum legal limit, while providing enough water for Cal-Am's existing and future water demands. As described below, the Pure Water Expansion ~~provides~~**does not provide** a feasible ~~and~~**or** less environmentally damaging alternative to Cal-Am's proposed Project – ~~that would~~**nor could it** protect the public welfare by providing adequate regional water supplies for the coming decades. The Pure Water Expansion would be located at the same site and would use the same water sources, treatment methods, and aquifer injection/extraction methods as the Pure Water project ~~to~~**, but it is speculative to assume that the Expansion can** supply an additional 2,250 acre-feet per year~~, all of which would be available to Cal-Am.~~**. Further, even under the lowest estimates of demand for Cal-Am's service territory (10,855 acre-feet per year) provided to the Commission by MPWMD, supply in Cal-Am's service area with the Pure Water Expansion, but without the Project, would not be sufficient to meet demand. Reliance on the Expansion without the Project would result in a water supply deficit on the Peninsula, and the Pure Water Expansion is therefore incapable of meeting basic project objectives. Therefore, it cannot be considered a feasible alternative to the Project.**

The Findings below evaluate and compare the Pure Water Expansion and Cal-Am's proposed Project in five main ways:

1) ~~1)~~ **Feasibility:** The Pure Water Expansion is evaluated using the criteria of the Coastal Act's definition of "feasible."

2) ~~2)~~ **Water supply and demand:** Each project is evaluated as to whether it would provide the expected amount of water needed for current and future demands.

---

[162] **The Commission also acknowledges Cal-Am's argument that the Commission, as a responsible agency under CEQA, may only consider alternative project locations within the coastal zone. An agency may consider jurisdictional issues in determining whether an alternative is feasible and could actually be approved by that agency. In practice, however, the Commission has in certain instances considered alternatives outside of the coastal zone. In any case, the Commission need not resolve this issue. Even if the Commission could consider alternatives beyond the coastal zone, the Pure Water Expansion Project is not a feasible alternative, as discussed below.**

Note: These are not Commission Staff's Recommended Findings

3) ~~3)~~ **Project objectives and criteria:** Each project is described as to how it meets the project objectives developed for Cal-Am by the CPUC in its Decision and Final EIR/EIS. Additionally, the Pure Water Expansion is described in relation to the nine criteria the CPUC used to evaluate the initial Pure Water project and to determine ~~that~~whether it would be a suitable and reasonable component of ~~Cal-Al's~~Cal-Am's water supply portfolio.

4) ~~4)~~ **Adverse environmental effects:** The two projects are compared as to what overall adverse environmental effects they would cause.

5) ~~5)~~ **Areas of Uncertainty:** Both projects involve some degree of uncertainty, though not in the same issue areas.

1) Feasibility

Each project is briefly evaluated for conformity to the criteria of the Coastal Act Section 30108 definition of feasibility – i.e., "'*Feasible*"' *means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors.*"

- **"Capable of being accomplished in a successful manner~~Both~~": Wh**ile Cal-Am's desalination facili~~and the Pure Water Expansion~~-ty would use proven technology to produce and deliver drinking wa~~. Just as Cal-Am is proposing to use treatment processes common to other seawater desalination facilities in operation around the world, the Pure Water~~ ter, there remain serious concerns regarding the Pure Water Expansion's ability to deliver a reliable water supply.

  ~~—~~Pure Water Project Technological Issues. The Pure Water Expansion would use the same treatment processes now being used by the baseline Pure Water project and ~~by other water recycling projects in California and elsewhere. The Pure Water Expansion~~ is essentially ~~a larger~~an expanded version of the same Pure Water project that Cal-Am is relying on for a part of its expected water supply. ~~Given that the Pure Water Expansion would use the same processes as PWM and would be located at the Pure Water facility, which is designed to include this expansion, it is therefore capable of being successfully accomplished from a technological standpoint.~~However, the Pure Water project itself is currently facing significant technological barriers that call into question Monterey One Water's ability to utilize this same technology for the Pure Water Expansion. Monterey One Water is currently unable to inject treated water at rates originally promised for the Pure Water project. The existing Pure Water project shallow injection wells are being affected by sinkholes and/or subsidence, and are not currently injecting any water—indeed Monterey One Water believes the shallow wells may only ever be capable of operating at 25 percent of planned capacity.[163] Additionally, the Pure Water project deep injection wells are experiencing injection refusal and are only operating at injection rates of 70 percent or less. Monterey One Water has stated that the deep wells may only ever inject treated water at 1,600 to 1,800 gpm, out of a planned 2,000 gpm. As such, Monterey One Water estimates that the Pure Water project is currently capable of annual injection rates of only 2,030 acre-feet per

[163] August 12, 2020 Cal-Am Letter to Commission, p. 2.

Note: These are not Commission staff's Recommended Findings

year—this is less than 58 percent of the 3,500 acre-feet per year allocated to Cal-Am under the existing Water Purchase Agreement for Pure Water project water.

~~In its June 30, 2020 letter to the Commission, Cal-Am contends that the Pure Water Expansion would not meet this criterion of feasibility because of the above-referenced start-up problems with its wells and injection rates and because of uncertainties about the quality of its source waters, particularly from agricultural operations. However, as noted above, the start-up problems are of a type that can readily be resolved, and in fact, Monterey One Water has developed the methods and schedule for adding a new well and improving conditions at the existing wells to allow for the full expected production. Regarding the quantity of the Pure Water project's source water supply, Monterey One Water has contracts and agreements in place for more than enough water actually needed to provide the Pure Water project's expected production volumes, which would allow it to operate even if some sources are not available or are available in lesser amounts, and the Final Supplemental Environmental Impact Report ("FSEIR") prepared for the Pure Water Expansion concludes that there is adequate water for the facility. Regarding the quality of source water, and as noted above, the Pure Water project is designed to take already treated water from Monterey One Water's other treatment facility and then apply four additional treatment methods designed to handle the expected source waters. The Pure Water project's treatment methods are similar to those used in other recycled water treatment facilities in California and elsewhere. An August 20, 2020 letter from Monterey One Water addresses Cal-Am's contentions and clarifies that Cal-Am's concern about inadequate wastewater was based on incorrect analyses and that its concern about source water quality is misplaced because the Pure Water project has already successfully treated water from agricultural operations, as it is approved to do so by the State Water Board's Department of Drinking Water.[111]~~

In order to address these issues with the Pure Water project, Monterey One Water is proposing a series of remedies, including repairs to the shallow wells, final commissioning of the deep injection wells, and construction of a third deep well beginning in November.[164] Monterey One Water also has proposed the potential addition of a fourth deep well in an attempt to address injection refusal issues.[165] The FSEIR for the Pure Water Expansion analyzed a total of five deep wells for both components of the Pure Water project,[166] including two deep wells for the initial Pure Water project and three deep wells for the Pure Water Expansion. Now that up to four deep wells may be necessary for the Pure Water project, and three deep wells still appear to be needed for the Pure Water Expansion, this will exceed the number of wells the FSEIR analyzed. Any more than five deep wells will require additional environmental analysis that has not been conducted or

[166] PWM Expansion Draft SEIR, p. 2-22.

Note: These are not Commission staff's recommended Findings

circulated for public review and comment.

In total, Monterey One Water estimates that these remedies will increase Pure Water project costs by roughly $13 million—however, it is not certain that Monterey One Water's proposed actions will allow it to deliver the promised quantities of Pure Water project water to Cal-Am. It is also unclear when or if Monterey One Water will resolve these issues, and it is speculative to assume that these issues will be resolved by CDO deadline of December 31, 2021. It appears likely that the proposed Pure Water Expansion could face similar barriers to implementation. Importantly, to achieve the MPWMD's lowest demand estimate of 10,855 acre-feet per year, 100 percent of the promised water supply from the Pure Water project (3,500 acre-feet per year) plus 100 percent of the promised water supply from the Expansion (2,250 acre-feet per year) would be required.

Pure Water Expansion Source Water. There also remains significant uncertainty regarding the availability of source water for the Pure Water Expansion. At the moment, many of the water rights that Monterey One Water states are available for the Pure Water Expansion are in fact not permanent water rights, but instead are interruptible use entitlements, many of which are also disputed by the owners of the corresponding water rights.[167] For instance, the Amended and Restated Water Recycling Agreement ("ARWRA") between Monterey One Water and MCWRA contains multiple requirements and conditions regarding the construction, operation, and financing of new source water for the Pure Water project.[168] The ARWRA sets forth multiple outstanding conditions that are required to be completed before the ARWRA can become effective, which was acknowledged by the SEIR for the Pure Water Expansion.[169] Monterey One Water and MCWRA amended the agreement in June 2019 to allow additional time to address the conditions while allowing M1W to use the new source waters for the PWM Project until the conditions are met. However, the conditions to the ARWRA have yet to be satisfied and it is speculative to assume when the agreement will become effective. Therefore, the reliability of certain ARWRA source waters for even the Pure Water project are speculative due to the dispute concerning unmet conditions that must be satisfied before sources of water become fully secured.[170] Additionally, reliance on agricultural produce wash water as a source for the Pure Water Expansion is speculative because the City of Salinas disputes Monterey One Water's ability to use that water for the Expansion and asserts that the ARWRA only permits Monterey One Water to use agricultural produce wash water for the original Pure Water project.[171] Salinas explains that these water sources are not available for the Pure Water Expansion because "the City fully intends to use available Agricultural Wash Water for its own purposes, including to support farmers, ranchers and the City's agriculture industry, as determined by the City in its sole and absolute discretion." Therefore, these sources cannot be relied upon

Note: These are not Commission staff's Recommended Findings

in determining the available source waters for the Pure Water Expansion.

Further, Monterey One Water's source water projections for the Pure Water Expansion do not account for the inherent uncertainty in utilizing wastewater as source water for the Expansion, given the variability in wastewater availability from year-to-year and under drought conditions.[172] As drafted, Appendix I to the Pure Water Expansion Final Supplemental EIR ("FSEIR"), which describes source water availability for the Expansion, does not consider wastewater treatment plant ("WWTP") flows since 2013, or the fact that WWTP flows generally correlate to area water demand and use, which have been decreasing on the Monterey Peninsula over time. As such, Appendix I overstates the availability of WWTP flows for use as Expansion source water.

The Pure Water Expansion FSEIR specifically asserts that WWTP flows should be based on 2009 to 2013, when WWTP flows were 21,764 af, or a worst case flow of 20,090 acre-feet per year based on the 2013 drought year.[173] However, a separate appendix to the FSEIR indicates that WWTP flows were reduced to 18,810 acre-feet per year in 2018.[174] This number was not utilized in the FSEIR to calculate available WWTP flows as source water for either the Pure Water project or Pure Water Expansion. Further, Monterey One Water presented additional data regarding WWTP flows to its Ad-Hoc JPA Revision Committee on July 20, 2020, indicating that since the beginning of 2020, WWTP flows are reduced to 17,980 acre-feet per year.[175]

Monterey One Water recently provided the Commission with post-2013 WWTP flow data in an August 20, 2020 letter that confirms WTTP flows have continued to decrease since 2013 and were 18,875 in 2019. Therefore, this post-2013 flow data demonstrates that WWTP source water supplies for the Pure Water Expansion in Normal/Wet years are significantly less than as stated in the FSEIR and are unavailable to the Pure Water Expansion during Dry years.[176] Moreover, this newly-available WWTP flow data may constitute significant new information regarding the Expansion's impacts, thereby requiring recirculation of the Pure Water Expansion FSEIR for renewed notice and comment. (CEQA Guidelines, § 15088.5, subd. (a); *Laurel Heights Improvement Assn., supra*, 6 Cal.4th at p. 1129.)

In addition, the Pure Water projects also depend heavily on surface water flows for their projected source water. However, the most recent data available from the

[172] See Exhibit 25, pp. 6-7 – California American Water Peer Review of Supply and Demand for Water on the Monterey Peninsula, Hazen and Sawyer, August 11, 2020 ("August 11, 2020 Hazen Memo").

[173] Pure Water Expansion SEIR, April 2020, Appendix I – Source Water Availability, Yield, and Use Technical Memorandum, Tables 8-11.

[174] Pure Water Expansion SEIR, April 2020, Appendices to the M1W Draft Supplemental EIR 11-7-2019 -Appendix E - Water Quality and Statutory Compliance Report-Appendix C – Projected Monthly Flows of Source Waters to the Regional Treatment Plant Influent.

[175] Exhibit 25 – August 11, 2020 Hazen Memo, p. 7, Exhibit 5.

[176] See See Exhibit 24, p. 6 – California American Water Peer Review of Peer Review of August 20, 2020 Letter from M1W to CCC, Hazen and Sawyer, August 23, 2020 ("August 23, 2020 Hazen Memo).

Note: These are not Commission Staff's Recommended Findings

U.S. Geological Survey ("USGS") shows that average surface water flows from the Reclamation Ditch are lower than assumed in the FSEIR, and therefore the FSEIR overstates the availability of this source water.[177] Further, agricultural flows have decreased by 1/3 in recent years, meaning that monthly flows to the Blanco Drain and the Agricultural Wash Water are also below what is projected in the FSEIR, and further limiting available sources for the Pure Water Expansion.

Accounting for these lower WWTP flows and decreased supply from the Reclamation Ditch, the existing demands for the source waters listed in the FSEIR for the Pure Water Expansion far exceed available supplies in both Normal/Wet years and Dry years.[178] Without an adequate source water supply, Peninsula water users will be forced to choose between supplying source water for the Pure Water Expansion or the Castroville Seawater Intrusion Project ("CSIP"), the reduction of which may cause significant environmental impacts, such as additional seawater intrusion, which have not been analyzed.[179]

Pure Water Expansion EIR. Finally, Monterey One Water is not moving forward with the development of the Pure Water Expansion and does not appear to have resources dedicated to the project, such that the Pure Water Expansion would be capable of being accomplished in a successful manner.[180] On April 27, 2020, the Monterey One Water Board of Directors denied certification of the FSEIR for the Pure Water Expansion.[181] The Monterey One Water Board acknowledged that major deficiencies remain unaddressed in the FSEIR related to its analysis of Expansion source water, Peninsula water supply and demand, impacts to agricultural water supplies, and the FSEIR's failure to evaluate the Pure Water Expansion as either an alternative to or a cumulative project with the Cal-Am project. Monterey One Water acknowledges that it does not possess the funding to fix the gaps in the Pure Water Expansion FSEIR, and as such, the Monterey One Water Board has ordered its staff to stop all work on the Expansion. The impact of limited funding to complete adequate environmental review also will affect Monterey One Water's ability to recirculate the SEIR, as may be required under CEQA.

~~Cal-Am and other commenters have also recently asserted that Monterey One Water will not have enough source water for the Pure Water Expansion because some of water would be directed to other uses or that the above-referenced contracts and agreements did not contemplate use of the water for the Expansion, just for the baseline Pure Water project. However, the above-referenced Monterey One Water letter refers to the Pure Water Expansion project's Final SEIR analysis that showed, using conservative assumptions about these expected source water supplies, sufficient quantities will be available for the combined projects (see additional discussion below).[112]~~

Note: These are not Commission staff's recommended findings

Unless and until the Monterey One Water Board chooses to move forward with correcting and thereafter certifying the FSEIR, the Pure Water Expansion is on indefinite hold. Moreover, without a certified SEIR, Monterey One Water cannot obtain any discretionary permits necessary to construct the Pure Water Expansion. As such, the Pure Water Expansion is not currently capable of being accomplished in a successful manner.

- **"Within a reasonable period of time":** Cal-Am's facility is expected to take about 21 months to construct and about six months to commission and begin operations. The Pure Water Expansion has a projected construction and start-up schedule of about 24 to 27 months total. If each project received all final approvals and started construction today, ~~Cal-Am's facility could be providing~~**both projects would be on similar timelines and would be expected to provide** water by early ~~2024, whereas the Pure Water Expansion could provide water by late 2022~~**2023**. At this point, neither project can anticipate being online and able to provide water by **the** December 2021 **CDO deadline**, which is the date by which Cal-Am is required to end its overpumping of the Carmel River. ~~However, Cal-Am has sufficient water in storage that would allow it to end its overpumping by that deadline without reducing supplies to its customers.~~

- For either project, the actual timeline to produce drinking water is likely to take somewhat longer, as complex water treatment facilities such as these often require several months of adjustment to achieve their expected production level or needed level of treatment. An additional consideration is that both projects have additional approvals necessary before they can begin operation, as well as other potential obstacles that could adversely affect their feasibility and schedule. The main issues that could affect the timing of each project are briefly discussed below, and these and other issues are also further addressed at the end of the Alternatives section in the subsection regarding Areas of Uncertainty.

  The primary remaining elements needed for the Pure Water Expansion are certification of its ~~Final Supplemental EIR (~~FSEIR~~)~~, approval by the CPUC of a Water Purchase Agreement, and final state and federal approval for its modified discharge into coastal waters. ~~The Monterey One Water Board considered certifying the FSEIR at its April 27, 2020 meeting. The vote to certify it failed by a vote of 10 to 11. There was then a motion to deny certification of the FSEIR and terminate any further action on the Expansion project, which also failed on a vote of 10 to 11. The effect is that the FSEIR was not certified but that the Board remains free to reconsider the FSEIR and project approval at a future hearing, if it so chooses. The main area of controversy that was raised during the FSEIR public comment period relates to whether there is an adequate water supply for the Expansion. As noted above, the FSEIR concludes that the water supply is adequate for the Expansion, and some evidence and arguments submitted by parties to this proceeding have not demonstrated otherwise.~~**As noted above, the Monterey One Water Board has denied certification of the Pure Water Expansion FSEIR due to ongoing flaws in the FSEIR's analysis, including the availability of source waters. Monterey One Water does not currently possess the funding to fix these deficiencies, and has therefore ordered its staff to suspend work on any part of the Pure Water Expansion.**

  Moreover, if the flaws in the FSEIR are corrected, Monterey One Water would be expected to recirculate the FSEIR for additional notice and comment to account for the significant new information related to the post-2013 WWTP flows recently

Note: These are not Commission staff's Recommended Findings

made publicly available, including the identification of alternate and verifiable source waters as necessary.[182] Further, should Monterey One Water choose to construct a fourth deep injection well for the Pure Water project, it would also be required to recirculate the Pure Water Expansion FSEIR to allow for additional notice and comment on the addition of this well and the likely need to add further wells for the Expansion. In total, this recirculation process will likely add an additional six to twelve months to the Pure Water Expansion's timeline—demonstrating that the Pure Water Expansion cannot be completed in a "reasonable period of time."

In terms of the Water Purchase Agreement, the Pure Water Expansion ~~would not~~cannot proceed until such an Agreement in place, because that Agreement ~~would be~~is needed to secure funding for the project. As the FSEIR states: "Without knowing when or whether a Water Purchase Agreement will be negotiated, it is currently not possible to estimate when the Proposed Modifications would be completed." ~~However, Cal-Am is the party that would need to pursue the~~Moreover, any Water Purchase Agreement~~, and it could likely do so expeditiously if it so desired. Given that the main barrier to securing that Agreement is a barrier that Cal-Am largely has control over, any uncertainty related to when an Agreement can be reached should not be considered when analyzing the timing and feasibility of the Pure Water Expansion. Finally, while the Pure Water Expansion will require additional review and permits for its expected discharge, that discharge will be similar to the discharge of the already permitted baseline Pure Water project, so much of the necessary analysis has already been completed.~~ for Pure Water Expansion water would need to incorporate additional terms beyond those included in the Pure Water project Water Purchase Agreement, including guarantees from Monterey One Water of the full production volume for the Expansion, and a full indemnification for Cal-Am against any risk, liability, or penalties in the event that the Expansion fails to provide an adequate supply.[183]

Further, with respect to the Water Purchase Agreement for the original Pure Water project, "Significant Events of Default" may have already occurred with respect to the Delivery Start Date and the Performance Start Date for the Pure Water project.[184] Monterey One Water has repeatedly delayed the Performance Start Date for the Pure Water project.

As noted by the State Water Resources Control Board, the timeline for the Pure Water Expansion has been delayed beyond the CDO deadline of December 31, 2021, and the Expansion requires "approvals and funding for which the details are uncertain and the timeline is indefinite"—as such, "[i]t is uncertain whether or

[182] Pub. Resources Code, § 21092.1; CEQA Guidelines, § 15088.5; Cadiz Land Co. v Rail Cycle (2000) 83 Cal.App.4th 74, 95 (holding that an EIR required revision and circulation to incorporate important new information about a project's potential impacts identified in expert reports submitted after the final EIR was completed); Save Our Peninsula Committee v. Monterey Cty. Board of Supervisors (2001) 87 Cal.App.4th 99, 131 (holding that information regarding a new mitigation measure, which was only added to the record after the EIR was completed, should have been included in the EIR and recirculated for public review and comment).

[183] See Exhibit 28 – May 9, 2020 Cal-Am Letter to Monterey One Water, p. 5.

Note: These are not Commission staff's Recommended Findings

when the proposed [PWM Expansion] may proceed beyond its currently pending environmental review . . .”[185] Accordingly, it does not appear that the Pure Water Expansion could be constructed and operational within a reasonable period of time as compared to the Cal-Am project.

For its part, Cal-Am faces a variety of hurdles that could delay construction and operation of its project. First, it ~~needs to design, and likely~~**must** obtain one or more permits to install, the outfall liner in Monterey One Water’s outfall line. The CPUC analyzed the potential environmental effects of such work, including likely impacts to ESHA and potential impacts to endangered species (specifically the Western snowy plover), and assumed that an additional CDP would be needed to undertake this work. It is possible that CDPs would be needed from Monterey County, the City of Marina, and the Commission to allow installation of the outfall liner. ~~If that ends up needing to occur, it could take significant time for the City and others to analyze the impacts of such a project and act on a permit.~~ However, Cal-Am ~~is investigating whether it may be able~~**has proposed** to install the needed liner entirely from inside the outfall without any ground-disturbing activity in the coastal zone, which may allow the installation to occur without all or some of the above requirements for permits. **(See Special Condition 4.)**

Cal-Am also needs to either obtain approval by the Marina Coast Water District to allow Cal-Am to use a shared water delivery pipeline or else design, conduct environmental review for, and obtain needed permits for Cal-Am to construct a new section of water delivery pipeline between its facility and its service area, which would lie outside the coastal zone. On October 17, 2019, the Marina Coast Water District determined that the pipeline did not have sufficient capacity to accommodate Cal-Am’s expected water volumes, and ~~it has rejected Cal-Am’s assertion that~~**although it appears that existing agreements permit** Cal-Am ~~has~~**to utilize** the ~~right to use the~~**shared** pipeline **to convey product water from the desalination plant**. To help resolve this issue, ~~the Monterey Peninsula Water Management District~~**MPWMD**, on July 30, 2020, considered approving an addendum to a CEQA document that would have allowed Cal-Am to construct a parallel pipeline that would serve the jointly managed Aquifer Storage and Recovery water supply system and would have also allowed Cal-Am to transport water to its service area. However, ~~the District declined to approve that~~**MPWMD’s decision on** addendum~~, so it is unclear whether that option will be available to Cal-Am~~ **has been delayed until its October Board meeting**. Additionally, the pipeline construction would occur outside of the coastal zone but within an area that may have unexploded ordinance from the former Fort Ord, so it would be subject to additional review through completion of a Munitions Response Remedial Investigation/Feasibility Study (“MR RI/FS”) and approval by Monterey County of an excavation permit.[113]

There is also ongoing litigation related to various aspects of Cal-Am’s proposed Project. This includes litigation filed by the City of Marina and later joined by Marina Coast Water District contending that Cal-Am is not able to use more than 500 ~~acre-feet~~**acre- feet** per

Note: These are not Commission staff’s Recommended Findings

~~[113] See July 2020 Addendum No. 6 to the Aquifer Storage and Recovery Project Environmental Impact Report/Environmental Assessment for the Bypass Pipeline & De-Chlorination Facility Modification, available at: https://www.mpwmd.net/wp-content/uploads/ASR-Addendum-No.6-July-2020.pdf (accessed July 17, 2020).~~

year of groundwater from the CEMEX site.[114] The CPUC analyzed the same claims that have now been made in the litigation and, after consulting with the State Water Board, determined that it was reasonably foreseeable that Cal-Am had a path forward to obtain the necessary water rights. The CPUC recognized that its proceeding was not an adjudication of water rights and that such rights would likely have to be definitively resolved at a future time by the appropriate body, such as a court. However, its conclusion was that questions regarding water rights were not so serious as to compromise project feasibility. **It does not appear that this framework through which Cal-Am may appropriate groundwater rights can be modified by this litigation.** There is also litigation challenging Monterey County's environmental review of the desalination facility and some pipelines outside of the coastal zone that are a part of the desalination project. As of the publication date of these Findings (August 24, 2020), there is a temporary stay on construction, which**, as imposed by the Superior Court in mid-September 2019, is in effect until August 25, 2020, at which time the court will consider extending or modifying the stay.** **will likely be lifted following the Commission's decision on the Cal-Am Project. On balance, it does not appear that the Cal-Am's Project faces more significant delays in implementation than would be faced by the Pure Water Expansion.**

"… and taking into account the following factors":

- **"Economic": There remains significant uncertainty regarding the costs for Pure Water Expansion water, given the significant cost overruns that have been experienced during implementation of the Pure Water project.[186] The CPUC has previously approved a rate of $1,720 or less per-acre-foot for water produced by the Pure Water project. In June 2020, Monterey One Water stated that at the current projected delivery rate of 2,030 acre-feet per year, Pure Water project water costs would increase to $3,678 per-acre-foot—a 115 percent increase over the approved rate.[187] Even under the best case scenario put forward by Monterey One Water under which delivery of the promised 3,500 acre-feet per year is achieved, after the aforementioned fixes to the Pure Water project, including repairs to the shallow wells, commissioning of deep wells, and the addition of a third deep well, costs would be 2,508 per-acre-foot – representing a 50 percent increase from the rate approved by the CPUC.[188] Moreover, Monterey One Water may decide to install a fourth, costly deep injection well.[189] It appears likely that Pure Water project costs will continue to rise, and it is reasonable to assume that the Pure Water Expansion would face similar cost overruns. As such, there is uncertainty regarding final construction and water costs for the Pure Water Expansion.**

  "Economic": The expected costs of Cal-Am's proposed Project are much higher than those of the Pure Water Expansion. Cal-Am and its ratepayers would be paying an

Note: These are not Commission staff's Recommended Findings

estimated $400 million in initial capital costs for the overall project, along with operational and maintenance costs of about $1 billion or more during its initial 30 years of operations. The Pure Water Expansion is estimated to have about $60 million in initial capital costs and about $190 million in operational and maintenance costs over a 30-year operating life~~.~~ although as discussed above, such costs are expected to increase.

Although the desalination facility would produce more water than the Pure Water Expansion, its cost per unit of water would be much higher. ~~At current expected costs, ratepayers would pay about $6,000 to $8,000 per acre-foot for Cal-Am's water and about $2,300 per acre-foot for the Pure Water Expansion supply.~~However, current costs projections for Pure Water Expansion do not account for costs already spent on the Cal-Am desalination facility, which will be recovered via water rate increases that could increase customer bills by approximately $10 to $20 per month even if the desalination facility is never built. Further, regardless of the cost per acre-foot for desalination facility water, that cost is not going to materially affect the costs for the desalination facility on the water bills of Cal-Am's customers. This is because the CPUC already determined the rate increase for Cal-Am's customers for the desalination facility based on a calculation of the annual revenue required to repay capital costs to build the facility, including set financing repayment requirements, and the annual facility operations and maintenance. How much water the facility ultimately produces (or does not produce) is not a material variable in rates that customers are charged, except for minor, incremental operating and maintenance costs. Thus, whether the project produces 2,000 acre feet or 10,000 acre feet of water each year, the amount needed to be recovered annually from customers for physical construction and operation of the facility and for financing/loans essentially remains the same. Based on available information, the CPUC approved a rate increase of about $37-$40 per month for the average Cal-Am customer in a single family residence for the desalination facility, and that increase is not tied to per acre foot water costs.[190] That is why the CPUC found that approving a smaller 4.8 MGD desalination facility would not result in any "significant, if any, cost savings to ratepayers" and determined that alternative was not feasible. (CPUC Decision 18-09-017, p. 129.) As a result, the speculative per acre foot water costs being projected by Commission staff and Pure Water Expansion proponents are not relevant to any consideration by the Commission of how rates for the desalination facility will impact Cal-Am's customers.

~~In its June 30, 2020 letter, Cal-Am pointed out that the above-referenced Monterey One Water status report on the Pure Water project identified higher than expected first year operating costs – instead of about $2,442 per acre-foot, Monterey One Water expects the first year's costs to be about $3,678 per acre-foot. Cal-Am contended that the Pure Water Expansion would likely experience a similar increase. However, that same Pure Water project status report noted that Monterey One Water expects that once repairs are complete and a new well is~~

[190] See August 13, 2020 Latham Letter to Commission, p. 1, Exhibit 1, p. 3 n.4 (citing Attachment C-1 to Advice Letter No. 1220-A from California-American Water Company to CPUC). As noted above, the Commission recently approved a project – the Morro Bay Water Reclamation Facility – that would result in a $41 increase in water bills.

Note: These are not Commission staff's Recommended Findings

~~installed, costs will be about $2,508 per acre-foot, still substantially less than Cal-Am's costs. In addition, the costs of Cal-Am's Project have risen and are likely to continue to rise.~~ Over the last several years, costs to construct ~~the plant~~Cal-Am's Project have increased from about $223 million to $279 million. Its expected cost per acre-foot of water have increased from an estimated $5,100 in 2012 to a recent estimate of about $6,100.[115] The desalination cost per acre-foot would be even higher for some period of time, since Cal-Am would be operating at less than full capacity, which results in higher per unit costs. As discussed in Section IV.N, *supra*, the average single-family Cal-Am customer's monthly water bills are expected to increase by approximately $37 to $40 once the Project begins producing desalinated water.[191] However, as discussed above, there remains significant uncertainty regarding construction costs and water rates for the Pure Water Expansion.

- **"Environmental":** This factor is discussed in more detail below, under the comparison of the projects' environmental effects, and elsewhere in these Findings. ~~In general, however, and as~~Certain commenters have raised concerns regarding the Cal-Am Project's potential impacts to environmentally sensitive habitat areas and groundwater, and its effects on marine life related to brine discharge. As noted in the Findings above, Cal-Am's proposed Project would ~~result in several significant adverse effects on coastal resources – including environmentally~~be inconsistent with Coastal Act and Marina LCP policies regarding sensitive habitat ~~areas, groundwater, and effects on marine life from its brine discharge – whereas the Pure Water Expansion would be built entirely outside the coastal zone (though would discharge effluent in the coastal zone) and have relatively few environmental impacts compared to Cal-Am's Project.~~including wetland/vernal pond ESHA; however the Project would incorporate mitigation to the maximum extent feasible. (See Sections IV.F, G, *supra*.) In addition the Project would be consistent with Coastal Act and Marina LCP policies regarding coastal waters with the implementation of Special Conditions. (See Section IV.I, *supra*.) Further, the Cal-Am Project will be consistent with policies regarding groundwater without Special Conditions. (See Section IV.J, *supra*.)

~~"Social": As described more below and in the report's Findings on Section 30260's public welfare test, both projects would provide sufficient water for the Cal-Am's service area, though Cal-Am's would have far greater environmental justice-related effects on low-income ratepayers and other communities of interest (see Section II.N – Environmental Justice).~~

Significant questions remain unresolved regarding the environmental impacts of the Pure Water Expansion, and the FSEIR for the Expansion requires additional analysis as discussed above. As a result of these flaws, the Monterey One Water Board denied certification of the FSEIR for the Expansion. Moreover, Monterey One Water has not evaluated the potential impacts from seawater intrusion to the Salinas Valley Groundwater Basin, should the Pure Water Expansion be constructed in place of the Cal-Am Project.[192] Thus, substantial evidence does not

---

~~[115] See California-American Water, "Monterey Supply Project Scenarios," CPUC workshop for A.12-04-019, December 11-13, 2012. Current cost estimates are based on Cal-Am's Advice Letter 1220, Attachment C-3, December 31, 2018.~~

[191] As noted above, the Commission recently approved a project – the Morro Bay Water Reclamation Facility – that would result in a $41 increase in water bills.

[192] See January 30, 2020 Cal- Am Comments on Pure Water Expansion DSEIR, pp. 17-18.

Note: These are not Commission staff's Recommended Findings

demonstrate that the Pure Water Expansion will have fewer environmental impacts compared to the Cal-Am Project.

- "Social": It is likely that the proposed Project would result in increased costs of water for Cal-Am ratepayers, and thereby may involve environmental justice-related effects on low income ratepayers and other communities of interest. (See Section IV.N, *supra*.) However, as described above, Cal-Am offers rate assistance programs for low-income ratepayers, and as required in Special Condition 13, Cal-Am must develop and submit for CPUC approval additional ratepayer assistance programs to address possible barriers to access, customer outreach, and the need to offset rate increases for low-income customers. Moreover, Cal-Am intends to offer discounted water rates to Castroville, a community of concern whose water supply has diminished in recent decades due to overpumping. The Commission has imposed conditions to ensure that Cal-Am's customers in other nearby disadvantaged communities will not be required to absorb the costs of providing this discounted water.

  The Pure Water Expansion is likely to cause a series of environmental justice impacts to communities on the Monterey Peninsula. First, Monterey One Water currently proposes to utilize upwards of 3,700 acre-feet per year in agricultural produce wash water generated in the City of Salinas in order to produce the 2,250 acre-feet per year planned for the Expansion. However, the City of Salinas disputes Monterey One Water's rights to use these agricultural wash waters, which the City argues is needed to "support farmers, ranchers, and the City's agriculture industry."[193] (See Section IV.N, *supra*.) Second, as discussed below, implementation of the Pure Water Expansion, without the proposed Cal-Am Project, will not allow Cal-Am to provide sufficient water to meet even MPWMD's lowest projections of demand within its Monterey Service Area. As discussed in Section IV.N, *supra*, without a sufficient water supply, there will be insufficient water to construct affordable housing on the Monterey Peninsula, which will in turn drive up current housing costs, forcing employees in the service industry on the Peninsula to reside in more affordable inland communities and contend with lengthy commutes to their jobs on the Peninsula. These workers will then have to bear additional economic burdens, including the cost of gasoline or other transportation, in order to travel to the Peninsula. Third, as noted above, because WWTP flows that Monterey One Water relies upon as Pure Water Expansion source water are continuing to decline, in most situations there would be insufficient source waters to supply both the Expansion and the CSIP. Without sufficient source water to supply CSIP, seawater intrusion in the Salinas Valley Groundwater Basin will continue to progress, disproportionately affecting the residents of the disadvantaged community of Castroville. (See Section IV.N, *supra*.)

- **"Technological":** ~~As noted above, both projects would generally use proven technology for treating and distributing water.~~ The Cal-Am project would use a slant well system to provide its source water, and although there are no other operating desalination facilities known to use this system, there are at least two projects ~~here~~ in California where slant wells were successfully tested as a method to supply source

[193] See January 29, 2020 City of Salinas Letter to Monterey One water, pp. 1-2.

Note: These are not Commission Staff's Recommended Findings

water to desalination facilities.[116][194] **Moreover, subsurface slant wells are the type of intake technology preferred by the state resources agencies, including the Commission, for desalination facilities under the California Ocean Plan.[195]** The Pure Water **project uses a train of**Expansion would utilize four different treatment methods **commonly used in water treatment facilities. Cal-Am,, which are currently being used by** the Pure Water project **and the Pure Water Expansion all rely in part on an Aquifer Storage and Recovery ("ASR") system that is being used in numerous locations as a proven method to store and provide water supplies. As.** However, as noted above, the Pure Water project **has experienced some start-up issues, which are relatively common during the initial operations of water treatment facilities, and Monterey One Water has identified proposed solutions and a schedule to implement them.**is currently facing significant technological and logistical difficulties in both construction and startup, including failures in the Pure Water project injection wells. Given that the Pure Water Expansion will rely on the same technologies currently being used by the Pure Water project and is proposed for the same location as the Pure Water project, it is likely that the Pure Water Expansion would face similar barriers to construction and implementation. As such, the Cal-Am Project's use of the preferred slant well technology renders it the more technologically feasible water supply solution for addressing demand on the Peninsula.

2) Water supply and demand – would the Pure Water Expansion provide sufficient amounts of water to allow Cal-Am's water portfolio to meet expected demands?

In comparing the Pure Water Expansion with Cal-Am's Project, key issues include: 1) whether either project would provide an adequate and reliable water supply to meet current and future demands; 2) whether either would be consistent with state requirements regarding the design and capacity of water supply facilities; and 3) whether they would allow Cal-Am to meet conditions of the State Water Board's cease and desist order for reducing withdrawals from the Carmel River.

Although Cal-Am's desalination facility would provide more **reliable and drought resilient** water **supply** than would the Pure Water Expansion**, either project, when. When** combined with Cal-Am's other available water sources, **would provide more than****and when considering the most conservative projections of demand from the MPWMD (10,855 acre-feet per year), only Cal-Am's Project is capable of providing** adequate water supplies for current and expected future demands and **would allow****allowing** the water system to conform to the state's design and capacity requirements. **Adding either project****Only the addition of the Project** to Cal-Am's water portfolio would **also** allow Cal-Am to reduce its withdrawals from the Carmel River in accordance with requirements of the State Water Board's **cease-and-desist order. Importantly, although****CDO. While** the CPUC's 2018 decision described the Pure Water Expansion as speculative, it recognized that, if built, it would satisfy **project****some** objectives and **could** provide sufficient water if the desalination facility was delayed for five to fifteen

[116][194] Along with Cal-Am's test slant well, the South Coast Water District in Orange County conducted successful slant well tests and has proposed using them for its full-scale desalination facility in Dana Point.

[195] See California Ocean Plan, section III.M.2.d(1)(a).

Note: These are not Commission staff's Recommended Findings

years.[117]~~With~~ [196] **Nevertheless, the CPUC concluded that a desalination would be necessary to meet the Peninsula's long term water supply needs. Now that more information is available concerning the Pure Water Expansion based on its SEIR and subsequent expert analysis, it is now evident that despite** the currently lower baseline demand described below, the Pure Water Expansion ~~can be expected to provide~~**is not capable of providing** the necessary amount of water ~~for at least 20 to 25 years~~**to meet that demand** without the desalination facility in place.

The CPUC's 2018 Final EIR/EIS and its Final Decision described Cal-Am's current and future expected water needs and available supplies. However, the baselines and assumptions used in those analyses have since been updated with new data and projections. In September 2019, ~~the Monterey Peninsula Water Management District ("~~MPWMD~~")~~ published its *Supply and Demand for Water on the Monterey Peninsula* (see Exhibit ~~15~~**17** – "**MPWMD** 2019 Update"), which was supported by recent data that were not available at the time of the CPUC review.[118][197] In March 2020, the MPWMD provided an additional update ("**MPWMD** 2020 Update" – see Exhibit ~~16~~**18**) that incorporates more recent data and responds to comments received on its September 2019 report. **Cal-Am, through its expert Hazen and Sawyer, provided updated data on water supply and demand on January 22, 2020, August 11, 2020 and August 23, 2020. Monterey One Water also provide an update as to the availability of source water for the Pure Water Expansion Project on August 20, 2020.** The evaluation below compares the earlier CPUC projections with those of the 2019 and 2020 Updates **and the Hazen analyses** using the same criteria that were used in the CPUC analysis, along with several others, to identify how either the Pure Water Expansion or the Cal-Am desalination facility would provide for the expected water supply and demand needs for Cal-Am's service area. The CPUC's analyses and projections showed that adding Cal-Am's desalination facility to its water supply portfolio would provide about 109% of its identified needed future water supplies – about ~~15, 296~~**15,296** acre-feet of supply versus 14,000 acre-feet of demand. The most recent analyses and projections, which start at a lower baseline but include a relatively high growth rate, show that adding the Pure Water Expansion instead of the desalination facility to the portfolio would, in most cases, ~~result in a similar "overage" of~~

~~[117] The CPUC decision states: "…the PWM Expansion would satisfy the basic and key purposes of the Project (i.e., sufficient and reliable water supply) only in conjunction with construction of a desalination plant of some size within five to fifteen years." See CPUC Decision D.18-09-017, Appendix C, p. C-71.~~

[196] The CPUC decision states: "…the PWM Expansion would satisfy the basic and key purposes of the Project (i.e., sufficient and reliable water supply) only in conjunction with construction of a desalination plant of some size within five to fifteen years." See CPUC Decision D.18-09-017, Appendix C, p. C-71.

[118][197] According to the ~~District's~~**MPWMD's** website statement, it serves over 100,000 people within the cities of ~~Carmel-by-the-Sea~~**Carmel- by-the-Sea**, Del Rey Oaks, Monterey, Pacific Grove, Seaside, and Sand City, the Monterey Peninsula Airport District, and portions of unincorporated Monterey County including Pebble Beach, Carmel Highlands and Carmel Valley. It is a public agency funded largely by property taxes, user fees, water connection charges, investments, grants, permit fees and project reimbursements. ~~The District~~**MPWMD** operates pursuant to five main goals:

1) Increase the water supply to meet community and environmental needs.
2) Assist California American Water in developing a legal water supply.
3) Protect the quality of surface and groundwater resources and continue the restoration of the Carmel River environment.
4) Instill public trust and confidence.
5) Manage and allocate available water supplies and promote water conservation.

Note: These are not Commission staff's Recommended Findings

~~water supply, which provides a measure of reliability~~fail to provide adequate water supplies to meet demand.

Determining the amount of water needed for current and future demands involves three main steps: 1) identify existing water use; 2) identify the expected rates of growth; and 3) identify the sources of water needed to serve that growth. As acknowledged in the CPUC's Final EIR/EIS, "[f]orecasting future demand and supply is not an exact science," and "estimating future water demand necessarily entails the use of assumptions about demand factors that cannot be predicted with absolute certainty."~~119~~198 This uncertainty leads to analyses of future water needs often being based on relatively conservative assumptions to ensure that errors are generally on the side of ensuring more water is available rather than not enough.~~120~~ ~~The~~ 199

First the Findings ~~below first~~ describe the basis for the CPUC's projection of Cal-Am's expected water supply and demands, which served as the basis for the CPUC's approval of a 6.4 mgd desalination facility.~~121~~ ~~They then~~ 200 Second, the Findings describe new information related to ~~those~~ expected ~~water supplies and~~ demands as evaluated in the 2019 and 2020 Updates, both of which show that current actual demand is substantially lower than identified during the CPUC's proceedings. Third, the Findings describe the availability of Cal-Am water sources and the reliability of supply sources to feed the Pure Water Project. The Findings then compare how much water Cal-Am would have available in its current and future water portfolio with the proposed desalination facility or with the Pure Water Expansion project. These Findings also consider a key issue fundamental to Cal-Am's expected water supplies and demands – the need for Cal-Am to meet the obligations of the State Water Board's cease-and-desist order that requires Cal-Am to stop its excess water withdrawals from the Carmel River by December 2021. In sum, the Findings below show that Cal-Am could not meet its expected water needs by including ~~either the desalination facility or~~only the Pure Water Expansion, without the desalination facility, in its overall water portfolio.

CPUC's current and projected water demand

As part of the CPUC's review, it identified ~~Cal-Am's~~Cal-Am's existing and projected future water demands, relying, in part, on state regulatory requirements used to identify baseline water requirements. This regulation – the California Waterworks Standards – requires that water supply systems have the capacity to meet maximum day demand and peak hourly demand, as based on the most recent 10 years of a water system's operations.~~122~~201 The CPUC determined

---

~~119~~198 See Section 8.2.13 – Master Response 13: Demand (Project Need) and Growth.

~~120 See, for example, the Pacific Institute's "An Assessment of Urban Water Demand Forecasts in California," August 2020, which describes common patterns and reasons that result in water districts often overestimating expected water demands.~~

199 See, for example, the Pacific Institute's "An Assessment of Urban Water Demand Forecasts in California," August 2020, which describes common patterns and reasons that result in water districts often overestimating expected water demands.

~~121 Those analyses are provided in greater detail in Section 2.6 of the Final EIR/EIS and in the CPUC's September 13, 2018 Final Decision on the proposed project.~~

200 Those analyses are provided in greater detail in Section 2.6 of the Final EIR/EIS and in the CPUC's September 13, 2018 Final Decision on the proposed project.

~~122~~201 See Title 22, CCR Division 4, Chapter 16, Section 64554. Maximum day demand is determined by selecting the month with the highest water use during the past ten years ~~or~~of service, dividing by the number of days in that month, and multiplying the average daily use by a peaking factor of at least 1.5.

Note: These are not Commission staff's Recommended Findings

that, for Cal-Am, using the peak month demand would be the critical determinant as to whether the proposed Project could meet its maximum day and peak hour demand, as peak month represents an elevated demand sustained over multiple days.[~~123~~202] At the time of the CPUC review, the peak month during the 10-year period from 2006 to 2015 was July of 2010 when Cal-Am's ratepayers used 1,111 ~~acre-feet~~acre- feet. The average annual demand during that 10-year period was 12,351 acre-feet.

The CPUC also considered several events that occurred before, during, and after that 10-year period that had affected the area's rate of water use. It recognized that water demand in the area had been somewhat higher long before that particular 10-year period and that it had declined in part due to reduced visitation to the Monterey Peninsula after the events of September 11, 2001 and due to the recession that occurred between 2007 and 2009. It also recognized that California, including Cal-Am's service area, had experienced several years of drought conditions that had further reduced water use and led to implementation of a number of water conservation measures, many of which were still in place and likely represent permanent reductions in the expected water use per capita in the Monterey area and elsewhere. This was accompanied by behavior changes by water users that led to additional reductions, which may or may not be as long-lived as the structural conservation measures but may nonetheless continue to some degree beyond the period of drought conditions due, in part, to continued changes in behavior, increases in the price of water, and other factors. The CPUC also acknowledged that by the time the desalination facility would be operating, Cal-Am's average 10-year and maximum year demands would be lower that the above-referenced 10-year period. Based on these considerations, the CPUC concluded that the existing annual demand was about 12,000 acre-feet per year.[~~124~~203]

Along with identifying these existing water system demands, the CPUC considered several expected future demands that it noted would increase that existing demand by about 2,000 acre-feet per year for a total expected demand of about 14,000 acre-feet per year. Table 4 below shows the expected existing demand and these expected future demands, which are described below.

Table 4: CPUC identified existing and future demand

	CPUC review (totals in ~~acre-feet~~acre-feet per year)
Existing demand (10-year annual average**):**	12,000

Peak hourly demand is determined by calculating the average hourly rate for the maximum day demand and multiplying by a peaking factor of 1.5.

[~~123~~202] This was also reflected in the CPUC's inclusion of a project objective in the Final EIR/EIS that was to ensure the water supply would be able to serve peak month demands. The CPUC's September 13, 2018 Final Decision on the project notes that "[t]his is consistent with Cal-Am's assertion that peak month demand is a more critical consideration for its operations than peak day demand. This appears undisputed, as all of the parties presented their demand projections in a similar method (see, ~~E~~e.g., Exhibit SF-12 Attachment A) and we use monthly and annual figures throughout in our consideration of the standard."

[~~124~~203] The CPUC's Final Decision states that "[a] projection of demand for existing customers of approximately 12,000 afy is appropriately conservative and reasonable."

Note: These are not Commission staff's Recommended Findings

Future demand:	
• Pebble Beach water entitlements	325
• Hospitality industry rebound	500
• Lots of record	1,181
Total:	**14,006**

- **Pebble Beach water entitlements:** As part of a water reclamation project funding agreement between the ~~Monterey Peninsula Water Management District~~MPWMD and the Pebble Beach Company, the ~~District~~MPWMD granted water entitlements totaling 380 ~~acre-feet~~acre- feet per year to the Company. The funded reclamation project provides reclaimed water for use on golf courses in the Del Monte Forest area. Because that water would have otherwise come from Cal-Am's use of Carmel River water, the State Water Board recognized in its cease-and-desist order to Cal-Am that those entitlements could be considered part of Cal-Am's expected additional water demands for proposed development in this area. As of the time of the CPUC's decision, about 325 acre-feet per year of these entitlements had not been used and were therefore considered part of potential future growth.

- **Hospitality industry rebound:** As noted above, the CPUC acknowledged that water demand in Cal-Am's service area had declined post-2001 and during the 2006-2009 recession, due in part to a reduction in visitation rates. Cal-Am had proposed as part of the CPUC's review that an additional 500 acre-feet per year be added to the projected future demand to reflect an expected rebound in visitation to the area. ~~The Monterey Peninsula Water Management District~~MPWMD conducted a 2013 study that determined that 500 acre-feet per year was a reasonable expectation. The CPUC accepted this figure, though it acknowledged that part of the rebound dependent on these 500 acre-feet per year had already occurred and that some of that supply would therefore be available for other uses.

- **Water for lots of record:** Cal-Am's service area has several hundred undeveloped "lots of record," and it proposed that the CPUC include 1,181 acre-feet per year of water for the expected development of those parcels.

During its review, the CPUC also requested and received alternative water demand/supply scenarios proposed by intervenors. These included the same demand categories identified above, though they varied in the current and expected volumes in each category.[~~125~~204] These alternative scenarios proposed that the CPUC consider that expected future demands could range from about 9,700 to 15,000 acre-feet per year. In comparing and evaluating the above demand categories and the scenarios presented by intervenors, the CPUC concluded that ~~Cal-Am's~~Cal-Am's existing demands along with the above expected future demands would total about 14,000 acre-feet per year.

~~CPUC's projected available water supplies~~

Note: These are not Commission staff's Recommended Findings

[~~125~~204] Scenarios were provided by Cal-Am, the City of Marina, the Marina Coast Water District, the Monterey Peninsula Regional Water Authority, ~~Monterey Peninsula Water Management District~~MPWMD, the Planning and Conservation League, Surfrider Foundation, the Coalition of Peninsula Businesses, and Water Plus.

~~The CPUC also showed that Cal-Am's water portfolio, including production from the proposed desalination facility, would provide about 1,300 acre-feet more water than needed to serve the then-expected 14,000 acre-foot per year demand. The components of the expected water portfolio are shown in Table 5 and described below.~~

~~Table 5: CPUC identified available water supplies~~

~~Source:~~	~~Amount Available (in acre-feet per year):~~
~~Carmel River~~	~~3,376~~
~~Seaside Groundwater Basin~~	~~774~~
~~Aquifer Storage and Recovery~~	~~1,300~~
~~Sand City Desalination Facility~~	~~94~~
~~Pure Water Monterey Groundwater~~	
~~Replenishment Project~~	~~3,500~~
~~Total:~~	~~9,044~~
~~Total when including a 6.4 mgd (6,252 afy) desalination facility:~~	~~15,296~~

~~The water supply sources included:~~

- ~~Carmel River: Although Cal-Am is required to reduce its withdrawals from the Carmel River, it continues to have the legal right to withdraw 3,376 acre-feet per year from the river.~~

- ~~Seaside Groundwater Basin: Cal-Am has also relied on past withdrawals from the Seaside Groundwater Basin. As part of the Basin's adjudication in 2006, Cal-Am was determined to have rights to 1,474 acre-feet per year from the Basin; however, based on its overwithdrawals from past years, Cal-Am is required to replenish the Basin at a rate of 700 acre-feet per year over a 25-year period, which limits its allowable withdrawals to 774 acre-feet per year. On August 12, 2020, the Commission received a letter from the Seaside Groundwater Basin Watermaster, who expressed concern that the Basin would need additional water – about 1,000 acre-feet per year over and above the currently proposed 700 acre-feet per year – to provide protective groundwater elevations in the Basin, and that the proposed Cal-Am facility is the only possible source for this additional supply. It appears, however, that the Basin management considered this measure in 2009 and 2013 but took no action to implement the associated infrastructure that would be needed or to fund the approximately $6,000,000 per year needed to purchase that amount of desalinated water. Nor did the CPUC consider this large, potential additional demand for water in its proceeding. Accordingly, any such new demand for water appears to be speculative and is not considered a reason that the Pure Water Expansion would be infeasible.~~

- ~~Aquifer Storage and Recovery ("ASR"): Cal-Am and the Monterey Peninsula Water Management District together implemented an ASR project that provides a water supply based on using available storage capacity in the Seaside Basin. The project involves diverting high winter flows of Carmel River water into the Basin for later recovery, treatment, and delivery to customers during summer months to help reduce summer withdrawals from the river. The winter flows it diverts are only those identified as excess to the flows needed to support the river's~~

Note: These are not Commission staff's Recommended Findings

~~threatened steelhead population. The first ASR phase was completed in 2008 and allows a maximum annual diversion of about 2,400 acre-feet per year from the Carmel River, and an average yield of approximately 920 acre-feet per year. The second phase, completed in 2013, allows storage of up to 2,900 acre-feet per year and provides an average yield of 1,050 acre-feet of additional water supply. For water supply planning purposes, ASR is estimated to produce an average of 1,300 acre-feet annually.~~

~~- Sand City Desalination Facility: This facility is owned by Sand City but operated by Cal-Am. Of the facility's 300 acre-feet per year capacity, Cal-Am has available to it a long-term supply of 94 acre-feet per year.~~

~~- Pure Water Monterey Groundwater Replenishment Project: At the time of the CPUC's review, the first phase of this project – a joint proposal by the Monterey Regional Water Pollution Control Agency and the Monterey Peninsula Water Management District – had just undergone environmental review. The project involves treating several water sources – including treated wastewater, agricultural runoff water, and stormwater – and injecting the treated water into the Seaside Groundwater Basin for later additional treatment and use as a potable water supply. The CPUC's decision to approve Cal-Am's desalination facility relied on Cal-Am being able to purchase 3,500 acre-feet per year from the Pure Water project, which allowed the CPUC to reduce the size of Cal-Am's desalination facility from its initially proposed 10,700 acre-feet per year to its currently proposed 6,252 acre-feet per year (i.e., from 9.6 to 6.4 mgd).~~

~~A common principle in water planning is that having more water sources is preferred to having fewer, as more sources generally allow for more overall reliability. Most areas rely on one or two main sources (along with conservation) to meet their water needs. As shown above, Cal-Am currently has five (not counting conservation). Adding the Pure Water Expansion and including it as part of the existing Pure Water project would keep Cal-Am with five sources, while adding desalination would increase sources to six.~~

~~In summary, the CPUC identified a current baseline use of 12,000 acre-feet per year, an expected future demand of about 14,000 acre-feet per year, and an available supply, including Cal-Am's proposed desalination facility, of 15,296 acre-feet per year.~~

~~2019 and 2020~~ **Updates of water supply and demand**

As noted above, MPWMD prepared two updated assessments of expected water demands and supplies for Cal-Am's service area (see Exhibits ~~15~~17 and ~~16~~18), which are collectively referred to as the "Updates" herein. The more recent Update was included as part of the Final SEIR for the Pure Water Expansion project. These MPWMD assessments updated the CPUC's evaluation of the total water demands and supplies available with Cal-Am's desalination facility as compared with supplies that would be available with the Pure Water Expansion project. Table ~~6~~5 below provides the 2020 Update's comparison of these two supply scenarios showing that the scenario with the Pure Water Expansion would provide about 4,000 acre-feet per year less than the scenario with Cal-Am's desalination facility:

Table ~~6~~5: Comparison of water supply portfolio with Cal-Am desalination or Pure Water Expansion

Note: These are not Commission staff's Recommended Findings

Supply Source	With Cal-Am desalination (in afy)	With Pure Water Monterey Expansion (in afy)
Cal-Am Desalination	6,252	0
Pure Water Monterey	3,500	3,500
~~Pure Water Monterey~~		
Pure Water Monterey Expansion	0	2,250
Carmel River	3,376	3,376
Seaside Basin	774	774
~~Aquifer Storage and~~		
Aquifer Storage and Recovery	1,300	1,300
Sand City Desalination	94	94
Total Available Supply	**15,296**	**11,294**
Other Available Supply	406	406
Total Available Supply w/Other	**15,702**	**11,700**

Note: to ensure a more conservative assessment of available supplies, the "Other Available Supply" category above is not included in the analyses immediately below, as that category includes some less certain water sources, such as increased production from the Sand City desalination facility, and "Carryover Credits" that Cal-Am has available to it based on unused capacity in the Seaside Groundwater Basin. However, this category is included later under "Additional considerations for projecting future demand."

Importantly, the MPWMD also updated the current and expected future water demands the CPUC had identified during its proceedings, using the same demand categories as the CPUC had used, but including more recently available data and some modified assumptions. The Updates show that Cal-Am's current baseline demand is substantially lower than identified by the CPUC. Using the average annual use for the past 10-year, five-year, and three-year periods, the Updates calculated the current baseline demand to be 10,863, 9,825, and 9,817 acre-feet per year, respectively – or between about 1,100 and 2,300 acre-feet less than the previously assumed 12,000 acre-feet. The Updates had the benefit of about two years of more recent data, starting in January 2018, that show continued reductions in existing water demand compared to the demand figures available to the CPUC. The Updates also show ~~that the~~ expected future demand ~~is~~as substantially lower than had been identified previously and hypothesize that demand could be met for the next twenty years or more by adding either Cal-Am's desalination facility or the Pure Water Expansion project to the water supply portfolio. Importantly, these Updates also evaluated the expected rate of growth in water demand, a consideration absent from Cal-Am's Final EIR/EIS. The Updates conclude that, although the Pure Water Expansion scenario would not provide as much water as the desalination facility scenario, that scenario would provide sufficient water for twenty years or more, even when considering substantially higher growth rates than the area has ever experienced during the past several decades. ~~If~~The Updates concluded that if growth actually occurs at closer to historic rates, then the Pure Water Expansion could provide sufficient water for approximately forty years. The two sets of demand scenarios are provided in Table ~~7~~6 below. The Updates also conclude that the Pure Water Expansion could meet the maximum daily demand and peak day flows as required by the state's Waterworks standards. Finally, they evaluate how a Cal-Am water supply portfolio that

Note: These are not Commission staff's Recommended Findings

included the Pure Water Expansion instead of the desalination facility could provide adequate water supplies during multiple years of drought.

Importantly, and as shown in Table ~~7~~6, the Updates' lower demand numbers for the ~~five-year~~five- year and three-year average annual demands are supported by data Cal-Am provided to the CPUC in July 2019. The table includes Cal-Am's 2019 existing demand as identified in its July 1, 2019 General Rate Case application to the CPUC.[~~126~~205] For purposes of this ongoing rate case, Cal-Am reports that its 2018 water demand was 9,679.1 acre-feet, much less than the 12,000 acre-feet estimate in the 2018 Final EIR/EIS and even less than the lowest of the calculated baseline volumes in the ~~above-referenced~~above- referenced Updates. Cal-Am also reports that its expected demand from 2019 through 2022 is 9,789.4 acre-feet per year, which also remains below those lowest calculated baseline amounts. Cal-Am's current CPUC proceeding also includes testimony from a Cal-Am expert witness, who anticipates somewhat lower demand during these immediately upcoming years – from 9,338 in 2021 to 9,610 in 2023.

Table ~~7~~6: Comparison of existing and future demand scenarios

	2018 CPUC review	**MPWMD 2020 Update**	**2019 Cal-Am**
Existing demand:	12,000	9,817 – 9,825	~~9,338 – 9,789~~9,338- 9,789 (through 2023)
Future demand:			
Pebble Beach entitlements	325	103 to 160	
Hospitality industry rebound	500	100 to 250	
Lots of record	1,181	864 to 1,014	
Total:	**~14,000** at an unspecified future date	**10,884 – 11,249**	

This range of current demand numbers – 9,338 to 9,825 acre-feet per year – is further supported by two recent evaluations conducted on behalf of the City of Marina and the Marina Coast Water District, which are detailed below under Other Reviews.

Future demand: The Updates also show lower expected future demands in each of the categories that the CPUC study had used, as shown below:

- **Pebble Beach entitlements:** As noted above, the CPUC had identified about 325 ~~acre-feet~~acre-feet of expected demand for build-out in the Pebble Beach area. The analyses in the Updates ~~show~~argue that the actual baseline amount was somewhat lower – about 299 acre-feet – and would be split between two categories – a 145 acre-foot expected average for buildout and a 154-acre-foot expected average in "other

[~~126~~205] See July 1, 2019 application by California American Water application for CPUC's General Rate Case A1907004, available at: https://apps.cpuc.ca.gov/apex/f?p=401:57:0: (accessed August 10, 2020).

Note: These are not Commission staff's Recommended Findings

entitlement demand."[~~127~~206] The Updates ~~note~~argue that this buildout demand is likely overstated, in that it was based on higher water usage rates than are the current norm. For example, the buildout figures were based on a period when residences used about a third more water than the current average and included a proposed hotel that is no longer being pursued.

The Updates also conclude that the "other entitlement demand" is similarly overstated in that this demand would not exist once a new water supply – such as Cal-Am's Project or the Pure Water Expansion – makes water available to users that would otherwise need the entitlement. These entitlements were developed as part of a financing package for an area recycling project, allowing the Pebble Beach Company to sell some of its unused water entitlements to residential property owners in the area. Over the last decade or so, these average entitlement demands have totaled about 4.9 acre-feet per year. It is unlikely that there will be additional requests for those same entitlements amounts during the approximately three years before one of these two water supply projects is online, largely because the entitlements cost about $250,000 per acre-foot. The Updates acknowledge, however, that there could be some limited future interest in these entitlements, though more in the range of 10 to 15 acre-feet total rather than the above-referenced 154 acre-feet. The 2019 Update did not include this 10-15-acre-foot demand in its expected growth figures, though it addressed potential growth in a different way to provide sufficient conservatism in its calculations, as described below. The Updates conclude that the actual expected future demand for these categories of water use should be lowered from the previously presumed 325 acre-feet to between 103 and 160 acre-feet. Both Cal-Am and the Pebble Beach Company have contended that the full entitlement amounts may be used, though there is no certainly as to when or how quickly they might be drawn upon should this relatively high cost water be needed. **However, the Pebble Beach Company has used or allocated all but 60 acre-feet of its entitlement, implying that the Updates underestimate current and future demand as a result of the Pebble Beach entitlements.**[207]

- **Hospitality industry rebound/tourism bounce-back:** The 500 acre-feet the CPUC included in this category was based **testimony from the local hospitality industry and** on an expected recovery in the number of visitors to the Monterey Peninsula area. As part of the CPUC proceedings, the industry noted that hotel occupancy rates declined after 2001 and after the ~~2006–2009~~**2006- 2009** recession and requested that the CPUC consider including additional water in its demand scenarios to serve the expected increase in occupancy rates that would accompany an improved economy. As described in the Updates, the pre-2001 occupancy rates were about 72%, dropped in 2001 to about 63%, and stayed at about that level until 2012-13. The Updates note that since then, occupancy rates have returned to the previous high pre~~-2001~~**-2001** level of about 72%, yet the water use in this sector is substantially lower than it was in 2001 – about 2,442 acre-feet per year in 2018 versus 3,387 acre-feet in 2001. The Updates credit this reduction to recent mandatory conservation standards and improved conservation measures, many of which are permanent. They **fail to** acknowledge, though, that ~~even~~

Note: These are not Commission staff's Recommended Findings

[~~127~~206] See April 2012 Pebble Beach Final Environmental Impact Report, Appendix H – Water Supply and Demand Information for Analysis. This document identifies demands wet, average, dry, and critically dry years that range from 128 to 145 acre-feet per year for buildout and 147 to 167 acre-feet per year for "other entitlement demand."

[207] **September 10, 2020, Pebble Beach Company Letter to Costal Commission, p. 2.**

~~with these improvements~~due to tiered water pricing that is in place to encourage conservation, many hotels in the region send laundry miles out of the area to be washed in less expensive service territories. Therefore, there is likely to be some "rebound" for this demand sector~~, though it is more likely~~. MPWMD assumes the rebound to be in the range of 100 to 250 acre-feet, without justification for those numbers, and not the 500 acre-feet referenced above.[~~128~~208] The Coalition of Peninsula Businesses disputes MPWMD conclusion and notes that the "500 afa of supply was intended to include not just the return to prior levels of occupancy on the Peninsula (full-service facilities, for instance, were at occupancy levels in the high 70s to low and mid-80s during 1998-99-2000) but water use increases as the rest of the Peninsula economy recovers…"[209] Although Cal-Am has contended that the bounceback would be higher because many of those conservation measures are temporary, MPWMD ~~confirmed~~claims that most are considered permanent, so the lower rates are likely to be long-term.

- **Lots of record:** Cal-Am's Final EIR/EIS identified an expected future annual demand of 1,181 acre-feet from development of vacant lots of record within ~~Cal-Am's~~Cal- Am's service area, based on a study done in 2002.[~~129~~210] The Updates ~~note~~argue that expected per capita or per household water use at the time of that 2002 analysis was substantially higher than current usage and argue that this expected future demand should be reduced to reflect this lower per capita use. They also ~~note~~argue that some of these lots included in this calculation are not buildable or have already been developed and are therefore already included as part of Cal-Am's existing demand. The Updates conclude that the proposed 1,181 ~~acre-feet~~acre-feet of demand should be reduced by about 167 acre-feet to reflect reduced per capita/per household usage and by about 150 acre-feet to account for already developed or undevelopable lots. It acknowledges that some growth will occur both within and near Cal-Am's service area, though that growth will be spread out over time rather than occur immediately. Overall, the Updates calculate the amount of new demand for this category at between 864 and 1,014 acre-feet.[~~130~~211] Cal-Am's June 30, 2020 letter disagrees with this lower projection, stating that once the CDO is lifted, a "pent-up demand" to build will occur. Even if that were to occur, the Updates argue that it would take many years of growth for any "pent-up demand" to reach either of the above-referenced future demand volumes. This growth issue is further detailed below.

Rate of increase for future demand: The Updates also evaluate how these overall future water demands would be developed over time. Unlike the approach taken in ~~Cal-Am's~~Cal-Am's Final EIR/EIS, which identified an existing demand of 12,000 acre-feet per year and a future need for 14,000 acre-feet per year but did not identify the rate at which that level of water

---

~~128~~208 The Final EIR/EIS also acknowledged that much of the expected rebound had occurred, that the 500 acre-foot demand expectation was long-term, and that a reasonable estimate for hospitality industry rebound would be on the order of 200 to 300 acre-feet per year. See Section 2 – Water Demand, Supplies, and Water Rights, page 2-13, and Section 6 – Other Considerations, page 6-15.

[209] September 24, 2019, Coalition of Peninsula Businesses letter to MPWMD, p. 4.

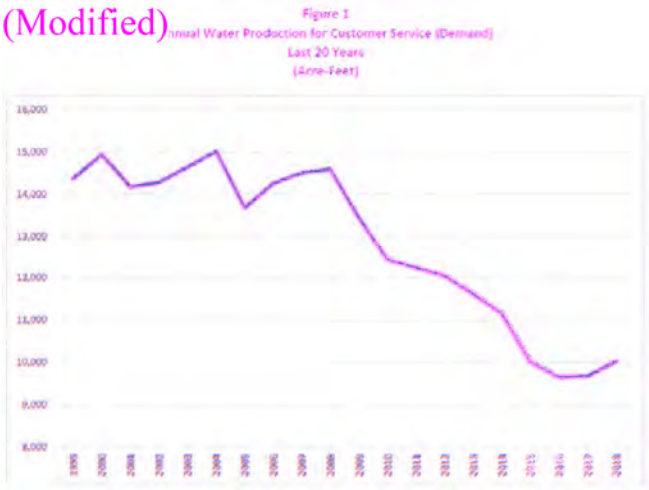
~~129~~210 The 2019 Update notes that this figure was based on a February 2002 analysis conducted by the ~~District~~MPWMD that was revised slightly upward later that year to about 1,211 acre-feet.

~~130~~211 This is largely consistent with ~~the District's~~MPWMD's testimony to the CPUC, in which it recommended the CPUC not use the 2002 figures for the reasons cited above. See Final EIR/EIS Section 2 – Water Demand, Supplies, and Water Rights, pages 2-14 & 2-15.

Note: These are not Commission staff's Recommended Findings

use would be needed, the Updates calculated expected rates of increase in demand by looking at past rates of growth in water demand and projecting them over the next several decades. They also included several additional considerations in their calculations, such as potential higher growth rates, the cost of water, and the effects of recent legislation that are expected to limit or reduce future per capita demands. These projections and other considerations are described below.

The Updates ~~found~~**argue** that annual water growth rates during the past 20 years, which included periods of high water availability as well as drought and imposed conservation measures, ranged from about nine to 16.4 acre-feet per year. Based on the current range of existing demand identified above – i.e., from 9,338 to 9,825 acre-feet per year ~~–~~and on the total available future supplies identified above in Table ~~7~~**6**, with Cal-Am's desalination scenario providing about 15,296 acre-feet per year and the Pure Water Expansion scenario providing about 11,294 acre-feet per year, **the Updates assert that** Cal-Am's Project would result in an immediate excess supply of between 5,471 and 5,958 acre-feet and the Pure Water Expansion would result in an immediate excess supply of between 1,469 and 1,956 acre-feet. ~~At~~**The Updates claim that at** the highest rate of past growth – 16.4 acre-feet per year – the total portfolio with the Pure Water Expansion would supply several decades of growth.[~~131~~212] The Updates also ~~considered~~**purport to consider** other growth scenarios, with higher water demands that still resulted in the Cal-Am water portfolio with the Pure Water Expansion providing sufficient water for several decades, as described below.



Additional considerations for projecting future demand: There are several additional planning considerations that **the Updates claim** support a conclusion that the Pure Water Expansion would provide water for a substantially higher number of years of growth in the area:

- **Continually lowering baseline:** As noted above, both the CPUC and the Updates considered a period of the past 10 years of usage data as a basis for average annual demand. The 2020 Update also identifies average demands based on the past five years and three years, both of which resulted in lower average demands of 9,825 ~~acre-feet~~**acre-feet** per year and 9,817 acre-feet per year, respectively, or about 10% less than the existing 10-year average. The Updates also include a graph showing the past 20 years of demand, which illustrates the substantial drop in water demand over that period and also illustrates that the early part of the most recent 10-year periods is much higher than current use – e.g., 2007 and 2008 have much higher demand than 2017 and 2018.

Note: These are not Commission staff's Recommended Findings

[~~131~~212] The substantially higher "overage" that Cal-Am's Project would supply might also raise concerns with conformity to Coastal Act Section 30254, which requires that new public works facilities be designed and limited to accommodate needs generated by development or uses consistent with other Coastal Act provisions.

(Modified)

This graph also illustrates that calculating the 10-year average during the next several years will involve removing the higher demand years from 2008 to about 2015 and replacing them with lower demand years of 2019, 2020, and onward. As noted above, Cal-Am's recent testimony to the CPUC shows that it expects demand in 2020 through 2022 to remain at the low end of use – about 9,789 acre-feet per year – which results in the high demand during 2008 and 2009 of around 14,000 acre-feet being replaced by upcoming years of about 4,000 acre-feet less demand. Moving forward each year by deleting the earliest year of the 10-year period and adding a new year that includes the expected high estimate of 16.4 acre-feet per year of predicted growth (which, as noted in the Updates, is the highest rate over the past 20 years) results in the next several 10-~~-~~year annual averages dropping well below the current 10-year average of 11,232 acre-feet per year – to a low of about 10,047 acre-feet in 2024.[~~132~~213] It would then be expected to start increasing at the anticipated rate of growth. This approach puts the upcoming 10-year averages much closer to the existing five-year average used in the 2019 Update and allows for a relatively consistent comparison with the same approach used in the CPUC's reliance of the 10-year average. As described below, more recent use figures provided by Cal-Am show an even lower current baseline.

- **Rate of market absorption of water demand:** Although the Updates use a ~~five-~~

[~~132~~213] This approach results in the 10-year annual average roughly equaling:

In 2019 (2010 to 2019): 10,902

In 2020 (2011 to 2020): 10,661

In 2021 (2012 to 2021): 10,467

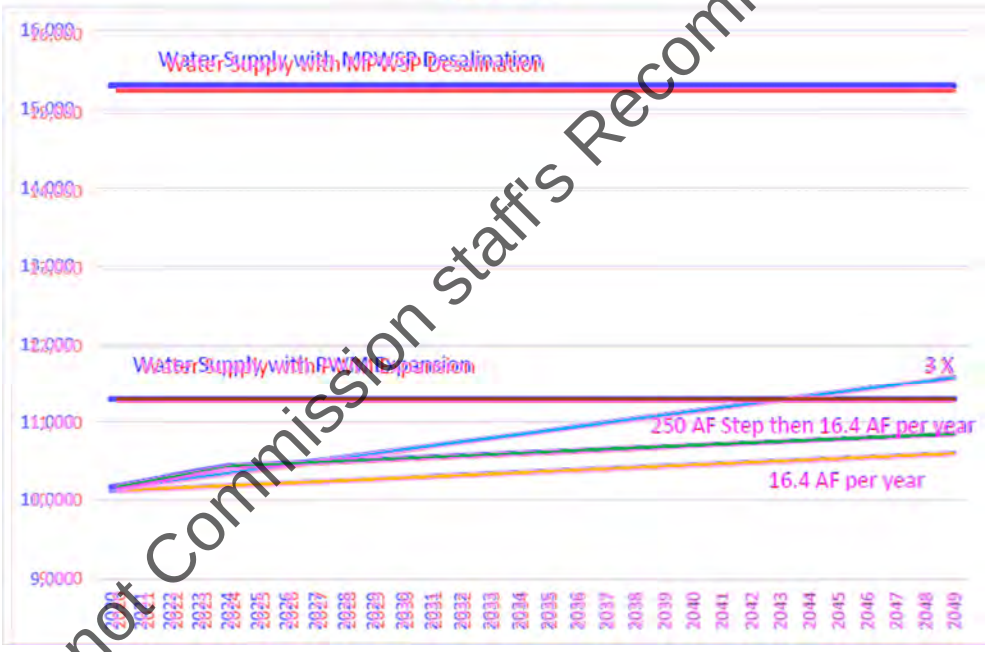
In 2022 (2013 to 2022): 10,280

In 2023 (2014 to 2023): 10, 135

In 2024 (2015 to 2024): 10,047

In 2025 (2016 to 2025): 10,061

In 2026 (2017 to 2026): 10,102



In 2027 (2018 to 2027): 10,140

Note: These are not Commission staff's Recommended Findings

~~year~~five- year average demand rather than the 10-year average demand used in the CPUC's review, it included ~~added~~ several potential growth scenarios to assess how the Pure Water Expansion would support expected growth into future decades. Using the current ~~five-year~~five-year average annual demand as a baseline, it calculated future expected water demands in three ways: 1) adding the above-referenced 16.4 acre-feet per year growth rate; 2) adding three times that growth rate; and 3) adding an initial 250 acre-feet of growth during the first five years, followed by annual 16.4 acre-feet growth rates. As shown on the 2019 Update's Figure 3, those projections show that Cal-Am's available water portfolio with the Pure Water Expansion instead of the desalination facility would provide sufficient water under those growth rates until well beyond 2050, until about 2043, and again, well beyond 2050, respectively.

(Modified)

Figure 3
Market Absorption of Water Demand Compared to Water Supply
Current Demand at 5-Year Average
(Acre-Feet)

- **Effects of cost on expected water demand:** Water use rates are also driven by considerations other than growth, including the cost of water. Reliance on either of these facilities – the Cal-Am project or the Pure Water Expansion – as part of ~~Cal-Am's~~Cal-Am's water portfolio would result in increased water costs and water rates in ~~Cal-Am's~~Cal- Am's service area. Current costs for water from the Carmel River and the Seaside Basin are in the range of several hundred dollars per acre-foot~~, whereas water from the Cal-Am project is expected to cost about $6,100 per acre-foot and water from the Pure Water Expansion about $2,340 per acre-foot. Either would increase the average cost of water from Cal-Am's water portfolio, though the Cal-Am project, at about three times the cost of the Pure Water Expansion, would create a substantially larger cost increase (this issue is discussed in more detail in Section II.N – Environmental Justice and Section II.P – Coastal-Dependent Industrial Facility Override). Additionally, because the Cal-Am project would be built to produce significantly more water than will be needed for a number of years, its~~

Note: These are not Commission staff's Recommended Findings

~~actual costs per acre-foot would be substantially higher than $6,100 for as long as the facility was operated at less than its design capacity. This is because its fixed costs, such as the capital costs for building the facility, would be spread among the smaller number of acre-feet actually produced. The Updates illustrate this difference, as shown in Table 8 below, which identify the expected cost per acre-foot at three different levels of production:~~.

As discussed above, the CPUC approved a rate increase of about $37-$40 per month for the average Cal-Am customer in a single family residence for desalination facility costs and financing, and that increase is not directly tied to per acre-foot water costs.[214] Whereas water from the Pure Water Expansion is currently projected to be somewhere in the range of $2,508 to $3,678 per acre-foot – at minimum, more than 50% above the rate of $1,720 per acre-foot approved by the CPUC. Either water supply project would increase the average cost of water from Cal-Am's water portfolio, though the expected costs of Cal-Am's proposed Project would be higher than those of the Pure Water Expansion. At current expected costs, ratepayers would pay more per acre-foot for Cal-Am's water than Pure Water Expansion. However, current costs projections for Pure Water Expansion do not account for costs already expended on the Cal-Am desalination facility, which is currently approximately $110 million, and it is reasonably foreseeable that such costs would be recovered via water rate increases in connection with the Pure Water Expansion. Further, as discussed in more detail in Section IV.N, *supra*, and as the CPUC recognized in its final decision to approve the Cal-Am Project's Final EIR/EIS, the relatively high cost of desalinated water must be balanced against the need to achieve a sufficient supply of reliable potable water for the Peninsula. Because there are no feasible alternatives to the proposed Project, it remains the best option to ensure water reliability. Moreover, with implementation of Special Condition 13, which will increase the discount offered from Cal-Am's Customer Assistance program and improve efforts to enroll eligible customers, costs to residents newly enrolled in the Customer Assistance program could see their rates drop rather than increase after the Project begins operations.

~~Table 8: Cal-Am costs per acre-foot at different production levels~~

~~Annual production by desalination facility (in acre-feet):~~	~~6,252~~	~~5,000~~	~~4,300~~
~~Annual fixed costs (in millions):~~	~~$30.3~~	~~$30.3~~	~~$30.3~~
~~Annual variable costs (in millions):~~	~~$7.8~~	~~$6.2~~	~~$5.4~~
~~Total annual costs to customers (in millions):~~	~~$38.1~~	~~$36.5~~	~~$35.7~~
~~Resulting cost per acre-foot~~	~~$6,094~~	~~$7,308~~	~~$8,294~~

~~As in past instances, if actual costs are higher than initially determined by the CPUC, Cal-Am would presumably seek to recover those costs through a CPUC-approved rate increase or surcharge.~~

[214] See August 13, 2020 Latham Letter to Commission, p. 1, Exhibit 1, p. 3 n.4 (citing Attachment C-1 to Advice Letter No. 1220-A from California-American Water Company to CPUC).

Note: These are not Commission staff's Recommended Findings

- **Lower per capita use due to conservation:** The Updates also describe the effects of recent legislation that establishes urban water efficiency standards to be implemented by water agencies.[~~133~~215] The legislation establishes standards for indoor and outdoor water use, allowable limits for water lost to leaks, and other measures meant to reduce per capita water use in the state. It establishes, for example, an indoor water use rate of 55 gallons per person per day that will be further reduced to 50 gallons per person per day in the coming years. The Updates note that per capita use in the Cal-Am service area is currently at 57 gallons per person per day, so meeting the new mandates will result in a relatively small reduction of about five percent per capita, which will likely lead to a moderate reduction in the future growth rates described above and will allow the water supplies provided by either project to last somewhat further into the future.

- **Effects of COVID-19 restrictions:** It is difficult to quantify the short- or longer-term effects of the COVID-19 pandemic on expected rates of water use. Cal-Am's service area has been heavily dependent on tourism and associated hotel, restaurant, and visitor-serving uses, but the water uses by those industries have been significantly curtailed due to pandemic-related travel restrictions and ~~shelter-in-place~~shelter-in-place requirements. With area residents sheltering in place, it is likely that residential water use has increased, but not sufficiently to match the missing demand of the above-referenced industries. ~~At the very least, it appears~~However, it is speculative to assume that COVID-19 will result in a slower and longer recovery or "bounce-back" period. ~~With the current lower baseline use and with 700 acre-feet per year of water available through ASR storage, Cal-Am will likely be able to meet its CDO obligations without having either project online by the December 2021 CDO deadline.~~

  To provide a short-term comparison, the chart below compares Cal-Am's ~~pre-COVID~~pre- COVID-19 total water production in March, April, May, and June of 2019 with its water demand during those same months in 2020 and shows an approximately 10% decrease in water use:

Month:	2019:	2020:	Reduction from 2019 to 2020:
March	1029.29	851.88	-177.41 (-17.2%)
April	1021.33	931.86	-89.47 (-8.8%)
May	917.91	843.90	-74.01 (-8.1%)
June	866.82	844.71	-22.11 (-2.6%)
Totals:	3835.35	3472.35	-363.00 (-9.5)

Note: all figures in acre-feet, and are obtained from Cal-Am's quarterly reports to the State Water Resources Control Board required by Cease-and-Desist Order 2016-0016, available at:
~~https://amwater.com/caaw/customer-service-billing/billing-payment-info/water-rates/monterey-district~~
https://amwater.com/caaw/customer-service-billing/billing-payment-info/water-rates/monterey-district

~~In sum, with the current 10-year annual average demand being lower than the demand identified in Cal-Am's Final EIR/EIS, with any of several potential future growth rates, and with increased water costs and increased conservation mandates, adding the Pure Water~~

[~~133~~215] The 2019 Update referenced both the 2018 adoption of SB 606 and AB 1668.

Note: These are not Commission staff's Recommended Findings

~~Expansion to Cal-Am's water supply portfolio instead of the desalination facility, is expected to provide sufficient water for at least the next two or more decades.~~

~~Two additional factors support this conclusion. First, and as noted above, the Updates include a category of "other available supplies" that would provide an additional 406 acre-feet per year to the above totals. These include:~~

- ~~Up to about 300 acre-feet per year from the Carmel River (through State Water Board Permit #21330 issued to Cal-Am in 2013).~~
- ~~Additional production from the Sand City desalination facility: up to about 106 acre-feet per year available to Cal-Am until Sand City generates sufficient growth and development to use this volume of water. At the time of the CPUC's review, this additional production had been suggested, but the CPUC found that it was not supported by credible evidence. More recently, however, Cal-Am's has reported as part of its compliance requirements to the State Water Board that it used 189.55 acre-feet from the Sand City facility during the most recent water year, about 80% more than had been anticipated in the CPUC's review.~~

- ~~"Carryover Credit" from the Seaside Groundwater Basin: Cal-Am has a number of "credits" for water in the Seaside Groundwater Basin that Cal-Am was allowed to produce, but did not produce due to constraints within the delivery system. The Basin currently has about 1,400 acre-feet in storage.~~

~~While these supplies are not as certain or may not be as consistently reliable as other supplies in Cal-Am's water portfolio, some proportion of these 406 acre-feet is likely to be available as part of future supply portfolios.~~

Maximum daily and peak hour demands: As noted above, Cal-Am's CEQA review evaluated whether the desalination facility, if included as part of Cal-Am's water portfolio, would allow Cal-Am's water system to provide maximum daily demand ("MDD") and peak hour demand ("PHD"), pursuant to the state's requirements for public water systems. That review considered Cal-Am's peak month demand as being ~~the critical~~thecritical determinant as to whether the system could meet MDD and PHD. The review used July of 2010 as the peak month demand, when Cal-Am's ratepayers used 1,111 acre-feet of water. The CPUC's Final Decision noted, based on the information available at that time, that the MDD was 60.48 acre-feet (about 19.7 million gallons) and the PHD was 15.12 acre-feet (about 4.9 million gallons).

MPWMD has also prepared calculations to determine whether including the Pure Water Expansion instead of the desalination facility as part of the water portfolio could meet maximum daily and peak hour demands (see Exhibit ~~17~~19 – MPWMD *Analysis of Available Well Capacity for 10-Year Maximum Daily Demand (MDD) and Peak Hour Demand (PHD)*). It used an even higher peak month as its baseline – July of 2012, when demand was 1,206 acre-feet – and determined that the Pure Water Expansion would more than allow Cal-Am to meet these standards. ~~The District's~~MPWMD's calculations included assumptions that the additional well capacity included as part of the Pure Water Expansion and a proposed pump station would be developed as proposed and one or more existing wells not currently connected to the system could be added. It concluded that these demands could be met under any of several operating scenarios that used the Pure Water Expansion instead of the desalination facility. Cal-Am's June 30, 2020 letter stated that the Pure Water Expansion would not be sufficient to support these peak demand needs~~; however, it neglected to address other factors that were~~

Note: These are not Commission Staff's Recommended Findings

~~addressed in another recent study, as described below.[134]~~. Cal-Am explained that using only MDD and PHD to project demand is inappropriate because public water systems must be able to "deliver water supplies at near MDD levels during dry years over a few maximum months of demands." The appropriate way to ensure adequate capacity is by calculating demand based on maximum month demand ("MMD") as required by the California Waterworks Standards (Cal. Code Regs., tit. 22, § 64554, subds. (a), (b)(2)). Cal-Am explained that MPWMD's conclusion that the Pure Water Expansion can meet MDD and PHD relies on the availability of drought reserves to meet such demand—however, MPWMD also assumes that no drought conditions will occur on the Monterey Peninsula between now and 2034, allowing for the buildup of such reserves. As explained below, the assumption that the Peninsula will not experience drought conditions over any significant period is wholly untenable, given that California has experienced a drought in every decade over the last century,[216] and recharge of groundwater reserves is essentially unavailable under drought conditions.[217]

~~Drought supply: A key concern raised by Cal-Am and others about the Pure Water Expansion is whether it would be able to provide sufficient water supply during multiple years of drought. The Project Final EIR/EIS described concerns about whether even the first phase of the Pure Water project would provide sufficient water during multiple drought years, and it based the approved size and volume of the desalination facility, in part, with this concern in mind.[135] MPWMD has evaluated how much water would be available during multiple drought years and determined that, with the Pure Water Expansion adding water to the ASR project each year and with the current level of demand and expected increases in that demand, Cal-Am's portfolio could provide adequate water for multiple drought years (see Exhibit 18 – Final Supplemental Environmental Impact Report for the Proposed Modifications to the Pure Water Monterey Groundwater Replenishment Project, April 2020, Appendix M: Source Water Operational Plan Technical Memorandum). MPWMD's modeling shows that the amount of water stored in the ASR would increase at a rate allowing it to contribute water to Cal-Am's water supply portfolio during an increasing number of drought years through time. Starting in 2020, the ASR would provide between about 4,750 and 5,950 acre-feet per year and by 2024 would have enough water stored to provide for about two years of drought~~

~~[134] In an April 17, 2020 call with staff of the State Water Board's Drinking Water Division and MPWMD to discuss MPWMD's analysis, Board staff identified no inconsistencies with state drinking water requirements.~~

[216] See U.S. Geological Survey, 2012-2016 California Drought: Historical Perspective, available at https://ca.water.usgs.gov/california-drought/california-drought-comparisons.html#:~:text=Runoff%20and%20precipitation%20conditions%20for%20California's%20six%20historical%20droughts; California Department of Water Resources, California's Most Significant Droughts: Comparing Historical and Recent Conditions, p. 54 (January 2020), available at https://water.ca.gov/-/media/DWR-Website/Web-Pages/What-We-Do/Drought-Mitigation/Files/Publications-And-Reports/a6022_CalSigDroughts19_v9_ay11.pdf.

[217] In an April 17, 2020 call with staff of the State Water Board's Drinking Water Division and MPWMD to discuss MPWMD's analysis, Board staff identified no inconsistencies with state drinking water requirements.

~~[135] See, for example, the Final EIR/EIS Section 8.2.13 at pages 117-18, which states: [t]he recent severe, five-year drought demonstrated that it is not reasonable to assume that there would never be drought conditions that could deplete ASR reserves and prevent new ASR supplies being diverted from the Carmel River for storage and use. Consequently, changes in plant sizing based on scenarios that assume the availability of adequate ASR supplies would need to be considered carefully.~~

Note: Three additional Commissioner staff's Recommended Findings

~~and by 2034 would have enough stored for at least four years of drought and possibly longer.~~

Other reviews: In response to the November 2019 Commission staff report on the ~~Cal-Am~~Cal-Am project and to the 2019 Update, Cal-Am prepared a review and critique of the conclusions of those documents. However, that review (see Exhibit ~~19~~21 – California American Water Peer Review of Supply and Demand for Water on the Monterey Peninsula, Hazen and Sawyer, January 22, 2020) assumed for its analyses that ~~Cal-Am's~~Cal- Am's current demand was 12,350 acre-feet per year, which was substantially greater than the above-referenced 9,789 acre-feet that ~~Cal-Am~~Cal-Am has recently acknowledged to be its expected demand in 2019 through 2022.

In addition to the analyses conducted by the CPUC, Cal-Am, and MPWMD, ~~the Marina Coast Water District ("~~MCWD~~") –~~ conducted its own analyses to identify whether the Pure Water Expansion would provide adequate future water supplies. ~~The~~ MCWD's report (see Exhibit ~~20~~22 – Expert Report and Recommendations of Peter Mayer, P.E., Regarding Water Supply and Demand in the California American Water Company's Monterey Main System, April 21, 2020) used an even higher, and therefore more conservative, demand figure than both the MPWMD and Cal-Am had used (9,885 ~~acre-feet~~acre- feet versus 9,825 and 9,789 acre-feet, respectively), but similarly concluded that the Pure Water Expansion would meet water needs and state requirements until at least 2040. ~~These reports also countered the other conclusions of the above-referenced Hazen and Sawyer report – for example, they point out that the Hazen and Sawyer report made errors in its peak demand analyses and assumed that per capita water use would increase despite state requirements to reduce that use.~~[136]

The Mayer report includes additional assessments of expected growth, using population projections provided by the Association of Monterey Bay Area Governments ("AMBAG") and based on expected water usage in the various water demand sectors – e.g., residential, commercial. It evaluated expected water use using both the current demands and using the expected reductions in demand that would occur during ongoing implementation of water efficiency measures. Under both scenarios, it determined that either project would allow Cal-Am to have sufficient water supplies through 2040 and that adding the Pure Water Expansion to Cal-Am's water supply portfolio would provide an approximately 1,200-acre-foot surplus supply in 2040. It also provides an evaluation of how the Pure Water Expansion would allow Cal-Am to meet expected peak demand requirements under any of several scenarios and shows that ~~Cal-Am~~Cal-Am has additional water management options – such as adding additional pumping capacity, implementing rate or demand control measures, etc. – that would provide even more ability, if needed, to meet those peak demands.

Demand Determinations

The Commission has been presented with conflicting ranges of estimates and projections of current and future water demand for the Peninsula. The MPWMD range of future demand is 10,855 acre-feet per year to 12,287 acre-feet per year.[218] Demand

---

~~[136] See also the March 6, 2020 letter from the Monterey Peninsula Water Management District to Cal-Am, which raises similar concerns about the Hazen and Sawyer report.~~

[218] Compare Update 2019 Table 8 with Update 2020 Table 9. In the 2019 Update, MPWMD estimated the higher end of demand to be 12,656 acre-feet per year but revised its estimate to 12,287 acre-feet in the 2020 Update.

Note: These are not Commission staff's Recommended Findings

projections from MCWD are generally within this same range. In response to the analysis provided to the Commission by MPWMD and MCWD, on August 12, 2020, Cal-Am submitted an expert report prepared by Hazen and Sawyer, which demonstrates that the Pure Water Expansion is not capable of meeting even the most conservative end of the range of demand estimates when combined with Cal-Am's existing portfolio without the desalination Project.[219] A supplemental report from Hazen and Sawyer, dated September 10, 2020, and attached hereto as Exhibit 23, confirms this assessment. Therefore, without deciding on the merits of the various demand projections presented to the Commission, for purposes of determining whether the Pure Water Expansion could provide sufficient supply to meet the Peninsula's water demand, the Commission is assuming that demand for Cal-Am's Monterey service area is 10,855 acre-feet per year (although MPWMD has acknowledged that demand may be as high as 12,287 acre-feet per year).[220]

Evaluation of Available Supplies to Meet Demand

To determine if the Pure Water Expansion is a feasible alternative to the Project, it must be determined whether available water supplies within Cal-Am's service territory can meet 10,855 acre-feet per year of demand with only the addition of the Pure Water Expansion.

The CPUC analysis showed that Cal-Am's water portfolio, including production from the proposed desalination facility, would provide about roughly 1,300 acre-feet more water than needed to serve the CPUC expected 14,000 acre-feet per year demand. The components of the expected water portfolio are shown in Table 5 and described below.

Table 5: CPUC identified available water supplies

Source:	Amount Available (in acre-feet per year):
Carmel River	3,376
Seaside Groundwater Basin	774
Aquifer Storage and Recovery	1,300
Sand City Desalination Facility	94
Pure Water Monterey Groundwater Replenishment Project	3,500
Total:	9,044
Total when including a 6.4 mgd (6,252 afy) desalination facility:	15,296

[219] See Exhibit 25 – August 11, 2020 Hazen Memo.

[220] Since the Commission adopts the most restrictive estimate of demand for purposes of evaluating the feasibility of the Pure Water Expansion, the Commission does not need to evaluate arguments from MCWD, Stoldt, and Marina concerning the effectiveness of future conservation measures, the effects of increased customer rates on demand, expected demand from the buildout of the Pebble Beach entitlements and lots of records, hospitality industry rebound/tourism bounce-back or other similar arguments that demand will be further depressed.

Note: These are not Commission staff's Recommended Findings

A common principle in water planning is that having more water sources is preferred to having fewer, as more sources generally allow for more overall reliability. Although some areas in the state rely on one or two main sources (along with conservation) to meet their water needs. However, the Peninsula is unique and does not have a significant local water supply source of its own. As shown above, Cal-Am currently has five sources (not counting conservation). Adding the Pure Water Expansion and including it as part of the existing Pure Water project would keep Cal-Am with five sources, while adding desalination would increase sources to six.

In summary, the CPUC identified a current baseline use of 12,000 acre-feet per year, an expected future demand of about 14,000 acre-feet per year, and an available supply, including Cal-Am's proposed desalination facility, of 15,296 acre-feet per year.

Similar to the competing demand scenarios described previously, the Commission received competing analyses purporting to identify the available water supplies for the Peninsula within Cal-Am's water supply portfolio. Table 7 below summarizes the conflicting evaluations of available supplies.

Note: These are not Commission staff's Recommended Findings

Table 7: Identified Available Water Supplies In Acre-Feet Per Year

Note: These are not Commission staff's Recommended Findings

The availability of the water supply sources included in Table 7 above are described in more detail below.

Source 1. Carmel River.

Although Cal-Am is required to reduce its withdrawals from the Carmel River, it continues to have the legal right to withdraw 3,376 acre-feet per year from the river.

Source 2. Seaside Groundwater Basin.

Cal-Am has also relied on past withdrawals from the Seaside Groundwater Basin. As part of the Basin's adjudication in 2006, Cal-Am was determined to have rights to 1,474 acre-feet per year from the Basin; however, based on its overwithdrawals from past years, Cal-Am is required to replenish the Basin at a rate of 700 acre-feet per year over a 25-year period, which limits its allowable withdrawals to 774 acre-feet per year. In an August 12, 2020 memorandum, the Seaside Groundwater Basin Watermaster expressed concern that the Basin would need additional water – about 1,000 acre-feet per year over and above the currently proposed 700 acre-feet per year – to provide protective groundwater elevations in the Basin, and that the proposed Project is the only possible source for this additional supply. For the sake of this alternatives analysis of the Pure Water Expansion, the Commission is utilizing the most conservative demand levels presented to it (10,855 acre-feet per year) without considering the potential need for an additional 1,000 acre-feet per year for the Seaside Basin. The Commission notes, however, that based on the submission from the Seaside Groundwater Basin Watermaster, future demand on the Peninsula could increase by 1,000 acre-feet per year to account for the additional water needed to prevent groundwater intrusion in the Basin.

Source 3. Aquifer Storage and Recovery ("ASR").

Cal-Am and MPWMD together implemented an ASR project that provides a water supply based on using available storage capacity in the Seaside Basin. The project involves diverting high winter flows of Carmel River water into the Basin for later recovery, treatment, and delivery to customers during summer months to help reduce summer withdrawals from the river. The winter flows it diverts are only those identified as excess to the flows needed to support the river's threatened steelhead population. MPWMD's website explains that the first ASR phase was completed in 2008 and allows a maximum annual diversion of about 2,400 acre-feet per year from the Carmel River, and has an average yield of approximately 920 acre-feet per year. The second phase, completed in 2013, allows storage of up to 2,900 acre-feet per year and provides an average yield of 1,050 acre-feet of additional water supply.[221] However, MPWMD explains in the Updates that "[b]ased on long-term historical precipitation and streamflow data, ASR is designed to produce 1,920 AFA on average."

The analyses in the Updates rely on ASR providing 1,300 acre-feet every year for Pure Water Expansion to meet existing Peninsula water demand and assumes no drought between now and 2034. These assumptions are unrealistic for the following reasons. First, as explained in the August 11, 2020 report from Hazen and Sawyer, ASR using excess Carmel River water in the past 15 years has not shown the ability to consistently

[221] See https://www.mpwmd.net/water-supply/aquifer-storage-recovery/

Note: These are not Commission staff's Recommended Findings

provide 1,300 acre-feet in any given year, much less in drought years. Between 2005 and 2019, annual ASR reinjection only reached 1,300 acre-feet twice.[222] During that same period, ASR only achieved an output of the 1,300 acre-feet assumed by the Updates once. Second, during drought periods, injeciton and recovery from ASR is essentially unavailable. In a single dry year, ASR water availability is reduced to 63%. Following three dry years, ASR availability is reduced to 4%.[223] The reliability of ASR during drought conditions is depicted in Cal-Am's Urban Water Management Plan Table 6-2, as shown below.

(Added)

Table 6-2: Monterey County District Supply Reliability-Current Water Use

Water Supply Sources[1]	Average / Normal Water Year Supply	Single Dry Water Year	Multiple Dry Water Year Supply		
			Year 1	Year 2	Year 3
Carmel Valley Aquifer	100%	100%	100%	100%	100%
Seaside Groundwater Basin	100%	100%	100%	100%	100%
Salinas Valley Groundwater Basin	100%	100%	100%	100%	100%
Aquifer Storage and Recovery	100%	63%	74%	17%	4%
Sand City Desalination	100%	100%	100%	100%	100%

Third, ASR has not proven itself capable of building up a drought reserve to consistently deliver 1,300 acre-feet. For the last 15 years, average annual storage of ASR is approximately 138 acre-feet per year. Over the last five years, average annual storage of ASR is 352 acre-feet per year.[224] These amounts are not sufficient storage to provide 1,300 acre-feet annually over a multi-year drought. As a result, the Commission cannot rely on the availability of 1,300 acre-feet per year from ASR as part of the water supply portfolio.

In Table 7, three ASR Controlled scenarios are presented: No ASR, Half ASR (650 acre-feet per year), and Full ASR (1,300 acre-feet per year). The Half ASR scenario involves more generous assumptions of ASR availability than the ASR average of 450 acre-feet per year during the past 22 years. Under these three scenarios, water supply for all other sources is assumed to be equal to the availability assumed by the Updates and by the CPUC – i.e., only availability of ASR is variable. As shown, ASR must provide 1,300 acre-feet per year every year in order to achieve the low end demand of 10,855 acre-feet per year. Under the Half ASR scenario, this demand cannot be met.

When a multi-year drought is considered, the availability of ASR is reduced to zero. The Updates assume that ASR water supply is available each year, such that the Peninsula can build up a reserve of ASR water to compensate for extended drought conditions, and that no drought will occur between now and 2034. In assuming that no drought will occur, the Updates also ignore the fact that ASR recharge is unreliable and takes place

[222] Exhibit 25 – August 11, 2020 Hazen Memo, pp. 5, 19.

[223] Exhibit 21 – January 23, 2020 Hazen Memo, pp. 6-8; Exhibit 25 – August 11, 2020, Hazen Memo, pp. 5.

[224] Exhibit 25 – August 11, 2020 Hazen Memo, p. 5.

Note: These are not Commission Staff's Recommended Findings

intermittently, at best. California has experienced a multi-year dry period or drought in every decade for the last century, and recharge of groundwater reserves is essentially unavailable under drought conditions. Therefore, it is inappropriate not to consider the effects of drought when analyzing the availability of ASR water. ASR water availability is reduced to 63% in a single dry year, and even further reduced to 4% following three dry years.[225] Accordingly, when considering availability of ASR alone, the Pure Water Expansion cannot meet even the low demand projection of 10,855 acre-feet per year. As discussed below, when drought is factored in while also considering the availability of wastewater and Reclamation Ditch flows, the Peninsula's water supply deficit could reach upwards of 5,311 acre-feet.

Source 4. Sand City Desalination Facility.

This facility is owned by Sand City but operated by Cal-Am. Of the facility's 300 acre-feet per year capacity, Cal-Am has available to it a long-term supply of 94 acre-feet per year.

Source 5 and 6. Pure Water Project and Pure Water Expansion.

At the time of the CPUC's review, the first phase of Cal-Am's Project – a joint proposal by the Monterey Regional Water Pollution Control Agency and MPWMD – had just undergone environmental review. The project involves treating several water sources – including treated wastewater, agricultural runoff water, and stormwater – and injecting the treated water into the Seaside Groundwater Basin for later additional treatment and use as a potable water supply. The CPUC's decision to approve Cal-Am's desalination facility relied on Cal-Am being able to purchase 3,500 acre-feet per year from the Pure Water project, which allowed the CPUC to reduce the size of Cal-Am's desalination facility from its initially proposed 10,700 acre-feet per year to its currently proposed 6,252 acre-feet per year (i.e., from 9.6 to 6.4 mgd). As discussed in the feasibility analysis above, due to technical issues, the Pure Water project is currently only capable of producing 2,030 acre-feet per year, which is less than 58 percent of the 3,500 acre-feet per year the project was intended to produced. The Pure Water Expansion is intended to expand the Pure Water project with the goal of supplying 2,250 acre-feet per year in addition to the 3,500 acre-feet per year to be supplied by the Pure Water project. In order to achieve the low-end demand of 10,855 acre-feet per year, MPWMD has assumed that 100% of the projected supplies from both the Pure Water project and the Pure Water Expansion will be available at all times.

Speculative Source Water Supplies for the Pure Water Project and Expansion. As described above in the discussion of Pure Water Expansion feasibility, there is significant uncertainty and controversy surrounding the availability and reliability of the source waters for the Pure Water project and the Pure Water Expansion. (See Section IV.C.1, *supra*.) Many of the water sources purportedly available to Monterey One Water to supply the Pure Water project and the Pure Water Expansion are either contractually dedicated to other users or are merely "paper" water, meaning these sources are not actually available when Monterey One Water needs them most, such as during the summer or during drought. Relying on such speculative water sources to supply the Pure Water Expansion will result in inadequate supplies for the Peninsula.

[225] Exhibit 21 – January 23, 2020 Hazen Memo, pp. 6-8.

Note: These are not Commission staff's Recommended Findings

It is unnecessary to make any conclusions regarding the contractual disputes between Monterey One Water and other public agencies (such as Monterey One Water's dispute with MCWRA over the ARWRA source waters and Monterey One Water's dispute with the City of Salinas regarding use of the City's agricultural produce wash water). Instead, the limited and variable availability of WWTP flows and surface water flows from the Reclamation Ditch indicate that the Pure Water project and the Pure Water Expansion will not be able to produce their assumed supply of 3,500 acre-feet per year and 2,250 acre-feet per year, respectively.

- WWTP Flows. There are significant limitations on wastewater flows, and data gaps within the analyses in the SEIR for the Expansion and offered by the Updates that do not account for the continuing decrease in WWTP flows in the region over the past decade. Specifically, the SEIR and subsequent analysis provided by the Updates and MCWD do not account for WWTP flows beyond 2013. In response to the August 11, 2020 Hazen and Sawyer memo demonstrating that WWTP flows declined significantly since 2013, Monterey One Water made updated WWTP flow information available to the Commission and the public for the first time on August 20, 2020. In Hazen and Sawyer's August 23 and September 10, 2020 supplemental reports, Hazen demonstrates that based on the new WWTP flow information provided by Monterey One Water, the Pure Water project and the Pure Water Expansion cannot reasonably rely on WWTP flows to produce 3,500 acre-feet per year and 2,250 acre-feet per year, respectively. Similarly, there is a continuing decline of wastewater effluent directed to the ocean outfall. The Draft SEIR indicated that there was approximately 8,000 acre-feet per year of wastewater effluent available to the ocean outfall in a normal year. (Draft SEIR Appendix M, Table 2.) However, the Final SEIR updated this assumption to 5,811 acre-feet per year. When considering Monterey One Water's flow information for 2020, which shows wastewater flow at 17,980 acre-feet, the available wastewater flow to the ocean outfall is 5,554 acre-feet.[226] Given that the Pure Water project requires 4,568 acre-feet-per-year of wastewater to produce 3,700 acre-feet-per-year in product water for Cal-Am and to build a drought reserve, and the Regional Urban Water Augmentation Project requires at least 741 acre-feet-per-year, only 432 acre-feet-per-year in WWTP flows will be available for the Pure Water Expansion.[227] Given that the Pure Water Expansion requires at least 2,778 acre-feet-per-year to produce the promised 2,250 acre-feet-per-year in treated water, available WWTP source waters are insufficient to allow the Expansion to operate near its capacity. Actual WWTP flows are likely to be even less in dry years, during which there will be no flow available for the Pure Water Expansion. When data and wastewater trends are taken into account, the Pure Water project and the Pure Water Expansion would not have sufficient source water to provide the Peninsula with an adequate water supply during substantial periods during the year in both normal and dry years.[228]
- Reclamation Ditch Flows. As explained above, the Pure Water projects depend heavily on surface water flows. Among the surface water flows relied upon for the Pure Water projects is flow from the Reclamation Ditch. Reclamation Ditch flows were analyzed originally in the Schaaf & Wheeler Agricultural Ditch Yield Study,

[226] Exhibit 23 – September 10, 2020 Hazen Memo, p. 2.

[227] *Id.*

[228] Exhibit 25 – August 11, 2020 Hazen Memo, pp. 6-10.

Note: These are not Commission staff's Recommended Findings

March 2015, based on 2006-2014 data, and were updated in the Pure Water Expansion SEIR Appendix I Tables 8-11. Hazen and Sawyer's August 11, 2020 report updated Reclamation Ditch flows using actual recorded flow data from U.S. Geological Survey ("USGS").[229] Notably, the USGS data provides recorded Reclamation Ditch flow by month from 2010 to April 2020. Based on a review of actual flow records from USGS, the SEIR for the Pure Water Expansion significantly overestimated the availability of Reclamation Ditch flow by 16 to 67 percent in critical summer months.

- Monterey One Water has claimed that it has secured agreements for more than adequate source waters to supply the Pure Water Expansion. However, Tables 2 and 3 to the Pure Water Expansion SEIR, coupled with the above-described analysis of WWTP flows, demonstrates that sufficient source waters are not in fact available. When accounting for all assumed and estimated source water flows according to the Source Water Priority Table 3 in Appendix M to the Pure Water Expansion SEIR, there is only 2,297 acre-feet-per-year available to the Pure Water Expansion.[230] With such flows available, the maximum treated water that could be produced by the Pure Water Expansion amounts to 1,860 acre-feet-per-year. That supply is further reduced to 1,597 acre-feet-per-year if source water figures are reduced to account for current wastewater flows described above. These supplies are far below the 2,250 acre-feet-per-year that Monterey One Water claims could be supplied by the Pure Water Expansion, and would not provide adequate supplies to meet demand in Cal-Am's Monterey service area.

In Table 7, under the Wastewater & Reclamation Ditch Scenarios, the source water data in the FSEIR has been updated to account for the availability of WTTP flows and Reclamation Ditch flows. Under these three scenarios, all other sources, including ASR, are assumed to be fully available. As depicted in the Wastewater & Reclamation Ditch Scenarios in Table 7, the operation of the Pure Water project and the Pure Water Expansion, when combined with Cal-Am's existing sources, cannot satisfy MPWMD's low-end demand estimate of 10,855 acre-feet per year. In normal years the supply deficit could range from -1,083 acre-feet to -1,092 acre-feet, while in a dry year that deficit could reach -5,311 acre-feet. If the full availability of ASR were replaced in the table with realistic ASR assumptions for the Wastewater & Reclamation Ditch Scenarios, then the supply deficit would be even more severe.

Source 7. Other Available Supplies.

The Updates also assert that the following "Other Available Sources" are available to Cal-Am:

- Up to about 300 acre-feet per year from the Carmel River ("Table 13" water rights through State Water Board Permit #21330 issued to Cal-Am in 2013). Cal-Am's

[229] Exhibit 25 – August 11, 2020 Hazen Memo, pp. 10-11; see also September 10, 2020 Pebble Beach Company Letter to Coastal Commission p.2 (From 30 years of experience with the Pebble Beach water reclamation project "we've learned that the supply of recycled water is extremely dependent upon the community's potable water use that, in turn, supplies the 'raw product' for the reclamation process… Recycled water alone simply cannot meet the Monterey Peninsula's water supply needs on a sustainable, long-term basis.")

[230] See Exhibit 23 – September 10, 2020 Hazen Memo, p. 2.

Note: These are not Commission staff's Recommended Findings

Table 13 water rights under Permit 21330 provide a potential right to divert up to 1,488 acre-feet per year from the Carmel River, but this right is only available between December and May and is subject to instream flow requirements, such that in times of drought Table 13 water may not be available. Use of Table 13 water is also limited to the Carmel River watershed. The Updates acknowledges these limitations, but assumes that 300 acre-feet per year will be available, despite the fact that diversions were only 42.2 acre-feet in 2015 and 164.2 acre-feet in 2016. A water system's supply must be assessed in dry and multiple dry water years, and must include the source's lowest anticipated daily yield.[231] Because of the uncertainty of availability of Table 13, inclusion of any permitted amounts from this source in determining adequacy of supplies is speculative and not supported.

- Additional production from the Sand City desalination facility: up to about 106 acre-feet per year available to Cal-Am until Sand City generates sufficient growth and development to use this volume of water. The CPUC considered whether any additional supply was available from the Sand City desalination plant, and specifically whether an additional 106 acre-feet per year was available to Cal-Am. The CPUC concluded that arguments about any additional allocation above the 94 acre- feet per year already allocated to Cal-Am confused the Sand City plant's total expected production of 200 acre-feet-per-year with Cal-Am's allocation, and that no credible evidence supported the claim that Cal-Am would be able to rely on receiving more than the 94 acre-feet-per-year to which it is currently entitled.[232] More recently, Cal-Am has reported as part of its compliance requirements to the State Water Board that the Sand City facility had produced a total of 153.95 acre-feet during the 2018-2019 recent water year, although Cal-Am's existing agreements continue to permit it to utilize only 94 acre-feet-per-year of the production from the Sand City facility.[233] As such, reliance on this water source in an amount greater than 94 acre-feet-per-year is speculative.

- "Carryover Credit" from the Seaside Groundwater Basin: Cal-Am has a number of "credits" for water in the Seaside Groundwater Basin that Cal-Am was allowed to produce, but did not produce due to constraints within the delivery system. The Updates assert that the Basin currently has about 1,400 acre-feet in storage. However, this position conflicts with the CPUC's determination that only 774 afy is available from the Seaside Basin: "Cal-Am's has an adjudicated right to 1,474 afy from the Seaside Groundwater Basin. *See, Cal-Am v. City of Seaside et al., Super. Ct. Monterey County, 2006*, No. M66343. However, Cal-Am must also repay the Seaside Basin for overdrafts and has therefore assumed a reduction of supply of 700 af, over 25 years, resulting in a net supply available to Cal-Am of 774 afy from the Seaside Groundwater Basin."[234] Further, the Seaside Watermaster has provided the Commission with evidence that up to an additional 1,000 acre-feet per year may need to be injected into the Seaside Basin to prevent seawater intrusion. If the Seaside Basin were to become seawater intruded, then Cal-Am

[231] See Water Code, § 10635(a); Cal. Code Regs., tit. 22, § 64554(k).

Note: These are not Commission Staff's Recommended Findings

and others (including Monterey One Water) may not be able to pump water from the Basin.

While these supplies are not as certain or may not be as consistently reliable as other supplies in Cal-Am's water portfolio, some proportion of these 406 acre-feet is likely to be available at certain times as part of future supply portfolios. To ensure a more conservative assessment of available supplies, the "Other Available Supply" category above is considered a speculative supply and not certain to be available to Cal-Am, as that category includes some less certain water sources.

Drought Supply Considerations.

A key concern raised by Cal-Am and others about the Pure Water Expansion is whether it would be able to provide sufficient water supply during multiple years of drought. The Project Final EIR/EIS described concerns about whether even the first phase of the Pure Water project would provide sufficient water during multiple drought years, and it based the approved size and volume of the desalination facility, in part, with this concern in mind.[235] MPWMD has evaluated how much water would be available during multiple drought years and determined that, with the Pure Water Expansion adding water to the ASR project each year and with the current level of demand and expected increases in that demand, Cal-Am's portfolio could provide adequate water for multiple drought years.[236] MPWMD's modeling purports to show that the amount of water stored in the ASR would increase at a rate allowing it to contribute water to Cal-Am's water supply portfolio during an increasing number of drought years through time. Starting in 2020, MPWMD assets that the ASR would provide between about 4,750 and 5,950 acre-feet per year and by 2024 would have enough water stored to provide for about two years of drought and by 2034 would have enough stored for at least four years of drought and possibly longer. MPWMD also assumes that no drought will occur on the Peninsula between now and 2034.

As discussed above, these assumptions are unrealistic. First, ASR using excess Carmel River water in the past 15 years has not shown the ability to consistently provide 1,300 acre-feet in any given year, much less a drought year. Between 2005 and 2019, annual ASR reinjection only reached the 1,300 acre-feet twice and only achieved the 1,300 acre-feet output assumed by the Updates once.[237] Further, as shown in Table 6-2, from Cal-Am's Urban Water Management Plan, ASR is significantly reduced in dry years and unavailable in drought years. Finally, ASR has not proven itself capable of building a sufficient drought reserve to consistently deliver 1,300 acre-feet based on average

[235] See, for example, the Final EIR/EIS Section 8.2.13 at pages 117-18, which states: [t]he recent severe, five-year drought demonstrated that it is not reasonable to assume that there would never be drought conditions that could deplete ASR reserves and prevent new ASR supplies being diverted from the Carmel River for storage and use. Consequently, changes in plant sizing based on scenarios that assume the availability of adequate ASR supplies would need to be considered carefully.

[236] See Exhibit 20 – Final Supplemental Environmental Impact Report for the Proposed Modifications to the Pure Water Monterey Groundwater Replenishment Project, April 2020, Appendix M: Source Water Operational Plan Technical Memorandum.

[237] Exhibit 25 – August 11, 2020 Hazen Memo, pp. 5, 19.

Note: These are not Commission staff's Recommended Findings

annual storage over the last 15 years (138 acre-feet) and five years (352 acre feet)[238] Since ASR has not been able to store 1,300 feet consistently, it cannot be relied upon to deliver 1,300 acre-feet in any given year or a consecutive year period.[239]

In order to achieve the amount of storage that MPWMD claims, it would require more than a decade without any drought on the Peninsula. MPWMD's assumption that the Peninsula will not experience drought conditions over any significant period is not reasonable given that California has experienced a multi-year dry period or drought in every decade for the last century. As shown in Table 7 above, during drought conditions, ASR water is essentially unavailable, which would increase the supply deficit that would result from adding the Pure Water Expansion to Cal-Am's existing water supplies. There is simply no assurance that sufficient water is available for ASR reinjection and storage in any given year, much less to build up adequate storage during drought years. As a result, the Commission cannot rely on the availability of 1,300 acre-feet per year from ASR as part of the water supply portfolio.

The Pure Water Expansion also fails to comply with California mandates designed to ensure that as climate change continues, water suppliers remain capable of providing a drought-proof supply to their customers. Governor Newsom's 2020 Water Resilience Portfolio requires that water suppliers plan for prolonged drought conditions, and "[d]evelop strategies to protect communities and fish and wildlife in the event of a drought lasting at least six years."[240] As discussed, during Normal/Wet years and in Dry years, the Pure Water Expansion would not be able to achieve MPWMD's low-end demand projections for the Peninsula of 10,855 acre-feet per year due to limitations on the available source waters for the Pure Water Expansion. This deficit will only increase during prolonged periods of drought. As such, the Pure Water Expansion would not meet the state's water supply resilience goals, further confirming that is not a feasible alternative to Cal-Am's Project. In contrast, the source water for the proposed Project, the Pacific Ocean, is not vulnerable to drought.

Therefore, since the Pure Water Expansion and existing supply sources would not meet water demand needs on the Peninsula during prolonged drought conditions, the Expansion cannot serve as a viable alternative to the Project during such conditions.

Pure Water Expansion Supplies Do Not Meet Demand.

As shown in Table 7, when ASR is accounted for at a realistic level, the Pure Water Expansion cannot meet the lowest estimate of 10,855 acre-feet per year demand. Likewise, when WWTP flows and Reclamation Ditch flows are accounted for based on current flow data, the Pure Water Expansion cannot meet 10,855 acre-feet per year demand. These scenarios are not exclusive, and despite generously assuming that all other sources are available, the supply deficit would likely be even greater than as depicted in Table 7, particularly during drought years. Accordingly, the Pure Water Expansion is not capable of providing the Cal-Am Monterey service area with reliable water supplies across reasonable and probable scenarios, such as prolonged drought

[238] Exhibit 25 – August 11, 2020 Hazen Memo, p. 5.

[239] Exhibit 25 – August 11, 2020 Hazen Memo, p. 5.

Note: These are not Commission staff's Recommended Findings

conditions, and cannot meet projected demand using reasonable and realistic assumptions.

3) How does the Pure Water Expansion conform to the Final EIR/EIS Project Objectives and Criteria used for Cal-Am's Project?

In order to qualify as a feasible alternative to a proposed ~~Project~~project, an alternative generally must feasibly accomplish most of the basic objectives of the project. The Findings below ~~compares~~compare the two projects as to whether they meet the project objectives selected as part of the CPUC's Final EIR/EIS and its Final Decision. Those documents included nine primary objectives and three secondary objectives, all of which are provided below, followed by a brief description of how the two projects conform to them. For purposes of this comparison, the Commission assumes that ~~Cal-Am~~Cal- Am would be successful in gaining approval for use of the shared pipeline, described above, that is critical to ~~its project's~~the Project's feasibility, though it acknowledges that this issue is not yet resolved. Following this comparison, the Findings then evaluate the Pure Water Expansion against the nine criteria the CPUC applied to the initial phase of the Pure Water project to determine ~~that~~whether it was a suitable and reasonable source of water supply for Cal-Am. ~~As noted above, the CPUC determined that although the Pure Water Expansion was speculative at the time of its decision, if built, it would satisfy the basic and key project purposes.~~

Final EIR/EIS primary objectives:

1. ~~1.~~ **Develop water supplies for the Cal-Am Monterey District service area to replace existing Carmel River diversions in excess of Cal-Am's legal entitlement of 3,376 afy, in accordance with SWRCB Orders 95-10 and ~~2016-0016~~2016- 0016:** As described above, ~~including either project as part of~~only Cal-Am's ~~water supply portfolio~~Project would allow Cal-Am to replace its excess diversions from the Carmel River and meet the Peninsula's water demand.

2. ~~2.~~ **Develop water supplies to enable Cal-Am to reduce pumping from the Seaside Groundwater Basin from approximately 4,000 to 1,474 afy, consistent with the adjudication of the groundwater basin, with natural yield, and with the improvement of groundwater quality:** As ~~described in the CEQA documents for both~~discussed above, only Cal-Am's Project ~~and~~ would enable Cal-Am to reliably reduce pumping from the Seaside Groundwater Basin. The Pure Water Expansion would not supply water sufficient to meet even the lowest projection of Peninsula water demand (10,855 acre-feet per year), and therefore poses a significant risk that operation of the Expansion without desalination would not allow Cal-Am to reduce its Seaside Groundwater Basin withdrawals.[241] The CPUC also has noted that the Pure Water Expansion~~, both projects are designed to meet this objective. The Pure Water project and the Pure Water Expansion have contracts and agreements for more than the amount of water they will need, so there is likely to be sufficient water, even if those full amounts are not available.~~ could not "provide supply to allow for replenishment of water that Cal-Am previously pumped from

[241] See Seaside Groundwater Master Letter, p. 2; see also Exhibit 25 – August 11, 2020 Hazen Memo, p. 6; June 30, 2020 Cal-Am Letter to Commission, p. 65.

Note: These are not Commission Staff's Recommended Findings

the Seaside Basin in excess of Cal-Am's adjudicated right . . . . ."[242]

3. ~~3.~~ **Provide water supplies to allow Cal-Am to meet its obligation to pay back the Seaside Groundwater Basin by approximately 700 ~~afy~~acre-feet per year over 25 years as established by the Seaside Groundwater Basin Watermaster: ~~Similar to~~Like** the above, ~~both projects are designed to~~only Cal-Am's Project could reliably meet this objective.[243]

4. ~~4.~~ **Develop a reliable water supply for the Cal-Am Monterey District service area, accounting for the peak month demand of existing customers:** As described above, ~~both projects are sized to accomplish~~only Cal-Am's Project would be able to provide a sufficient water supply to meet peak monthly demand. (See Section IV.O.2, *supra*.) MPWMD's conclusion that the Pure Water Expansion can meet MDD and PHD assumes that no drought conditions will occur on the Monterey Peninsula between now and 2034. This assumption is untenable, given that California has experienced a multi-year drought in every decade for the last century, and recharge of groundwater reserves is essentially unavailable under drought conditions. (See Section IV.O.2, *supra*. As a result, only Cal-Am's project is capable of meeting this objective.

5. ~~5.~~ **Develop a reliable water supply that meets fire flow requirements for public safety:** As described above, ~~both projects are designed to meet maximum daily demand and peak hour demands, which are intended to provide the required factor of safety to ensure public water systems can meet emergency demands.~~only Cal-Am's Project can meet even the most conservative projections of demand for Cal-Am's service area (10,855 acre-feet per year). (See Section IV.O.2, *supra*.) The appropriate way to ensure adequate capacity is by calculating demand based on maximum month demand ("MMD) as required by the California Waterworks Standards (Cal. Code Regs., tit. 22, § 64554, subds. (a), (b)(2)), which was not done to arrive at the 10,855 acre-feet demand scenario.[244] Nevertheless, because the Pure Water Expansion cannot provide sufficient water supplies to achieve 10,855 acre-feet of demand, Pure Water Expansion cannot provide a reliable water supply that meets relevant fire flow requirements.

6. ~~6.~~ **Provide sufficient water supplies to serve existing vacant legal lots of record:** The buildout of existing lots of record has the potential to cause current water demand on the Peninsula to grow. The rate of growth due to this buildout is disputed by Cal-Am, MPWMD and others. However, a determination of the rate of growth as a result of buildout is not required. As described above, ~~adding either project to Cal-Am's water supply portfolio would provide sufficient water for the area's lots of record.~~the Pure Water Expansion is not capable of meeting the low projected demand of 10,855 acre-feet per year without desalination, which does not even take into consideration higher housing demand projections from cities in

[242] See CPUC Decision D.18-09-017, p. 40.

[243] See Seaside Groundwater Master Letter, p. 2; see also Exhibit 25 – August 11, 2020 Hazen Memo, p. 6; June 30, 2020 Cal-Am Letter to Commission, p. 65.

[244] June 30, 2020 Cal-Am Letter to Commission, p. 61.

Note: These are not Commission staff's Recommended Findings

Cal-Am's service territory like Monterey.[245] Accordingly, the Pure Water Expansion does not satisfy this objective.

7. ~~7.~~ **Accommodate tourism demand under recovered economic conditions:** As described above, ~~adding either project to Cal-Am's water supply portfolio~~even if the lowest demand projection for the Peninsula is accepted, the addition of the Pure Water Expansion to Cal-Am's existing water supplies (without the addition of the proposed Project) is insufficient to meet 10,855 acre-feet per year demand and therefore could not accommodate tourism demand. In contrast, Cal-Am's Project would allow for an ~~expected~~ increase in tourism demand for water over the coming two decades or longer.[246]

8. ~~8.~~ **Minimize energy requirements and greenhouse gas emissions per unit of water delivered:** The Pure Water Expansion would use about 23,000 megawatt hours per year of electricity, ~~almost all of~~ which ~~will be~~is proposed tobe generated by landfill gas that would otherwise be released to the atmosphere, as well as 45 megawatt hours per year of electricity from the grid. However, Monterey One Water has not yet secured construction bids to build the infrastructure that would support this conversion and the bids it has received far exceed its original estimates. If Monterey One Water cannot secure reduced bids or obtain additional funding, it cannot implement this landfill gas power system. Accordingly, the greenhouse gas emissions of the Pure Water Expansion are somewhat unknown at this time. Cal-Am's Project would use about ~~52,000~~38,000 megawatt hours per year, potentially from grid-based electricity that currently represents production of ~~about 8,000~~just over 5,188 metric tonnes of CO2 equivalent per year. (See Section K, *supra*.) However, the CPUC imposed a mitigation measure that requires Cal-Am's operations to ~~be carbon neutral~~result in net zero operational emissions, either through securing on-site or off-site renewable energy, or purchasing and retiring renewable energy or carbon credits. Overall, Cal-Am's electrical use would be, both initially and over the long term, ~~significantly~~ higher than that of the Pure Water Expansion, although it would also produce more water. Per unit of water delivered, it appears that Cal-Am's Project would have slightly lower energy use~~; however, unless it was powered by renewable energy sources, it would result in generation of more greenhouse gas emissions than the Pure Water Expansion, thus the need for Cal-Am's mitigation requirement to obtain emission offsets~~. Emissions related to both projects' electricity use ~~is~~are slated to be carbon neutral, though they would reach that goal through different means. ~~The Pure Water Expansion is slated to use landfill gas that otherwise enters the atmosphere, which would be carbon benefit. Cal-Am may achieve its carbon neutrality through a combination of renewable energy purchases and offsets, which are less certain to provide actual greenhouse gas benefits (see also Section III of these Findings). In fact, a recent court decision rejected another agency's use of the same type of carbon offsets that the CPUC imposed on Cal-Am, finding that they were not certain to result in verifiable and permanent carbon reductions. *Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467. Overall for this objective, Cal-Am would use more energy and is less certain to offset the emissions caused by its use of energy, though the Expansion project~~

[246] See June 30, 2020 Cal-Am Letter to Commission, pp. 66-67.

Note: These are not Commission staff's Recommended Findings

~~may use more energy per unit of water.~~.

~~9. Minimize project costs and associated water rate increases: The PWM Pure Water Expansion conforms to this objective far better than the Cal-Am project. Pure Water's capital costs are roughly a quarter or a third of Cal-Am's; its water costs are about a third of Cal-Am's, and the effects on water rates are expected to be similarly less than Cal-Am's.~~

9. Minimize project costs and associated water rate increases: The CPUC approved a rate increase of about $37-$40 per month for the average Cal-Am customer in a single family residence for the desalination facility, and that increase is not directly tied to per acre-foot water costs, and that rate will not be affected by any growth in per acre-foot water costs.[247] This is because the CPUC already determined the rate increase for Cal-Am's customers for the desalination facility based on a calculation of the annual revenue required to repay capital costs to build the facility, including set financing repayment requirements, and the annual facility operations and maintenance. How much water the facility ultimately produces (or does not produce) is not a material variable in rates that customers are charged, except for minor, incremental operating and maintenance costs. It is uncertain whether the Pure Water Expansion conforms to this objective, as new evidence suggests the project's projected costs continue to increase. As of June 2020, Monterey One Water stated that at the current projected delivery of 2,030 acre-feet per year, costs for Pure Water project water would increase to $3,678 per-acre-foot. Under the most optimistic scenario presented by Monterey One Water, the Pure Water project water costs will amount to $2,508 per-acre-foot. This represents a 50 percent increase over the water rate approved for the Pure Water project by the CPUC. Moreover, an increase in the Pure Water Expansion's costs is made more likely by recent information, which suggests the project will not have sufficient source water to meet the area's demands. (See Section IV.O.1, *supra*.) Finally, current costs projections for Pure Water Expansion do not account for costs already spent on the Cal-Am desalination facility, which will be recovered via water rate increases that could increase customer bills by approximately $10 to $20 per month even if the desalination facility is never built. Accordingly, is it uncertain, if not doubtful, whether the Pure Water Expansion satisfies this final, Project objective.

Final EIR/EIS secondary objectives:

1. ~~1.~~ **Locate key project facilities in areas that are protected against predicted future sea-level rise in a manner that maximizes efficiency for construction and operation and minimizes environmental impacts:** ~~Cal-Am's well field, located several hundred feet from the Monterey Bay shoreline, would likely be affected directly by sea level rise and the accompanying erosion of the shoreline. As described above in Section II.H of these Findings, the initial effect on the wells would be from the dune recession that will accompany this coastal erosion – as the shoreline profile moves inland, the foredunes that are seaward of the well field would move inland and bury the well heads. The wells would later be subject to coastal erosion. The Commission's current sea level rise projections show that the well heads would likely be subject to dune recession by about 2040 and would~~

[247] See August 13, 2020 Latham Letter to Commission, p. 1, Exhibit 1, p. 3 n.4 (citing Attachment C-1 to Advice Letter No. 1220-A from California-American Water Company to CPUC).

Note: These are not Commission staff's Recommended Findings

~~be affected by erosion around 2060. The state's more recent guidance to consider a higher scenario of 3.5 feet of sea level rise by 2050 would result in burial and erosion several years sooner. Although Cal-Am has stated that it may avoid these impacts because it expects the wells to operate for no more than 20-25 years, it has not identified where it could relocate the wells. Conversely, the~~As discussed in Section IV.H, Cal-Am's Project is not expected to face any impact from coastal erosion or rising sea levels during the economic life of the Project's slant wells and is consistent with this Secondary Objective. (See Section IV.H; see also AECOM Coastal Erosion Hazard Analysis.) The Expansion would take place at an inland location outside of the coastal zone and is likely to experience few, if any effects of sea level rise.

2. ~~2.~~ **Provide sufficient conveyance capacity to accommodate supplemental water supplies that may be developed at some point in the future to meet build out demand in accordance with adopted General Plans:** As described ~~in Exhibit 17 – Monterey Peninsula Water Management District~~above, Cal-Am's Project would provide adequate conveyance capacity to meet build out demand in accordance with adopted General Plans. The Pure Water Expansion does not appear able to provide adequate conveyance to meet even the lowest projection of demand presented by MPWMD. Exhibit 19 – MPWMD Analysis of Available Well Capacity for 10-Year Maximum Daily Demand (MDD) and Peak Hour Demand (PHD), does not explain how the Pure Water Expansion ~~has been planned to~~project will provide ~~adequate~~excess conveyance ~~to meet the expected water demands.~~capacity for future water projects, as is required to satisfy Secondary Objective 2.[248] Moreover, based on the most recent analysis provided by Hazen and Sawyer, the Pure Water Expansion project does not appear able to meet PHD.[249] Although, the Pure Water Expansion project may have sufficient conveyance capacity, it does not appear able to satisfy this objective because there is insufficient source water for the Expansion to meet its delivery promises. Accordingly, the Pure Water Expansion does not satisfy this secondary objective.

3. ~~3.~~ **Improve the ability to convey water to the Monterey Peninsula cities by improving the existing interconnections at satellite water systems and by providing additional pressure to move water over the Segunda Grade**: ~~Both projects are able to meet this objective, though only if Cal-Am is able to use the distribution pipeline it shares with the Marina Coast Water District or builds a new pipeline (see Section II.A of these Findings).~~The Commission has not received evidence indicating that the Pure Water Expansion would satisfy this Secondary Objective. In contrast, as explained above, existing agreements permit Cal-Am to utilize the shared pipeline, and the pipeline has ample capacity to serve Cal-Am's uses for the Project.[250] If Cal-Am is required to construct an additional, parallel pipeline to carry Project water, that potential additional pipeline remains before MPWMD for approval, and will be considered by the MPWMD Board at a later date.[251] Because only Cal-Am's Project has demonstrated that it will improve

[248] See June 30, 2020 Cal-Am Letter to Commission, p. 68.

[249] See Exhibit 24 – August 23, 2020 Hazen Memo, p. 6.

[251] See July 31, 2020 MPWMD Board of Directors Meeting Final Minutes, p. 1.

Note: These are not Commission staff's Recommended Findings

existing interconnections via the shared pipeline or the construction of a parallel pipeline, it is more likely to satisfy this secondary objective.

Applying the criteria used by the CPUC for the Pure Water project to the Pure Water Expansion: During the CPUC's review of Cal-Am's proposed Project, it evaluated several other water supply alternatives to consider whether they could help meet the above project objectives. In 2017, the CPUC applied nine criteria to determine that the then-proposed Pure Water project would provide a reliable 3,500 acre-feet of water per year, which would allow for a smaller desalination facility than Cal-Am had originally proposed – i.e., a 6.4 million ~~afy~~acre-feet per year facility instead of a 9.6 million ~~afy~~acre-feet per year facility.[137][252] To determine whether the proposed Pure Water project would provide a suitable and reliable water supply source, the CPUC had, in 2016, evaluated the Pure Water project against nine criteria, which are provided below. For each of those nine criteria, these Findings compare the status of the Pure Water project at the time of the CPUC's decision with the current status of the Pure Water Expansion.[138][253] This comparison is meant to help determine whether it is similarly reasonable for the Commission to now consider the Pure Water Expansion as a feasible project alternative.

- **Criterion 1 – Final EIR:** The CPUC evaluated whether the Pure Water project had an approved EIR, whether it was subject to a CEQA lawsuit, or whether it was subject to a stay due to any such lawsuit. At the time of the CPUC's decision regarding Cal-Am's Project, the Pure Water project had a completed EIR and was not subject to lawsuits or stays. In applying this criterion to the Pure Water Expansion, that project has ~~a Final SEIR~~an FSEIR that that has ~~been drafted but~~ not yet been certified by ~~the lead agency. Even though the Pure Water Expansion has not quite advanced to the degree the Pure Water project had been at the time of the CPUC's decision, it raises essentially the same issues that were successfully addressed, without challenge, as part of the Pure Water project~~Monterey One Water. After receiving several comments that raised substantial concerns regarding the Pure Water Expansion, the Monterey One Water Board voted to deny certification of the FSEIR on April 27, 2020. Moreover, Monterey One Water has stated that it does not possess the funding to remedy the deficiencies in the Pure Water Expansion FSEIR, and the Monterey One Water Board has ordered its staff to stop all work on the Expansion. As such, CEQA approval for the Pure Water Expansion has not occurred, and the project does not meet this feasibility criteria. Moreover, as discussed in Section IV.O.1, if Monterey One Water eventually chooses to certify the FSEIR, it will likely have to recirculate the FSEIR, respond to public comment, and revise the document before it can be certified, in light of significant new information regarding the availability of source water for the Pure Water Expansion, and the need to construct additional Pure Water deep injection wells, among other issues. Accordingly, the Pure Water Expansion does not satisfy the criterion of having a final EIR.

- **Criterion 2 – Permits:** This criterion was used to determine the status of permits needed to construct and operate the Pure Water project, including whether they had

[137][252] See California Public Utilities Commission, Decision 16-09-021, issued September 22, ~~2106~~2016.

[138][253] The ~~PWM~~Pure Water project sponsors initially prepared a status report in 2018 that applied these nine criteria to the ~~PWM~~Pure Water Expansion. (See May 10, 2018 Progress Report on Pure Water Monterey Expansion, prepared by Monterey One Water.) These Findings provide an update of the conclusions of that 2018 Progress Report.

Note: These are not Commission staff's Recommended Findings

been obtained or whether the weight of evidence showed that they were likely to be obtained in a timeframe consistent with the project's proposed schedule. At the time of the CPUC decision, the Pure Water project had not yet obtained several key permits, but the CPUC determined that its sponsors were working diligently to obtain the needed approvals and there was no indication they would not be able to obtain them. ~~The Pure Water Expansion similarly has not obtained all of its needed permits; however, those permits are generally expected to be modified versions of permits the Pure Water project has since obtained. At this point, neither~~Here, the Pure Water Expansion ~~nor Cal-Am~~has not obtained any of its needed permits. Accordingly, it is doubtful the Pure Water Expansion would be able to complete construction and start operations in time to meet the December 2021 deadline established in the State Water Board's ~~cease-and-desist order; however, as described below, the path forward~~CDO. As described in Section IV.O.1, additional delays for construction permitting can be expected due to the likely need for recirculation of the Pure Water Expansion's FSEIR. Monterey One Water cannot obtain any discretionary permits for the Pure Water Expansion ~~involves fewer such obstacles than the Cal-Am Project, and can therefore be expected to be online at least as soon if not sooner.~~until it has certified the FSEIR. Accordingly, the Pure Water Expansion falls short of this criterion.

- **Criterion 3 – Source waters:** This criterion was meant to establish whether there was sufficient legal certainty as to whether the Pure Water project had adequate source water. At the time of the CPUC's decision, the Pure Water project had agreements that could provide it with more than the amount of water it needed to produce the expected 3,500 acre-feet per year, and it was seeking approval for additional amounts. ~~The Pure Water Expansion would use the same water sources, and possibly others. As noted above, an August 20, 2020 Monterey One Water letter referred to the Pure Water Expansion's Final SEIR, which includes a detailed technical memorandum that uses a number of relatively conservative assumptions to evaluate several different scenarios – e.g., dry year versus wet year supplies, variable seasonal or annual amounts from different sources, etc. – and determined in each case that there would be sufficient water to produce the 2,250 acre-feet expected from the Pure Water Expansion (see Exhibit 18). Although some commenters questioned whether the Pure Water Expansion would have a sufficient, reliable supply of water, the project's Final SEIR states that "[n]o new source water diversion and storage sites are necessary to achieve the Expanded PWM/GWR Project's recycled water yield objective of an additional 2,250 AFY of replacement supplies." It further notes that the Pure Water Expansion is designed to use water from existing Monterey One Water contractual rights. Several commenters contended that those contracts allow water to be used only for the Pure Water project, not the Pure Water Expansion. However, the contracts do not make such a distinction, so there appears to be adequate source water for both. Monterey One Water has at least one water source – about 8,000 acre-feet per year – that is not involved in this contractual uncertainty, is not needed by the baseline Pure Water project, and would reliably~~ As discussed in detail above, recent analyses demonstrate that there are not sufficient agreements in place to guarantee water supplies for the Pure Water Expansion, and that when examining available WTTP flows and surface flows that could be available, there is insufficient source water to provide the ~~approximately~~ 3,000 acre-feet per year that the Pure Water Expansion

Note: These are not Commission staff's Recommended Findings

would need to produce its 2,250 acre-feet per year.[139] ~~Also,~~ As discussed above, there is a continuing decline of wastewater effluent directed to the Monterey One Water ~~staff has stated that, in any event, it could use the certain water sources in question for~~ ocean outfall, which based on Monterey One Water's flow information for 2020, is 5,554 acre-feet. Accordingly, when looking at outfall flows as a sole source of supply, there are insufficient flows to provide the necessary source water to both the Pure Water project~~,~~ and ~~reserve other water sources (that are not in question) for~~ the Pure Water Expansion. ~~Although some parties still debate whether there is a sufficient long-term water supply for the Pure Water Expansion, its Final Supplemental EIR sufficiently responds to and addresses those questions and provides substantial evidence that adequate source waters exist.~~ Therefore, this criterion cannot be met because source waters are inadequate to produce the Pure Water Expansion's promised 2,252 acre-fee per year.

- **Criterion 4 – Water quality and regulatory approvals:** Similar to Criterion 2, this criterion had the CPUC examine whether it was likely that the Pure Water project would obtain approvals from the state Department of Health and the Regional Water Quality Control Board for its proposed treatment and injection processes. Neither had been obtained at the time of the CPUC decision, though the CPUC noted that available evidence indicated that the approvals would be forthcoming. It cited additional assurance in that the expected water quality sampling and testing program would ensure project water quality would meet necessary health and safety standards and would protect uses of the aquifer. As noted above, the Pure Water project has since obtained those approvals and is now operating. ~~Both~~ Although the Pure Water project and the Pure Water Expansion use the same treatment methods ~~as approved at other permitted facilities of this type in California. Cal-Am and some other commenters submitted comments to Monterey One Water claiming that~~, there are unresolved questions about the quality of treated water that would come from both projects. For instance, there are concerns about whether agricultural runoff water can be successfully treated since the Pure Water ~~Expansion. However, as described in the Final SEIR for the~~ project ~~(which~~ has not yet ~~been certified but which contains the most comprehensive analysis of these issues),~~ successfully treated any such water. Accordingly, there remains uncertainty about whether this criterion can be met by the Pure Water Expansion ~~"would not increase the quantity or type of new source waters that would flow into the [treatment plant] compared to the quantity and type of new source waters that were evaluated in the certified [EIR for the original PWM project]." In other words, the Monterey One Board has previously found that treatment of these source waters is feasible and will create water that meets state drinking water quality standards. As noted above, the current project schedule would allow the PWM Expansion to be constructed and operating about 24 to 27 months after obtaining the necessary permits. Once obtained, the Pure Water Expansion, which would use the same treatment systems and presumably have similar sampling and monitoring requirements, could be expected to obtain the new or amended version of these permits for its operation.~~

- **Criterion 5 – Pure Water Expansion project schedule compared to desalination**

~~[139] The Pure Water Expansion is designed to operate at a relatively high efficiency of about 80% – that is for every hundred gallons of source water, it would produce about 80 gallons of usable water.~~

Note: These are not Commission staff's Recommended Findings

schedule: At the time of CPUC Decision 16-09-021, the Pure Water **project** was expected to be completed in late 2017, with the desalination facility to be completed in mid-~~2019~~ **2019**. Both schedules were delayed somewhat; however, the Pure Water project has been completed and started **limited** operations in March 2020~~. Current expectations are that once construction starts for either facility, the Pure Water Expansion would take about 24 to 27 months to complete, while the desalination facility would take slightly longer. At this point, neither project would be able to meet the December 2021 deadline imposed by the State Water Board cease-and-desist order; however, the Pure Water Expansion would likely be available several months sooner than the desalination facility.~~**, though no water deliveries to Cal-am have been made to date. Currently, there is some degree of uncertainty as to whether Cal-Am can meet its expected desalination facility schedule, due to certain remaining project approvals and pending litigation. However, there is also uncertainty over the project schedule for the Pure Water Expansion. As discussed in Section IV.O.1, the Pure Water Expansion still requires certification of its FSEIR, approval by the CPUC of a Water Purchase Agreement, and final state and federal approval for its modified discharge into coastal waters. Specifically, the Monterey One Water Board has denied certification of the Pure Water Expansion FSEIR due to ongoing flaws in the FSEIR's analysis, and has ordered its staff to suspend work on the Pure Water Expansion. Even if staff resumes work, the FSEIR will need to be revised and recirculated for public comment to reflect significant new information, including new information concerning source waters and available wastewater flows, and the need to construct additional deep injection wells for the Pure Water project. (See Section IV.O.1.) This recirculation could add an additional 6 to 12 months before certification of the final SEIR, further delaying the project's schedule. Until the FSEIR is revised and certified, it is speculative to assume that no litigation will occur.**

~~There is some uncertainty about the timeline for the Pure Water Expansion, as it still needs to have its environmental review document certified and a Water Purchase Agreement approved by the CPUC. The initial Pure Water project was delayed for several months due to various scheduling issues typical of a complex industrial construction project. However, there is also doubt about whether Cal-Am can meet its expected desalination facility schedule, due to several issues, including: 1) the above-referenced lack of approval from the Marina Coast Water District to allow use of a shared pipeline and its lack of approval to build an alternative, parallel pipeline; 2) the uncertainty about the timing, effects, and any permitting needed for the outfall liner that Cal-Am must have installed before it can discharge its brine waste; 3) litigation related to Cal-Am's proposed use of groundwater from the Salinas Valley Groundwater Basin; and 4) litigation over Monterey County's approval of portions of the project in its jurisdiction, which so far has resulted in the Superior Court in mid–September 2019 issuing a temporary stay on construction activity. In addition, if the Commission were to approve the project, there is a substantial likelihood that its decision would also be challenged in court. These areas of concern do not apply to the Pure Water Expansion.~~

- **Criterion 6 – Status of Pure Water Expansion project engineering:** ~~This criterion required that the Pure Water project be developed to at least a 10% design level or that its development is at or beyond the level of engineering prepared for the desalination facility. At the time of the CPUC's decision, the various components of the Pure Water project were at anywhere from at least 10% to 100% design and~~

Note: These are not Commission Staff's Recommended Findings

~~it therefore met this criterion. The project is now constructed and about to produce purified water. The Pure Water Expansion, being an expanded version of the existing facility, is well beyond this 10% design threshold.~~As discussed above, work on the Pure Water Expansion has been stopped. (See Section IV.O.1.) The Pure Water project has already encountered significant delays and cost overruns that have placed the project eight months behind schedule, and these issues are likely to translate to the Pure Water Expansion.[254] Likewise, The Pure Water project has also encountered problems with its deep and shallow well injection, which has significantly reduced its delivery capacity.[255] As a result, it is likely the Pure Water Expansion, which relies on the same technology, will encounter similar issues. Concerns also have been raised regarding the Pure Water Expansion's ability to rely on certain source waters, including agricultural wash from the Salinas Valley.[256] In light of these concerns and comments raising environmental concerns with the Pure Water Expansion's SEIR, the Monterey One Board has denied certification of the FSEIR, and staff has been ordered to suspend work on the Pure Water Expansion. (See Section IV.O.1.) Accordingly, project engineering of the Pure Water Expansion is not proceeding, and this criterion is not satisfied.

- **Criterion 7 – Pure Water Expansion project funding.** This criterion required that Pure Water project funding be detailed sufficiently for the project to apply to a State Revolving Fund loan. At the time of the CPUC decision, Monterey One Water had applied for that loan and had received confirmation from the State Water Board that its application was complete and that would be eligible for a relatively low (1%) interest rate on the loan. It has also received over $100 million in grants and loans from state and federal agencies. ~~For additional needed funding, the Pure Water Expansion would rely on a commitment from Cal-Am to purchase the water it produces (through a Water Purchase Agreement approved by the CPUC – see below). Cal-Am has not yet pursued such an Agreement, largely because it is proposing the desalination project instead; however, it would be within Cal-Am's control to work expeditiously toward a Water Purchase Agreement if it decided to pursue the PWM Expansion project.~~However, as discussed above, the Monterey One Water Board has denied certification of the Pure Water Expansion's FSEIR and lacks the funds to address the substantial flaws in the FSEIR's analysis. Additionally, any Water Purchase Agreement for Pure Water Expansion water also would need to incorporate additional terms beyond those included in the Pure Water project Water Purchase Agreement, including guarantees for the full production volume of the Expansion, and full indemnification to Cal-Am or all risks, liabilities, or penalties in the event that the Pure Water Expansion fails to provide an adequate supply for any reason. Such assurances would be necessary to ensure that Cal-Am does not need to undertake additional Carmel River or Seaside Basin water withdrawals to serve its customers if water demand cannot be met by the Pure Water and Pure Water Expansion projects. These additional terms also could

[254] See August 13, 2020 Cal-Am Letter to Commission, p. 4; August 12, 2020 Cal-Am Letter to Commission, pp. 1-3.

[255] See August 13, 2020 Cal-Am Letter to Commission, p. 4; August 12, 2020 Cal-Am Letter to Commission, pp. 1-3.

[256] See August 13, 2020 Cal-Am Letter to Commission, p. 4; August 12, 2020 Cal-Am Letter to Commission, pp. 3-5.

Note: These are not Commission staff's Recommended Findings

result in a higher project cost.[257] Accordingly, the Pure Water Expansion lacks necessary project funding and does not meet this criterion.

~~Cal-Am and other commenters recently expressed concern that Monterey One Water's finances, which have diminished recently, would not be adequate for the funding and staffing needed to construct and operate the Pure Water Expansion. However, Monterey One Water staff have clarified that funding for the Expansion would be separate from other general Monterey One Water funds, and once Cal-Am received an approved Water Purchase Agreement, would likely be administered through bond purchases or other similar instruments.~~

- **Criterion 8 – Reasonableness of Water Purchase Agreement terms:** This criterion was meant to ensure that Cal-Am and the Pure Water project sponsors had concurred on a "just and reasonable" water purchase agreement. The CPUC determined, at the time of this 2017 decision, that the agreement that the parties had reached in 2016 met this criterion. The agreement included a first-year cost cap and a provision that Cal-Am would pay only the actual costs for Pure Water project water. Water from the Pure Water and Pure Water Expansion projects is expected to cost between about $2,000 and $3,000 per acre-foot, ~~both well~~ below the $6,000 per acre-foot cost for water from ~~Cal-Am's Project.]~~Cal-Am's Project. However, Cal-Am and Monterey One Water have not reached any agreement for the purchase of Pure Water Expansion water, and the parties would need to agree to new performance standards in any such agreement to ensure a continued water supply in the event that the Pure Water Expansion cannot meet Peninsula demand.[258] Accordingly, this criterion is not satisfied.

- **Criterion 9 – Reasonableness of the Pure Water Expansion project revenue requirement:** Similar to Criterion 8 above, the CPUC required for this criterion that the revenue requirement for the smaller desalination facility – i.e., the currently proposed facility – combined with Pure Water project was "just and reasonable" as compared to the revenue requirement of the larger proposed desalination facility alone. At the time of this 2017 decision, there was a great deal of uncertainty about expected Pure Water project costs, but the CPUC determined that it was reasonable to move forward with the combination of a desalination facility and Pure Water project, based in part on the ~~first-year~~first-year cost cap referenced in Criterion 8, on an evaluation of the likely "indifference cost" of the two options,[~~140~~259] and on the broader benefits provided by the Pure Water project, such as supporting aquifer recharge, having lower greenhouse gas emissions, and others. There is, in fact, more ~~certainty at this point than during the 2017 decision about the expected costs of all the projects, which provides more certainty about~~uncertainty regarding Pure Water Expansion now than when the CPUC reached its 2017 decision. The Pure Water project has incurred major cost overruns and faces ongoing technical obstacles, thereby driving up projected Pure Water project water rates. It is likely that the Pure Water Expansion will face

[257] See June 30, 2020 Cal-Am Letter to Commission, p. 72.

[258] June 30, 2020 Letter to Commission, pp. 72-73.

[~~140~~259] The CPUC's 2017 decision describes the "indifference cost" as the range of costs within which ratepayers are indifferent as to whether they are paying for water from the larger desalination facility or the smaller facility in combination with the PWM. This range was determined to be between $1,178 and $2,062, which bracketed the expected first-year cost cap of $1,720.

Note: These are not Commission staff's Recommended Findings

similar cost overruns, and therefore it would be speculative to reach a conclusion on the reasonableness of ~~expected~~the Pure Water Expansion's project revenue requirements. Moreover, as discussed above, new significant information indicating that the Pure Water Expansion lacks sufficient source water to meet its promised water deliverables is only likely to further increase costs. Accordingly, the Pure Water Expansion cannot currently satisfy this criteria.

4) Adverse environmental effects of each project

As noted above and in the Findings of this report, Cal-Am's proposed Project would be inconsistent with Coastal Act and Marina LCP policies regarding sensitive habitat including wetland/vernal pond ESHA. (See Sections F, G, *supra.*) But with the implementation of Special Conditions 5 and 6, the Commission will have adopted all feasible mitigation to reduce potential ESHA impacts, including potential wetland/vernal pond ESHA impacts. Further, the Cal-Am Project will be consistent with all other Coastal Act and LCP policies with implementation of Special Conditions. (See Section IV.O.1, *supra.*) In contrast, significant questions remain unresolved regarding the environmental impacts of the Pure Water Expansion, and the FSEIR for the Expansion requires substantial additional analysis. As a result of these flaws, the Monterey One Water Board denied certification of the FSEIR for the Expansion. (See Section IV.O.1, *supra.*)

~~As noted above and in the Findings of this report, the Cal-Am project would have significant adverse effects on several coastal resources, including environmentally sensitive habitat areas and endangered or threatened species (see Section II.F – Environmentally Sensitive Habitat Areas). Its effects on marine life and ocean water quality have not yet been determined.~~ The Pure Water Expansion ~~would have few, if any, adverse effects on coastal resources, as it would be located entirely outside of the coastal zone and would be constructed largely on an existing industrial site. It would also~~is designed to be greenhouse gas neutral, as it ~~would~~proposes to use electricity generated from landfill gasses. ~~Although the Cal-Am~~As explained previously, Cal-Am's Project would rely on grid-supplied electricity, which generally has a current emissions rate of up to several hundred pounds of greenhouses gasses per megawatt-hour. However, the CPUC imposed a mitigation measure ~~(MM 4.11-1)~~ that requires ~~the Project to have net zero greenhouse gas emissions from electricity used during~~Cal-Am's operations~~. However, this mitigation is less certain~~ to result in ~~permanent, enforceable, and verifiable greenhouse gas reductions than the mitigation for the Pure Water Expansion's emissions.~~net zero operational emissions, either through securing on-site or off-site renewable energy, or purchasing and retiring renewable energy or carbon credits. (See Section IV.K, *supra.*) Thus, emissions related to both projects' electricity use are slated to be carbon neutral, though they would reach that goal through different means.

An underlying environmental concern applicable to both projects is the potential effect of ~~Cal-Am~~Cal-Am not having an adequate water supply project in place by December 2021 so that it can meet its obligation under the State Water Board's ~~cease-and-desist order~~CDO to reduce its withdrawals from the Carmel River to no more than its legal limit. ~~Cal-Am has a supply of "banked" water in the Seaside Aquifer that it may be able to rely on for some period of time, but it~~It is possible that Cal-Am would seek, and obtain, an extension to allow completion of its desalination facility or of Pure Water Expansion if needed, which could lead to continued excessive water withdrawals from the Carmel River until the new project was ready. This would result in further adverse effects in the Carmel River ecosystem and specifically to the steelhead that are listed as threatened. However, as noted above, the ~~Cal-Am project~~Pure

Note: These are not Commission staff's Recommended Findings

Water Expansion appears to have as great or a greater risk of delay than does the ~~Pure Water Expansion, so~~desalination Project due the Monterey One Water Board's decision not to certify the FSEIR, the lack of resources needed to revises the analysis in the FSEIR and the potential need to recirculate the FSEIR for further public review. Accordingly, this potential environmental effect is ~~at~~ least ~~as~~ likely to occur if the Cal-Am project moves forward ~~at the expense of the Pure Water Expansion~~.

5) Areas of Uncertainty

Both projects involve areas of uncertainty, albeit over different issues, as described below. These issues relate to whether the Pure Water Expansion is a feasible alternative, as well as to whether the public welfare would be adversely affected if ~~Cal-Am's~~Cal- Am's Project were not approved:

Pure Water Expansion:

- **Amount of water produced:** ~~The~~As discussed above, the baseline Pure Water project started operating in March 2020, but its annual production volume is currently lower than the full expected amount – ~~about 170~~currently around 2,030 acre-feet per ~~month versus its average expected 290 acre-feet per month. However, the operator, Monterey One Water, has identified the problems – two wells that are not injecting water into the aquifer at the expected rate and a sinkhole at another well site – along with proposed solutions to those problems: installing an additional injection well and "swabbing," or cleaning one of the existing wells. Monterey One Water is scheduling the swabbing for later this year and the installation of the new well sometime next year. With the new components, Monterey One Water expects the injection rates to improve and provide more than the expected volume – up to about 330 acre-feet per month~~year out of a planned 3,500 acre-feet per year.[260] This shortfall is the result of sinkholes and subsidence affecting the Pure Water project short wells, as well as injection refusal in the deep wells. (See Section IV.O.1, *supra*.) To remedy these technological difficulties, Monterey One Water is proposing repairs to the shallow wells, to carry out final commissioning of the deep wells, and to install a third, and potentially a fourth, deep well. Until the work is completed, there will be uncertainty about exactly how much water can be produced~~; however, injection wells and these cleaning methods are common and proven technologies, so Monterey One Water's estimates can be considered relatively reliable. Additionally, and as noted previously, these types of adjustment are common and typically necessary as part of the start-up of complex water treatment plants. Finally, the Pure Water project description anticipated this initial lower production, noting that its first-year production would be about 1,000 acre-feet per year, not the full 3,500 acre-feet per year. Some commenters have stated that these start-up issues demonstrate that the Pure Water project, and by extension the Pure Water Expansion, may not provide as much water as promised, and that the Pure Water Expansion therefore should not be relied on as an alternative project. However, the evidence so far does not support these assertions; as described above, the start-up issues are being dealt with and are not entirely unexpected.~~ by the Pure Water project, and it is not clear that the baseline project will be capable of

[260] See August 12, 2020, Cal-Am Letter to Commission, p. 2.

Note: These are not Commission staff's Recommended Findings

supplying its full projected outlay.

- ~~Type of~~Availability and type of **source water:** The Pure Water project is treating several types of source water, including treated wastewater, stormwater, and agricultural runoff, which is considered one of the more difficult water source to treat. Several commenters have raised concerns that the Pure Water Expansion's treatment methods will not adequately treat this type of water~~. As noted above, complex water treatment facilities such as PWM generally expect to adjust treatment as needed to address changes in source water, and the treatment methods it uses are commonly used in such facilities. The FEIR for the original Pure Water project analyzed treatment of agricultural source waters and found that they could be adequately treated, and the Pure Water project has, in fact, started treating that water source, as approved by the State Water Board's Department of Drinking Water. The Pure Water Expansion would use the same source waters that were analyzed in that document and are being successfully treated~~, including it Pure Water Expansion's ability to treat agricultural water runoff containing lingering concentrations of pesticides.[261] Moreover, there remains significant uncertainty regarding the availability of planned source waters for the Pure Water Expansion—the claimed water rights for the Expansion are highly disputed, and substantial evidence demonstrates that WWTP and surface water flows for use as Pure Water Expansion source water are significantly less than assumed by Monterey One Water. (See Section IV.O.1, *supra*.) Based on the available evidence, the Pure Water Expansion does not have adequate source waters to enable the project to produce 2,250 acre-feet per year. As a result of this shortfall, the Pure Water Expansion would prevent Cal-Am from meeting even the lowest demand projection presented by MPWMD (10,855 acre feet per year).

- **CEQA:** A ~~Final SEIR~~FSEIR has been prepared for the Pure Water Expansion, but ~~has not yet been~~there is uncertainty as to when it may be certified. (See Section IV.O.1.) The Monterey One Water Board ~~considered certifying~~of Directors denied certification of the FSEIR at its April 27, 2020 meeting. The ~~vote to certify it failed by a vote of 10 to 11. There was then a motion to deny certification of the Final SEIR and terminate any further action on the Expansion project, which also failed on a vote of 10 to 11. The effect is that the Final SEIR was not certified but that the Board remains free to reconsider the Final SEIR and project approval at a future hearing, if it so chooses. The main area of controversy that was raised during the Final SEIR public comment period relates to whether there is an adequate water supply for the Expansion. As described elsewhere in these Findings, the Final SEIR provides substantial evidence that the water supply is adequate for the Expansion, and arguments submitted by parties to this proceeding have not demonstrated otherwise.~~Board did so in recognition of the significant remaining flaws in the FSEIR, including its analysis of source water availability for the Expansion, Peninsula supply and demand, impacts to agricultural water supplies, and the FSEIR's failure to evaluate the Expansion as either an alternative to or a cumulative project with the Cal-Am facility. Given that Monterey One Water does not possess the funding to correct these deficiencies, and has now ordered its staff to halt all work on the Pure Water Expansion, it is not certain when the Expansion will have a certified FSEIR. Until then, Monterey One Water cannot obtain any discretionary permits for the Expansion.

[261] See June 30, 2020 Cal-Am Letter to Commission, pp. 70-71.

Note: These are not Commission staff's Recommended Findings

- **Funding and Water Purchase Agreement:** Cal-Am would need to seek CPUC approval of a Water Purchase Agreement in order to provide funding for ~~to~~ Monterey One Water to implement the Pure Water Expansion. Cal-Am has ~~not had an incentive to do this to date because it is pursuing its desalination project. However, there do not appear to be any practical barriers to such an approval being considered by the CPUC if Cal-Am needs to proceed with the Pure Water Expansion.~~previously met with Monterey One Water and MPWMD to discuss a Water Purchase Agreement for Expansion water.[262] However, Cal-Am determined at that time that it could not yet pursue a Water Purchase Agreement for Pure Water Expansion water, given the ongoing uncertainties related to source water availability, environmental impacts, permitting requirements, funding, and product water pricing. As explained above, many of these uncertainties persist. Moreover, as discussed above, if the Pure Water project and the Pure Water Expansion were to become the primary water sources in Cal-Am's Monterey service area, any Water Purchase Agreement for Expansion water would need to include guarantees from Monterey One Water for the full production volume of the Expansion, and full indemnification to Cal-Am in the event that the Pure Water Expansion does not provide an adequate water supply.[263] Such assurances would be necessary to ensure that Cal-Am does not need to undertake additional Carmel River or Seaside Basin water withdrawals to serve its customers if water demand cannot be met by the Pure Water and Pure Water Expansion projects. As such, it is not clear when or if Cal-Am and Monterey One Water would be able to enter into a Water Purchase Agreement for Pure Water Expansion water, or whether the CPUC would approve such an agreement.

Cal-Am:

- ~~Cal-Am:~~
  Coastal hazards and expected operating life of slant wells: ~~with~~With current sea level rise projections, incorporating the reduction in coastal erosion reasonably expected from the cessation of sand mining, Cal-Am's well field ~~could~~would not be affected ~~by dune recession as soon as 2040 and~~ by climate change-related coastal erosion ~~by about 2060. However, and along with the general uncertainty about the rate and severity of future climate change, there are two specific areas of uncertainty associated with the wells. First, as described above in Section II.H, the analyses anticipate that there will be a 60% reduction in the current rate of erosion resulting from the upcoming cessation of sand mining at the CEMEX site. While this appears to be a reasonable assumption, it cannot be verified because sand mining has not yet ended. Second, as part of its response to these hazards, Cal-Am expects its wells to have an operating life of 20 to 25 years, after which they would likely need to be relocated. While this limited operating life would likely allow them to avoid the effects of dune recession and coastal erosion, it raises uncertainty about what other locations might be available for the wells. There are no alternative, more landward locations for the wells within Cal-Am's easement, as they would be located at the most inland extent of Cal-Am's easement at the CEMEX site. Therefore, there is uncertainty about how the facility would operate after the first 20-25 years of its 60-year~~ , including dune recession due to wave

[262] Exhibit 30 – March 19, 2019 Cal-Am Advice Letter No. 1231 to the CPUC.

[263] See Exhibit 28 – May 9, 2020 Cal-Am Letter to Monterey One Water, p. 5.

Note: These are not Commission staff's Recommended Findings

erosion or sea-level rise, until near 2120. Two of the seven wells could be affected by sand burial by windblown sand prior to 2040, but these impacts will be avoided by implementation of Special Condition 8.[264] Accordingly, the proposed well site locations, as conditioned, would allow the wells to avoid coastal hazards during their expected operating life.

- **Water rights:** ~~There are at least two~~Certain comments have asserted that there are uncertainties associated with water rights ~~issues. First, Cal-Am has not yet established~~for the Cal-Am Project. However, multiple agencies have confirmed that Cal-Am may develop appropriative rights to source water for ~~the groundwater that~~ its project ~~would withdraw, and it is not clear how long that process and any accompanying litigation might take or whether Cal-Am will be successful~~. No permit is required by the State Water Board to acquire or use appropriative groundwater rights, but Cal-Am will have an ongoing burden to demonstrate that its withdrawal and use of fresh water (i.e., non-seawater) will not harm or cause injury to any other legal user of water. As part of its review of ~~Cal-Am's~~Cal- Am's Project, the CPUC asked the State Water Board whether ~~Cal-Am~~Cal-Am has a credible legal claim to extract feed water for the proposed desalination plant. The State Water Board issued an opinion stating, in relevant part, that:

> to appropriate groundwater from the Basin, the burden is on ~~Cal-Am~~Cal-Am to show no injury to other users. Key factors will be the following: (1) how much fresh water Cal-Am is extracting as a proportion of the total pumped amount and how much desalinated seawater is thus available for export as developed water; (2) whether pumping affects the water table level in existing users' wells and whether Cal-Am can avoid injury that would otherwise result from any lowering of water levels through monetary compensation or paying for upgraded wells; (3) whether pumping affects water quality to users' wells within the capture zone and whether Cal-Am can avoid or compensate for water quality impacts.(4) how Cal Am should return any fresh water it extracts to the Basin to prevent injury to others; and (5) how groundwater rights might be affected in the future if the proportion of fresh and seawater changes, both in the larger Basin area and the immediate area around Cal-Am's wells.

~~Cal-Am has entered a return water agreement that addresses item (4), though, as described in Section II.J of these Findings, Cal-Am may be required to return significantly more water to the Basin than anticipated during development of this agreement and as anticipated in the Final EIR/EIS. Additionally, many of the other questions and issues above cannot be answered or dealt with until pumping actually begins and continues for a period of time.~~ The State Water Board concluded that "[i]f overlying groundwater users are protected from injury, appropriation of water consistent with the principles discussed in this report may be possible." ~~However, it~~The State Water Board also made a variety of recommendations for what sort of monitoring and other measures would need to be undertaken to ensure that other users were not

[264] See Section IV.H, *supra*.

Note: These are not Commission staff's Recommended Findings

injured. The CPUC ~~determined that, although it is "not the arbiter of whether Cal-Am possesses water rights for the project," these water rights issues did not raise significant enough questions about the project's viability to warrant finding that the project was infeasible.[141]Because these rights are not known, cannot be known until after pumping occurs, and involve issues that have been highly contentious in the area, there is the possibility that they could cause Cal-Am's Project to be further delayed or, if it is built, to incur additional costs – potentially significant costs (see Section II.J describing the possible need for Cal-Am to return greater percentages of water to Castroville).~~thereafter confirmed that the State Water Board, the agency charged with primary responsibility for regulating state water resources, had determined that Cal-Am could develop all necessary water rights to develop and operate the desalination facility. As such, there is no ongoing uncertainty related to Cal-Am's right to source water for the Project.

~~Additionally, the City of Marina has filed litigation against CEMEX for allowing Cal-Am to obtain an easement at the site that is meant to allow an export of more than 15,000 acre-feet of groundwater away from the site each year. The City contends that a 1996 agreement with CEMEX limited water use at the site to no more than 500 acre-feet per year.~~

- **Effects on wetlands and vernal ponds:** As described in Section ~~II~~IV.G of these Findings, recent ~~hydrogeological monitoring conducted by the Commission's independent hydrogeologist shows that~~reports are inconclusive regarding whether Cal-Am's proposed well field operations could result in a groundwater drawdown ~~of about two to four feet beneath nearby vernal ponds and lesser drawdowns in other, slightly more distant vernal pools and wetlands. The closest wetland/vernal pond areas are about 1,000 feet at their closest from the well field and cover about 80 acres, with other groups of wetland/vernal ponds somewhat more distant. The modeling conducted during the project's CEQA review did not evaluate the effects of these drawdowns on the wetlands/vernal ponds, as it was believed at the time that these landscape features were hydraulically isolated from the underlying groundwater. However, there are currently no data available to confirm whether there is a connection and whether these areas would be affected. If they are connected to groundwater, this could result in an additional and as-of-yet unevaluated and unmitigated impacts to up to several acres of wetlands/vernal ponds.~~that would adversely affect the function and values of vernal ponds and wetlands. Accordingly, Special Condition 7 requires Cal-Am to implement an Adaptive Management Program which would monitor the vernal ponds to determine first, whether they are groundwater dependent, and if so, what changes might be associated with any pumping-related drawdowns. If the additional analysis determines that there would be impacts from pumping-related drawdowns, Special Condition 7 requires Cal-Am to implement a Wetland Resiliency, Enhancement, Restoration, and Monitoring Plan to mitigate for potential impacts to the vernal ponds at specified ratios.

~~[141] The CPUC's EIR stated: "The CPUC is not the arbiter of whether CalAm possesses water rights for the project and nothing in this EIR/EIS should be construed as the CPUC's opinion regarding such rights, except to the extent that the CPUC must determine whether there is a sufficient degree of likelihood that CalAm will possess legal rights to pump and desalinate the source water that would supply the desalination plant such that the proposed project can be deemed to be feasible."~~

Note: These are not Commission staff's Recommended Findings

- **Lack of water distribution pipeline**: Cal-Am's proposed Project is slated to rely on delivering water to its service area using a pipeline it shares with MCWD. MCWD has informed Cal-Am that the pipeline does not provide sufficient capacity for Cal-Am's proposed use. Cal-Am disputes this claim, ~~though asserts~~arguing that there is in fact excess capacity in the shared pipeline for Cal-Am's use, and noting that its existing agreements permit it to use the shared pipeline for desalinated product water. However, Cal-Am has also noted that, if needed, it could construct another pipeline parallel to that shared pipeline, in order to convey project water. ~~Without one of these options, Cal-Am would not be able to deliver water to its customers. As noted above, in July 2020, the MPWMD chose not to make the necessary approval for Cal-Am to construct that~~Potential approvals for this parallel pipeline, ~~though it could revisit that decision at any point in the future if it chose to do so.~~ will be considered by the MPWMD Board in October. Given more than one available option, there do not appear to be significant barriers to Cal-Am's project related to its need for a desalinated water distribution pipeline.

- **Lack of required outfall liner:** One of the adverse impacts identified in Cal-Am's Final EIR/EIS was corrosion of the proposed outfall due to the brine discharge from the desalination facility. The Final EIR/EIS included a mitigation measure that required ~~Cal-Am~~Cal-Am to install an outfall liner before discharging from its facility, and although that liner was not fully designed at the time of the CEQA review, the CPUC analyzed several reasonably foreseeable impacts of installing the liner and imposed conditions to minimize such impacts~~. It anticipated additional impacts to ESHA due to the anticipated need to cause ground disturbance along the outfall route while installing the liner, and noted that installation would have to occur during the outfall's low-flow period in the summer when most of its discharges are treated and rerouted to be used for agricultural irrigation; however, work in the summer would likely involve work on the beach within critical habitat for the Western snowy plover during its breeding and nesting period. Rather than applying for a permit to install the liner along with its desalination project, Cal-Am has stated that the owner of the outfall, Monterey One Water, will separately apply for the necessary permits once the liner has been designed, and that any potential impacts would be evaluated at that time. At this point, there is no approved design in place and it is unknown what additional environmental review and permits would be needed to install a liner. It is reasonably likely that Cal-Am would need to apply for a CDP for this work from the City of Marina.~~ to a less than significant level. Moreover, as described in Section IV.F, on August 18, 2020, the Commission received a letter from Cal-Am describing an updated liner installation method that would be done almost entirely within the outfall and would involve no ground disturbance within the coastal zone of the City or the County. As discussed in Section IV.F, because there is a less impactful feasible alternative, Special Condition 4 requires Cal-Am to implement the proposed spray-lining method prior to the commencement of Project operations or to obtain an amendment to this CDP or a new CDP should Cal-Am need to implement a different method to install the outfall liner. Because Special Condition 4 guarantees there will be no adverse impacts to ESHA caused by the installation of the outfall liner, this future Project component does not raise significant concerns regarding project certainty.

Note: These are not Commission staff's Recommended Findings

~~In early August 2020, Cal-Am submitted new information about a possible "spray-on" method to install the liner without any ground disturbance within the coastal zone, which may obviate the need for the work to require a CDP. However, the outfall owner, Monterey One Water, has not yet evaluated this proposed spray-on liner to determine whether it would be feasible and would provide sufficient protection. Uncertainty about how the required liner is to be installed could lead to at least one substantial impact, as both of the two currently proposed installation methods would have to occur during the outfall's low-flow period in the summer, when most of the discharges normally routed through the outfall are rerouted, after treatment to be used for agricultural irrigation. However, any installation in the summer that requires work on the beach would adversely affect critical habitat for the Western snowy plover during its breeding and nesting period. It is uncertain at this time whether Cal-Am could avoid impacts to the plover or would need to obtain approval from the U.S. Fish and Wildlife Service to allow "take" of a listed threatened or endangered species. It also appears that the spray-on method would take somewhat longer to install – from eight to 12 weeks – which may exceed the amount of time the outfall is available for the proposed work.~~

As noted above, the Project Final EIR/EIS also considered smaller alternative desalination facilities to meet Cal-Am's needs. Based on the modular nature of desalination treatment trains, with each train able to treat about 1.6 mgd, there was brief consideration of a 4.8 mgd and a 3.2 mgd facility; however, those options would likely have been more costly per unit of water produced because they would require much of the same infrastructure and capital construction, but would produce much less water. They would also share many of the same concerns as ~~Cal-Am's~~**Cal-Am's** currently proposed 6.4 mgd facility~~, e.g., the lack of a distribution pipeline, the lack of the needed outfall liner, and smaller, but similar concerns about impacts to wetlands. There would also be similar impacts to ESHA, though the area of impacts on the dunes would be slightly smaller because one or more wells would not need to be drilled~~. Overall, the Commission did not consider this alternative in depth because its environmental impacts were not significantly less than the Project's impacts.

"No Action" Alternative

The existing water supply situation is discussed above and elsewhere in this report, and this analysis relies on that discussion. The purpose of describing the "no action" alternative is to allow decision makers to compare the impacts of approving a proposed Project with the impacts of not approving it. Here, if the Commission denies the proposed desalination project, Cal-Am will need to pursue other options to obtain alternative water supplies. Over the past decade or two, other water supply projects have been considered – for example, new desalination facilities elsewhere in Monterey County. Those other desalination facilities have proposed to use open water ~~intakes~~**intake** and could also affect areas of ESHA, thereby potentially causing greater adverse impacts than Cal-Am's proposed Project. However, none of those proposals could meet the deadline imposed by the State Water Board's cease-and-desist order, and Cal-Am is therefore not likely to pursue them, at least in the foreseeable future.

If the Commission does not approve this ~~project~~**Project**, the most likely scenario is that Cal-Am will pursue the Pure Water Expansion. The PUC acknowledged this possibility in its 2017 Decision when it stated that it would consider an application for the Pure Water Expansion if the "desalination plant authorized in this decision (i.e., 6.4 mgd) is delayed to the point that sufficient source water capacity is more likely than not to be unavailable after the December 31, 2021, deadline set by the State Water Resources Control Board." Given that the design and environmental review for the Pure Water Expansion is already well underway, it appears as

Note: These are not Commission staff's Recommended Findings

though is the only other water supply project that could be ~~ready to allow Cal-Am~~developed in the near future – though not in time to meet the State Water Board's cease-and-desist order. Therefore, what is most reasonably expected to occur in the foreseeable future if Cal-Am's Project is not approved is that Cal-Am will pursue the Pure Water Expansion. ~~As described above, the Pure Water Expansion would have fewer impacts on coastal resources than the proposed Project.~~

The no action alternative is not feasible for the same reasons the Pure Water Expansion is not feasible. As explained above, if the Project is not approved, Cal-Am will not have an adequate water supply project in place by December 2021 to meet its obligation under the State Water Board's CDO to reduce its withdrawals from the Carmel River to no more than its legal limit. It is possible that Cal-Am would seek an extension to allow completion of its desalination facility or of Pure Water Expansion if needed, though approval of such an extension by the State Water Board is uncertain. Any extension could lead to continued excessive water withdrawals from the Carmel River and pumping form the Basin until the new project was ready. In the interim, the Monterey Peninsula will be left in a perpetual water supply deficit with available supplies unable to meet demand. This would result in further adverse effects in the Carmel River ecosystem and specifically to the steelhead that are listed as threatened. Further, overdraft from the Basin would likely occur, which has the potential to result in greater seawater intrusion, which the Project would have helped to prevent.[265] Such potential environmental effect are least likely to occur if the Cal-Am Project moves forward.

~~As the analysis above shows, the Pure Water Expansion should provide adequate water supply for Cal-Am's service area for several decades. However, if Cal-Am determines that it needs additional supply during or after that time period, or if the Pure Water Expansion falls short of its expected production volumes, it may seek~~Thus, if the Commission selected the no action alternative, Cal-Am may be required to develop ~~such~~ other water supplies to comply with the CDO. These could include ~~any of several~~ other possible water supply projects, including some considered by the CPUC in its Alternatives Analysis, but dismissed because they were then considered speculative, were not far enough along in design and planning, or were constrained by then-unresolved technical or environmental issues – for example, other desalination facilities that have been considered for the region, alternative slant well locations, etc. Presumably, Cal-Am could seek approval for some amount of additional legal rights to pump water from the Carmel River, though likely at a lower volume than its past overpumping. There may also be other alternatives available within the upcoming 20 to 25 year time frame considered in these Findings – for example, extraction wells being considered by the Salinas Valley Basin Groundwater Sustainability Agency to reduce the rate of seawater intrusion may provide a source of water for a desalination or water recycling facility.

Whether and when any such projects might be proposed, whether they would be approved by the ~~PUC~~CPUC and other agencies, and what impacts those supply projects might have on coastal resources, is speculative at this time. If Cal-Am did not pursue any of these other alternatives, then it would possibly continue overpumping the Carmel River and the Basin, which would cause the ongoing~~,~~ adverse impacts ~~to the river, its population of steelhead, and other wildlife~~described above.

Conclusion

[265] October 4, 2019, Seaside Basin Watermaster letter to Coastal Commission, p. 1.

Note: These are not Commission staff's Recommended Findings

Based on the above, the Commission finds that there ~~is a~~no feasible and less environmentally damaging alternative that would meet all or most of the proposed Project's objectives in a timely manner.

Note: These are not Commission staff's Recommended Findings

P. COASTAL-DEPENDENT INDUSTRIAL FACILITY OVERRIDE

Section 30260 of the Coastal Act states:

> Coastal-dependent industrial facilities shall be encouraged to locate or expand within existing sites and shall be permitted reasonable long-term growth where consistent with this division. However, where new or expanded ~~coastal-dependent~~coastal- dependent industrial facilities cannot feasibly be accommodated consistent with other policies of this division, they may nonetheless be permitted in accordance with this section and Sections 30261 and 30262 if (1) alternative locations are infeasible or more environmentally damaging; (2) to do otherwise would adversely affect the public welfare; and (3) adverse environmental effects are mitigated to the maximum extent feasible.

Section 30101 of the Coastal Act states:

> "Coastal-dependent development or use" means any development or use which requires a site on, or adjacent to, the sea to be able to function at all.

Section 30101.3 of the Coastal Act states:

> "Coastal-related development" means any use that is dependent on a ~~coastal-dependent~~coastal- dependent development or use.

The City of Marina LCP includes the following provisions:

LCLUP Policy 41:

> To give priority to Coastal-dependent development on or near the shoreline and ensure that environmental effects are mitigated to the greatest extent feasible.

LCLUP Geotechnical Policies, Policy 1 (first bullet)

> Structural development shall not be allowed on the ocean-side of the dunes, in the area subject to wave erosion in the next 50 years, or in the tsunami run-up zone. The only exception to this would be essential support facilities to a coastally-dependent industry, and in these areas the city will not undertake liability for property damage due to hazards.

Project components within the City of Marina are on property designated by the LCP as "Coastal Conservation and Development," a designation that prioritizes ~~coastal-dependent~~coastal- dependent industrial uses.

LCLUP Coastal Conservation and Development Uses, Policy 2 (second bullet) states:

> Coastal Conservation and Development uses shall be allowed on the west side of Dunes Drive. These activities shall include, but not be limited to, marine agriculture (Mariculture); off-shore and surf-zone sand mining, and other commercial activities dependent for economic survival on proximity to the ocean, salt water or other elements available in this particular environment.
>
> Development in this area will be allowed in already disturbed areas.

Note: These are not Commission staff's Recommended Findings

The LCLUP, at page 41, describes uses allowed in areas designated Coastal Conservation and Development:

> ~~...~~...such uses as are dependent upon salt water, the unique coastal-marine environment found in Marina, and/or on resources present only in this portion of Marina's Coastal Zone. Development shall be sited in already disturbed areas. Access roadways shall be kept to the minimum necessary to serve the proposed development and buildings shall be designed and sited to preserve sensitive habitats and views of the coastal dunes.

The IP, in its regulations for Coastal Conservation and Development Districts, includes similar standards for allowed uses in this district. They include:

> Coastal research and educational uses; developed public access and other coastally dependent recreation uses; coastal dependent industrial uses including but not limited to marine agriculture (mariculture), dredge pond, surf zone and offshore sand extraction;

The LCLUP's policies relating to the North of Reservation Road Planning Area identify appropriate uses within the high Flandrian dune area, in which this project is proposed, to include "activities specifically dependent upon proximity to the ocean" (see LCLUP, page 37). It further states that the uses allowed in Coastal Conservation and Development districts are those consistent with numerous Coastal Act policies, including Coastal Act Section 30260 (see LCLUP, pages 38 and 44).

Analysis

As evaluated above, the Commission finds that **despite Special Conditions imposed to reduce impacts,** the proposed Project ~~is fundamentally~~**remains** inconsistent with ~~**(i.e., is inconsistent and could not be brought into consistency through mitigation measures)**~~ Coastal Act and/or LCP policies regarding ~~**environmentally sensitive habitat areas and placement of fill in coastal waters**~~**ESHA, including wetland and vernal pond ESHA**. Nonetheless, Coastal Act Section 30260 allows the Commission to consider approval of a coastal-dependent industrial facility that is otherwise inconsistent with one or more policies of the Coastal Act's Chapter 3. The City of Marina's LCP, under its Coastal Conservation and Development land use designation, similarly allows coastal-dependent uses that are dependent on proximity to the ocean if the uses are consistent with Coastal Act Section 30260, subject to certain limitations.

The LCP does not define the term "coastal-dependent," but Coastal Act Section 30101 states that a coastal-dependent development or use *"means any development or use which requires a site on, or adjacent to, the sea to be able to function at all."* Cal-Am's proposed Project is coastal-dependent because: 1) the proposed well field would be located adjacent to the shoreline so it can extract primarily seawater from beneath the seafloor and the shoreline of Monterey Bay while reducing its effects on non-seawater components of the underlying groundwater aquifers; 2) the proposed Source Water Pipeline is needed to transport that water from this shoreline area to the inland desalination facility; and 3) the Project's proposed use of an existing ocean outfall is needed to convey the facility's brine discharge into coastal waters.

Some commenters have asserted that the Project is not coastal-dependent because they claim that the extraction wells would be drawing brackish groundwater, not mostly seawater, and the well heads could draw such water even if they were located farther inland. However, as explained in the Final EIR/EIS and these Findings, the Project is expected to draw

Note: These are not Commission Staff's Recommended Findings

approximately 88 to 99% seawater over time. As also explained elsewhere in these Findings, this type of slant well cannot be more than several hundred feet long, so they could not pull in mostly intruded seawater if they were located farther inland. In addition, if the wells were located inland and were pulling a higher percentage of non-seawater, this could affect ~~Cal-Am's~~Cal-Am's ability to obtain sufficient appropriative water rights and would significantly alter its return water obligations, likely making the Project infeasible.

The proposed Project is also an industrial facility. Several Project components fall within at least one category of the North American Industry Classification System ("NAICS") – i.e., NAICS #237110: Water and Sewer Line and Related Structures Construction.[~~142~~266] Some of the Project components would be built within currently active industrial sites and would use similar equipment and methods as the other uses on those sites. The proposed Project would be implemented by Cal-Am, an entity that, along with being a publicly regulated utility, is considered part of the water and wastewater industry. Further, the Commission has previously recognized that public utilities conduct industrial activities – for example, in its 2013 certification of Santa Barbara County Local Coastal Program Amendment No. LCP-4-STB-13-0215-2 allowing natural gas exploration and production by public utilities. The City's LCP also includes several provisions that similarly address "coastal-dependent" uses. The proposed Project is therefore a coastal-dependent industrial facility.[~~143~~267]

Application of Coastal Act Section 30260

Coastal Act Section 30260 provides for special consideration of coastal-dependent industrial facilities that would otherwise be unapprovable due to inconsistencies with the Act's Chapter 3 coastal resource protection policies. Section 30260 allows the Commission to approve such projects, notwithstanding the project's inconsistencies with those other policies, if they meet a three-part test: 1) if alternative locations are infeasible or more environmentally damaging; 2) to do otherwise would adversely affect the public welfare; and 3) if adverse effects are mitigated to the maximum extent feasible. The LCP similarly allows approval of coastal-dependent industrial uses in dune habitat if they are the types of uses allowed pursuant to Coastal Act Section 30260, if the development is sited in the most disturbed areas, and if the adverse impacts of the development are mitigated.[~~144~~268] Thus, the Commission interprets these LCP provisions consistent with Section 30260 to determine if the proposed Project is approvable, despite its inconsistency with the habitat protection policies of the LCP.[~~145~~] ~~**For this first test of Section**~~

[~~142~~266] NAICS was formerly the Standard Industrial Classification, or SIC system. Both systems have been used by U.S. EPA, the State and Regional Water Boards, and others to categorize various industrial activities.

[~~143~~267] The Commission's findings here are also supported by an unpublished Court of appeal opinion upholding the Commission's 2014 approval of Cal-Am's test well and finding that the test well was a "coastal-dependent industrial facility" and that the City's LCLUP incorporates Section 30260. See *Marina Coast Water Dist. v. California Coastal ~~Comm'n~~Comm'n*, 2016 WL 6267909, (Oct. 26, 2016).

[~~144~~268] For example, LCLUP Uses allowed in the CD District, Policy 2, p. 41, LCLUP Habitat Protection Policy 1, LCLIP Regulations for CD Districts section b(2)(b).

~~[145] *McAllister v. California Coastal Commission*, (2009) 169 Cal.App.4th 912, 931. Marina Coast Water District submitted comments asserting that the Commission may only consider whether the Project is consistent with the City's LCP in the appeal and may not use the Section 30260 override. The Court of appeal has previously rejected a substantially similar argument made by Marina Coast Water District in litigation that it brought challenging the Commission's approval of Cal-Am's test well. See Marina Coast Water Dist. v. Cal. Coastal Commission (2016) 2016 WL~~

Note: These are not Commission staff's Recommended Findings

~~30260, the Commission is also incorporating the alternatives analysis required pursuant to Coastal Act Section 30233 – that there be no feasible, less environmentally damaging alternative to the proposed Project.~~[269] Application of the Section 30260 override provision is discretionary: it *allows* the Commission to approve a project that meets the three statutory criteria, but it does not *require* the Commission to do so. Similarly, the Commission need not find that a coastal-dependent industrial project fails to meet the three criteria in order to deny it, although such findings could support a denial. If, however, the Commission finds that any of the three tests are *not* met – e.g., if it finds that denial of the Project will not harm the public welfare because there is ~~a~~an alternative location that is feasible and environmentally preferable ~~alternative –~~ then it may not approve the Project. The three tests of Section 30260 are applied below.

Test 1 – Alternative Locations are Infeasible or More Environmentally Damaging and Development is Limited to Already-Disturbed Areas: The first test of Coastal Act Section 30260 allows the Commission to approve a project that is otherwise inconsistent with Coastal Act policies, or in this case, if it is also inconsistent with LCP policies, if it finds that "alternative locations are infeasible or more environmentally damaging." ~~As noted above, the Commission is also considering this question in the context of Coastal Act Section 30233's provision allowing fill in coastal waters only "where there is no feasible less environmentally damaging alternative."~~

As part of the proposed Project's CEQA review, the Final EIR/EIS evaluated alternative locations to the proposed Project.[270] For instance, the Final EIR/EIS analyzed two alternative locations for the slant wells, which involved the construction of intake systems at a site on Potrero Road and a site at Moss Landing. The Final EIR/EIS concluded that siting intake systems at either Potrero Road or the Moss Landing site would not "offer an overall environmental advantage over the proposed project," and would increase impacts compared to the CEMEX site.

- Slant wells at Potrero Road. The Final EIR/EIS determined that a slant well system at Potrero Road would be infeasible because it would require drawing a greater volume of water from the SVGB. As a result, Cal-Am could be required to increase the amount of water that it must return to the SVGB, which could result in a remaining water supply that would be insufficient to meet recovered tourism demand or serve vacant legal lots of record. Slant wells at Potrero Road could also capture groundwater that would otherwise flow into Elkhorn Slough, which would lead to significant and unavoidable impacts on marine and terrestrial biological resources.

~~6267909 (upholding the Commission's use of the 30260 override, as it is incorporated in the City's LCP, to approve the test well).~~

[269] *McAllister v. California Coastal Commission*, (2009) 169 Cal.App.4th 912, 931. MCWD submitted comments asserting that the Commission may only consider whether the Project is consistent with the City's LCP in the appeal and may not use the Section 30260 override. The Court of appeal has previously rejected a substantially similar argument made by Marina Coast Water District in litigation that it brought challenging the Commission's approval of Cal-Am's test well. See *Marina Coast Water Dist. v. Cal. Coastal Commission* (2016) 2016 WL 6267909 (upholding the Commission's use of the 30260 override, as it is incorporated in the City's LCP, to approve the test well).

[270] See Final EIR/EIS, §§ 5.4 to 5.6.

Note: These are not Commission staff's Recommended Findings

- Slant wells at Moss Landing: The Final EIR/EIS determined that this alternative would involve "additional permitting complexity," which would hinder Cal-Am's ability to implement the alternative before the CDO deadline. The Moss Landing Site would also lead to: (1) significant and unavoidable impacts to marine habitat and biological resources associated with construction and operation of the intakes; (2) potentially significant impacts related to the open ocean intakes' potential to cause underwater landslides and interfere with oceanic processes; and (3) significant and unavoidable impacts to marine biological resources caused by intake and entrainment of marine life.

As such, the Final EIR/EIS selected the proposed Project, with slant wells located at the CEMEX site, as the environmentally superior alternative. The Final EIR/EIS concluded that the Project's proposed location offers environmental advantages to alternative sites, such as use of an existing outfall, no construction on the seafloor, avoiding impingement and entrainment of an open water intake, and less than significant impacts to groundwater resources, surface water resources and marine biological resources.[271] These findings and conclusions were incorporated into the CPUC's final decision regarding the proposed Project.

In addition, while the Commission's review under Section 30260 is limited to "alternative locations" the Commission also evaluated alternatives to the proposed Project in Section IV.O of these Findings, and concluded that the Pure Water Expansion is not a feasible alternative due to lack of sufficient water source supplies, inability to meet water demand, disputes over water rights, impacts to agricultural water supplies, and increased costs resulting from issues with technology and injection wells.

~~Section II.O of these Findings describes a feasible and less environmentally damaging alternative to the Cal-Am's proposed Project. Like Cal-Am's proposed Project, the Pure Water Expansion project is a water supply project, but it would have few adverse environmental effects compared to the proposed Project, and few, if any, adverse effects to coastal resources, since it would be located outside of the coastal zone. For example, it would result in no impacts to coastal ESHA, would have far fewer greenhouse gas emissions compared to the Cal-Am Project, and would not cause the brine discharge-related water quality impacts that Cal-Am's Project would cause. This alternative project would meet the same project objectives as developed under CEQA for Cal-Am's proposed Project and would also meet the relevant state requirements for water supply systems. This alternative project also appears to be fully feasible, as it would be an extension of an existing facility that is modeled on other similar, existing treatment facilities. Importantly, it fully meets the criteria of the Coastal Act's definition of feasibility. Thus, the Commission finds that the proposed Cal-Am Project does not meet the first test of Section 30260 because the Commission has determined that there is a~~Because there is no feasible and less damaging alternative to the proposed Project, the Commission finds that the proposed Cal-Am Project meets the first test of Section 30260.

Test 2 – To not permit the development would adversely affect public welfare: Section 30260's second test provides that coastal-dependent industrial development may be permitted if to do otherwise (i.e., to deny the proposal) would adversely affect the public welfare. The Findings herein evaluate several benefits and concerns regarding the proposed Project's effects

[271] See Final EIR/EIS, §§ 5.1 to 5.6.

Note: These are not Commission staff's Recommended Findings

as related to the public welfare.

The Commission acknowledges the need for Cal-Am to obtain a new water supply. As noted above, Cal-Am and other entities in the area have been seeking a water supply since about 1995 to replace that obtained from the Carmel River in response to the requirements of a cease-and-desist order from the State Water Board to reduce its water withdrawals from the Carmel River by December 2021 so as to eliminate ~~Cal-Am's~~Cal- Am's water extractions above its legal rights to that water and to benefit the Carmel River watershed, particularly the federally-listed Central Coast steelhead. ~~Cal-Am's proposed Project also~~

To not permit the proposed Project could mean that Cal-Am would miss CDO milestones. In 2009, the State Water Board adopted a CDO in which it set a compliance schedule requiring Cal-Am to take actions necessary to reduce its diversions from the Carmel River and ultimately terminate the withdrawals by December 31, 2016.[272] In 2016, the State Water Board approved an amended CDO that would maintain Cal-Am's effective diversion limit from the Carmel River from the start of water year 2015-2016 until December 31, 2021, as long as Cal-Am meets defined Project approval and construction milestones.[273] The amended CDO also imposes interim Project milestones, and failure to meet each interim milestone results in a 1,000 afy reduction in Cal-Am's annual Carmel River diversions.

Additionally, the CDO imposes a moratorium on new service connections and certain increases in use until Cal-Am certifies that it has obtained sufficient alternative water supplies. Cal-Am has proposed a facility sized to meet expected water supply and demand projections for its service area. As described in Section IV.O of these Findings, without the proposed Project, a deficit between available water supplies and total demand will result and worsen over time, particularly during drought periods. The Final EIR/EIS explained that a prolonged deficit could lead to prohibitions on all or specified non-essential water uses.[274] Failure to approve the proposed Project could lead to severe rationing and restrictions on water usage, including restrictions on watering and irrigating and requirements for specific reductions in residential water use.[275]

Further, as discussed in Section IV.O, although it is possible that Cal-Am could seek an extension of the CDO deadline with the State Water Board, approval of such an extension by the State Water Board is uncertain. Regardless, any extension could lead to continued excessive water withdrawals from the Carmel River and pumping from the SVGB. This would result in further adverse effects to the Carmel River ecosystem, particularly the steelhead. Moreover, if SVGB overdraft occurs, the Basin would experience greater seawater intrusion, which the Project would have helped to prevent.

Notably, the moratorium and water supply deficit prevent the development of essential affordable housing in the region and the attainment of State housing goals. The proposed Project could provide sufficient water for the State Water Board to lift the moratorium and for the Monterey Peninsula to meet its housing goals. In particular, the

[275] Final EIR/EIS, pp. 5.4-10 to 5.4-11.

Note: These are not Commission staff's Recommended Findings

proposed Project could promote the buildout of necessary affordable housing on the Peninsula, as dictated by the Regional Needs Housing Assessment ("RHNA") for the Monterey Bay Area.[276]

The CPUC also determined that the proposed Project would support economic growth in the area. In approving the proposed Project, the CPUC's final decision explained:

> Ensuring long-term water supply in the Monterey Peninsula area will boost the region's economic vitality, particularly the County's 'four pillars' – agriculture, tourism, education, and research, by substantially enhancing the reliability of water resources and water infrastructure. The Project will allow residential, commercial (including tourism) and industrial activities to continue to exist and flourish within the greater Monterey area, benefiting those who live and work throughout the greater Monterey area (and not merely within the CalAm Monterey service territory).

(See CPUC Final Decision 18-09-017, pp. C-74 to C-75.) In the absence of the Project, the region would remain in a state of water poverty and would not experience the economic benefits that the Project would enable. For instance, construction of the Project is anticipated to generate $258.5 million in one-time economic impacts and support 1,762 job years in Monterey County over the anticipated development timeline.[277]

In addition, Cal-Am's proposed Project includes three components ~~meant in part~~designed to address public welfare concerns to ensure that the Project would not adversely affect public welfare. First, Cal-Am selected a site where it could obtain its source water using subsurface intakes, which is the state's preferred method for seawater desalination facilities, due to their limited or non-existent adverse effects on marine life. ~~It~~In addition, the proposed Project's slant wells would extract primarily seawater from the SVGB and would prevent seawater intrusion from migrating further inland. Cal-Am also selected a site that~~, at the time,~~ was already being used by a coastal-dependent industrial facility – the CEMEX sand mining operation – rather than a completely undeveloped coastal location where it may have caused additional adverse effects. ~~Cal-Am also proposed a facility sized to meet the then-expected water supply and demand projections for its service area.~~

Some commenters suggest that the public will be adversely affected because CEMEX will be permanently ending its operations in the next several months, and therefore commenters argue that the site will be largely set aside for habitat restoration, public access, and passive recreational opportunities. However, as discussed in Section IV.L of these Findings, prior to the site becoming open for public access, a government agency or non-profit entity must purchase the property, and the purchase must be approved by the Commission. There is no current timeline for the purchase. The Settlement Agreement also does not require the purchaser to use and manage the property for a specific level of public accessibility or for certain activities such as ESHA restoration or to provide funding to achieve restoration and desired improvements. It is therefore unclear when that would occur or what the exact scope of future uses on the site would

[276] See Latham and Watkins Letter to Tom Luster, dated June 30, 2020, pp. 40, 62.

[277] See Exhibit 31 – Economic & Planning Systems letter to California American Water, dated August 31, 2020, pp. 4, 7.

Note: These are not Commission staff's Recommended Findings

be.

Regardless, the Project would have a nominal effect on public use of the area. As described in Section IV.L of these Findings, the Project will occupy a small portion of the CEMEX site – approximately 0.25 acres on the 400+ acre site, or 0.06%. Minimal additional area would be occupied for periodic maintenance activities beginning in year five of operations. None of the area impacted by the Project's construction or operation, including those maintenance activities, would impede beach use or access, and the remaining 400+ acres of the CEMEX site would be available for potential coastal access and recreation. Furthermore, although the Project would not impact public access, Special Condition 10 allows the Commission to require Cal-Am to make changes to its Public Access Plan depending on the final approved use of the CEMEX site.

~~However, the situation has recently changed significantly for two of these aspects of the Project. First, Cal-Am would no longer share the site with another industrial facility, as CEMEX will be permanently ending its operations in the next several months. Pursuant to the above-referenced CEMEX Settlement, the site will be largely set aside for habitat restoration, public access, and coastal educational opportunities. Second,~~Some commenters also have suggested that another potential project has been developed – the above-referenced Pure Water Expansion – ~~which, as described above in Section II.O of these Findings, will be able to~~that could provide a water supply adequate for current and expected future growth and that will allow Cal-Am to meet its obligations regarding reduced withdrawals from the Carmel River. ~~As described above,~~These commenters suggest that the alternative project will have ~~far~~ fewer adverse impacts than Cal-Am's Project. ~~Because of this~~However, as described in Section IV.O of these Findings, the Pure Water Expansion is not a feasible alternative~~, the Commission's denial of Cal-Am's Project will not adversely affect the public welfare, as the alternative project will be able to provide the needed water.~~. Among other things, the Pure Water Expansion faces significant technological issues and requires additional environmental analysis. There is also significant uncertainty regarding the availability of source water for the Pure Water Expansion, and based on expert analysis, it would not provide a water supply adequate to meet even the lowest water demand numbers from MPWMD (10,855 acre-feet per year). Further, Monterey One Water is not currently moving forward with the development of the Pure Water Expansion and does not appear to have resources to dedicate to the project.

~~Importantly, and as detailed in Section II.N – Environmental Justice, Cal-Am's Project would create substantial hardships for several communities of concern that would be affected by the relatively high water costs resulting from the Project, by potential indirect impacts to other area water supplies, and by the presence of Cal-Am's well field on a site that otherwise would provide amenities such as habitat restoration, public access to the shoreline, and recreational opportunities. As noted in that section, Cal-Am's proposed Project would benefit a different community of concern – Castroville – by providing it with relatively inexpensive water to supplement Castroville's current supply that is provided by several wells that are experiencing, or will soon experience, seawater intrusion. However, those benefits would come at the expense of other communities of concern.~~

~~Additionally, the alternative Pure Water expansion water supply project eliminates concerns about potential adverse effects that Cal-Am's proposed Project would have on groundwater. As noted~~Further, as described in Section ~~II~~IV.~~I~~J of these Findings, Cal-Am's

Note: These are not Commission staff's Recommended Findings

proposed extraction of groundwater will not result in adverse effects on local and regional groundwater resources in the ~~Salinas Valley Groundwater Basin appear to be greater than were evaluated during the previous monitoring and modeling efforts done to characterize those effects. Cal-Am's~~SVGB. In addition, as discussed in Section IV.G, with the implementation of Special Conditions the Project's extraction of groundwater would ~~likely~~not result in adverse impacts to ~~up to several dozen acres of~~ vernal ponds~~, and its proposed groundwater use remains subject to future review to determine whether Cal-Am can obtain the water rights necessary to extract this water while protecting other users. Its proposed use of groundwater from this site is also currently subject to litigation, and it appears likely that its return water obligations may be much greater than originally anticipated, which could affect the cost and feasibility of the Project~~ because impacts would be mitigated to the maximum extent feasible. There is strong public interest in these groundwater resources, as evidenced by development of a basin management plan being developed by local stakeholders~~, pursuant to requirements of the state's~~, Cal-Am's proposed Project has been designed to prevent further migration of seawater into the SVGB in furtherance of the goals of Sustainable Groundwater Management Act. ~~Implementing the alternative project instead of Cal-Am's would eliminate this current uncertainty about the extent of Cal-Am's effects on these groundwater resources and how those effects may affect local water sources or regional use of the Basin.~~

Notably, Cal-Am's proposed Project will not only benefit the SVGB, but will also provide much needed protections to the Seaside Groundwater Basin, which is another critical water supply source for the Peninsula. The Seaside Groundwater Basin also provides groundwater storage for ASR and Pure Water Monterey. Cal-Am is currently obligated to replenish approximately 700 afy of water to the Seaside Basin over a 25-year period. The Seaside Basin Watermaster also has identified to the Commission that an additional 1,000 afy is needed for injection into the Basin to maintain the Basin's water levels. Both Cal-Am's replenishment water and the additional 1,000 afy identified by the Seaside Basin Watermaster appear necessary to achieve and maintain protective water levels for the Seaside Basin to prevent seawater intrusion and irreversible loss of basin storage. If Seaside Basin storage is lost or reduced as a result of seawater intrusion, other existing water supplies – that is, ASR and Pure Water Monterey – would be in jeopardy because seawater intruded aquifers cannot be used for groundwater storage.

Additionally, and as detailed in Section IV.N, Cal-Am's Project will benefit several communities of concern. As noted in that section, Cal-Am's proposed Project would benefit Castroville by providing it with relatively inexpensive water to supplement Castroville's current supply that is provided by several wells that are experiencing, or will soon experience, seawater intrusion. Through a Return Water Agreement developed during the CPUC's review of Cal-Am's Project, Cal-Am would return a portion of the water it extracts and exports from the Salinas Valley Groundwater Basin back into the Basin via pipeline in the form of reduced-cost potable water for the Castroville.[278] As a result, Castroville would benefit from the Cal-Am project because the agreement will help to maintain existing low water rates (approximately $45 per month) and stakeholders say it would also help with the development of critical affordable housing projects and agricultural jobs. Further, Cal-Am has an existing Customer Assistance Program for qualifying water consumers that will help defray increased water costs associated with the proposed Project, and pursuant to Special Condition 13 will develop additional

[278] See CPUC Final Decision 18-09-17, Appendix H.

Note: These are not Commission Staff's Recommended Findings

programs. Moreover, the Commission finds that the approximately $37-40/month water bill increase following Project implementation is consistent with previous Commission decisions (i.e., the Commission's July 2019 approval of the Morro Bay Water Reclamation Facility that would result in $41/month water bill increase,[279] see Section IV.N of these Findings).

Based on the above, the Commission finds that denying the proposed Project would ~~not~~ adversely affect the public welfare~~. The Project would result in a number of adverse impacts, and there is also substantial uncertainty about the Project's long-term feasibility due to questions about return water obligations, groundwater rights, where future wells could be located once the initial ones need to be replaced, and costs, among other things. Because denying the project is likely to lead to implementation of a project alternative that would benefit the public welfare, the project does not meet~~ and, thus, meets the second test of Section 30260~~, which would be required for approval~~.

Test 3 – Adverse environmental effects are mitigated to the maximum extent feasible: ~~Because the Commission has determined that the proposed Project does not meet either of the first two tests of Section 30260, there is no need to determine whether it meets this third test. Nonetheless, and as described below, the Commission finds that the proposed Project does not meet the~~The third test of Section 30260 and of the LCLUP's Habitat Protection Policy 1 require that the proposed Project's adverse environmental effects be mitigated to the maximum extent feasible.

~~This third test of Section 30260 and of the LCLUP's Habitat Protection Policy 1 require that the proposed Project's adverse environmental effects be fully mitigated. As noted in the Findings above, several Project components are not yet fully mitigated. For example, and as described in Sections II.F of these Findings, the Project's adverse effects on ESHA could be fairly extensive – up to about 35 acres of terrestrial ESHA – yet Cal-Am's currently proposed mitigation strategy would result in a net loss of ESHA. Additionally, the recently identified impacts to up to several dozen acres of nearby vernal ponds described in Section II.G have not been fully evaluated and the mitigation that may be needed for those impacts has not yet been identified. If those impacts can be feasibly mitigated, then the currently proposed mitigation does not yet meet the standard of impacts being mitigated to the maximum extent feasible. The Commission therefore finds that Cal-Am's proposed Project does not meet the third test of Section 30260.~~

As noted in these Findings, with the implementation of the CPUC's mitigation measures identified in the Final EIR/EIS and imposition of the Special Conditions above, the proposed Project's impacts have been mitigated to the maximum extent feasible. For example, as described in Section IV.F, the CPUC's MMRP and Cal-Am's HMMP are robust plans that require Cal-Am to mitigate the proposed Project's potential environmental impacts to terrestrial biological resources in the coastal zone to the maximum extent feasible. Further, as described in Section IV.G, Special Condition 7 requires Cal-Am to implement an Adaptive Management Program to monitor the vernal ponds. If monitoring reveals that the vernal ponds are groundwater dependent and would be impacted by pumping-related drawdowns, Special Condition 7 requires Cal-Am to obtain Commission approval to implement a Wetland Resiliency, Enhancement, Restoration, and Monitoring Plan to mitigate for those potential impacts to the maximum extent feasible. Potential impacts to coastal hazards, coastal waters, and public access are also mitigated to the

[279] See CDP No. 3-19-0463.

Note: These are not Commission Staff's Recommended Findings

maximum extent feasible through Special Conditions 6 through 10.

With the mitigation measures identified in the CPUC's MMRP and the above Special Conditions, the Commission therefore finds that Cal-Am's proposed Project meets the third test of Section 30260.

~~Conclusion~~

~~The Commission finds that the proposed Project does not meet the three tests of section 30260 and the parallel LCP policies.~~

Conclusion

Cal-Am's proposed Project is inconsistent with Coastal Act and City of Marina LCP policies regarding protection of ESHA and primary habitat, including wetland/vernal pond ESHA. Nonetheless, the proposed Project meets the three tests of Section 30260, and therefore, the Commission may exercise its discretion to approve Cal-Am's proposed Project.

Note: These are not Commission staff's Recommended Findings

V. ~~III.~~ CALIFORNIA ENVIRONMENTAL QUALITY ACT

Section 13096(a) of the Commission's administrative regulations requires that Commission approval of a Coastal Development Permit application be supported by a finding showing that the application, as conditioned by any conditions of approval, is consistent with any applicable requirements of the California Environmental Quality Act (CEQA). Section 21080.5(d)(2)(A) of CEQA prohibits a proposed development from being approved if there are feasible alternatives or feasible mitigation measures available which would substantially lessen any significant adverse effect that the activity may have on the environment. ~~In addition, CEQA Guidelines Section 15042 states that "[a] Responsible Agency may refuse to approve a project in order to avoid direct or indirect environmental effects of that part of the project which the Responsible Agency would be called on to carry out or approve."~~ As a responsible agency under CEQA, the Commission is limited to considering alternatives within its jurisdiction. (Pub. Resources Code, § 21002.1(d); CEQA Guidelines, §§ 15042, 15096(g)(1).)

The CPUC, as lead agency under ~~the California Environmental Quality Act (~~CEQA~~)~~, prepared and certified a Final EIR for the project in 2018. The CPUC's Final EIR certification was challenged in court, and in 2019 the California Supreme Court upheld the Final EIR certification. The Coastal Commission, acting as a responsible agency pursuant to CEQA, has reviewed and considered the information contained in the Final EIR on the project. The findings in the staff report also address and respond to all issues pertaining to significant adverse environmental effects that were raised in public comments received prior to preparation of the staff report.

The Commission has identified and adopted 15 Special Conditions necessary to avoid, minimize, or mitigate potential impacts to coastal resources. However, as discussed above, the proposed Project is inconsistent with certain Coastal Act and City of Marina LCP policies with respect to ESHA and vernal ponds. Nonetheless, with the inclusion of these Special Conditions, the Commission finds that there are no further feasible alternatives or mitigation measures available which would substantially lessen any significant adverse effect which the proposed project may have on the environment. Therefore, the proposed project, as conditioned, has been adequately mitigated and is determined to be consistent with CEQA.

~~The Commission incorporates its findings on inconsistency with the Coastal Act and City's certified LCP at this point as if set forth in full. As discussed above, the proposed development is inconsistent with various, applicable policies of the certified LCP and Coastal Act, and is denied on that basis. As an additional and independent basis for denial, the Commission denies the proposed Project under CEQA in order to avoid the environmental effects that Cal-Am's Project would have within the coastal zone, including the effects to environmentally sensitive habitat and the other impacts described in this report. Denial is also appropriate because there is also a feasible alternative available that would substantially lessen significant adverse effects that the proposed development may have on the environment.~~

~~In addition, Section 21080(b)(5) of CEQA, as implemented by section 15270 of the CEQA Guidelines, provides that CEQA does not apply to projects that a public agency rejects or disapproves. Accordingly, the Commission's denial of this project represents an action to which CEQA, and all requirements contained therein that might otherwise apply to regulatory actions by the Commission, does not apply.~~

A. Environmentally Sensitive Habitat Areas (Staff Report, pp. 28-47)

- The Project's Final EIR/EIS determined that the Project would result in a significant and unavoidable inconsistency with the City of Marina's Local Coastal Program's ("LCP") Habitat Protection Policies regarding development in primary habitat. (Final EIR/EIS, p. 4.6-235.) However, as explained in the Project's Final EIR/EIS, the Project would not result in a substantial adverse ***physical*** impact to sensitive habitats during Project construction or operation with the implementation of all feasible and enforceable mitigation measures. (Final EIR/EIS at pp. 4.6-198, 4.6-201, 4.6-204 to 4.6-205, 4.6-215, 4.6-258 to 4.6-259.) With the implementation of the mitigation identified in the Final EIR/EIS, Cal-Am's Habitat Mitigation and Monitoring Plan ("HMMP"), and Cal-Am's proposed Special Conditions, potential impacts to ESHA would be mitigated to the maximum extent feasible. (See Applicant's Staff Report, Section IV.F.) Thus, the Commission may approve the Project under Coastal Act section 30260, which allows for coastal-dependent industrial facilities like the Project to be approved despite any potential LCP inconsistencies. (See *ibid*.)

1. <u>Scope of ESHA Impacts</u>

- The Staff Report states that the Project "would disturb up to several dozen acres of ESHA or would otherwise adversely affect, or have the potential to adversely affect, a number of sensitive plant and animal species." (Staff Report, p. 31; see also *id*., pp. 40-43.) As described in the Applicant's Staff Report, Section IV.F, and below, staff greatly overestimates the amount of ESHA the Project could impact.

    - The acreages used in the Staff Report come from the Final EIR/EIS, which conservatively assumed that all undeveloped areas in the Project's footprint within the Coastal Zone were ESHA. (Final EIR/EIS, p. 4.6-36.) This resulted in a maximum envelope of ESHA impacts associated with the Project being disclosed in the Final EIR/EIS.

    - Subsequent to the certification of the Final EIR/EIS, more detailed biological assessments have been prepared to better define the scope of biological resources impacts. The HMMP relied upon these assessments, which identified ground cover within undeveloped areas of the Project area within the Coastal Zone as not satisfying the definition of ESHA. (HMMP, p. 3-3.) These areas were then mapped with GIS accuracy. (*Id*.) Accordingly, the areas identified in the HMMP more accurately capture physical conditions that exist on the ground and should be utilized for establishing the acreage of impacts to ESHA in lieu of the conservative assumptions that were included in the Final EIR/EIS.

    - Moreover, the majority of the ESHA impacts would occur where Cal-Am proposes to install the Project's pipelines, which would be located in the Transportation Agency for Monterey County right-of-way ("TAMC ROW"). The TAMC ROW, which was previously operated by Southern Pacific Railroad, consists of remnant railroad tracks and previously disturbed dune habitat. The TAMC ROW runs from the community of Castroville to the City of Monterey,

and is, on average, 100-feet wide with a single rail track in the center. The TAMC ROW is host to existing linear utilities including electric, communications and wastewater.[1] Thus, it has already been subject to various ground disturbances as it serves as an existing utilities corridor.

- The project studied in the Final EIR/EIS was also a larger version (9.6 mgd) of the currently proposed Project (6.4 mgd), and which would have included additional intake wells and wellheads on the CEMEX property. Ultimately, the CPUC selected Alternative 5a, a 6.4 mgd project, for approval. Accordingly, the HMMP reflects subsequent design drawings prepared for the smaller desalination project as well as the completion of more detailed design for the Project components. (HMMP, p. 3-11.)

- The specific acreage of impacts to biological resources potentially impacted by the Project as updated with information provided in the HMMP as compared to the Staff Report is shown below.

Impact Location in Coastal Zone	Staff Report Acreage[2]	HMMP Acreage
CEMEX site	9	8.4
Desalinated Water Pipeline	16.9	2.12
Source Water Pipeline	11.8	4.8
Desalinated/Source Water Pipeline Overlap	0	1.95
Transmission Main Pipeline	5.4	0.1
Castroville Pipeline	0.4	0.13
Total	43.5[3]	17.5

[1] In August 2019, TAMC's Board of Directors approved an Easement Purchase Agreement and Operations Plan and Agreement with Cal-Am to install the pipelines in the TAMC ROW. (https://www.tamcmonterey.org/wp-content/uploads/2019/08/TAMC_Agenda_2019_8_28_Meeting219.pdf.)

[2] The Staff Report states that there would be overlap in potential impact acreage for certain Project components, but does not quantify the extent of overlap. For instance, the Staff Report notes that the Desalinated Water Pipeline would impact up to 16.9 acres of ESHA within the City of Marina. (Staff Report, p. 40.) But the Staff Report further provides that "some of this area of impact would likely overlap with some of the areas affected by the Source Water Pipeline construction." (*Ibid*.) Moreover, staff identifies an overlap in Desalinated Water Pipeline Construction across the City of Marina's LCP jurisdiction and the County's Coastal Zone. (*Id*., p. 41.) Staff identifies similar overlaps for the Source Water and Transmission Main Pipelines. (See *id*., pp. 41-42.)

[3] The Staff Report asserts that the Project could result in "up to about 35 acres of both temporary and permanent impacts to terrestrial ESHA during construction and operation" (Staff Report, p. 5), but the sum of potential impact acreages identified in the Staff Report totals 43.5 acres. However, as noted above the Staff Report states that there would be overlap in potential impact

- Further, as explained in Cal-Am's June 30, 2020 Letter to Commission staff ("June 30 Letter to Commission") and detailed in the HMMP, the Project would only permanently impact approximately 2.2 acres of ESHA and temporarily impact approximately 15.3 acres. (June 30 Letter to Commission, Att. A, p. 1.)

Impact Location in Coastal Zone	Permanent Acres	Temporary Acres	Total
CEMEX site	2.2	6.2	8.4
Pipelines outside of Marina	0	4.6	4.6
Pipelines within Marina	0	4.5	4.5
Total	2.2	15.3	17.5

- Staff also suggests that Project construction would result in impacts to an additional 6.6 acres of ESHA, suggesting that this acreage would be in addition to the ESHA impact locations identified in the table above. (See Staff Report, p. 43.)

  - While Cal-Am would establish several construction staging areas, the staging areas would occur in paved areas or within the construction footprint for the slant wells or pipelines. (See Applicant's Staff Report, Section IV.F.) As a result, these staging areas would not result in any additional impacts to ESHA.

2. <u>Uses of the CEMEX Site</u>

- The Staff Report incorrectly characterizes the CEMEX Settlement Agreement, suggesting that, as of December 31, 2020, the CEMEX site will be limited to public access, open space, and habitat. (Staff Report, p. 37.) Staff acknowledges Cal-Am's existing easement over a 30-acre area of the CEMEX site, but suggests that Cal-Am's proposed activities within that easement are inconsistent with public access, open space, and habitat uses. (See *ibid*.) In addition, the Staff Report claims that the HMMP proposes restoration activities in a place that is already expected to benefit from preservation pursuant to the Settlement Agreement. (*Ibid*.)

  - As Cal-Am explained in its June 30 Letter to the Commission, the Project is consistent with the Settlement Agreement's restrictions on the use of the CEMEX site because Cal-Am is proposing to use the easement to facilitate Project construction and operation. (See June 30 Letter to Commission, Att. A, pp. 3-4 [citing Settlement Agreement, § 6.1].)

  - Further, under the HMMP, Cal-Am proposes to promote the Settlement Agreement's intent by restoring approximately 14.6 acres at the CEMEX site (6.6 acres for permanent impacts, 6.2 acres for temporary impacts, and an additional 1.8 acres that is not required but is proposed to benefit the overall restoration of the CEMEX site). Restoration at the CEMEX site would include re-

acreage for certain Project components and therefore the 43.5 acre total reflects the overlap that would need to be removed to avoid double-counting the same impact areas.

establishment, rehabilitation and enhancement of habitats through removal of existing sizeable invasive species populations, and reintroduction of native species indigenous to the dune habitat. The HMMP also requires long-term management activities to remove newly emerging invasive vegetation and protect and preserve the restored and existing native habitats. (See June 30 Letter to Commission, Att. A, p. 4.)

- Moreover, Cal-Am's proposed HMMP ensures that any impacts on the CEMEX site as a result of Project construction and operation will be mitigated to the maximum extent feasible. Implementation of the HMMP will result in the restoration of approximately 14.6 acres on the CEMEX site to its natural condition, the funding for which would not be secured in the absence of Cal-Am's Project and the HMMP.

- The Staff Report's suggestion that the HMMP proposes restoration in an area that is already expected to benefit from preservation is a significant overstatement of the Settlement Agreement.

    - The Settlement Agreement requires CEMEX to transfer title to a Commission-approved entity to either manage the property for conservation uses or use the property for allowable activities, such as the proposed Project. (Settlement Agreement, § 6.1.) The Settlement Agreement does not require the future purchaser to use or manage the property for ESHA preservation or restoration.

    - In addition, the restoration activities proposed in the HMMP would be located entirely in areas that are not identified for restoration under the Settlement Agreement or CEMEX's Reclamation Plan. The Settlement Agreement and Reclamation Plan require restoration activities in certain limited areas of the CEMEX site related to sand mining activities, but they do not require restoration activities across the entire 400-acre property. Both the Settlement Agreement and Reclamation Plan focus restoration activities on the southern portion of the CEMEX site in areas where recent sand mining activities have occurred. The HMMP, however, proposes permanent mitigation in the northern portion of the CEMEX site. Specifically, the HMMP notes that the northern portion of the CEMEX site "offers highly suitable multi-resource mitigation sites of varying sizes and does not overlap with areas that CEMEX is required to restore based on the CDO and Reclamation Plan prepared for the CEMEX plant consistent with the Surface Mining and Reclamation Act (SMARA) requirements." (HMMP, p. 4-1; see also HMMP, pp. 7-12, 7-26.) Therefore, the HMMP was specifically designed to provide for permanent restoration activities in areas of the CEMEX site that are in need of restoration that are not provided for in the CEMEX Settlement Agreement or Reclamation Plan. All of the HMMP work would result in benefits to habitat beyond those contemplated in the Settlement Agreement and Reclamation Plan. No restoration or enhancement of these areas is

otherwise proposed, required, or funded under the Settlement Agreement or Reclamation Plan.

- Therefore, Cal-Am's proposed use is entirely consistent with the Settlement Agreement's intent and would result in the restoration of area that would not otherwise be restored.

3. Slant Well Construction and Maintenance

- The Staff Report states that potential impacts from well construction and maintenance cannot be considered "temporary" because Cal-Am will need to conduct maintenance at the well sites every few years, which would result in "ongoing impacts" to approximately six acres and "ongoing disturbance during the expected recovery periods." (Staff Report, p. 37.)

    - Although Cal-Am anticipates having to conduct recommended maintenance at the well sites about every five years, staff misconstrues the potential impacts. While the Final EIR/EIS indicated that the disturbed area from well construction and ongoing maintenance would be 6 acres, the HMMP explained that this area has been reduced to 2.2 acres as a result of a smaller desalination project being approved by the CPUC and subsequent refinements to Project design. (HMMP, p. 3-11.) Therefore, the updated area of disturbance for construction (including staging) would be located within a 1.2-acre area already included in the 2.2 acres identified in the HMMP as an area of *permanent* impact. (See Applicant's Staff Report, Section IV.F.)

    - To mitigate for impacts to ESHA from well site construction and maintenance, the HMMP provides for approximately 6.6 acres of restoration for the 2.2 acres of potential permanent impacts at a 3:1 mitigation ratio. (Applicant's Staff Report, Section IV.F; see also June 30 Letter to Commission, Att. A, pp. 1, 10.)

- The Staff Report states that, in order to drill the well sites within the expected Project deadlines, Cal-Am would be required to perform construction work during western snowy plover breeding and nesting season. (Staff Report, p. 38.)

    - Staff ignores Cal-Am's June 30 Response on this exact issue. (See June 30 Letter to Commission, Att. A, pp. 4-5.)

    - The CPUC's Mitigation Monitoring and Reporting Program ("MMRP") limits how and when Cal-Am can perform Project work to minimize potential impacts to western snowy plover. Cal-Am cannot perform work during western snowy plover breeding season without first obtaining approval from the U.S. Fish and Wildlife Service ("USFWS") and subject to conditions. (See Final EIR/EIS, p. 4.6-175 [emphasis added]; CPUC Decision D.18-09-017, Appx. C, p. C-18; *id.*, Appx. D, pp. D-19 to D-21.) If Cal-Am applies for, and obtains, such approval, it is anticipated that USFWS would condition the construction or maintenance work to avoid or minimize impacts to western snowy plover.

        - These measures included in the MMRP are similar to a Special Condition approved by the Commission for Cal-Am's test slant well, which did not prohibit construction during western snowy plover breeding season, but rather imposed pre-construction and pre-disturbance survey requirements and protections for any work performed between February 28 and October 1. (See Final Adopted Findings, CDP App. No. 9-14-1735, Appeal No. A-3-MRA-14-0050 (Nov. 12, 2014), pp. 8, 13-15.)

    - Further, regardless of whether construction occurs during plover breeding season, slant well construction has been designed to "occur ***outside*** of western snowy plover critical habitat and ***would not result in direct impacts on critical habitat***." (Final EIR/EIS, p. 4.6-197 [emphasis added].)

- Cal-Am agrees with staff's suggestion that impacts from disposing of well drilling spoils offsite would be *de minimis*. (Staff Report, pp. 38-39.) Any impacts would be negligible and do not create any new or more severe impacts in addition to those identified and mitigated in the Final EIR/EIS. (See June 30 Letter to Commission, Att. A, p. 6.)

- Staff asserts that "Cal-Am expects the [slant] wells to have operating lives of about 20 to 25 years," and that the wells would be impacted by coastal erosion and dune recession. (Staff Report, p. 31.) As a result, staff claims that Cal-Am would need to relocate the wells, which would result in additional ESHA impacts. (*Id*., p. 31; see also *id*., pp. 37-38, 39-40.)

    - As explained in Sections IV.H and IV.F of the Applicant's Staff Report, it would be total speculation to assess where or how Cal-Am would replace or relocate its wells after their 25-year operating life. For example, technological advancements over the next 25 years could enable the location of alternative wells in locations that are not feasible today, such as further away from the coast. Moreover, by the time Cal-Am needs to decommission the wells authorized by this permit, Cal-Am would need to apply to the Commission for authorization to replace or relocate the wells, and the Commission would need to consider whether the proposal would result in additional ESHA impacts based on the specific proposed well locations. These requirements are incorporated in Special Condition 9, under which Cal-Am must report to the Commission on the need for any replacement or relocation of the wells and apply for a CDP amendment should such actions be necessary, no later than 24 years from the commencement of operations, unless the Executive Director deems it unnecessary.

4. <u>Monterey One Water Outfall Clamp Replacement and Installation of Interior Lining</u>

- The Staff Report finds that the Monterey One Water outfall clamp replacement work required by the Final EIR/EIS would not conform to Marina's LCP or Coastal Act section 30240. (Staff Report, pp. 43-44.) In particular, staff claims that Cal-Am would replace clamps during Western Snowy Plover season, and that clamp replacement work requires heavy equipment that would disturb half an acre of critical habitat for 6-8 weeks. (*Ibid*.)

- Staff ignores that the Final EIR/EIS analyzed the potential secondary impacts of the clamp replacement work. After identifying all feasible mitigation measures, the Final EIR/EIS concluded that potential impacts to ESHA from the clamp replacement work would be less than significant with mitigation. (Final EIR/EIS, p. 4.13-28 to 4.13-33; see also Applicant's Staff Report, Section IV.F.)

    - As described in Cal-Am's local CDP application, the work would be performed late in the snowy plover nesting season when eggs would have already hatched. Moreover, although the activities could temporarily disturb approximately a half acre between the dunes and the beach, beach access would remain open, except during extreme high tide events. Any clamp replacement materials and equipment placed on the beach would be removed by sunset each day that work occurs, with the exception of limited larger equipment for which daily removal would be impracticable. Finally, all accessways impacted by construction activities would be restored to pre-construction condition or better within 3 days of construction completion. (See Applicant's Staff Report, Section IV.F.)

- Even if the Commission finds that the clamp replacement work is inconsistent with the habitat protection policies of Marina's LCP and Coastal Act section 30240, the Commission may still approve the Project as a coastal-dependent industrial facility under Coastal Act section 30260. (See Applicant's Staff Report, Sections IV.F, IV.P.)

- The Staff Report concludes that installation of the liner in the Monterey One Water outfall, as described in the Final EIR/EIS, would not conform to Coastal Act Section 30240 as a non-resource-dependent activity that would occur in ESHA. (Staff Report, p. 44.) In doing so, the Staff Report assumes the worst-case conditions for the outfall lining work, while ignoring the Final EIR/EIS's analyses and mitigation measures for that work. (See Final EIR/EIS, pp. 4.13-33 to 4.13-36.)

    - Recognizing that the installation of the outfall liner could result in environmental impacts, the EIR/EIS evaluated the potential secondary impacts of lining the outfall. (Final EIR/EIS, pp. 4.13-33 to 4.13-36.) The Final EIR/EIS identifies all feasible mitigation measures, the implementation of which would reduce ***each potential impact to less-than-significant levels***. (*Id*., pp. 4.13-33-36.)

    - Nonetheless, to address staff's concerns with potential impacts from the outfall lining work, Cal-Am has proposed an alternative approach that is as effective as the approach evaluated in the Final EIR/EIS and that would minimize or eliminate impacts to coastal resources and ESHA. (See Cal-Am's August 17, 2020 Letter to Commission.) As staff correctly points out, this alternative "spray on" method for the outfall lining work "would be done almost entirely within the outfall and ***would involve no ground disturbance within the coastal zone of the City [of Marina] or the County***." (Staff Report, p. 45 [emphasis added]; see also Applicant's Staff Report, Section IV.F.)

- The Staff Report correctly acknowledges that this new "spray-on" proposal "would appear to avoid any impacts related to ESHA and would avoid having the liner work cause a non-resource dependent use in ESHA." (Staff Report, p. 45.) However, the Staff Report errs by concluding that Cal-Am has not demonstrated that this approach is "feasible," because M1W has not chosen a final design or received the necessary permits for this work. (*Ibid*.)

    - The Coastal Act and CEQA both define "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors." (See Pub. Resources Code, §§ 21061.1 [CEQA], 30108 [Coastal Act].) Staff identifies no evidence that suggests the proposed outfall lining work is not "capable of being accomplished in a successful manner within a reasonable period of time." Further, while M1W's August 17, 2020 technical memorandum regarding the spray liner proposal identifies that certain issues still need to be resolved before the spray lining work can proceed, M1W does not find the method proposed to be infeasible.

    - Staff takes inconsistent approaches to "feasibility" in its Staff Report. Staff (incorrectly) concludes that the PWM Expansion—which is without a certified EIR or any project approval and must address numerous environmental concerns that have been identified—is a "feasible" alternative to the Project. (See Staff Report, p. 4.) At the same time, the Staff Report provides no reasoning as to why the proposed outfall pipeline lining work is infeasible, despite the fact that Cal-Am has provided a detailed proposal, showing that the spray-lining work could be "accomplished in a successful manner within a reasonable period of time." (See Pub. Resources Code, §§ 21061.1, 30108.) The Staff Report even concedes that it is possible the outfall lining work could be accomplished without *any* CDP from Monterey County, the City of Marina, or the Coastal Commission. (Staff Report, p. 112.)

- Proposed Special Condition 4 would require Cal-Am to implement the less impactful spray-on lining method prior to the commencement of Project operations or to obtain a CDP amendment or a new CDP should Cal-Am need to implement a different method to install the outfall liner. (Applicant's Staff Report, Section IV.F.) Therefore, Special Condition 4 ensures that approval of the current CDP application will not result in any adverse impacts to ESHA from the installation of the outfall liner. (See *ibid*.)

5. <u>Mitigation Measures & Mitigation Ratios</u>

- The Staff Report assumes that all Project-related impacts that cannot be restored within 12 months are "greater than temporary" or permanent. (Staff Report, pp. 37, 38.) Under a definition of "temporary" that requires impacts to be restored within 12 months, staff concludes that Cal-Am has proposed insufficient mitigation acreage and that the mitigation ratio for temporary impacts should be increased. (*Ibid*.; see also *id*., p. 46.)

- The Project's temporary impacts are construction impacts that can be fully restored to pre-disturbance conditions for most species following completion of construction, such as impacts from construction staging, laydown, trenching areas, and other work space that will not be occupied by permanent facilities during Project operation. Due to the proposed activities and the fact that restoration will begin concurrent with Project construction, sequencing work to ensure that impacts are temporally limited, these impacts are properly considered temporary instead of permanent. (See Applicant's Staff Report, Section IV.F.) The mitigation ratio proposed for temporary impacts is consistent the mitigation requirement included in the Final EIR/EIS. (Final EIR/EIS, p. 4.6-170.)

- The Staff Report asserts that Cal-Am's HMMP "involve[s] a number of uncertainties that make it difficult to evaluate potential mitigation success" and "proposes a number of measures that are not consistent with past Commission-approved mitigation plans." (Staff Report, p. 46.) Responses to staff's claims are provided below:

  - ***Timing and Funding for Mitigation.*** As explained in Section IV.F of the Applicant's Staff Report, because the CEMEX site has not yet been purchased by a Commission-approved entity, Cal-Am has proposed Special Condition 5 to address the uncertainty regarding the CEMEX site closure and subsequent transfer to a purchaser. Special Condition 5 requires Cal-Am, in consultation with the Executive Director, to prepare and submit a final plan that selects one of the proposed mitigation approaches for implementing the HMMP at the CEMEX site. Under any proposal, Special Condition 5 will provide certainty regarding the implementation of the HMMP, including funding mechanisms.

  - ***HMMP Reference Sites, Success Criteria, and Analysis Methods:*** The Staff Report notes concerns regarding the HMMP reference sites, success criteria, and analysis methods. The reference site and success criteria are consistent with those provided in the Final EIR/EIS. (See e.g. Final EIR/EIS pp, 4.6-177, 4.6-179, 4.6-181, 4.6-190, 4.6-219, and 4.6-220.) In addition, as provided in the HMMP "[p]roject impact areas will be surveyed for pre-Project/baseline data by the Biological Monitor or Restoration Ecologist before construction and the start of monitoring of mitigation sites in order to provide comparable sets of data by which the mitigation sites' performance will be assessed." (HMMP, p. 6-4.) Both qualitative and quantitative monitoring will occur. Quantitative monitoring will include "quantification of vegetation characteristics (e.g., native and non-native vegetation cover, species diversity, dominant species, target species cover and density) and collection of established viewpoint photographs." (*Ibid*.) The percent cover of native species will be estimated using a modified relevé method. (*Id*.) Accordingly, the HMMP is proposing reference site, success criteria, and analyses methods consistent with other habitat mitigation and monitoring plans.

  - ***Agricultural Runoff Management.*** The Staff Report states that the HMMP proposes to use agricultural runoff as part of its dune restoration. That is not accurate. In the *Monterey Peninsula Water Supply Project: CEMEX North Dunes – Agricultural Runoff Drainage System Observations and Options* prepared by

AECOM and dated August 19, 2020, AECOM provided additional information regarding the valley and agricultural runoff. As clarified in AECOM's memorandum, the HMMP proposes that the agricultural runoff into the dunes be discontinued, that all the invasive vegetation associated with the agricultural runoff be removed, and the entire dune area impacted by the agricultural runoff be restored with coastal dune habitat. AECOM notes that discontinuation or alternative management strategies for the agricultural runoff would occur as part of implementation of the HMMP. Because there is some uncertainty regarding the discontinuation or alternative management strategies for the agricultural runoff, Cal-Am has proposed Special Condition 6, which requires Cal-Am to submit a plan for Executive Director review and approval prior to permit issuance, which will detail the plan for the discontinuation or alternative management for the agricultural runoff. (See Applicant's Staff Report, Section IV.F.)

6. <u>Consistency with Marina's LCP and Coastal Act Section 30240; Coastal Act Override Under Section 30260</u>

- The Staff Report finds that the Project is not consistent with the Coastal Act and LCP provisions that require development in ESHA to be dependent on the protected habitat resources. (Staff Report, pp. 32, 34, 43.) Nonetheless, staff finds that the Project can be considered for approval under Coastal Act section 30260 as a coastal-dependent industrial facility. (*Id*., pp. 32, 43, 47.)

    - The Project would conform to the Habitat Protection Policies in Marina's LCP, as supplemented by its consistency with the Coastal Dependent Development priorities in the LCP and Coastal Act section 30260, which allows for coastal-dependent industrial facilities like the Project to be approved despite any potential LCP inconsistencies. (See June 30 Letter to Commission, Att. A, p. 1.)

    - Although the Final EIR/EIS determined that the Project would be inconsistent with provisions of Marina's LCP and Coastal Act section 30240 regarding development in protected habitat resources, the CPUC adopted a robust MMRP to ensure the Project's potential impacts to ESHA are mitigated to the maximum extent feasible. (See Final EIR/EIS, Appx. D, pp. D-1 to D-58.)

    - Moreover, Cal-Am prepared a comprehensive HMMP addressing impacts to habitat within the Coastal Zone. The HMMP would ensure that the Project would not result in substantial adverse effects on sensitive natural communities in the Coastal Zone, including ESHA, during Project construction and operation. (See Applicant's Staff Report, Section IV.F.) Further, Cal-Am has proposed Special Conditions that require implementation of the HMMP and impose additional protections against potential impacts to ESHA. (See *ibid*.) With the implementation of the HMMP and proposed Special Conditions, potential impacts to ESHA would be mitigated to the maximum extent feasible. (See *ibid*.)

    - Cal-Am agrees with staff that the Commission may approve the Project notwithstanding potential inconsistencies with the habitat protection policies in

Marina's LCP and the Coastal Act under Coastal Act section 30260. As explained below in Section K of this Response, and in the Applicant's Staff Report, Section IV.P, the Project satisfies the three tests for approval of coastal-dependent industrial facilities.

B. Wetlands and Vernal Pond ESHA (Staff Report, pp. 48-53)

- The Staff Report concludes that there are "likely" impacts to vernal ponds from Cal-Am's pumping of groundwater and therefore the Project cannot be found consistent with the Coastal Act or LCP. (Staff Report, p. 53.)
    - The Staff Report's conclusion is not based on the totality of the evidence and instead entirely relies on information provided by the City of Marina. Specifically, the City of Marina's submittal argues that the Project's pumping of groundwater would result in groundwater drawdowns that would impact certain vernal ponds that the City of Marina claims are groundwater dependent ecosystems.
- The Staff Report fails to address the robust analysis submitted by Cal-Am regarding the vernal ponds, which demonstrates that the vernal ponds are unlikely to be impacted by the Project.
    - Geoscience and AECOM prepared a thorough analysis of the vernal ponds using available information, *Understanding the Influence of Subsurface Aquifer Drawdown Upon Surface Waters and Wetlands for the Proposed Monterey Peninsula Water Supply Project* dated August 18, 2020 ("Pond Memo").
    - The Pond Memo provides a detailed assessment of the vernal ponds within the Project's drawdown area and concludes: 1) that the vernal ponds are likely not groundwater dependent; or 2) if they are groundwater dependent they are supported from a perched source, the Fort Ord Perched "A" Aquifer, which is not hydraulically connected to the Dune Sand Aquifer from which the Project would draw water. (Pond Memo, p. 35.) This conclusion is consistent with the Final EIR/EIS for the Project. (See Final EIR/EIS, pp. 8.5-688, 8.5-702.)
    - To reach its conclusion the Pond Memo evaluated existing monitoring wells, conducted water quality sampling, researched surface water conditions, examined historical aerial imagery, and reviewed previously prepared analyses regarding the ponds.
    - For six of the seven ponds at issue, the Pond Memo explains that urban development has substantially altered the existing functions of the ponds and that the main water source for those ponds is from surface water runoff, including storm water discharged from adjacent urbanized areas.
    - For the seventh pond, the Armstrong Ranch ponds, the Pond Memo explains that agricultural irrigation and historic use as a cattle pasture has affected the extent to which the ponds are groundwater dependent. The Pond Memo concludes that

surface water and rainfall are likely the source of water for the Armstrong Ranch ponds.

- The Pond Memo also notes that the Dune Sand Aquifer is directly connected to the ocean and reflects tidal changes. Accordingly, if any of the ponds were hydraulically connected to the Dune Sand Aquifer the pond surface water elevation would rise and fall with daily tidal fluctuations. None of the ponds show influence of tidal changes, which further supports that the ponds are not hydrologically connected to the Dune Sand Aquifer.

- The Staff Report disregards the comprehensive Adaptive Management Program proposed by Cal-Am.

  - While the Pond Memo concludes that the Project is not anticipated to adversely affect any vernal ponds, the Pond Memo nevertheless includes a comprehensive Adaptive Management Program whereby the ponds would continue to be evaluated prior to the commencement of Project operations, and that if it is determined that there would be impacts from Project pumping, the Adaptive Management Program requires implementation of wetland resiliency, enhancement, or restoration activities to ensure that there would be no adverse effects associated with the Project.

  - As proposed by Cal-Am at Special Condition 7, implementation of the Adaptive Management Program would occur in close coordination with Coastal Commission staff and all analysis would be required to be submitted to staff for review and approval. In addition, if wetland resiliency, enhancement, or restoration activities are necessary they would be reviewed by the Commission under a future permit amendment.

  - The Adaptive Management Program includes a three stage process:

    - Stage 1: consists of supplemental data collection and near-term monitoring that would include surveying all ponds, installing monitoring equipment, sampling water quality, evaluating the biological conditions, and conducting a historical review. Stage 1 would occur over a 12 month period to account for seasonal variation and would be completed prior to Project operations. Stage 1 would determine whether there is a connection between the ponds and the Dune Sand Aquifer.

    - Stage 2: if Stage 1 determines that there is a hydrological connection between the ponds and the Dune Sand Aquifer, Stage Two would evaluate the degree to which the Project's pumping would affect the ponds.

    - Stage 3: based on the results of Stage Two, Stage Three would require development of a Wetland Resiliency, Enhancement, Restoration, and Monitoring Plan that would require compensation for potential impacts based on specified standards. Resiliency, enhancement, and restoration

actions could include providing supplemental water, pond restoration or enhancements, on-site habitat restoration, or off-site restoration. The measures would entirely off-set all potential impacts.

- Therefore, based on the ***Pond Memo and with the implementation of the Adaptive Management Program included as Special Condition 7, the Project would ensure that any impacts to the vernal ponds are mitigated to the maximum extent feasible.***

C. Coastal Hazards (Staff Report, pp. 54-61)

- The Staff Report confirms that the desalination facility and other Project components would be located outside of the coastal zone and away from any coastal hazards, but that the slant well field at the CEMEX site could be subject to coastal hazards and "the risk from these hazards would be expected to be relatively minor." (Staff Report, pp. 55.) Cal-Am agrees.

- In particular, the Staff Report explains that the slant wells would avoid coastal hazards within their economic life of 20 to 25 years, and therefore would be consistent with the LCP's coastal hazards provisions related to the expected economic life of the development. (Staff Report, pp. 58, 60.) Again, Cal-Am agrees that the slant wells will be safe from coastal hazards within their economic life, and likely would be for much longer.

- The Staff Report states that based on the technical memorandum prepared by the Commission's coastal engineer that "the test well site and other well sites would likely be safe from erosion through 2040, the test well site could be at risk by 2060, and that both test well site and other well sites would likely be at risk by 2120." (Staff Report, p. 58.)

    - The Staff Report acknowledges that Cal-Am's coastal erosion analysis is exceedingly conservative, explaining that Cal-Am's analysis assumes the "extreme risk aversion scenarios for the years 2040, 2060, and 2120," "includes the high GHG emissions scenario for each to provide a more conservative assessment of expected effects," and "also considers the effects of both a 100-year and 500-year storm event on site erosion to provide additional conservatism." (Staff Report, pp. 57-58.) These conservative assumptions go beyond the most extreme scenarios proposed by the Commission's most recent sea-level rise guidance. The analysis concluded that the slant wells (including the test slant well) would not be at risk from coastal erosion until near 2120. (June 30 Letter to Commission, Att. A, pp. 10-13.)

    - However, the Staff Report fails to account for ***any*** reduction in coastal erosion from the end of sand mining at the CEMEX site. (See, e.g., Staff Report, Exhibit 10, p. 3.) Staff's refusal to assume any reduction of coastal retreat is not a reasonable approach, and staff does not provide any modeling or data to support its assumption. Even under staff's approach, eliminating any and all reductions to coastal retreat from the cessation of sand mining, the Staff Report only identifies a

potential impact to the test slant well by 2060, years after the well's useful life of 20 to 25 years has passed. (Staff Report, p. 58.)

- In contrast, AECOM applied a reasonable and conservative 60 percent reduction in the historic coastal retreat rate to account for the cessation of sand mining activities at the CEMEX site, based on prior analysis of retreat reductions at other sand mine closure sites along the southern Monterey Bay coastline earlier in the 20th century, combined with a site-specific sand budget analysis. (June 30 Letter to Commission, Att. A, pp. 11-12.) This reduction is based in part on a study commissioned by the Office of Naval Research that assessed sand mining impacts on long-term dune erosion in southern Monterey Bay. (*Ibid.*) Moreover, when the Commission was considering the CEMEX Settlement Agreement in 2017, its own staff prepared a technical report stating, "[i]f sand mining from the CEMEX Pond were to stop, the rate of shoreline retreat and dune erosion within the SMB Littoral Cell would likely ***reduce significantly***." (See Exhibit 5 to Commission Staff Recommendations and Findings for CEMEX Closure, p. 2, attached to June 30 Letter to Commission as Exhibit 7, [emphasis added].) Indeed, improvements to shoreline change and reductions in erosion were precisely some of the factors contemplated in seeking the closure of the CEMEX sand mining operations. (June 30 Letter to Commission, Att. A, p. 12 [quoting and citing Commission Staff Recommendations and Findings for CEMEX Closure].) Thus, when using a reasonable estimation of reduction in coastal retreat, the slant wells (including the test slant well) are projected to be unaffected by coastal hazards until near 2120.

- The Staff Report also claims that California has developed a new principle calling for permitting agencies, such as the Commission, to consider an increase in sea level of 3.5 feet by 2050. (Staff Report, p. 58.) However, as the Executive Director stated in his May 22, 2020 letter endorsing this new principle, the new principle is not a new sea level rise projection and is, in general, already accounted for by utilizing and implementing the projections and recommendations in the Commission's Sea Level Rise Policy Guidance, which was used by AECOM and staff to evaluate the potential impacts for the project.[4] Using those projections and recommendations, the slant wells will be unaffected by 3.5 feet of sea-level rise in 2050, and therefore the Project is consistent with the new state principle. AECOM provided a supplemental technical analysis confirming that no adverse impacts to the test slant well or the proposed slant well field would occur based on 3.5 feet of sea level rise at 2050. (See August 13, 2020 Letter to Commission, Exhibit 4, p. 1.) Accordingly, the Staff Report's

[4] Executive Director's Letter Endorsing "Making California's Coast Resilient to Sea Level Rise: Principles for Aligned State Action," (May 22, 2020), https://documents.coastal.ca.gov/assets/slr/CCCendorsement_SLRPrinciples.pdf.

suggestion that the principle represents a new heightened level of sea-level rise scrutiny or that the wells would be impacted under the new principle is incorrect.

- Despite these inaccuracies, the Staff Report concludes that the slant wells would be safe from coastal hazards for their economic life and would therefore be consistent with LCP and Coastal Act policies. (Staff Report, p. 61.)

- Even though the slant wells, including the test well, are not projected to be exposed to coastal hazards until near 2120, Mitigation Measure 4.2-10 conservatively requires Cal-Am to monitor and report the rate of coastal retreat to the Commission annually. (Final EIR/EIS, p. 4.2-72.) Beginning at least five years prior to anticipated slant well exposure, Cal-Am must take steps to remove the wells from service and abandon them. (*Ibid.*) Accordingly, even in the extremely unlikely event coastal erosion exceeds any of the extreme scenarios that have been analyzed, the wells would avoid costal hazards and remain consistent with Coastal Act and LCP policies. (See Applicant Staff Report, Section IV.H.)

- Further, the Project has seven wells for reliability purposes, but only needs five to be operating in order to maintain the Project's permitted water deliveries. Thus, even in the event that the test slant well needs to be decommissioned early due to potential risks from coastal hazards, the Project could continue to supply water to the Monterey Peninsula. (June 30 Letter to Commission, Att. A, pp. 12-13, 14.)

- The Staff Report claims that AECOM did not assess risk from dune recession. (Staff Report, p. 59.) This is not so. On June 30, 2020, Cal-Am submitted a detailed technical memorandum prepared by AECOM analyzing expected dune recession at the site. (Staff Report, p. 60.)

  - The Commission's technical memorandum concedes that its own analysis of dune recession did not consider cessation of sand mining at the CEMEX site, did not include any modeling of the back profile of the dunes, and covered the potential for burial only in general terms. (Staff Report, Exhibit 10 p. 4.)

  - In contrast, AECOM's analysis specifically evaluated the various mechanisms involved in dune recession and concluded that just two of the seven wells could be affected by sand burial within 20 to 25 years. (Staff Report, p. 60; see also June 30 Letter to Commission, Exhibit 9.) The analysis also found that burial could be reduced or avoided through various soft measures. In the Applicant's Staff Report at Special Condition 8, Cal-Am is required to monitor and report annually on the risk of impacts to the wellheads from dune recession and wind-blown sand and if necessary, implement soft measures such as the removal of invasive non-native plants, revegetation of native plants, and sand removal. If additional measures become necessary, Cal-Am would be required to seek approval from the Commission and mitigate any potential impacts to ESHA.

- Regardless of Cal-Am's Special Condition, which conservatively ensures no potential coastal hazard impacts, the Staff Report independently concludes that the slant wells would be safe from dune recession and sand burial for their economic life and therefore consistent with LCP and Coastal Act policies. (Staff Report, p. 60.)

- The Staff Report also claims that because the operating/economic life of the slant wells is 20 to 25 years, Cal-Am would necessarily need to relocate the wells further inland and Cal-Am does not have legal interest in property further inland that would allow it to do so. (E.g., Staff Report, p. 60.) Accordingly, the Staff Report asserts that the wells' limited operating life raises concerns about whether Cal-Am would be able to operate its desalination facility after 20 to 25 years and that future movement of the wells would conflict with plans to restore the CEMEX site pursuant to the CEMEX Settlement Agreement. (*Ibid.*)

  - It is speculative to assess how or where Cal-Am may replace or relocate its wells after their operating life. Within the wells' operating period, technical advancements may be made that would allow the replacement of the wells or development of alternative wells in alternate locations that are not feasible today. Moreover, the future scope and use of the CEMEX site has not yet been determined. Thus, consideration of future well sites and operations beyond the wells' operating period is speculative. Moreover, as explained above, Mitigation Measure 4.2-10 and the Project's seven-well design ensure that wells can be decommissioned prior to being affected by coastal hazards, if necessary, while still allowing the Project to continue operations. (See Final EIR/EIS, p. 4.2-72; June 30 Letter to Commission, Att. A, pp. 12-13, 14.) Additionally, to ensure that the Project remains consistent with the LCP's coastal hazards provisions, Special Condition 9 requires Cal-Am to return to the Commission for a CDP amendment should there be a need to replace or relocate any slant wells, no later than 24 years from the commencement of operations, unless the Executive Director deems it unnecessary.

- Therefore, for the reasons explained herein the Project is consistent with the relevant coastal hazard Coastal Act and LCP policies.

D. Protection of Coastal Waters and Marine Resources (Staff Report, pp. 62-67)

- For the reasons discussed in the Applicant's Staff Report, the Project would not involve the placement of fill in coastal waters, and therefore, would not trigger Coastal Act Section 30233. As described therein, the work required for each Project aspect that Staff has identified is temporary in nature and limited in scope, and potential impacts to receiving coastal waters, if any, would be minimal. Furthermore, the Project and associated brine discharges would have minimal impacts on receiving coastal waters, which would be mitigated below a level of significance.

- The Staff Report alleges that outfall work would coincide with Western snowy plover breeding and nesting season. (See Staff Report, p. 66.) According to staff, the area of the

beach where work is required to replace existing clamps on the outfall is designated as critical habitat for the plover, and work would represent a significant disturbance during a critical period of the plover's life cycle. (*Ibid*.)

- This issue was addressed in detail in Cal-Am's June 30, 2020 Letter. (June 30 Letter to Commission, Att. A, pp. 4-5.) Further, as discussed in the Final EIR/EIS, installation of the WEKO seal clamps is designed to occur in *late summer/early fall*. This "[t]iming would [] be late in the snowy plover nesting season, when eggs would have hatched," which would minimize any adverse impacts that construction work would have on the snowy plover breeding and nesting cycle. (Final EIR/EIS, p. 4.13-28.) Additional information on this issue is provided in Attachment B, Section A, *supra.*

- The Staff Report contends that diffuser retrofit, buoy installation, and WEKO clamp replacement would each involve placing fill in coastal waters, thereby triggering Coastal Act Section 30233. (See Staff Report, p. 66.) As discussed below, staff wrongly characterizes these Project components as involving the placement of fill in coastal waters and fails to provide any support for its determination.

  - As an initial matter, aside from the replacement of existing WEKO seal clamps within the nearshore portion of the outfall with corrosion-resistant clamps, potential modifications to the M1W outfall to retrofit its existing diffuser are not part of Cal-Am's CDP application. Potential retrofitting would be addressed through a separate CDP application to be submitted by Monterey One Water, the owner of the outfall.

  - Although the Staff Report contends that the potential diffuser retrofit, the buoy installation, and WEKO seal clamp replacement would constitute "placing fill in coastal waters in the form of new or modified structures," staff does not provide any support whatsoever for this determination or attempt to explain its conclusion in any meaningful way. (See Staff Report, p. 66.) Staff also fails to address Cal-Am's assertions regarding this issue in Cal-Am's June 30 Letter, in which a comprehensive analysis is provided along with a review of relevant Commission precedent. (See June 30 Letter to Commission, Att. A, p. 19.)

  - ***Diffuser Retrofit.*** As the Staff Report correctly notes, retrofitting the diffuser is currently a "potential design change." (See Staff Report, p. 65.) Even if this design change were implemented, "[t]he impacts associated with the physical construction of such a retrofit would likely be minor and temporary." (Final EIR/EIS, p. 4.3-109.) Construction impacts would consist primarily of minor sea-bed disturbance and temporary water quality degradation. Even so, "[w]ater quality would rapidly return to ambient conditions following completion of the retrofit." (*Ibid.*) Likewise, any disturbance to benthic communities would be short in duration and of low intensity, such that the communities are anticipated to return to baseline conditions. (*Ibid.*) Accordingly, the Final EIR/EIS determined that secondary construction and operational impacts of diffuser retrofit were determined to be less than significant. (*Id.*, pp. 4.3-109 to 4.3-110.) In light of

the extremely limited and temporary ecological footprint that the diffuser retrofit would entail and the Staff Report's failure to identify any specific aspect of the work that might constitute "fill," there is no reasonable basis to conclude that the diffuser retrofit would trigger Coastal Act section 30233.

- ***Buoy Installation.*** The Staff Report ignores Cal-Am's June 30 Letter to the Commission on this issue, which confirms that the proposed monitoring equipment and buoys are not "fill" as contemplated by the Coastal Act. (See June 30 Letter to Commission, Att. A, p. 20.) As Cal-Am previously stated, the proposed monitoring equipment and telemetry buoy would be temporarily attached to the sea floor by an anchor. (See Monterey Peninsula Water Supply Project (MPWSP) Components in Commission's Original Jurisdiction (Sept. 19, 2019), p. 5.) "The proposed temporary equipment anchoring systems are static and would be less impactful to benthic resources than a typical fishing or research vessel mooring anchor." (*Ibid*.) Importantly, installation would be complete in a matter of hours, and impacts would be limited to temporary seabed disturbance. (*Ibid.*) As such, this minor temporary anchoring does not constitute "fill." (See June 30 Letter to Commission, Att. A, p. 20.) The Staff Report neither attempts to address these facts nor provides an independent justification for characterizing the buoy installation as "fill."

- ***WEKO Clamp Replacement.*** Staff wrongly states that WEKO clamp replacement constitutes "fill" in coastal waters. Without an explanation as to how Staff reaches this conclusion, it is unclear which aspect of the clamp replacement, if any, could trigger Coastal Act section 30233. According to Staff, installation activities would occur on the beach "and possibly within coastal waters." (See Staff Report, p. 66.) However, Staff has not identified which aspect of the installation work would involve the placement of "fill" in coastal waters. As the Final EIR/EIS asserts, "[c]onstruction work shall not be conducted seaward of the mean high water line unless tidal waters have receded from the authorized work areas." (Final EIR/EIS, p. 4.13-28.) Installation activities on the beach would be conducted at a distance of roughly 100 feet from the shoreline. Additionally, while in operation, construction vehicles will "remain as high on the upper beach as possible to avoid contact with ocean waters and intertidal areas." (*Id.*, p. 4.13-29.) All construction materials will either be removed by sunset each day that work occurs or stored beyond the reach of tidal waters. (*Ibid.*) Finally, all construction activities that result in discharge of materials, polluted runoff, or wastes to the beach of the adjacent marine environment will be prohibited. (*Ibid.*) Therefore, Staff has not demonstrated that WEKO clamp replacement would involve placing "fill" in coastal waters.

- The Staff Report alleges that is unclear at this time as to what effects the desalination plant would have on water quality and marine life and what measures would be needed to ensure Cal-Am's discharge meets relevant Ocean Plan objectives and that potential adverse effects are addressed. (See Staff Report, p. 65.)

- Staff has previously raised this issue and Cal-Am responded in its June 30 Letter. (See June 30 Letter to Commission, Att. A, pp. 16-18.) Cal-Am's prior response to this issue, which Staff failed to address, is as follows:

> "**The Project's potential effects on ocean water quality and marine life were analyzed in detail in the Final EIR/EIS**. Specifically, Impact 4.3-5 assessed whether the Project's operational brine discharge would violate water quality standards or waste discharge requirements, or degrade ocean water quality. (Final EIR/EIS, pp. 4.3-95 to 4.3-113.) As discussed therein, the Final EIR/EIS concluded that implementation of the Project could potentially cause exceedances of Ocean Plan water quality objectives for the ammonia and cyanide under certain operational conditions when wastewater volumes co-mingled with the brine are low. For an additional thirteen constituents, the Final EIR/EIS determined that there is not enough information to assess concentrations at the edge of the zone of initial dilution. Therefore, the Final EIR/EIS conservatively concluded that Ocean Plan water quality objectives could potentially be exceeded during operations for some operational discharge scenarios.
>
> However, the Final EIR/EIS determined that Impact 4.3-5 would be less than significant with implementation of Mitigation Measure 4.3-5 (Implement Protocols to Avoid Exceeding Water Quality Objectives), which requires Cal-Am to perform an extensive water quality assessment prior to Project implementation. (Final EIR/EIS, p. 4.3-104.) Operational discharges that cannot be demonstrated to conform to the Ocean Plan water quality objectives may only be released following implementation of additional design features, engineering solutions, and/or operational measures that ensure compliance with these objectives.[5] (*Id*., p. 4.5-64.) In other words, **no exceedance of Ocean Plan objectives will occur because no discharges will be permitted unless the water quality assessment confirms that the discharges comply with the Ocean Plan**. The Commission did not comment on or object to Mitigation Measure 4.3-5 in its comments on the EIR/EIS."

- Additionally, Impact 4.3-4 in the Final EIR/EIS considered whether the Project would violate water quality standards or waste discharge requirements or degrade water quality from increased salinity as a result of brine discharge from the operation of the desalination plant. In order to address this concern, the Final

[5] The Final EIR/EIS also described the potential design features and operational measures that could be employed, such as retrofitting the existing outfall diffuser, additional pre-treatment of source water to the Desalination Plant component of the Project, treatment of discharge, flow augmentation, and end gate modification. (Final EIR/EIS, pp. 4.3-106 to 4.3-108.) The Final EIR/EIS also analyzed the potential secondary impacts of these potential design features and operational measures, and determined that those secondary impacts would be less than significant. (*Id*., pp. 4.3-109 to 4.3-113.)

EIR/EIS imposes Mitigation Measures 4.3-4, which requires the applicant to implement a monitoring and reporting plan in order to ensure that operational discharges from the Project are in compliance with applicable Ocean Plan salinity standards. (Final EIR/EIS, p. 4.3-93.) The plan will be approved by the Regional Water Board and MBNMS *prior to* implementation. (*Ibid.*) Moreover, monitoring will be conducted for one year *prior to* the commencement of operational discharges and will continue until at least five years after operational discharges commence. (*Id.*, p. 4.3-94.)

- As discussed in the Final EIR/EIS, implementation of these mitigation measures would ensure that impacts relating to water quality standards, waste discharge requirements, or ocean water quality, as a result of brine discharges from the Project, would be **less than significant**. Accordingly the Final EIR/EIS has thoroughly examined the effects that the desalination plant would have on water quality and the measures needed to ensure Cal-Am's discharge meets relevant Ocean Plan objectives and minimizes potential adverse effects.

- As a further precaution, the Applicant's Staff Report includes a Special Condition to ensure that all applicable water quality standards are met. The condition requires that prior to operation of the Project, the Applicant must demonstrate that discharges from the outfall would comply with the Ocean Plan and applicable water quality requirements by demonstrating that:

  - (1) a Coastal Development Permit or Amendment has been obtained and implemented for any necessary work on the Monterey One Water outfall related to the project's discharge; and/or

  - (2) Permittee has implemented other measures consistent with Final EIR/EIS Mitigation Measure 4.3-5, as necessary, outside of the Commission's jurisdiction.

- Even if buoy installation or WEKO clamp replacement would involve placing "fill" in coastal waters, the Project would conform to Coastal Act section 30233. Pursuant to Coastal Act Section 30233, fill is allowed if it meets a three-part test: 1) that there is no feasible less environmentally damaging alternative, 2) that feasible mitigation measures have been provided to minimize adverse environmental effects, 3) and that it be for certain specified purposes, including a new or expanded port, energy, or coastal-dependent industrial facility. Contrary to Staff's contention, there is no feasible or less environmentally damaging alternative project, all feasible mitigation has been identified and imposed, and these Project aspects would be used for a coastal-dependent industrial facility. (See Staff Report, p. 66.)

  - As an initial matter, even if the Project components that are the subject of these applications did involve fill, which they do not, the Commission's authority under Section 30233 would be limited to review of alternatives to those Project components within the Commission's jurisdiction that do involve fill, rather than wholesale alternatives to the entire Project. Even so, as discussed in Section J,

infra, at this time, there is no feasible or less environmentally damaging alternative project.

- Likewise, as discussed in Section K, *infra*, the Project has identified and imposed all feasible mitigation.

- Finally, the Project aspects would be used for certain specified purposes in support of a coastal-dependent industrial facility.

E. Groundwater Resources (Staff Report, pp. 68-73)

- Commission staff's analysis of the Project's potential groundwater impacts are not tied to Coastal Act Section 30231 as required. Section 30231 provides that biological productivity and water quality must be maintained through "preventing depletion of ground water supplies." (Pub. Resources Code, § 30231.) However, staff's evaluation focuses on the Project's potential public welfare impacts vis-à-vis groundwater—not the Project's potential environmental impacts to groundwater supplies in the Salinas Valley Groundwater Basin. While the Staff Report includes language confirming that "[a]lthough some commenters have expressed concern that the Project would adversely affect the water supply wells of Marina Coast Water District, . . . neither the Final EIR/EIS nor the Commission's independent hydrogeologist found evidence that such impacts are reasonably foreseeable" (Staff Report, p. 68), such a finding should be the basis of a conclusion that the Project is consistent with Coastal Act Section 30231. As described in the Applicant's Staff Report and throughout this Section, the Project will not adversely affect groundwater supplies in the SVGB and therefore is consistent with Coastal Act Section 30231.

1. MCWD Production Wells

- Project pumping will not adversely affect MCWD's water supply wells. The Staff Report recognizes that "neither the Final EIR/EIS nor the Commission's independent hydrogeologist found evidence that [impacts to MCWD water supply wells] are reasonably foreseeable." (Staff Report, p. 68.) However, Cal-Am disagrees with staff's suggestion that "additional modeling and data may be needed to more fully characterize the Project's likely effects on groundwater." (*Ibid*.) Because ***the EIR/EIS, the HWG, State Water Resources Control Board, and the Commission's independent hydrogeologist agree that groundwater impacts to MCWD's production wells are not reasonably foreseeable***, no further modeling is necessary. (See also Applicant's Staff Report, Section IV.J.) Notably, the only hydrogeologists claiming impacts to MCWD's wells are MCWD's paid consultants, and those claims are unsubstantiated and based on flawed or limited technical analysis.

2. Ocean Water Percentage ("OWP") and Groundwater Gradients

- Staff asserts that the modeling performed by its independent hydrogeologist, Weiss Associates ("Weiss"), shows the Project pumping would not reach the long-term OWP of 96-99% identified in the Final EIR/EIS, but rather that the OWP "would vary based on

whether it was a wet or dry season, how much irrigation occurred, etc." (Staff Report, p. 71.) Staff further asserts that the EIR/EIS's modeling "did not include this recharge component," rendering the EIR/EIS's projected OWP ranges inaccurate. (*Ibid*.)

- Staff misrepresents the Final EIR/EIS's and Weiss's OWP analyses and conclusions—all of which support an estimated OWP range of 87-99% under realistic, reasonable assumptions.

  - The EIR/EIS's modeling resulted in OWP ranging from 83-99% across the short- and long-term. (See Final EIR/EIS, Appx. H to Appx. E3, p. 11.) However, the EIR/EIS discounted the low bookend of the OWP range (83% after year 1 and 86% after year 2) because the results assumed a groundwater gradient not actually representative of the local conditions. (See *ibid*.; see also Final EIR/EIS, p. 8.2-44.) Using reasonable assumptions based on actual data, the EIR/EIS estimated OWP after one year of Project pumping to be 87 to 93%. (Final EIR/EIS, p. 4.4-56.) After two years of Project pumping, the OWP estimate increases to 92-97%. (*Ibid*.) Long-term equilibrium OWP would ultimately fall between 96-99%. (*Ibid*.) Thus, the EIR/EIS's estimated OWP ranges are consistent with Weiss's predicted ranges of 86-97% under reasonable modeling scenarios.

- Further, the EIR/EIS modeling did account for rainfall recharge and used reasonable rainfall recharge assumptions (5 in./yr.). (See Final EIR/EIS, Appx. E3, p. 65 [explaining that "seasonal changes in rainfall will result in a non-steady (i.e., fluctuating) increase in salinity from year-to-year, with some higher rainfall years showing a decrease in salinity and some lower rainfall years showing an increase in salinity."]; *id*., Appx. E3, p. 13 ["long term OWP is most influenced by net amount of recharge that occurs within the capture [zone]."].)

  - Average annual rainfall for the area is 14.8 inches, but only a fraction of total annual rainfall actually becomes groundwater recharge—typically 30%. (See HWG Comments on Weiss Report (Aug. 13, 2020), p. 4.)

  - In its July 2020 report ("2020 Weiss Report"), Weiss unrealistically assumed groundwater 100% recharge resulting from precipitation of 10 to 15 inches per year in its modeling scenarios, resulting in OWP ranging from 63% to 68% (assuming a flat gradient in the 180-Foot Aquifer), and from 69% to 96% (assuming landward gradient in the 180-Foot Aquifer). (See 2020 Weiss Report, Tables 2-2b.)

  - Even if the modeling used a conservation assumption in which recharge resulting from precipitation is less than 50% of average annual total rainfall, which is still much higher than the 30% recharge rate typically assumed in modeling, the resulting OWP ranges from 88-99%, consistent with the EIR/EIS's analyses. (HWG Comments on Weiss Report, p. 3; see also Final EIR/EIS, p. 4.4-56 [OWP ranges from 87-99%].)

- Although the 2020 Weiss Report uses unrealistic groundwater recharge amounts in certain scenarios, the Report nonetheless confirms that, with realistic rainfall recharge assumptions, the OWP amounts projected in the EIR/EIS are accurate. Therefore, the Project will not extract greater amounts of seawater than initially projected in the EIR/EIS. (See also Applicant's Staff Report, Section IV.J.) As the HWG confirms, there is "no need to further refine estimates of OWP within [this] range." (HWG Comments on Weiss Report, p. 2.) Moreover, even if the Project's source water has a greater OWP than the EIR/EIS predicted, that would not be an environmental impact. (See Final EIR/EIS, p. 8.2-13; see also June 30 Letter to Commission, Att. A, p. 29.)

- The Staff Report states that the 2020 Weiss Report "concluded that the amount of seawater extracted would vary due to the direction and slope of the groundwater gradient." (Staff Report, p. 71.) The Staff Report acknowledges that current gradients are landward, but then assumes a flat or seaward gradient "could be developed through the implementation of the Salinas Valley Groundwater Management Plan." (*Ibid*.)

  - As explained in Applicant's Staff Report, Section IV.J, ***OWP will likely exceed 88% even assuming a seaward gradient in the Dune Sand Aquifer***, using reasonable assumptions for other model inputs. (See also HWG Comments on Weiss Report, p. 3.) The HWG explained that the 2020 Weiss Report demonstrates that "[a]ssumed seaward gradients in the Dune Sand Aquifer **do not result in any significant difference** in OWP results." (*Id*., p. 1 [emphasis added]; see also *id.*, p. 3 ["OWP exceeds 88% for the assumed seaward gradient in the DSA using reasonable assumptions for other model inputs (e.g., landward gradient in the 180-Foot Aquifer, which represents current, historical, and projected future conditions; rainfall recharge that is less than 50% of average annual total rainfall)."].)

  - In reviewing the 2020 Weiss Report, the HWG explained that "[t]he only OWP estimate less than 88% required unreasonable/unsubstantiated rainfall recharge over the long-term or flat/seaward hydraulic gradients in the 180-Foot Aquifer (an unrealistic future conditions assumption that is not consistent with the GSP) that would require decades to centuries to reduce OWP." (*Id*., p. 3.)

    - The Sustainable Groundwater Management Act ("SGMA") does not require seaward gradients. (See *id*., p. 9.) "SGMA requires that the extent and magnitude of seawater intrusion not be exacerbated compared to current conditions, but does not require that existing seawater intrusion be mitigated/restored." (*Ibid*.)

    - In fact, the Staff Report correctly recognizes that "***even with a flat or shoreward gradient, . . . it could take several decades to increase the percentage of non-seawater, due to the large volumes of seawater that have already intruded to inland areas***." (Staff Report, p. 71 [emphasis added].) The 2020 Weiss Report confirms:

> Assuming that SGMA could create a flat gradient or even a pronounced seaward gradient, for the initial decades after this condition is achieved the Project pumping wells would capture the existing saline water in the 180-Foot Aquifer . . . and OWP would likely be at or close to the 92.7 baseline value. After many decades or a few centuries when the 180-Foot Aquifer becomes filled with fresh water, this water would flow out to sea under non-pumping conditions, or would be captured by the Pumping well field if operating. Only under these conditions would the 74.9 OWP occur.

(2020 Weiss Report, p. 4-4.) Until all the seawater is flushed from the 180-Foot Aquifer, "the Pumping well field would be capturing all of the saline water currently in storage in the 180-Foot Aquifer, resulting in average OWP ***greater than 91.5***." (*Id*., pp. 5-1 to 5-2 [emphasis added].)

- The 2020 Weiss Report further explains that the existing landward gradient, caused by historic inland groundwater pumping, "is quite steep and has been for more than 60 to 80 years. ***It is highly unlikely that a similarly steep seaward gradient could be achieved under SGMA***." (2020 Weiss Report, p. 4-4 fn. 7 [emphasis added].)

Thus, "it would take more than 80 years to reverse seawater intrusion impacts after a seaward gradient is achieved." (HWG Comments on Weiss Report, p. 3.) Even assuming a seaward gradient is achieved in the 180-Foot Aquifer by 2040 as a result of SGMA (which Weiss confirms is highly unlikely), the 70.8% estimated OWP would not be reached until after 2120 *at the earliest*. (See *ibid*.)

3. Vernal Ponds

- The Staff Report states that the 2020 Weiss Report identified areas of expected groundwater drawdown beneath nearby wetland and vernal pond areas. (Staff Report, p. 71.) "[T]his represents a previously unknown and unanalyzed potential impact of the proposed Project that could result in the spatial and/or temporal loss of up to several dozen acres of those wetland areas." (*Ibid*.)
    - As explained in Applicant's Staff Report, Section IV.G, and Section B, *supra*, vernal ponds are not likely to be hydrologically connected to the Dune Sand Aquifer from which the Project will pump water, and there is no technical justification for assuming a connection between Project pumping, groundwater in the Dune Sand Aquifer, and vernal ponds in the Project vicinity. Although the vernal ponds are unlikely to be affected by Project pumping, Cal-Am has nonetheless proposed an Adaptive Management Program that would include ongoing monitoring and evaluation of the ponds to determine conclusively that the ponds are hydrologically disconnected to the Dune Sand Aquifer, or to what extent Project pumping might affect the ponds, and Cal-Am has proposed to

mitigate and/or offset any potential adverse effects to the ponds should Project-related impacts be identified through the Adaptive Management Program.

4. Return Water Settlement Agreement

- Staff asserts that the Return Water Settlement Agreement contemplates that Cal-Am would return "no more than about 700 acre-feet of water per year." (Staff Report, p. 72.) However, "during years with higher precipitation rates, lower inland pumping rates, or other reasonably foreseeable conditions, Cal-Am would need to return up to 2,100 acre-feet per year." (*Ibid*.)

    - It is unclear which OWP estimate on which staff relies to yield a return water calculation of 2,100 afy. However, as explained in Applicant's Staff Report, Section IV.J, and above, the 2020 Weiss Report confirmed the EIR/EIS's conclusions that, under reasonable and realistic assumptions, OWP would range from 88-99%. (See also Final EIR/EIS, p. 4.4-56.) These OWP estimates formed the basis of the CPUC's approval of the Return Water Settlement Agreement, in which the parties agreed to an expected return water obligation of approximately 700 afy at a cost of $110 per acre-foot. (See CPUC Decision D.18-09-017, p. 109.) If the return water calculations for a particular year are less than the expected approximately 700 afy, then Cal-Am will make additional water available to Castroville for purchase at a cost of $580 per acre-foot. (*Ibid*.) If the return water obligation exceeds the approximately 700 af in a particular year, then Cal-Am will make the surplus available for delivery to the Castroville Seawater Intrusion Project. (*Ibid*.)

- The Staff Report concludes that, if Cal-Am's return water obligations are higher than expected, the "return" water would be subsidized by Cal-Am's ratepayers or would result in additional costs to Cal-Am that it may cover through additional cost recovery requests to the CPUC. (Staff Report, p. 72.) "That subsidy . . . could range from about $3,000 to $5,000 per acre-foot." (*Ibid*.) "Presumably, this higher return water volume would also reduce the water Cal-Am and its customers would be able to use for future growth." (*Id*., p. 73.)

    - The Staff Report's misunderstands the CPUC's decision on the Project, where the CPUC specifically considered limiting risk to Cal-Am's ratepayers from Cal-Am's return water obligations under the Return Water Settlement Agreement. Specifically, the CPUC allocated the costs and risks associated with the high Return Water obligations to Cal-Am, not on ratepayers. (CPUC Decision D.18-09-017, p. 111; see also Applicant's Staff Report, Sections IV.J, IV.N.)

        - Further, the CPUC is requiring Cal-Am to "track all MPWSP expenses in a memorandum account that will be subject to reporting requirements and submission of a Tier 2 advice letter process when the project is completed" so that the CPUC can continue to assess whether the Project "is used and useful as well as [to] ensure that the water produced is delivered for use by Cal-Am customers as opposed to a disproportionate

portion of the water going to meet the return water obligation." (CPUC Decision D.18-09-017, p. 138.) The CPUC determined that the return water percentages included in the EIR/EIS are reasonable, and any percentages above those are presumed "unreasonable." (See *id*., pp. 151-152.) Cal-Am ratepayers would not bear the costs for meeting return water obligations that are "unreasonable." (*Ibid*.) Thus, the CPUC will conduct a reasonableness review following Project start-up "will include an assessment of the facilities used and usefulness as well as to what extent the MPWSP is able to produce water for use by Cal-Am customers, as opposed to meeting the return water obligation." (*Ibid*.) Thus, the CPUC has mechanisms in place to ensure that Cal-Am ratepayers are receiving the water they need and not subsidizing Cal-Am's return water obligations.

- In addition, if Castroville had not agreed to buy the return water at its avoided cost rate, Cal-Am would be required to find an alternative outlet for this water, such as abandoning the water or injecting desalinated product water into the SVGB, which would come with its own additional costs. (See Applicant's Staff Report, Sections IV.J, IV.N.) The Return Water Settlement Agreement allows Cal-Am to meet the requirements of the Agency Act, provides a potable water supply to a disadvantaged community, and protects the Salinas Valley Groundwater Basin by alleviating a current pumping stress ahead of the seawater intrusion front.

- Further, regardless of the cost per acre-foot, that cost is not going to affect the cost for the Project on customers' water bills. The CPUC already determined the rate increase for Cal-Am's customers for the Project based on both the capital costs to build the facility and the cost of long-term operations and maintenance. As such, how much water the Project produces (or does not produce) is not a material variable in rates that customers are charged, except for minor, incremental operating and maintenance costs. Thus, if Cal-Am needs to produce more water in order to meet its return water obligations, it can do so without adding to the Project's fixed costs. (See Applicant's Staff Report, Section IV.O.3.)

5. <u>Relocation of the Project's Slant Well Network</u>

- In response to comments regarding the relocation of the existing well network, the Staff Report recognizes that current drilling technology "generally limits [well installation] to a maximum length of several hundred feet." (Staff Report, p. 73.) Further, the Staff Report explains the Project's well network cannot be located closer to the shoreline because it would increase the risks from coastal erosion and sea level rise. (*Ibid*.)

    - For the reasons explained in Applicant's Staff Report, Section IV.J, Cal-Am agrees with staff's determination that the proposed location for the slant wells is the environmentally superior design to maximize seawater capture and protect

against further inland migration of seawater in the Project area, and at the same time minimize capture of seawater intruded contaminated groundwater.

F. Energy Consumption & Climate Change (Staff Report, pp. 74-77)

- The Staff Report concludes that the Project appropriately minimizes energy consumption and is consistent with the LCP and Coastal Act policies regarding energy consumption and climate change. (Staff Report, p. 77.) Cal-Am agrees with Commission Staff's determinations.

- The Staff Report bases its conclusion by citing to data for the larger project that was analyzed in the Final EIR/EIS, not Alternative 5a, which was the reduced project alternative ultimately approved by the CPUC. To clarify the record, Alternative 5a (the Project for which Cal-Am applied to the Commission) would reduce emissions and energy use as follows:

    - As part of Alternative 5a, operational electricity use for the intake and desalination plant would be reduced to approximately 38,000 megawatt hours of electricity per year, which would be an increase of 27,000 megawatt hours per year over Cal-Am's existing baseline electrical use for its water portfolio (based on the 11,466 megawatt hour baseline used in the Final EIR/EIS). (See Final EIR/EIS, pp. 4.11-12, 5.5-341.)

- As noted in the Staff Report, the Project would reduce the carbon footprint of the Project's electricity consumption to zero with the incorporation of Mitigation Measure 4.11-1 from the CPUC's Final EIR/EIS. Specifically, Mitigation Measure 4.11-1 provides the following loading order: 1) obtain renewable energy from on-site solar panels and/or the adjacent landfill-gas-to-energy facility; 2) purchase renewable energy from off-site sources within California such as PG&E or Monterey Bay Community Power; 3) procure and retire Renewable Energy Certificates for projects or activities in California; and 4) procure and retire Carbon Offsets. Based on the loading order, Cal-Am is most likely to purchase renewable energy since it is a less expensive option than purchasing and retiring carbon offsets.

- However, the Staff Report also concludes that the PWM Expansion is a feasible alternative that would use less energy than the Project. The Staff Report notes that the PWM Expansion is proposed to operate entirely on renewable energy as opposed to Cal-Am's mitigation measure that proposes to use renewable energy, purchase emission credits, or a combination of both.

    - The Staff Report's statements that the PWM Expansion would operate entirely on renewable energy are in question. As discussed in Section J, *infra*, the PWM Expansion's proposal to use landfill gas for its energy use is facing obstacles. Therefore, the PWM Expansion's ultimate GHG impacts are not currently known.

    - The Staff Report also cites to *Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467 ("*Golden Door II*") to contend that Mitigation

Measure 4.11-1's allowance of offsets and carbon credits "does not necessarily result in real, permanent, verifiable, and enforceable greenhouse gas emissions." (Staff Report, p. 77.) Therefore, the Staff Report concludes that if Cal-Am does not operate entirely on renewable energy, "it would result in higher GHG emissions than the" PWM Expansion. This misconstrues the holding of *Golden Door II* and Mitigation Measure 4.11-1's requirements.

- *Golden Door II* expressly states that the "decision is not intended to be, and should not be construed as, blanket prohibition on using carbon offsets—even those originating outside of California—to mitigate GHG emissions under CEQA," contrary to the Staff Report's suggestion. (*Golden Door II*, *supra*, 50 Cal.App.5th at p. 483.) In addition, Mitigation Measure 4.11-1 does not contain the same flaws as *Golden Door II*'s measure, which impermissibly deferred mitigation by failing to include specific, objective, or enforceable performance standards to ensure offsets actually occurred. In fact, the Staff Report does not point to anything in Mitigation Measure 4.11-1 to suggest that the offsets will not occur. Indeed, Mitigation Measure 4.11-1 contains other performance standards to ensure that mitigation of GHG emissions occurs. Mitigation Measure 4.11-1 requires Cal-Am to submit documentation annually to the "CPUC demonstrating that the project's operational electricity use in the immediately preceding calendar year resulted in net zero GHG emissions." (Final EIR/EIS, p. 4.11-20.) Should the CPUC determine that Cal-Am has not achieved net zero GHG emissions, the CPUC will provide to Cal-Am a notice to procure, submit, and retire offsets in an amount at least equivalent to the exceedance. (*Id*., p. 4.11-21.) The *Golden Door II* measure was overturned in part because it contained no such requirements for demonstrating that net zero GHG emissions were achieved or any enforcement mechanisms for the County of San Diego to ensure that mitigation was actualized. Accordingly, the Staff Report's contention that Cal-Am would result in higher GHG emissions than the PWM Expansion simply because it may involve the purchase and retirement of offsets is without merit.

- Further, as Section J, *infra*, explains, the PWM Expansion is infeasible, and should not be considered as an alternative to the Project. Accordingly, comparing the Project's energy consumption to the PWM Expansion is unnecessary.

G. Public Access and Recreation (Staff Report, pp. 78-82)

- The Staff Report concludes that the Project's impacts on public access and recreation could be consistent with Coastal Act and LCP public access and recreation policies with the implementation of special conditions. (Staff Report, pp. 80-81.) Cal-Am believes that any public access and recreation impacts are *de minimis*, but as part of the Applicant's Staff Report proposed Special Condition 10, which requires the preparation of a Public Access Plan to ensure consistency with the applicable Coastal Act and LCP policies.

1. Public Access and Recreation During Construction

- The Staff Report acknowledges that construction activities to develop the well field and pipeline in the Coastal Zone would occur hundreds of feet from the shoreline and "would have little, if any, effect on public access or recreational use." (Staff Report, p. 80.)

- However, the Staff Report suggests that impacts related to the replacement of clamps on the outfall line as well as installation of the outfall liner could impact public access and recreation. (*Ibid*.)

    - Impacts related to clamp replacement would be temporary and would only occur over a 6 to 8 week period. Lateral beach access would remain open during the 6 to 8 week period and the Final EIR/EIS includes a mitigation measure to ensure that impacts from the clamp replacement would be less than significant. (Final EIR/EIS Mitigation Measure 4.13-5.) Nonetheless, Cal-Am proposes Special Condition 10 to further ensure that there are no public access and recreation impacts.

    - Regarding the outfall liner, Cal-Am has proposed an alternative approach to the outfall liner that would maintain the existing M1W outfall pipeline and avoid groundbreaking and impacts within the Coastal Zone. Specifically, Cal-Am has proposed excavating a single access point to the pipeline outside of the Coastal Zone and manually applying a protective spray liner throughout the pipeline's interior from the access point to the beach junction box. As a result of this change it would no longer be necessary for Cal-Am to excavate, open, and install a new physical liner in the pipeline at ten locations along the M1W right-of-way and no above grade work would occur within the Coastal Zone. Accordingly, the new design of the outfall liner would entirely avoid any potential public access impacts within the Coastal Zone. Special Condition 4 requires Cal-Am to implement the proposed spray-lining method prior to the commencement of Project operations or to obtain an amendment to this CDP or a new CDP should Cal-Am need to implement a different method to install the outfall liner.

- Cal-Am agrees with the Staff Report's conclusion that Project construction would be consistent with the LCP and Coastal Act policies, and believes that proposed Special Conditions 4 and 10 further will ensure that consistency.

2. Public Access and Recreation During Operations

- The Staff Report states that "[p]roject operations … would not cause public access or recreation impacts compared to currently existing conditions." (Staff Report, p. 80.) Cal-Am agrees. However, the Staff Report claims that the "Project could result in adverse effects to public access and recreation, depending on the eventual restoration and access plan that emerges from implementation of the CEMEX Settlement Agreement." (*Id.* at p. 80.)

- To begin, regardless of whether the Project's public access impacts are evaluated against existing conditions or a potential future condition—the Project's impact on public access is *de minimis*. The Project would "fence off a quarter-acre around the wellheads and some other equipment, occupy another quarter-acre for a period of nine to 18 weeks [every five years] for maintenance, and result in use of vehicles and other equipment over an approximately 6 acre area over time." (Staff Report, p. 81; see Final EIR/EIS, pp. 3-59, 4.8-33.) While the Final EIR/EIS indicated that the disturbed area from well construction and ongoing maintenance would be 6 acres over the project's lifetime (i.e., the cumulative effects of maintenance), this area has been reduced to 2.2 acres as a result of selecting the smaller desalination project and subsequent design drawings. (See Section A.) For context, the half-acre footprint would occupy only 0.12 percent of the 400+ acre CEMEX site at any one time.

- Nevertheless, the Staff Report's claim improperly relies on a future baseline. The proper baseline is existing conditions. (See *Neighbors for Smart Rail v. Exposition Metro Line Construction Auth.* (2013) 57 Cal.4th 439, 447; CEQA Guidelines, § 15125.) Staff's post-restoration baseline is improper because final removal of CEMEX buildings and facilities is not required until December 31, 2024, with an additional year—until December 31, 2025—to complete grading and seeding. (Final EIR/EIS, p. 8.2-122.) A restoration and access plan associated with the transfer in title of the CEMEX site to a purchaser could come even later and the scope of such a plan is unknown. (See Settlement Agreement, § 6 [providing only general requirements for use of site].) Staff provides no support for its reliance on conditions more than five years in the future as a baseline for Cal-Am's CDP. The Project should properly be evaluated against existing conditions which provide no public access.

- The Staff Report incorrectly claims that the six acres that would be occupied or disturbed over the Project's lifetime, could otherwise be used for public access. (Staff Report, p. 81.)

  - To begin, as explained above, the previously estimated six acres of disturbance has been reduced to 2.2. acres as a result of selecting the smaller desalination project and subsequent design drawings.

  - Further, while the Settlement Agreement requires CEMEX to transfer title in the property to a purchaser to either manage for conservation uses, or use the property for other allowable activities, the Settlement Agreement does not require the purchaser to use and manage the property for a specific level of public accessibility.

  - In addition, the Settlement Agreement, which was approved by the Commission, explicitly provides that uses consistent with Cal-Am's existing 30-acre permanent easement are permitted. (Settlement Agreement, §§ 6.2.D.1, 23.2.) Cal-Am's easement would remain even with implementation of a future restoration and access plan.

- Therefore, to suggest that the acreage used for the Project (approximately 2.2 acres) would otherwise be used for public access misstates the Settlement Agreement.

- Although the Project would not impact public access and recreation resources, Cal-Am has proposed Special Condition 10, which provides for a Public Access Plan for both construction and operations. Notably, the Public Access Plan commits Cal-Am to modify the Public Access Plan as required by the Executive Director in light of any future restoration and access plan prepared pursuant to the CEMEX Settlement Agreement. Therefore, the Project is consistent with relevant Coastal Act and LCP policies regarding public access, and would not interfere with the CEMEX Settlement Agreement.

H. Visual Resources (Staff Report, pp. 83-85)

- Cal-Am agrees with the Staff Report's conclusion that Project components within the Coastal Zone would be largely hidden from public view, and that ongoing Project maintenance would be limited and would not conflict with the LCP's policies regarding visual resources. (Staff Report, pp. 83-84.)

- The Staff Report further concludes that the Project's impacts on visual resources could conform with LCP and Coastal Act visual resources policies if the Commission were to impose special conditions on the Project. (Staff Report, p. 84.)

- In the Applicant's Staff Report, Cal-Am has proposed Special Conditions 11 and 12 to address staff's visual resources concerns. Special Condition 11 requires implementation of a Facility Design and Screening Plan and Special Condition 12 requires implementation of a Lighting Plan. Implementation of these two plans will ensure that the Project is consistent with applicable LCP and Coastal Act visual resources policies.

I. Environmental Justice (Staff Report, pp. 86-101)

- The Staff Report downplays the potential Project benefits to Castroville, a community of concern, and the Monterey Peninsula as a whole. (See Staff Report, pp. 90-91.)

    - As described in the Applicant's Staff Report, the Project will not only provide water supplies to Castroville, a particularly underserved community, but will also protect the Peninsula's groundwater supplies from seawater intrusion and provide a reliable drought-proof water supply for economic growth and much-needed affordable housing and residential development. (See Applicant's Staff Report, Sections IV.J, IV.N, IV.P.)

    - Not only would the Project benefit the SVGB by withdrawing seawater from the seawater intruded aquifers of the SVGB and preventing further seawater intrusion from migrating inland (see Applicant's Staff Report, Section IV.J; see also Final EIR/EIS, pp. 8.5-562, 8.5-615), but also the Project would provide much needed protections to the Seaside Groundwater Basin. The Project would enable the Seaside Basin to maintain the necessary groundwater levels to prevent seawater

intrusion and the irreversible loss of groundwater storage. (See Applicant's Staff Report, Section IV.P; see also October 4, 2019 Seaside Groundwater Basin Watermaster Letter to Commission.)

- In the absence of the Project, the region would remain in a state of water poverty and would not experience the economic benefits that the Project would enable. (See Applicant's Staff Report, Section IV.P.)

    - For instance, construction of the Project is anticipated to generate $258.5 million in one-time economic impacts and support 1,762 job years in Monterey County over the anticipated development timeline. (See Economic & Planning Systems Letter to California-American Water (Aug. 31, 2020), p. 4, attached as Exhibit 31 to Applicant's Staff Report.)

    - Further, the Project could provide sufficient water for the State Water Board to lift the moratorium and for the Monterey Peninsula to meet its housing goals. In particular, the proposed Project could promote the buildout of necessary affordable housing on the Peninsula, as dictated by the RHNA for the Monterey Bay Area. (See June 30 Letter to Commission, Ex. 28, pp. 9-11; see also Applicant's Staff Report, Section IV.P.)

- The Staff Report substantially overstates the Project's potential impacts to Marina, stating that Marina already has "a disproportionate amount of nearby industrial development" and would be further adversely affected by the Project's slant well field located on the CEMEX site. (Staff Report, p. 89) In particular, staff suggests that Marina residents would be burdened by the Project's potential impacts to public access, vernal ponds, and groundwater.[6] (*Id*., pp. 89-90.)

    - As an initial matter, much of the industrial development that staff represents to be in Marina is not, in fact, within city limits. Figure 1 of the Staff Report shows that, although Marina is near a regional landfill, regional composting facility, and regional sewage plant, this industrial development is located outside of Marina's boundaries. (See Staff Report, p. 100; see also Applicant's Staff Report, Section IV.N.) Further, although Fort Ord is a contaminated site, Marina is actively working to develop the area with housing. (See Applicant's Staff Report, Section IV.N.)

    - Moreover, the Project's impacts to public access and wetlands within Marina are expected to be minimal.

---

[6] Further, staff's evaluation of the Project's potential environmental justice impacts outside of the Coastal Zone exceeds the Commission's jurisdiction. (See *Sierra Club v. Cal. Coastal Com.*, 35 Cal.4th 839, 851-52.) Staff's consideration of environmental justice impacts should be limited to potential impacts within the Coastal Zone, consistent with staff's consideration of other Coastal Act and LCP policies in its Staff Report.

- ***Public Access.*** The Project's slant wells would involve the permanent development on only 0.25 acres of the approximately 400-acre CEMEX site (0.06 percent). (See Applicant's Staff Report, Sections IV.L, IV.N.) Further, Cal-Am has proposed Special Condition 10 to minimize potential impacts to public access. (See *id*., Section IV.L.)

- ***Vernal Ponds***. Based on the available evidence submitted to the Commission, any vernal ponds are unlikely to be hydrologically connected to the Dune Sand Aquifer from which the Project will pump water. (See Applicant's Staff Report, Section IV.G.) Thus, those ponds are unlikely to be affected by Project pumping. Nonetheless, Cal-Am has proposed an Adaptive Management Program that would include ongoing monitoring and evaluation of the ponds to confirm whether the ponds are hydrologically connected to the Dune Sand Aquifer, to what extent Project pumping might affect the ponds and to mitigate and/or offset for any potential adverse effects to the ponds should potential impacts be identified through the Adaptive Management Program. (See *ibid*.)

- Finally, the Final EIR/EIS, the Commission's independent hydrogeologist, the HWG, and the State Water Board all agree that the Project will not impact Marina's groundwater supply. (See Staff Report, p. 68 ["Although some commenters have expressed concern that the Project would adversely affect the water supply wells of the Marina Coast Water District, which are located about two miles from the Project's proposed well field, neither the Final EIR/EIS nor the Commission's independent hydrogeologist found evidence that such impacts are reasonably foreseeable"]; see also Applicant's Staff Report, Section IV.J.)

1. <u>Procedural Concerns</u>

- The Staff Report provides inadequate details on the extensive outreach Cal-Am performed in order to engage its customers and Monterey Peninsula residents regarding the Project. (See Staff Report, pp. 91-92.)

  - For example, Cal-Am maintained a website dedicated to the Project with information and updates for the public, sent bill inserts and direct mail pieces to customers regarding the Project, and engaged in a social media awareness campaign. (See Applicant's Staff Report, Section IV.N.)

  - Further, since 2013, Cal-Am has published a quarterly newsletter discussing Project need, status, and financing, as well as the permitting process. Cal-Am published the newsletter in local print media and circulated it via email. (See Applicant's Staff Report, Section IV.N.) Cal-Am also contributed guest editorials to inform the public on the Project. (See *ibid*.)

  - Moreover, two local agencies—the Monterey Peninsula Regional Water Authority and the Governance Committee—were established to increase public participation in the future of the Monterey Peninsula's water supply, particularly

the desalination component that the Project would provide. (See Cal-Am August 13, 2020 Letter, Ex. 1, p. 12.) These agencies hold regular public meetings to discuss issues concerning the Project. (See *ibid*.)

- Thus, in addition to the CPUC's extensive, six-year long public administrative process regarding the Project's environmental review and ratesetting, Cal-Am conducted thorough outreach to both its customers and the broader region, and ample opportunity was provided to the public to participate in the Project's review.

2. <u>Substantive Concerns – Water Costs</u>

- The Staff Report states that one of the primary concerns regarding the Project is the potential disproportionate burdens that low income ratepayers in Cal-Am's service area would experience as a result of increased rates. (Staff Report, pp. 92-96.) Although the rate increases are commensurate with other projects approved by the Commission,[7] Cal-Am has committed to further mitigating any potential disproportionate impacts on disadvantaged communities by proposing Special Condition 13 to increase the discount afforded to customers through its Customer Assistance Program ("CAP")[8] from 30% to 50%, increase enrollment in the CAP by launching a pilot program to enroll residents of multi-family housing to ensure more eligible customers can participate in the CAP, and contribute an additional $250,000 to the United Way to assist customers in Cal-Am's service territory who are having financial difficulties paying monthly bills. With implementation of Special Condition 13, the Project will be consistent with the Commission's Environmental Justice Policy.

- The Staff Report states that a 2017 Food & Water Watch survey indicates that Cal-Am's customers currently pay among the highest water rates in the country. (Staff Report, pp. 92-93.) The Staff Report also states that a MPWMD report found that costs of the Project would nearly double an average residential ratepayer's water bill by 2023.

    - As explained in the Applicant's Staff Report Section IV.N, based on available information, the CPUC approved a rate increase of about $37-$40 per month for the average Cal-Am customer in a single-family residence for desalination facility costs and financing. Although a final rate determination will be made by the CPUC when the Project goes into service, the Commission last year approved a project that would result in a $41 increase in water bills – the Morro Bay Water Reclamation Facility. (CDP App. No. 3-9-0463; see also Exhibit 1 to August 13, 2020 Letter to Commission ("Dudek Memorandum"), p. 3-4.)[9]

---

[7] E.g., Morro Bay Water Reclamation Facility, CDP App. No. 3-9-0463 (June 21, 2019), https://documents.coastal.ca.gov/reports/2019/7/Th13a/Th13a-7-2019-report.pdf.

[8] Previously referenced as the Low-Income Ratepayer Assistance ("LIRA") program.

[9] In July 2019, the Commission approved the Morro Bay Water Reclamation Facility even though the project would result in a $41 monthly surcharge to Morro Bay ratepayers. The

- Staff states that Cal-Am has repeatedly increased surcharges included in water rates, which the Public Advocates Office ("PAO") has protested. (Staff Report, p. 93.)

    - As explained in the Applicant's Staff Report, Section IV.N, surcharges are included as part of the base water rates and included in customer water bills out of transparency. Certain surcharges also will be expiring in the next few years. What is relevant for the Commission's consideration of the Project is that CPUC approved a rate increase of about $37-$40 per month for the average Cal-Am customer in a single-family residence for desalination facility costs and financing.

- The Staff Report claims that Cal-Am's CAP does not currently reach all low-income customers and has not fully offset the burden on those customers. (Staff Report, p. 94.) Because many otherwise eligible ratepayers live in multi-family structures, where the water bill is in the name of a landlord or management company and not individually metered, those customers may be unable to enroll in programs to offset rate increases. (*Ibid*.)

    - As an initial matter, Cal-Am already undertakes significant outreach efforts to customers who are eligible for CAP participation. Cal-Am publicizes the Customer Assistance Program by sending physical mailers, bill inserts, and email notices to all of its customers. (See Dudek Memorandum, pp. 5; Applicant's Staff Report, Section IV.N.) However, despite these efforts, eligible customers do not all participate in the program.

    - With the implementation of Special Condition 13, Cal-Am would implement a pilot program to provide the CAP's 50% discount to landlords and management companies of master metered multi-family housing where low income tenants reside. The discount would similarly be provided to non-profit housing facility organizations and investors. This would substantially increase the number of participating customers in Cal-Am's service area.

    - With the increased 50% discount provided in Special Condition 13, based on available information average bills for eligible customers would only be expected to increase $10 to $12 per month for desalination facility costs and financing, as compared to $37 to $40 per month for non-CAP customers.

    - In addition, Special Condition 13 requires Cal-Am to contribute an additional $250,000 to the United Way to assist customers in Cal-Am's service territory who are having financial difficulties paying monthly bills.

- The Staff Report reiterates that the lived experience of residents Cal-Am's service area and the potential for higher water rates to displace low income residents requires

---

Commission found that, although the project would be expensive and disproportionately impact low-income ratepayers, the project was nonetheless consistent with the Commission's Environmental Justice Policy and necessary to provide a safe and reliable supply to Morro Bay.

heightened scrutiny of the Project's environmental justice impacts. (Staff Report, pp. 95-96.)

- As described above, Special Condition 13 would prevent the Project form having unintended effects on vulnerable communities in Cal-Am's service territory by offering reduced rates to disadvantaged customers and improving Cal-Am's ability to enroll eligible customers in the CAP. (Applicant's Staff Report, Section IV.N.)

- The Staff Report downplays the Project's importance in ensuring a safe and reliable source of water to the Peninsula. (Staff Report, p. 96.) However, without the Project, there will be insufficient water to construct affordable housing and to allow the hospitality industry to rebound on the Peninsula. (See, e.g., June 30 Letter to Commission, Att. A, pp. 40, 62.) This is just one of the many adverse environmental justice impacts that would result from a failure to approve the Project's CDP.

- The Staff Report claims that the Project is unnecessary because the PWM Expansion is a feasible alternative that would supply customers with adequate, more affordable water supplies and fewer environmental justice impacts. (Staff Report, p. 96.) Staff is incorrect.

  - As more fully described at Section J, burdens related to water cost increases would not be avoided by the PWM Expansion. Projections of PWM Expansion water costs are entirely speculative at this time. Expected water costs from the Phase 1 PWM project have recently increased drastically due to technological difficulties and needed repairs. Monterey One Water estimates that Phase 1 PWM water may range between $2,508 and $3,678 per acre-foot – at minimum, more than double the rate of $1,720 per acre foot approved by the CPUC. (August 12, 2020 Cal-Am Letter to Commission, p. 3.) The projected costs for PWM Expansion would likely see similar increases in costs.

  - Moreover, the Final SEIR for the PWM Expansion was ***denied*** certification by Monterey One Water and is infeasible for myriad other reasons as explained in Applicant's Staff Report. (See Applicant's Staff Report, Section IV.O.1; May 20, 2020 M1W Board of Directors Staff Report.)

  - Notably, even if the PWM Expansion were to eventually be approved, it could fall short of meeting water demand, and will result in its own significant environmental justice impacts. Local groups representing farmers and communities of concern, such as the Monterey County Farm Bureau, the City of Salinas, and others, have voiced serious concerns regarding these significant environmental justice issues related to the PWM Expansion. (See Dudek Memorandum, pp. 14-17 [detailing these concerns]; Section J, *infra*.)

3. Substantive Concerns – Return Water Agreement to Castroville Community Services District ("CCSD")

- The Staff Report states that Cal-Am would provide water to CCSD and CSIP at a steep discount, at the expense of Cal-Am ratepayers. (Staff Report, p. 96.) As a result, staff asserts that the costs of providing discounted water to Castroville would disproportionately impact low-income ratepayers in Cal-Am's service area. (*Id*., pp. 96-97.) Staff incorrectly characterizes the Return Water Settlement Agreement and its specific provisions, as well as the intent underlying the Agreement.

    - As the Applicant's Staff Report, Section IV.N explains, many parties[10] negotiated and agreed to the Return Water Settlement Agreement's provisions, including the per-acre foot costs.

        - The Agreement requires Cal-Am to provide desalinated water to Castroville Community Services District ("CCSD") at about $110 per acre-foot for the return water. (CPUC Decision D.18-09-017, Appx. H, § 5.a.i.) This cost represents CCSD's avoided costs to produce groundwater from the SVGB to serve customer demand. (See *ibid*.) If CCSD wants to purchase additional desalinated water from Cal-Am, the cost would be approximately $580 per acre-foot, which includes various Project-related infrastructure costs. (See CPUC Decision D.18-09-017, Appx. H, § 5.a.ii.)

        - The Agreement also requires that excess return water be directed to the Castroville Seawater Intrusion Project ("CSIP") at a cost of $102 per acre-foot, representing CSIP's avoided costs to produce groundwater. (See *id*., § 5.b.)

    - Further, if Castroville did not agree to purchase the return water, Cal-Am would be required to build or use the infrastructure necessary to inject excess desalinated water into the SVGB in order to comply with the Agency Act. (See Applicant's Staff Report, Section IV.N.) This could result in additional Project costs. However, Castroville's agreement to purchase the return water avoids these costs for Cal-Am and its ratepayers. (*Ibid*.)

    - Moreover, as explained below and in the Applicant's Staff Report, Sections IV.J and IV.N, Cal-Am would incur the costs associated with any return water obligations that exceed those contemplated in the Final EIR/EIS.

- Staff asserts that "recent groundwater modeling shows that the amount of water Cal-Am may need to return to the Basin could be substantially higher than anticipated in previous modeling and in the Return Water Agreement." (Staff Report, p. 97.) As a result, the

---

[10] The development of the Return Water Settlement Agreement was a collaborative effort by Cal-Am, Coalition of Peninsula Businesses, Landwatch Monterey County, the Monterey County Farm Bureau, the Monterey County Water Resources Agency, the Monterey Peninsula Regional Water Authority, Monterey Peninsula Water Management District, Monterey One Water, Planning and Conservation League Foundation, and the Salinas Valley Water Coalition. (See CPUC Decision D.18-09-017, Appx. H.)

Staff Report states that Cal-Am may need to return up to 2,100 afy (as opposed to approximately 700 afy contemplated in the Return Water Settlement Agreement) at a cost of $3,000 to $6,000 more per acre-foot. (*Ibid*.)

- Pursuant to the Return Water Settlement Agreement, ***Cal-Am***—not ratepayers—would absorb any costs associated with Cal-Am's return water obligations if the Project extracts more non-seawater than the Final EIR/EIS estimates. (See CPUC Decision D.18-09-017, p. 192; see also Applicant's Staff Report, Sections IV.J, IV.N.)

4. <u>Substantive Concerns – Cumulative Environmental Impacts</u>

- The Staff Report raises concerns that the slant wells placement on the beach will impact public access, habitat restoration, and passive public recreational use after the CEMEX closure. (Staff Report, p. 98.)

  - As discussed in Section G, the Project's footprint is *de minimis*, and would permanently occupy only a quarter-acre on the 400+ acre CEMEX site, with another quarter-acre being required for periodic maintenance activities that are recommended for the wells approximately every five years and conducted over a period of nine to 18 weeks. (Staff Report, p. 81; see also June 30 Letter to Commission, Att. A, pp. 33-35; Applicant's Staff Report, Section IV.N.) Whether this very minor Project presence would interfere with a future restoration and access plan is entirely speculative because the scope of such a plan or even if one will occur is currently unknown.

  - Moreover, the Settlement Agreement, which was approved by the Commission, explicitly provides that uses consistent with Cal-Am's existing 30-acre permanent easement are permitted. (Settlement Agreement, §§ 6.2.D.1, 23.2.) Cal-Am's easement would remain even with implementation of a future restoration and access plan.

  - Finally, staff's comparison of conditions with the Project to a speculative future, relies on an improper baseline. The proper baseline is existing conditions. (See *Neighbors for Smart Rail v. Exposition Metro Line Construction Auth.* (2013) 57 Cal.4th 439, 447; see also Section G, *supra*.) Staff provides no support for its reliance on conditions more than five years in the future as a baseline for Cal-Am's CDP. The Project should be evaluated against the site as it exists—a site which has served industrial sand mining purposes for over a century and provides no public access.

  - Nonetheless, Special Condition 10, would require Cal-Am to prepare a Public Access Plan that would, among other things, allow the Executive Director to require further public access protections once a restoration and access plan is adopted for the CEMEX site some point in the future. (See Applicant's Staff Report, Section IV.N.)

- The Staff Report points to existing industrial facilities ***outside of the coastal zone***, located ***near*** the City of Marina as evidence that Marina is overburdened with cumulative impacts from industrial facilities. (Staff Report, p. 100.)

    - First, staff's evaluation of the Project's potential environmental justice impacts outside of the Coastal Zone exceeds the Commission's jurisdiction. (See *Sierra Club v. Cal. Coastal Com.*, 35 Cal.4th 839, 851-52.)

    - Second, as stated above, much of the industrial development is not, in fact, within city limits – it is ***near*** Marina. Figure 1 of the Staff Report shows that, although Marina is near a regional landfill, regional composting facility, and regional sewage plant, this industrial development is outside of Marina's boundaries. (See Staff Report, p. 100; see also Applicant's Staff Report, Section IV.N.) Further, although Fort Ord is a contaminated site, Marina is actively working to develop the area with housing. (See Applicant's Staff Report, Section IV.N.) Even so, the Project's *de minimis* presence would not contribute to cumulative impacts on Marina. (See Section G, *supra*.) The majority of the Project's footprint and the physical desalination facility will be located outside of Marina.

- The Staff Report states that Marina residents "are concerned about the potential impacts of the proposed slant wells on their own aquifer and groundwater supply." (Staff Report, p. 101.)

    - As explained above, the Commission's independent hydrogeologist, the Final EIR/EIS, the HWG, and the State Water Board all agree that the Project will not adversely impact groundwater or Marina's municipal supply wells. (See Staff Report, p. 68; Applicant's Staff Report, Section IV.J; Section E, *supra*.)

    - Further, as described above and throughout the Applicant's Staff Report, the Project will provide benefits to both the SVGB and Seaside Groundwater Basin. (Applicant's Staff Report, Sections IV.J, IV.N, IV.P.) The Project will help prevent further seawater intrusion in the SVGB and will protect groundwater levels in the Seaside Basin, thereby preventing seawater intrusion and the irreversible loss of groundwater storage.

- The Staff Report again claims that the PWM Expansion is a feasible alternative that would "avoid all the above-referenced impacts" and result in a "significantly lower rate increase." (Staff Report, p. 101.) For the reasons discussed above and in Section [Alts], staff is wrong that the PWM Expansion represents a feasible alternative, would avoid its own significant impacts, or would result in a significantly lower rate increase. Particularly with implementation of Special Condition 13, low income customers in Cal-Am's service territory will bear little to no costs from the rate increases associated with the Project.

J. Assessment of Alternatives (Staff Report, pp. 102-146)

1. <u>Interpretation of Coastal Act Sections 30233 and 30260</u>

- The Staff Report asserts that Coastal Act section 30233 permits the Commission to analyze Project alternatives because the concrete anchors attached to the Project's temporary monitoring buoys, and the retrofit of the M1W outfall, constitute "fill." (Staff Report, pp. 103, 107.)

    - Staff provides no support for the argument that work on the existing M1W outfall would involve "fill." Resources Code section 30108.2 defines "fill" as "earth or any other substance or material, including pilings placed for the purposes of erecting structures thereon, placed in a submerged area." As discussed in Section D, *supra*, no "fill" is involved in the Project construction. Therefore, Coastal Act section 30233 does not apply. Additionally, even if certain components did constitute "fill"—which they do not—the Commission's authority would be limited to review of alternatives as to those components, not wholesale alternatives to the entire Project. (June 30, 2020 Letter to Commission, Att. A, p. 46.)

- The Staff Report next claims that under the first test of Coastal Act section 30260, the Commission may consider the PWM Expansion project as an alternative. (Staff Report, pp. 103, 107.)

    - As stated in Cal-Am's June 30 Letter to the Commission, pp. 46-47, this position ignores the plain language of section 30260, which explicitly applies only to alternative "locations," not entirely separate projects. (See Pub. Resources Code, § 30260.) Although the Commission has previously interpreted section 30260 to allow consideration of a wide variety of different alternatives, including alternative technologies and methods for accomplishing a project's objectives, it has not previously interpreted section 30260 to allow consideration of wholly separate alternative projects. (See, e.g., Staff Report for Test Slant Well, App. No. 9-14-1735, A-3-MRA-14-0050, pp. 3, 57 [evaluating on- and off-site alternative locations for the test slant well].) Further, prior instances of nuclear storage projects in which the Commission considered out-of-state alternatives are not binding precedent on this proposed Project or other Commission actions.

- Staff also claims that the Commission may consider Project alternatives outside of the Coastal Zone, even though it is only a responsible agency under Public Resources Code section 21080.5(d)(2)(A). (Staff Report, pp. 103, 107-108.) The Commission's authority as a responsible agency is limited. (See, e.g., Pub. Res. Code, § 21002.1, subd. (d); Cal. Code Regs., Tit. 14, Div. 6, Ch. 3 ("CEQA Guidelines"), §§ 15042, 15096, subd. (g)(1) ["When considering alternatives and mitigation measures, a responsible agency is more limited than a lead agency. A responsible agency has responsibility for mitigating or avoiding only the direct or indirect environmental effects of those parts of the project which it decides to carry out, finance, or approve."]; see also June 30 Letter to the Commission [listing cases].)

- Lastly, the Staff Report argues that the Commission's public trust doctrine obligations require it to assess whether "there is an alternative project that would protect the public

trust resources in the Carmel River and that would not involve as many impacts to coastal and public trust resources as this proposed Project." (Staff Report, pp. 104-105.)

- Under the public trust doctrine, state agencies have "an affirmative duty to take the public trust into account in the planning and allocation of [trust] resources, and to protect public trust uses whenever feasible." (*National Audubon Society v. Superior Court* (1983) 33 Cal.3d 419, 446.) However, there is no "procedural matrix" by which an agency must abide in carrying out a public trust determination, and there is no requirement that an agency conduct a separate public trust analysis, as staff did here. (*Citizens for East Shore Parks v. State Lands Com.* (2011) 202 Cal.App.4th 549, 576, 578.)

- The Project does not harm public trust resources. Cal-Am agrees with the Staff Report that the Project "would entail the use of seawater, a public trust resource, in a manner that would not harm that particular resource," "will not take up space on, or affect, tidelands that provide public access", "protects marine water and wildlife public trust resources," and "would end the withdrawal of water from the [Carmel] River." (Staff Report, p. 105.) However, contrary to Staff's contention, as discussed in Section A, the proposed Project also has in place satisfactory measures to mitigate any potential adverse effects construction may have on sensitive species and their habitat.

- As described in this section and in Section K, there is no feasible alternative project that better protects public trust resources. (See Section K, *infra*; Applicant's Staff Report, Section IV.P.).

2. The PWM Expansion is Not A Feasible Alternative

- The Staff Report purports to analyze the PWM Expansion as an alternative to the Project under the "feasibility" criteria set forth under Coastal Act section 30108. (Staff Report, pp. 109-115.) Contrary to staff's claims, when assessed pursuant to the section 30108 criteria, the PWM Expansion is plainly infeasible as an alternative to the Project. (See Applicant's Staff Report, section IV.O.1; see also June 30 Letter to Commission, Att. A, Section I.2.)

a. "Capable of Being Accomplished in a Successful Manner"

- Staff argues that the PWM Expansion would use the same proven technology as Phase I PWM, and that the problems faced by Phase I at startup are common for water treatment projects and are being readily resolved. (Staff Report, p. 110.)

  - The Staff Report ignores the fact that M1W has ceased all work on the PWM Expansion and also fails to acknowledge the myriad technological/operational issues with the Phase I PWM and the PWM Expansion that will prevent the projects from being completed in a successful manner or within a reasonable period of time. (See Applicant's Staff Report, Section IV.O.1.) Given that the PWM Expansion has now been delayed indefinitely and would not meet even the

low demand scenario promoted by MPWMD, it can no longer be considered a feasible alternative to the Project.

- Staff fails to acknowledge that the PWM Expansion is no longer moving forward. (See Applicant's Staff Report, Section IV.O.1; see also June 30, 2020 Cal-Am Letter to Commission, pp. 47-48.) On April 27, 2020, the M1W Board denied certification of the Final SEIR for the PWM Expansion. (See May 20, 2020 M1W Board of Directors Staff Report.) In doing so, the M1W Board acknowledged that significant flaws remain unaddressed in the Final SEIR related to its analysis of PWM Expansion source water, water supply and demand, impacts to agricultural water supplies, and the SEIR's failure to evaluate the PWM Expansion as either an alternative to or a cumulative project with the Project. (*Id.*, p. 2; August 12, 2020 Cal-Am Letter to Commission.) M1W has stated that it does not possess the funding to remedy the significant deficiencies in the PWM Expansion SEIR, and therefore has ceased all work on the Expansion. (See May 20, 2020 M1W Board of Directors Staff Report, p. 1.)

- Phase I PWM continues to face significant technical and operational barriers, and given that it will use the same technology as Phase I PWM, there is no reason to believe that the proposed PWM Expansion will not encounter similar hurdles. (See Applicant's Staff Report, Section IV.O.1; June 30 Letter to Commission, Att. A, pp. 49-50.)

    - M1W is experiencing ongoing difficulties in achieving treated water injection rates originally promised for the Phase I PWM, and currently estimates that it is capable of an annual injection rate of 2,030 afy – less than 58% of the 3,500 afy it has contractually promised to Cal-Am. (Applicant's Staff Report, Section IV.O.1.)

    - In an attempt to address these technical barriers, M1W has proposed a series of costly fixes, including repairs to the shallow wells, final commissioning of the deep wells, and construction of a third, and possibly a fourth, deep injection well. (August 12, 2020 Cal-Am Letter to Commission, p. 2; August 31, 2020 M1W Board of Directors Meeting, at 1:14:20 to 1:22:10, available at https://montereyonewater.org/290/Audio-Recordings-of-Board-Meetings.) These attempted remedies will increase Phase I PWM costs by $13 million, with no guarantee that they will allow M1W to provide Cal-Am with its promised allocation of PWM water. It should be noted that in order to achieve the lowest demand estimate of 10,855 afy set forth in the Stoldt Memo, M1W must produce 100 percent of the promised water supply from the Phase I PWM, as well as 100 percent of the promised supply from the PWM Expansion—even with the proposed fixes the evidence demonstrates that such assumptions are unrealistic. (See Section J.3, *infra*.) These measures will also cause further delay in the Phase I PWM—for example, M1W does not intend to begin construction on the third deep well until November 2020, and it is

speculative to assume that all of its technical issues could be resolved by the December 31, 2021 CDO deadline. (*Ibid.*)

- Phase I PWM has not utilized certain source waters, including agricultural wash water, since startup. (August 12, 2020 Cal-Am Letter to Commission, p. 2.) It is not clear that PWM treatment technologies will be capable of treating these untested source waters to safe levels.

- Staff does not consider adequately the uncertainty regarding disputed water rights for the PWM projects. As discussed in the Applicant's Staff Report, the Amended and Restated Water Recycling Agreement ("ARWRA") between M1W and MCWRA contains multiple requirements and conditions regarding the construction, operation, and financing of new source water for the PWM projects. The conditions to the ARWRA have yet to be satisfied, thus the reliability ARWRA source waters, even for Phase 1 PWM, is speculative due to this ongoing dispute. Likewise, the City of Salinas disputes the PWM Expansion's use of agricultural wash from the City. (Applicant's Staff Report, Section IV.O.1.) Because these issues are currently being disputed, Staff is incorrect in determining that the Phase 1 PWM issues will be easily resolved.

- Staff rebuts the argument that PWM Expansion source waters are unsecured, pointing to the Final SEIR and M1W's August 20, 2020 letter. (Staff Report, pp. 110-111.)

  - As described in Section J.3, *infra*, recent data regarding wastewater treatment plant ("WWTP") and Reclamation Ditch flows demonstrates that under both normal and dry water years, there will be insufficient source waters to supply the Phase I PWM and the PWM Expansion.

b. <u>"Within a Reasonable Period of Time"</u>

- The Staff Report claims that the Project would take 27 months to construct and begin operations once all final approvals are received, while the PWM Expansion would take 24 to 27 months. Confusingly, staff then claims that if each project began construction today, the Project would begin providing water by early 2024, while the PWM Expansion could provide water by late 2022. (Staff Report, p. 111.) This contradicts staff's statement that both projects could be completed in about the same amount of time. Staff also argues that the primary remaining barriers for the PWM Expansion are: (1) certification of the Final SEIR and (2) approval of a new Water Purchase Agreement ("WPA"), which staff claims Cal-Am could pursue expeditiously if it chose to do so. (Staff Report, pp. 111-112.)

  - Even assuming that the M1W Board was ready to approve the PWM Expansion, which it is not (see Section J.2.a, *supra*), the approval of the PWM Expansion will be further delayed by the need to recirculate the SEIR for that project. Under CEQA, when "significant new information" is added to an EIR after the public notice and comment period, but before certification of the EIR, the lead agency must provide notice of an additional public comment period before certifying the

EIR. (Pub. Resources Code, § 21092.1; CEQA Guidelines, § 15088.5; *Save Our Peninsula Committee*, 87 Cal.App.4th 99, 130.)

Appendix I to the PWM Expansion Final SEIR does not consider post-2013 WWTP flow data, which demonstrates a consistent trend of decreasing WWTP flow to source the PWM Expansion, despite the fact that M1W apparently possessed this data when preparing the Final SEIR. (See August 23, 2020 Hazen Memo, p. 4; see Applicant's Staff Report, Section IV.O.1.) Accordingly, overall demand for the source waters listed for the PWM Expansion far exceeds available supplies in both Normal/Wet years and Dry years. (August 23, 2020 Hazen Memo, p. 6.) This newly released post-2013 WWTP flow data constitutes significant new information under CEQA because M1W will be required to identify new, secure water sources for the Expansion for it to be feasible. Further, the absence of the post-2013 WWTP flow data that M1W had in its possession from the Final SEIR created a CEQA document "so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded." (See CEQA Guidelines, § 15088.5, subd. (a)(4).) As a result, the Final SEIR will need to be revised and recirculated for public comment.

M1W also has proposed the potential construction of additional deep wells in an attempt to address injection refusal issues. (August 12, 2020 Cal-Am Letter to Commission, p. 2; August 31, 2020 M1W Board of Directors Meeting, at 1:14:20 to 1:22:10, available at https://montereyonewater.org/290/Audio-Recordings-of-Board-Meetings.) Initially, M1W anticipated constructing a third deep well, but is now discussing a fourth. (*Id.*) The decision to add these additional deep wells would also constitute significant information regarding the PWM Expansion's impacts, triggering a requirement for M1W to recirculate the Final SEIR for the PWM Expansion for additional notice and comment. (CEQA Guidelines, § 15088.5, subd. (a); *Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal.4th 1112, 1129.) As drafted, the PWM Expansion Final SEIR assumes that five deep injection wells would be constructed for both Pure Water projects in total: two deep injection wells for the Phase I PWM, two deep injection wells for the PWM Expansion at sites that would be relocated from those planned for the Phase I PWM, and one additional deep injection well for the PWM Expansion, for a total of three deep injection wells for the PWM Expansion. (See PWM Expansion Draft SEIR, p. 2-22.) Should M1W be required to construct a total of four deep injection wells solely for the Phase I PWM, it is likely that it would need to construct three deep injection wells for the PWM Expansion, for a total of seven wells. Even if only one additional deep injection well is constructed for the Phase I PWM, that would result in one more deep well than was analyzed in the PWM Expansion SEIR. As the Final SEIR has not assessed the impacts of constructing these additional wells, M1W would be required to revise and recirculate the Final SEIR to provide for public notice and comment regarding these additional impacts. (See Applicant's Staff Report, Section IV.O.1; Pub. Resources Code, § 21092.1; CEQA Guidelines, § 15088.5, subd. (a)(1).)

This entire recirculation process could add an additional six to twelve months to the PWM Expansion project's timeline—further demonstrating that the PWM Expansion is not a feasible alternative.

- Delivery of water from the PWM Expansion also will be delayed by the need for the CPUC to approve a WPA between M1W and Cal-Am for PWM Expansion water. As acknowledged by the PWM Expansion Final SEIR, such a WPA is needed to secure funding to construct the Expansion and thus, "[w]ithout knowing when or whether a [WPA] will be negotiated, it is currently not possible to estimate when the [PWM Expansion] would be completed." (See PWM Expansion Final SEIR, p. 3-35.) Any WPA for the PWM Expansion would be required to incorporate additional terms beyond those included in the WPA for Phase I PWM water to provide adequate assurances to Cal-Am and its customers that the PWM Expansion water will be delivered as promised, and enhanced protections in the event that the Expansion is incapable of providing adequate supplies. (See Applicant's Staff Report, Section IV.O.1; see also June 30 Letter to Commission, Att. A, p. 72.) Such performance guarantees must include a guarantee of the full production volume of PWM Expansion product water, and a full indemnification to Cal-Am against any risk, liability, or penalties should the PWM Expansion fail to provide an adequate water supply to meet the needs of Cal-Am's customers. (See Applicant's Staff Report, Section IV.O.1; see also May 9, 2020 Cal-Am Letter to M1W, p. 5.)

- As discussed by the State Water Board, the timeline for implementation of the PWM Expansion has been delayed beyond the December 31, 2021 CDO deadline, and the Expansion requires "approvals and funding for which the details are uncertain and the timeline is indefinite"—as such, "[i]t is uncertain whether or when the proposed [PWM Expansion] may proceed beyond its currently pending environmental review . . ." (See May 8, 2020 State Water Board Letter to Coastal Commission, pp. 4-5.) As such, it is unlikely that the PWM Expansion could be constructed and operational within a reasonable period of time as compared to the Project. (See Applicant's Staff Report, Section IV.O.1.)

- The Staff Report argues that Cal-Am must, for its part: (1) design and obtain permits to install an outfall liner; (2) obtain approvals to either use MCWD's pipeline or construct a new parallel delivery pipeline; and (3) overcome ongoing litigation with the City of Marina and MCWD, all of which the Staff Report claims will delay Project implementation. (Staff Report, pp. 112-113.)

  - None of the matters raised by the Staff Report here present the likelihood of significantly delaying the Project.

  - First, as described in an August 17, 2020 letter to the Commission, Cal-Am now proposes to install a liner to the existing M1W outfall from within the outfall itself via a spray-on method. (See August 17, 2020 Cal-Am Letter to Commission; see also Applicant's Staff Report, Section IV.O.5; Section A.4, *supra*.) As the spray-on liner would be installed entirely from within the outfall, and because the outfall

pipe would be accessed from points outside of the coastal zone, installation would not involve any ground disturbance within the coastal zone, and therefore would not require that Cal-Am obtain a CDP for the work. (See August 17, 2020 Cal-Am Letter to Commission, p. 3.) Cal-Am has proposed a Special Condition to ensure that this less impactful, feasible alternative approach to the outfall liner is pursued. (See Applicant's Staff Report, Special Condition 4.) As such, installation of the outfall liner will not cause any delay in Project implementation.

- Second, existing agreements already permit Cal-Am to utilize the pipeline shared with MCWD to convey Project water, and there remains sufficient excess capacity in the pipeline to accommodate Project water. (June 30 Letter to Commission, Att. A, pp. 54-55.) As acknowledged by the Staff Report, in the event that MCWD continues to unreasonably refuse to permit Cal-Am to exercise its right to utilize the pipeline, Cal-Am has proposed to construct an additional product water conveyance pipeline, running parallel to the shared pipeline. Approvals for this proposed parallel pipeline will come before MPWMD at its October Board meeting. (See July 31, 2020 MPWMD Board of Directors Final Minutes, p. 1.) Therefore, Cal-Am's ability to utilize the shared pipeline, or to obtain approvals for a new parallel pipeline, are not anticipated to cause any substantial delay in the Project's schedule.

- Third, with respect to the litigation initiated by the City of Marina, and in which MCWD has filed a cross-complaint, Cal-Am believes the claims in that case are meritless, and has demurred to MCWD's cross-complaint. (See Applicant's Staff Report, Section IV.O.1.) Further, the CPUC has declared that with respect to brackish groundwater to be extracted by the Project, Cal-Am may develop appropriative groundwater rights if the Project extracts otherwise unusable groundwater without harm to existing users, and Cal-Am thereafter returns any fresh water to the Basin—that framework cannot be modified through this litigation. (*Ibid.*) Moreover, the temporary stay currently in place as a result of MCWD's litigation with the County of Monterey is expected to be lifted following the Commission's decision on the Project. (*Ibid*.) As such, it is unlikely that the litigation initiated by Project opponents will cause significant delay in Project implementation.

c. "Taking into account economic, environmental, social, and technological factors"

- **Economic**—Staff argues that Project water would cost $6,000 to $8,000 per acre-foot, while PWM Expansion water would cost about $2,300 per acre-foot. (Staff Report, pp. 113-114.)

  - The Staff Report's acre-foot cost comparisons are not relevant to potential rate increases on Cal-Am's customers. As stated in the Applicant's Staff Report, based on available information the CPUC approved a rate increase of about $37-$40 per month for the average Cal-Am customer in a single family residence for the desalination facility, and that increase is not tied to per acre foot water

costs. (See Applicant's Staff Report, Section IV.O.1.) The CPUC's rate increase was based on a calculation of the annual revenue required to repay capital costs to build the facility, including set financing repayment requirements, and the annual operations and maintenance. The amount of water the facility produces is not a material variable in rates that customers are charged, except for minor, incremental operating and maintenance costs. Thus, regardless of the amount of water produced each year, the amount needed to be recovered annually from customers for physical construction and operation of the facility and for financing/loans essentially remains the same. (*Ibid.*) That is why the CPUC found that approving a smaller 4.8 MGD desalination facility would not result in any "significant, if any, cost savings to ratepayers" and determined that alternative was not feasible. (CPUC Decision 18-09-017, p. 129.)

- Further, projections of ***PWM Expansion water costs are entirely speculative*** at this time, and given recent increases in Phase I PWM water costs, the projected costs for PWM Expansion water are likely to see similar increases. (See Applicant's Staff Report, Section IV.O.1.) Given the above-discussed technological difficulties facing the Phase I PWM, M1W staff projects that at the current anticipated delivery rate of 2,030 afy, costs for Phase I PWM water may be as high as $3,678 per acre-foot. (August 12, 2020 Cal-Am Letter to Commission, p. 3.) These costs are more than double the rate of $1,720 per acre-foot approved by the CPUC for Phase I PWM water. (*Ibid.*) It is highly likely that the PWM Expansion would face similar cost hikes. Moreover, current cost projections for PWM Expansion water do not account for costs already expended on the Project, which are anticipated to be recovered via future water rate increases that would be expected to increase customer bills by approximately $10 to $20 per month even if the desalination facility is not built. (Applicant's Staff Report, Section IV.O.1.) It is therefore both irresponsible and speculative to compare estimated PWM Expansion water costs to Project water costs at this time.

- **Environmental**—The Staff Report claims that the Project would result in significant adverse effects to ESHA, groundwater, and marine life, while the PWM Expansion would be built entirely outside the coastal zone and would have relatively few environmental impacts. (Staff Report, p. 114.)

    - The Staff Report mischaracterizes the extent of the Project's environmental impacts. (See Applicant's Staff Report, Section IV.O.1.) As described above, the Project would be consistent with the Coastal Act and City of Marina LCP policies regarding coastal waters with the implementation of Cal-Am's proposed special conditions. (See Section D, *supra*; see also Applicant's Staff Report, Section IV.J.) Further, even without the implementation of special conditions, the Project is entirely consistent with all policies regarding groundwater. (See Section E, *supra*; see also Applicant's Staff Report, Section IV.J.) Finally, while the Project would be inconsistent with the Coastal Act and Marina LCP policies regarding ESHA, including wetland/vernal ponds EHSA, the Project would incorporate

mitigation measures to reduce impacts to ESHA to the maximum extent feasible. (See Section A, *supra*; see also Applicant's Staff Report, Section IV.F.)

- Further, there remains significant uncertainties regarding the PWM Expansion's environmental impacts. (See Applicant's Staff Report, Section IV.O.1.) The M1W Board has recognized that the PWM Expansion SEIR does not fully address a number of environmental issues, and therefore denied certification of the SEIR. (May 20, 2020 M1W Board of Directors Staff Report.)

- Finally, the Commission cannot purport to assess the PWM Expansion, which does indeed lie entirely outside the coastal zone, while simultaneously ignoring each and every one of the Expansion's environmental impacts. Staff cannot have it both ways—the Commission must either conduct a complete analysis of the PWM Expansion, including a thorough examination of ***all*** of the Expansion's impacts regardless of where they occur, or it must abandon its attempt to analyze and substitute an alternative for the Project where the alternative lies entirely outside the Commission's coastal zone jurisdiction.

- **Social**—The Staff Report asserts that the Project would have much greater environmental justice-related effects on low-income ratepayers and other communities of interest. (Staff Report, p. 114.)

  - As discussed in Section I, *supra*, Cal-Am offers rate assistance programs for low-income ratepayers, and, as required in proposed Special Condition 13, Cal-Am must implement additional ratepayer assistance programs to address potential barriers to access, customer outreach, and the need to offset any rate increases for low-income customers. (See Applicant's Staff Report, Section IV.O.1.) Moreover, Cal-Am will offer discounted Project water rates to Castroville, a disadvantaged community whose groundwater supply has diminished in recent decades due to overpumping. (*Ibid.*) Proposed Special Condition 13 will ensure that Cal-Am's low income customers will not be required to absorb the costs of providing this discounted water to Castroville residents. (*Ibid.*)

  - In contrast, the PWM is highly likely to cause a number of environmental justice-related impacts, which the Staff Report wholly ignores.

    - First, M1W currently proposes to use more than 3,700 afy in agricultural produce wash water generated by the City of Salinas in order to produce the 2,250 afy in treated water planned for the Expansion. However, Salinas disputes M1W's rights to use these agricultural wash waters, which the City argues is needed to "support farmers, ranchers, and the City's agricultural industry." (See Applicant's Staff Report, Section IV.O.1; January 29, 2020 City of Salinas Letter to M1W, pp. 1-2.)

    - Second, implementation of the PWM Expansion, without the Project, will not enable Cal-Am to provide an adequate water supply to meet even the lowest demand projections set forth in the Stoldt Memo. (See Applicant's

Staff Report, Section IV.O.2.) Without a sufficient water supply, there will be insufficient water available to construct affordable housing in Cal-Am's service area, which will force employees in the Monterey Peninsula service industry to continue residing in more affordable inland communities and contend with lengthy commutes to their jobs on the Peninsula. (*Id.*, Section IV.O.1.) These workers will then be forced to bear additional economic burdens, including costs spent on gasoline or other modes of transportation, in order to commute to the Peninsula, and reduced Coastal access opportunities. (*Ibid.*)

- Third, because WWTP flows that the PWM Expansion is projected to rely upon as source water are continuing to decline, in most situations there would be insufficient source waters to supply both the Expansion and the CSIP. (See Section J.2.a, *supra*; see also Applicant's Staff Report, Section IV.O.1.) Without adequate source water to supply the CSIP project, continued groundwater pumping resulting in seawater intrusion in the SVGB will continue to progress, disproportionately affecting the disadvantaged community of Castroville. (See Applicant's Staff Report, Section IV.O.1.)

- **Technological**—Staff acknowledges that the Project would utilize proven slant well technology, while claiming that the startup issues seen with Phase I PWM will be easily remedied. (Staff Report, pp. 114-115.)

  - Staff does not provide any evidence to back up its claims that the ongoing technological issues with the Phase I PWM, and by extension the PWM Expansion, can be readily corrected. (See Section J.2, *supra*.) M1W has proposed a series of fixes in an attempt to bring Phase I PWM production and injection rates up to planned capacity levels. (*Ibid.*) However, it is speculative at this time to assume that these repairs and additional measures will be effective.

3. Water Supply and Demand

- The Staff Report purports to evaluate the PWM Expansion under the criteria of the Coastal Act section 30108 definition of feasibility and concludes that the PWM Expansion is a feasible alternative to the Project. (Staff Report, p. 109.) Cal-Am and the Commission staff fundamentally disagree as to the feasibility of the PWM Expansion, the current and future water demand for the Cal-Am Monterey service area, and the availability of source water for the PWM Expansion.[11]

  - As explained in Applicant's Staff Report, Cal-Am's desalination facility would provide a more reliable and drought resilient water supply than would the PWM

[11] In response to the Staff Report's claims regarding Monterey Peninsula supply and demand and PWM Expansion source water, Hazen and Sawyer prepared an additional report debunking the Staff Report's assertions (the "September 10, 2020 Hazen Memo"), attached to the Applicant's Staff Report as Exhibit 23.

Expansion. (Applicant's Staff Report, Section IV.O.2.) When combined with Cal-Am's other available water sources, and when considering the most restrictive projections of demand presented to the Commission by MPWMD, only Cal-Am's Project is capable of providing an adequate water supply to meet the Peninsula's current and future demands. Only the addition of the Project to Cal-Am's water portfolio would allow Cal-Am to reduce its withdrawals from the Carmel River in accordance with requirements of the State Water Board's CDO.

- As shown in Table 1 below, the Commission has been presented with conflicting estimates and projections of current and future water demand for the Peninsula. As explained in Applicant's Staff Report, the Commission does not need to determine the validity of these competing demand projections because even when it is assumed that the lowest demand projections from MPWMD are accurate (10,855 afy), the PWM Expansion is not capable of and cannot be relied upon to satisfy that level of demand. (Applicant's Staff Report, Section IV.O.2.)

Table 1: Comparison of existing and future demand scenarios

	2018 CPUC	MPWMD March 2020	MPWMD September 2019	MCWD	2019 Cal-Am Rate Case[12]
Existing demand:	12,000	9,817 – 10,863	9,788 – 11,232	9,985	**9,338** – 9,789 (to 2023)
Future demand:	~14,000 at an unspecified future date	10,884 – 12,287	**10,855** – 12,656	10,412 – 10,983	NA

- **Additional Demand for Seaside Groundwater Basin.** The Seaside Groundwater Basin Watermaster also has concluded that in order to achieve protective water levels and prevent seawater intrusion, the Basin will require replenishment of an additional 1,000 afy over the next 25 years. (October 4, 2019 Seaside Groundwater Basin Watermaster Letter to Commission, p. 2.) Accordingly, each of the demand numbers presented above should be increased by 1,000 acre-feet. The Staff Report concedes that only the Project is capable of replenishing this additional water, however, claims without support that the Watermaster's identification of this 1,000 afy demand is merely "speculative"

[12] The purpose of a rate case is to determine what rates are needed for the next three years to cover the expenses of operating and maintaining the water supply system. To do that, it must be determined what those expenses will be, and what revenue will be generated from customers. Since part of a customer's bill is based on amount of water use, expected demand over the next three years is important to determine expected revenue. In projecting demand over the next three years, Cal Am used demand in 2019 for 2019-2022 based on the assumption that no growth would occur due to the moratorium. The issue of what supplies are needed to adequately and reliability provide water to meet customer demand at all times over decades to come is completely different. If a water system is sized only to meet average current demands, it will not have sufficient water to supply customers on the hottest summer days, in times of drought, or to accommodate growth.

since there is no contract in place to purchase the water. (See Staff Report, p. 120.) Notably, there are either no contracts in place or disputed contracts for numerous PWM Expansion source waters that Commission staff rely upon as part of staff's determination that sufficient source waters exist for the Expansion to be considered a feasible alternative. (See June 30 Letter to Commission, Att. A, pp. 50-51 [describing disputed ARWRA source waters and City of Salinas' agricultural produce wash water].) Despite staff's position on those source waters, somehow staff considers the Watermaster's determination to be speculative in the absence of a contract. (See June 30 Letter to Commission, Att. A, pp. 50-51 [describing disputed ARWRA source waters and City of Salinas' agricultural produce wash water].) Commission staff cannot have it both ways.

- *Sufficiency of Available Supplies to Meet Demand.* As explained in Hazen and Sawyer's August 11, August 23 and September 10, 2020 expert analysis submitted to the Commission, the analyses provided by proponents of the PWM Expansion fail to demonstrate that the Pure Expansion has reliable sources of water necessary to meet demand on the Monterey Peninsula, assuming 10,855 afy demand.

  To conclusively demonstrate that the PWM Expansion is not a feasible alternative capable of meeting even a conservative estimate of demand, Appendix A in the September 10, 2020 Hazen Memo provides an updated accounting of Cal-Am's water supply portfolio, assuming operation of the PWM Expansion, but without the Project. Appendix A in the September 10, 2020 Hazen Memo controls for multiple Aquifer Storage and Recovery ("ASR") scenarios and surface water scenarios and demonstrates that the PWM Expansion cannot meet 10,855 afy demand. Hazen Appendix A is reproduced below.

September 10, 2020 Hazen Memo, Appendix A

Source / Assumption Scenario	Proposed by Others			ASR Controlled*			Wastewater & Reclamation Ditch Controlled*		
	CPUC	MPWMD 2020	MPWMD 2019	No ASR	Half ASR (650 AFY)	Full ASR (1,300 AFY)	Updated Table 9 – Normal Year building Reserve	Updated Table 10 – Normal Yr after full Reserve	Updated Table 11 – Dry Year
1. Carmel River	3,376	3,376	3,376	3,376	3,376	3,376	3,376	3,376	3,376
2. Seaside Groundwater Basin	774	774	774	774	774	774	774	774	774
3. Aquifer Storage and Recovery	1,300	1,300	1,300	0	650	1,300	1,300	1,300	1,300

Surplus/Deficit assuming 10,855 afy demand	**-1,811**	**739**	**845**	**-861**	**-211**	**439**	**-1083**	**-1,092**	**-5,311**

* Figure 2 from the August 11, 2020 Hazen and Sawyer report depicts these alternative scenarios. (August 11, 2020 Hazen Memo, p. 19.)

The availability of the individual water supply sources included in Hazen Appendix A above are described in more detail in Applicant's Staff Report. (Applicant's Staff Report, Section IV.O.2.)

Specifically, as shown in Hazen Appendix A, Hazen concluded that ASR was incapable of consistently providing enough water supply to meet the 10,855 afy demand. (August 11, 2020, Hazen Memo, pp. 5-6.) In concluding the PWM Expansion can meet demand, MPWMD's General Manager unrealistically assumes that ASR will provide 1,300 afy of supply at all times and that no droughts will occur between now and 2034. As explained in Applicant's Staff Report, ***the assumption that ASR can reliably produce 1,300 afy on a consistent multi-year basis is unreasonable and speculative.*** (Applicant's Staff Report, Section IV.O.2.) First, as shown in the August 11, 2020 Hazen Memo, ASR using excess Carmel River water in the past 15 years has only achieved an output of 1,300 afy once and an input of 1,300 afy twice. (August 11, 2020 Hazen Memo, p. 5.) Second, during droughts, injection and recovery from ASR is essentially unavailable. (January 23, 2020 Hazen Memo, pp. 6-8; August 11, 2020 Hazen Memo, p. 5.) Third, ASR has proven to be incapable of building up a drought reserve to consistently deliver 1,300 afy. For the last 15 years, average annual storage of ASR is approximately 138 afy, and the last five years have seen an average of 352 afy. (August 11, 2020 Hazen Memo, p. 5.) Such amounts are insufficient storage to provide 1,300 afy over a multi-year drought. Hazen Appendix A accounts for the overall variability of ASR and shows that when realistic assumptions regarding ASR availability are made, there is an overall supply deficit ranging from -211 afy to -861 afy. Hazen found that this deficit will occur even when it is assumed that all other supplies will be fully available.

As explained in Applicant's Staff Report and as found by Hazen and Sawyer, wastewater and surface water flows are insufficient water sources for the Phase I PWM and the PWM Expansion to produce their promised supplies of 3,500 and 2,250 afy, respectively. (Applicant's Staff Report, Section IV.O.2; August 23, 2020 Hazen Memo, pp. 6-15.) Specifically, the PWM Expansion SEIR and analysis provided by PWM Expansion proponents did not evaluate wastewater flows beyond 2013 when considering if wastewater is a reliable water source. In response to the August 11, 2020 Hazen Memo demonstrating that wastewater flows declined significantly since 2013, M1W made wastewater flow information for 2014 to 2019 available to the Commission and the public for the first time on August 20, 2020. However, M1W's new flow information only confirmed that wastewater flow has declined by 2,110 acre-feet since 2013, essentially as Hazen and Sawyer predicted. Further, using recent recorded flow data from the U.S. Geological Survey, Hazen and Sawyer demonstrate that the Reclamation Ditch flows originally analyzed in the PWM Expansion SEIR were significantly overestimated by 16 to 67 percent in critical summer months. (August 11, 2020 Hazen Memo, pp. 10-11.) As shown in Hazen Appendix A, when current wastewater and surface water flows are accounted for, thereby reducing potential output from the Phase I PWM and PWM Expansion, implementation of the PWM Expansion (in lieu of the Project) is expected to result in a supply deficit ranging from -1,083 in normal year to -5,311 in dry years, even assuming MPWMD's low estimate of Peninsula water demand.

Although a supply deficit will occur when either ASR availability or wastewater and surface water flows are accounted for, if these scenarios occurred simultaneously, a greater supply deficit would result.

- The Staff Report also claims that M1W has agreements for more than enough water to supply the PWM Expansion. (Staff Report, p. 110.) However, Tables 2 and 3 provided by the PWM Expansion SEIR, coupled with the analysis of WWTP flows in the Applicant's Staff Report, plainly demonstrates that staff is incorrect. When all available assumed and estimated source water flows according to the Source Water Priority Table 3 in Appendix M to the SEIR are available, there is only 2,297 afy actually available to the PWM Expansion. (September 10, 2020 Hazen Memo, pp. 2-3.) The maximum treated water that could be produced by PWM Expansion with such source waters is 1,860 afy—that output is further reduced to 1,597 afy if the source water flows are reduced to account for current wastewater flows. (*Ibid*.) These outputs are far below the 2,250 afy assumed by M1W and the Staff Report for the PWM Expansion, and would not provide an adequate supply to meet Peninsula demand. (See Applicant's Staff Report, IV.O.2.)

4. <u>PWM Expansion Conformity with Project Objectives and Criteria</u>

- The Staff Report evaluates the Project's and the PWM Expansion's compliance with the primary and secondary Project objectives as set forth in the EIR/EIS. Staff concludes that PWM Expansion could meet each of these objectives, largely because the Staff Report had already concluded that the PWM Expansion could provide an adequate water supply to meet Cal-Am's needs and lift the CDO. (Staff Report, pp. 133-135.)

    - The Staff Report's conclusions regarding the PWM Expansion's ability to satisfy Project objectives and meet the feasibility criteria set forth by the CPUC were thoroughly addressed and refuted in Cal-Am's June 30 Letter. (See June 30 Letter to Commission, Att. A, pp. 63-73.)

    - Staff's determination that the PWM Expansion can meet all Project objectives is based upon the mistaken conclusion that the Expansion can provide a reliable water supply that will meet demand in Cal-Am's Monterey District service area—as explained above, even using the low end demand figures from MPWMD, Peninsula supply with the PWM Expansion, but without the Project, cannot accommodate that demand. (See Section J.3, *supra*; see also Applicant's Staff Report, Section IV.O.3.) Project Primary Objectives 1 through 7 each explicitly concern the proposed project's ability to accommodate present and future demand for water on the Monterey Peninsula as calculated by the CPUC, and thereby enable Cal-Am to abide by the requirements of the State Water Board CDO and deliver needed supplies to Peninsula water users. (Applicant's Staff Report, pp. Section IV.O.3.) Given that the PWM Expansion cannot provide a sufficient supply to meet even the hypothetical low demand figures, let alone the determinations of current and future demand issued by the CPUC, it cannot, by definition, satisfy these basic Project objectives. (*Ibid*.) As stated by the CPUC, the PWM Expansion would satisfy the basic purposes of the Project "***only in***

conjunction with construction of a desalination plant of some size within five to fifteen years" and would only delay the necessary implementation of a desalination project of some size. (CPUC Decision D.18-09-017, Appx. C, p. C-71 [emphasis added].) The Staff Report does not introduce any new evidence to suggest that the PWM Expansion is any more capable of meeting these objectives than when previously addressed by Cal-Am. (See June 30 Letter to Commission, Att. A, pp. 64-67.)

- With respect to Primary Objective 8, regarding minimizing energy requirements and GHG emissions, staff newly calls into question whether Cal-Am can use the carbon offsets ordered as a mitigation measure by the CPUC. (Staff Report, p. 134.) As explained above, implementation of Project Mitigation Measure 4.11-1 would result in the Project having zero net emissions from electricity consumption. (See Section F, *supra*.) The Staff Report's claim that this mitigation measure is "less certain to provide actual greenhouse gas benefits" is entirely without support. Moreover, the case cited by staff, *Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467, has no bearing on the Project's carbon offset program. In *Golden Door Properties*, the California Court of Appeal concluded that the respondent county's GHG mitigation measures, permitting the purchase of carbon offset credits from any carbon offset registry anywhere in the world, lacked sufficient safeguards to ensure that the offsets were permanent and enforceable. (*Id.* at pp. 347-348.) By contrast, the GHG reduction program MM 4.11-1 provides a detailed loading order for achieving net zero GHG emissions for the Project, including the possibility of purchasing and retiring carbon offsets from approved registries that represent reduction of sequestration of one metric ton of CO2e ***within California***. (See Final EIR/EIS, p. 4.11-20.) Any comparison between the Project's carbon offset plan and the mitigation measures rejected in *Golden Door* is unjustified.

- As to Primary Objective 9, requiring minimization of project costs and water rate increases, the Staff Report's conclusion that the PWM Expansion conforms better to this objective is pure conjecture. (Staff Report, p. 134.) Phase I PWM project costs continue to skyrocket—as of June 2020, M1W stated that at the current projected delivery of 2,030 afy, costs for Phase I PWM water would increase to $3,678 per acre-foot. (See Applicant's Staff Report, Section IV.O.3; August 12, 2020 Cal-Am Letter to Commission, p. 3.) Even under the most optimistic scenario presented by M1W, Phase I PWM water costs will amount to $2,508 per acre-foot—almost a 50 percent increase over the water rate approved for Phase I by the CPUC. (Applicant's Staff Report, Section IV.O.3.) There is every reason to assume that the PWM Expansion will face similar cost overruns and therefore no evidence to conclude that the Expansion conforms to this objective.

- Secondary Objective 1 requires that project facilities be sited in areas that are protected against future sea-level rise—the Staff Report claims that the Project well field "would likely be affected directly by sea level rise and the accompanying erosion of the shoreline." (Staff Report, pp. 134-135.) However, as described in Section C, *supra*, with current sea level rise projections, and

incorporating the reduction in coastal erosion rates to be expected from cessation of sand mining at the CEMEX site, the Project's well field would not be affected by climate change-related erosion, including dune recession, until near 2120. (See also Applicant's Staff Report, Section IV.H.) While two of the seven slant wells could be affected by sand burial from windblown sand prior to 2040, these impacts would be avoided with the implementation of special conditions proposed by Cal-Am. (*Ibid.*) As such, the Project well field, with the implementation of special conditions, will not be affected by coastal erosion during the wells' expected operating life and is therefore consistent with this objective. (See Applicant's Staff Report, Section IV.O.3.)

- The Staff Report's conclusion that the PWM Expansion can provide adequate conveyance capacity to accommodate any future supplemental water supplies, as required by Secondary Objective 2, is based entirely upon Exhibit 17 to the Staff Report, a one-page analysis of available well capacity to meet 10-year MDD and PHD prepared by MPWMD General Manager Stoldt, which was also included as Exhibit 9 to the 2019 Staff Report. (Staff Report, p. 135.) However, the Staff Report fails to explain how this report prepared by Stoldt speaks to the PWM Expansion's ability to provide excess conveyance capacity for ***future*** water projects, as is required to satisfy Secondary Objective 2. (See Applicant's Staff Report, Section IV.O.3.) By contrast, Cal-Am's project would provide adequate conveyance capacity to meet build out demand in accordance with adopted general plans and therefore satisfies this Project objective. (*Ibid.*)

- The Staff Report concludes that the PWM Expansion can meet Secondary Objective 3, which requires improvement of the ability to convey water to the Monterey Peninsula cities by improving existing connections at water satellite systems and by providing additional pressure to move water over the Segunda Grade. (Staff Report, p. 135.) In reality, staff has failed to provide ***any*** evidence that the PWM Expansion will provide such necessary conveyance improvements. (Applicant's Staff Report, Section IV.O.3.) Staff instead focuses on Cal-Am's ability to utilize the existing shared pipeline to convey Project product water. However, as explained above, existing agreements permit Cal-Am to utilize the shared pipeline, and the pipeline has ample capacity to serve Cal-Am's uses for the Project. (See June 30 Letter to Commission, Att. A, pp. 54-55.) Moreover, even if Cal-Am is required to construct an additional parallel pipeline to carry Project water, that potential additional pipeline remains before MPWMD for approval, and will be considered by the MPWMD Board in October 2020.

- The Staff Report goes on to apply each of the criteria used by the CPUC to assess the Phase I PWM, to the PWM Expansion, and concludes that the Expansion meets each of the criteria. (Staff Report, pp. 135-140.) Cal-Am has previously addressed each of the Staff Report's conclusions regarding PWM Expansion conformity with the CPUC's criteria (see June 30 Letter to Commission, Att. A, pp. 69-73). As explained in that submittal and the Applicant's Staff Report, based on the available evidence, the PWM Expansion cannot satisfy the feasibility criteria set forward by the CPUC. (See Applicant's Staff Report, Section IV.O.3.)

5. Adverse Environmental Effects

The Staff Report purports to compare the relative environmental impacts of the Project and the PWM Expansion, and concludes the PWM Expansion would have less adverse environmental impacts. (Staff Report, p. 140.)

- Staff contends that the Project would have significant adverse effects on coastal resources, including ESHA and protected species, while PWM Expansion would have few, if any, effects on coastal resources. (Staff Report, p. 140.)

    - As discussed in Section A, *supra*, Cal-Am's proposed Project would be inconsistent with Coastal Act and Marina LCP policies regarding sensitive habitat including wetland/vernal pond ESHA. (See Sections A, B, *supra.*) But with the implementation of Special Conditions 4, 5, and 7, the Commission will have adopted all feasible mitigation to reduce potential ESHA impacts, including potential wetland/vernal pond ESHA impacts. The proposed Project will also be consistent with all other Coastal Act and LCP policies with implementation of Special Conditions. (See Section J.2.c, *supra*; see also Applicant's Staff Report, Section IV.O.4.) The Project is also not anticipated to be impacted by sea level rise of coastal erosion until near the 2120 planning horizon, well beyond the economic lifespan of the Project's wells. (See Section C, *supra*.) Further, the CPUC has already determined that the Project will not result in substantial adverse impacts to coastal waters or marine resources during Project construction or operation with the implementation of all feasible and enforceable mitigation measures.

    - In contrast, the environmental analysis conducted for the PWM Expansion, as discussed in various comment letters on the PWM Expansion Draft and Final SEIRs, has significant flaws and requires substantial additional analysis. (See June 30 Letter to Commission, Ex. 20, Cal-Am Comments on PWM Expansion Final SEIR; see also January 30, 2020 Cal-Am Comments on PWM Expansion Draft SEIR, provided separately to Commission staff.) In fact, based on these significant flaws, the M1W Board denied certification of the SEIR. (See June 30 Letter to Commission, Ex. 18, M1W Board of Directors Staff Report.) Consequently, the full scope of the PWM Expansion's environmental impacts remains unknown.

    - Therefore, the Staff Report's conclusion that the PWM Expansion would have fewer adverse environmental effects is not supported by substantial evidence.

- Staff asserts that the PWM Expansion would be greenhouse gas neutral, while Cal-Am's Project, even with mitigation measures, "is less certain to result in permanent, enforceable, and verifiable" greenhouse gas reductions. (Staff Report, p. 140.)

    - As explained previously, the CPUC imposed Mitigation Measure 4.11-1, which requires Cal-Am's operations to result in net zero operational emissions, either through securing on-site or off-site renewable energy, or purchasing and retiring

renewable energy or carbon credits. (See Section F, *supra*; Applicant's Staff Report, Section IV.O.4.) Thus, the PWM Expansion is not more likely to achieve greenhouse gas reductions; rather, emissions related to both projects' electricity use are slated to be carbon neutral, though they would reach that goal through different means. (See Applicant's Staff Report, Section IV.O.4.)

- Moreover, the PWM Expansion's proposal to utilize landfill gas as a power source is uncertain at this time. (June 30 Letter to Commission, Att. A, p. 67.) If M1W is unable to secure reduced bids or obtain additional funding for this infrastructure, it will be unable to implement the landfill gas power system.

- Staff further states that "an underlying environmental concern applicable to both projects" is the possible effect of Cal-Am not having an adequate water supply to allow Cal-Am to reduce its Carmel River withdrawals by the CDO deadline. (Staff Report, p. 140.) Staff concludes that the risk of delay is "at least as likely to occur" if the Project moves forward instead of PWM Expansion. (*Ibid.*)

    - The assertion that the Project has a higher risk of delay than the PWM Expansion is not supported by the available facts. Cal-Am's Project has received numerous approvals, while the PWM Expansion has obtained no approvals. The PWM Expansion will also experience further delay due to the M1W Board's decision not to certify the Final SEIR, the lack of resources needed to revise the analysis in the Final SEIR, the potential need to recirculate the Final SEIR for further public review. (Applicant's Staff Report, Section IV.O.1.) Cal-Am would also need to seek CPUC approval of a WPA to provide funding for M1W to implement the PWM Expansion. (*Ibid*.) Further, there are questions about how long it could take the Original PWM Project to achieve its water delivery obligations. (See June 30 Letter to Commission, Ex. 25, PWM Status Update Presentation; Section J.2.a, *supra*.) It is virtually impossible that the PWM Expansion would meet the CDO 2021 deadline.

6. Areas of Uncertainty

- The Staff Report claims that both the Project and PWM Expansion involve certain "areas of uncertainty" that relate to the Expansion's status as a feasible Project alternative. (Staff Report, pp. 141-145.) Staff dismisses each "area of uncertainty" related to the PWM Expansion as inconsequential, while concluding that each identified uncertainty for the Project poses significant barriers to Cal-Am. The Staff Report appears willing to accept as insignificant the major questions surrounding the PWM Expansion, while simultaneously condemning the Project based on unfounded conjecture put forward by Project opponents like MCWD.

- Staff lists the following "areas of uncertainty" for the PWM Expansion:

    - **Amount of water produced**—Staff acknowledges that Phase I PWM is currently producing less water on startup than predicted, but asserts that this will be easily

remedied under M1W's plans, and argues that similar issues will not impact a potential supply from PWM Expansion. (Staff Report, p. 141.)

- Staff inappropriately dismisses the significant technological barriers facing the Phase I PWM that have yet to be resolved and which continue to cause significant uncertainty regarding the amount of water that the Phase I PWM is capable of producing. (See Applicant's Staff Report, Section IV.O.5.)

- **Type of source water**—The Staff Report refutes claims that there are potential issues associated with treating agricultural runoff that will be used by PWM Expansion. (Staff Report, p. 141.)

  - Despite staff's claims, the fact remains that that no agency has ever analyzed the impacts from using wastewater contaminated with pesticides or other chemicals as source water for the PWM Expansion. (June 30 Letter to Commission, Att. A, pp. 70-71.) Unless and until such analysis occurs, there will continue to be uncertainty regarding the PWM Expansion's ability to treat agricultural runoff to safe levels. (See Applicant's Staff Report, Section IV.O.5.)

- **CEQA**—The Staff Report acknowledges that the vote to certify the PWM Expansion Final SEIR failed, but argues that the M1W board is free to reconsider the Final SEIR if it so chooses. Staff argues that the primary area of controversy for the Final SEIR was whether adequate source waters exist for the Expansion, and that substantial evidence shows that source waters are adequate. (Staff Report, p. 142.)

  - The Staff Report fails to recognize that multiple, independent barriers remain before the M1W Board may certify the Final SEIR for the PWM Expansion. (See Applicant's Staff Report, Section IV.O.5.) First, in denying certification of the Final SEIR, the M1W Board of Directors explicitly recognized the myriad remaining flaws in the Final SEIR's analysis, including unresolved gaps regarding source water availability, water supply and demand, impacts to agricultural supplies, and the Final SEIR's failure to analyze the PWM Expansion as either an alternative to or a cumulative project with the Project. (*Ibid*; see also May 20, 2020 M1W Board of Directors Staff Report, p. 2.) M1W does not have the funds to correct these major deficiencies in the Final SEIR, and therefore has stopped all work on the PWM Expansion—there is no indication that M1W intends to resume its efforts to certify a complete SEIR any time soon. (See Applicant's Staff Report, Section IV.O.5.)

  - Further, as discussed above, before M1W is able to certify the PWM Expansion SEIR, it will be required to recirculate the SEIR for additional public notice and comment regarding substantial new information that has been learned since the Draft SEIR was circulated. (See Applicant's Staff

Report, Section IV.O.1; see Section J.2.b, *supra*, CEQA Guidelines, § 15088.5, subd. (a); *Cadiz Land Co.*, *supra*, 83 Cal.App.4th at p. 95.) As such, there continues to be significant uncertainty regarding when or whether M1W will be able to issue a certified Final SEIR for the PWM Expansion.

- **Funding and Water Purchase Agreement**—Staff claims that while Cal-Am would need to seek CPUC approval of a new WPA for PWM Expansion water, Cal-Am "has not had an incentive to do this to this date because it is pursuing its desalination project." The Staff Report therefore argues that there would be no barriers to WPA consideration "if Cal-Am needs to proceed with the Pure Water Expansion." (Staff Report, p. 142.)

  - The Staff Report fails to acknowledge that Cal-Am has in fact met with M1W and MPWMD on multiple occasions to discuss a WPA for PWM Expansion water. (See Applicant's Staff Report, Section IV.O.5; see Section J.4, *supra*; Applicant's Staff Report, Exhibit 30, p. 1.) However, Cal-Am determined that it could not, at that time, pursue a WPA for Expansion water given the significant uncertainties surrounding the PWM Expansion. (See Applicant's Staff Report, Exhibit 30, p. 2.) As demonstrated above, these uncertainties remain unaddressed. Finally, as discussed above, any WPA for PWM Expansion water would need to include additional performance measures to guarantee delivery of the full production volume of the PWM Expansion, and indemnification to Cal-Am in the event that the Expansion does not provide an adequate supply. (See Applicant's Staff Report, Section IV.O.5.) These protections would be necessary to ensure that Cal-Am does not need to undertake additional Carmel River or Seaside Basin withdrawals to serve its customers if water demand cannot be met by the PWM projects, without the Project. Accordingly, there is no reason to believe that Cal-Am could reasonably enter into a WPA for PWM Expansion any time soon, much less obtain the CPUC's approval of such an agreement.

- Staff lists the following "areas of uncertainty" for the Project:

  - **Coastal hazards and expected operating life of slant wells**—Staff argues that there are two areas of uncertainty associated with the Project slant wells: (1) the rate of erosion at the CEMEX site cannot be known until sand mining ceases; and (2) while Cal-Am acknowledges that the wells would need to be related after 20-25 years, Cal-Am has not identified alternative well locations. Therefore, there is uncertainty about how the Project would operate after the first 20-25 years of its 60-year operating life. (Staff Report, p. 142.)

    - As explained in Section C, *supra*, the Project well field will not be affected by climate-change-related coastal erosion until at least 2120. (See Applicant's Staff Report, Section IV.O.5.) With the implementation of special conditions proposed by Cal-Am, the current slant well sites will

allow the wells to avoid hazards related to coastal erosion during their expected operating life. (*Ibid.*)

- **Water rights**—the Staff Report asserts that there are two areas of uncertainty associated with Project water rights: (1) whether Cal-Am will be able to satisfy its ongoing burden to demonstrate that its withdrawals and use of fresh water (non-seawater) will not harm or cause injury to any other legal water user; and (2) whether Cal-Am will need to incur additional costs to return greater percentages of SVGB water to Castroville. (Staff Report, p. 143.) Staff also points out that Marina has filed litigation regarding limitations on uses of water at the CEMEX site. (*Id.*, p. 144.)

    - As acknowledged by the Staff Report, no water rights are necessary for the extraction of seawater from the SVGB. (Staff Report, p. 70.) With respect to the non-seawater component of the Project's source water, Cal-Am has proposed protections to ensure that its withdrawal of water does not harm existing SVGB groundwater users. (See Applicant Proposed Measures 4.4-3.) Further, the EIR/EIS explicitly concluded that the Project would not impact groundwater supplies in the SVGB. (See Final EIR/EIS, pp. 4.4-64 to 4.4-70.) The Commission's own independent hydrogeologist confirmed groundwater supplies will not be adversely impacted by Project operation. (See Applicant's Staff Report, Section IV.J.)

    - Additionally, it is not expected that the Project would withdraw greater amounts of "non-seawater" than estimated in the EIR/EIS. Rather, the Commission's independent hydrogeologist confirmed that, under reasonable modeling scenarios, the range of ocean water percentages to be utilized by the Project are consistent with the modeling set forth in the EIR/EIS. (See Section E*, supra*.) Regardless, even if Cal-Am were to extract a greater percentage of "non-seawater" than originally estimated in the EIR/EIS, the CPUC has imposed costs associated with noncompliance with the Return Water Settlement Agreement on Cal-Am, not the ratepayers. (CPUC Decision D.18-09-017, p. 111; see also Applicant's Staff Report, Sections IV.J, IV.N.)

    - Further, any determination regarding water rights is not within the Commission's jurisdiction. On the contrary, the State Water Board—the agency charged with responsibility for regulating state water resources (Water Code, § 174; Pub. Resources Code, § 30412)—has determined that Cal-Am can develop all necessary water rights to operate the Project. (CPUC Decision D.18-09-017, p. 80.) Nothing has occurred since the time of the State Water Board's 2013 opinion to change the Board's assessment in any way.

    - Finally, as explained in Section J.2.b, *supra*, Cal-Am believes that the claims made by Marina and MCWD in the litigation over water use at the

CEMEX site are meritless. The CPUC has already determined that Cal-Am may develop appropriative groundwater rights if the Project extracts otherwise unusable groundwater without harming other existing lawful groundwater users, and Cal-Am returns any fresh water to the Basin. (*Ibid*.) This framework by which Cal-Am may perfect rights to Project source water cannot be modified via this litigation.

- **Effects on wetlands and vernal ponds**—Staff argues that, as discussed in Staff Report Section II.G, recent hydrogeological monitoring conducted by the Commission's hydrogeologist suggests that Cal-Am's slant wells could result in groundwater drawdown at nearby vernal ponds and wetlands. Staff notes that there is no currently available data to confirm whether there is a connection between groundwater and the wetlands/vernal ponds. (Staff Report, p. 144.)

    - As stated in the Staff Report, recent reports regarding Project slant well impacts on nearby vernal ponds and wetlands are inconclusive. (See Applicant's Staff Report, Section IV.O.5.) As such, Cal-Am has proposed a Special Condition requiring the implementation of an Adaptive Management Program which would monitor the vernal ponds to determine: (1) whether the ponds are groundwater dependent and (2) if so, what changes to the ponds might be associated with Project-related drawdowns. (Applicant's Staff Report, Special Condition 7.) If the additional analysis determines that there would be impacts from pumping-related drawdowns, Special Condition 7 would thereafter require Cal-Am to implement a Wetland Resiliency, Enhancement, Restoration, and Monitoring Plan to mitigate for potential vernal pond impacts. (*Ibid.*) Accordingly, any uncertainty has been adequately addressed through a Special Condition.

- **Lack of water distribution pipeline**—Staff notes that: (1) MCWD claims that its product water pipeline does not have sufficient capacity to accommodate Project product water and (2) MPWMD chose not to make the necessary approval for Cal-Am to construct a parallel pipeline at this time. (Staff Report, p. 144.)

    - The Staff Report fails to recognize that existing agreements explicitly permit Cal-Am to utilize the shared pipeline for the conveyance of Project product water, and that there remains sufficient capacity in the pipeline to accommodate such water. (See Applicant's Staff Report, Section IV.O.5; June 30 Letter to Commission, Att. A, pp. 54-55.) Moreover, Cal-Am's alternate proposal to construct an additional pipeline, running in parallel to the shared pipeline, remains entirely feasible—while MPWMD has not yet issued the approvals for the parallel pipeline, the MPWMD Board will consider approvals for the pipeline at its October meeting. (See July 31, 2020 MPWMD Board of Directors Final Minutes, p. 1.) Cal-Am has every reason to believe that MPWMD will issue approvals for the proposed conveyance pipeline.

- **Lack of required outfall liner**—The Staff Report states that there is no approved design in place for the outfall liner proposed as a mitigation measure in the EIR/EIS, and that it is unknown what additional environmental review or permits would be needed for the liner. Staff further addresses Cal-Am's suggestion of a "spray-on" liner, but notes that M1W has not yet evaluated this proposal, and argues that any installation of the spray-on liner that requires work on the beach would adversely affect snowy plover habitat. (Staff Report, pp. 144-145.)

    - As a threshold matter, the Staff Report ignores the fact that the CPUC analyzed reasonably foreseeable impacts of the liner installation method proposed in the Final EIR/EIS, and concluded that these impacts would be less-than significant with mitigation. Nevertheless, Cal-Am has proposed to the Commission a less-impactful feasible alternative method for installing the liner that would be done almost entirely within the outfall and would involve no ground disturbance within the Coastal Zone of the City or the County. (See August 17, 2020 Cal-Am Letter to Commission.) As described in Section IV.F of the Applicant's Staff Report, Cal-Am has proposed Special Condition 4, which would require Cal-Am to implement this proposed spray-lining method prior to the commencement of Project operations. (See Applicant's Staff Report, Section IV.F.) Because Special Condition 4 guarantees there will be no adverse impacts to ESHA caused by the installation of the outfall liner, this future Project component does not raise concerns regarding Project certainty.

7. <u>"No Action" Alternative</u>

- The Staff Report states that under a "no action" alternative, Cal-Am would need to pursue alternative water supply solutions. (Staff Report, pp. 145-146.) Staff argues that the most likely scenario is that Cal-Am would pursue the PWM Expansion. (*Ibid.*) Staff also notes that if Cal-Am needs to obtain an additional supply in the next decade due to shortfalls in PWM Expansion supply, then it may be possible that Cal-Am would need to continue overpumping from the Carmel River. (*Id.*, p. 146.)

    - Cal-Am agrees with the Staff Report that the other water supply projects which have been considered over the past two decades have proposed to use open water intake and could also affect areas of ESHA, thereby potentially causing greater adverse impacts than Cal-Am's proposed Project. (See Staff Report, pp. 145-146.) In the course of reviewing the Project over six years, the CPUC analyzed, and rejected eleven different alternatives to the Project, including the PWM Expansion. Cal-Am also agrees that none of those proposals could meet the deadline imposed by the State Water Board's CDO. Cal-Am is not likely to pursue them.

    - As explained above and in Applicant's Staff Report, the PWM Expansion is not a feasible alternative and has a greater risk of delay than does the desalination Project due the M1W's declining to certify the Final SEIR, the lack of resources needed to revises the analysis in the Final SEIR, and the potential need to

recirculate the Final SEIR for further public review. (See Section J.2.b, *supra*; Applicant's Staff Report, Section IV.O.1.)

- Additionally, if the Project is not approved, Cal-Am will not have an adequate water supply in place to meet its obligation under the State Water Board's CDO. Although Cal-Am could seek an extension of the CDO deadline, approval of such an extension is speculative. Moreover, any extension would lead to continued excessive water withdrawals from the Carmel River in order to make up for shortfalls in supplies from the PWM project as a whole. The Staff Report does not adequately acknowledge the very real possibility that Cal-Am will be forced to continue pumping from the Carmel River to meet regional water demands or otherwise implement severe water rationing measures, along with any associated environmental, economic and environmental justice impacts.

K. Coastal Act Section 30260 Override for Coastal-Dependent Facility (Staff Report, pp. 147-153)

- Cal-Am agrees with the Staff Report's determination that Coastal Act section 30260 applies to the Project, has been incorporated into Marina's LCP, and that the Commission may conduct a section 30260 analysis in considering the Project. (Staff Report, pp. 148-149.) Cal-Am also agrees with staff's determination that the Project is coastal-dependent and an industrial facility (*Ibid.*), but disagrees that it does not meet the three tests under section 30260 (*Id.*, pp. 150-153). As explained in the Applicant's Staff Report, Section IV.P, and below, the Project satisfies section 30260, and the Commission may approve it.

1. Alternative Locations

- The Staff Report wrongly contends that under section 30260 the PWM Expansion is a feasible and less environmentally damaging alternative to the Project. (*Id.*, pp. 150-151.) First, as noted in the Applicant's Staff Report, Section IV.P, the alternatives analysis required under Section 30260 allows the Commission to only consider alternative *locations* for its project, not entirely different alternative projects. (See also June 30 Letter to Commission, Att. A, p. 76 [citing cases].) Second, even if the Commission could consider a separate alternative project, the PWM Expansion is not a feasible alternative. (See Applicant's Staff Report, Section IV.O [explaining that, among other reasons, the PWM Expansion is infeasible due to technological issues, delay, increased costs, and unknown environmental impacts].)

- As described in Applicant's Staff Report, Section IV.P and in the June 30 Letter to the Commission, Att. A, pp. 76-77, the Final EIR/EIS evaluated alternative locations for the Project's slant well network and determined that the CEMEX site is the environmentally superior alternative location. For instance, the two alternative locations considered for the slant wells were found infeasible due to impacts on marine and terrestrial biological resources, an inability to draw sufficient water, and additional permitting complexity.

- To the extent staff cites Coastal Act section 30233 regarding fill in coastal waters as a basis for evaluating whether alternative projects are less environmentally damaging, this

is incorrect. (See Staff Report, p. 150.) As explained above in Sections D and J and in Applicant's Staff Report, Sections IV.H and IV.O, Coastal Act section 30233 allows diking, filling, or dredging of open coastal waters only "where there is no feasible less environmentally damaging alternative." The Project does not involve the "diking, filling, or dredging" of coastal waters. (See Pub. Resources Code, § 30233.) The Project's underwater monitoring equipment and single buoy do not constitute "fill" as contemplated by section 30233 because the equipment uses anchors placed on the seafloor. (See June 30 Letter to Commission, Att. A, p. 77.) In addition, the potential retrofitting of the outfall diffuser and replacement of WEKO seal clamps on the outfall would not involve "fill" in coastal waters. (See Applicant's Staff Report, Section IV.I.) Accordingly, the alternatives analysis for the Project should not include an analysis under Coastal Act section 30233.

  - Moreover, even if the Project components that are the subject of these applications did involve fill, which they do not, the Commission's authority under Section 30233 would be limited to review of alternatives to those components within the Commission's jurisdiction that do involve fill, rather than wholesale alternatives to the entire Project. (Section J, *supra*; June 30 Letter to Commission, Att. A, p. 46.)

- Therefore, as concluded in the Applicant's Staff Report, Section IV.P, there is no feasible less damaging alternative to the Project, and the Project meets the first test of Section 30260.

2. <u>Public Welfare</u>

- The Staff Report contends that denial of the Project would not adversely affect the public welfare. (Staff Report, pp. 151-153.) To the contrary, to not permit the Project would have significant adverse effects on the public welfare.

- Although the Staff Report "acknowledges the need for Cal-Am to obtain a new water supply," it does not provide adequate disclosure of the Project's numerous benefits. (*Id.*, p. 151.) Specifically, the Staff Report either ignores or does not adequately address the following ways the public will be affected if the Project is not approved, as discussed in the Applicant's Staff Report, Section IV.P:

  - Without the Project, a deficit between available water supplies and total demand will result and worsen over time, potentially leading to prohibitions on all or specified non-essential water uses. Failure to approve the proposed Project could lead to severe rationing and restrictions on water usage, including restrictions on watering and irrigating and requirements for specific reductions in residential and commercial water use (Final EIR/EIS, pp. 5.4-10 to 5.4-11);

  - Without the Project, Cal-Am would fail to meet the CDO milestones, which could have harmful consequences for Cal-Am, its customers, the community, and the regional economy. Even if Cal-Am sought an extension of the CDO deadline, approval by the State Water Board is uncertain, and any extension could lead to

continued excessive water withdrawals from the Carmel River and associated environmental impacts, as well as pumping from the Seaside Groundwater Basin that could lead to seawater intrusion;

- The CDO imposes a moratorium on new service connections and certain increases in use until Cal-Am certifies that it has obtained sufficient alternative water supplies. Notably, the moratorium and water supply deficit prevent the development of essential affordable housing in the region. If the proposed Project is approved, it could promote the buildout of necessary affordable housing on the Peninsula, as dictated by the Regional Housing Needs Assessment ("RHNA") for the Monterey Bay Area;

- The Project would provide a water supply to replace that obtained from the Carmel River, benefiting the river watershed (Final EIR/EIS, p. 4.6-126);

- The Project would prevent further seawater intrusion into the SVGB (*id*., p. 4.4-92; D.18-09-017, Appx. C, p. C-75);

- The Project would provide sufficient water to support economic growth, particularly the County's "four pillars"—agriculture, tourism, education, and research.

- Further, as discussed above in Section I and in the Applicant's Staff Report, Section IV.N, the Project will not only benefit the SVGB, but will also provide much needed protections to the Seaside Groundwater Basin, which is another critical water supply source for the Peninsula. (Section I, *supra*; Applicant's Staff Report, Section IV.N.) Providing adequate protections to the Seaside Groundwater Basin is necessary to maintain protective water levels for the Seaside Basin to prevent seawater intrusion and irreversible loss of basin storage.

- Furthermore, as explained in the Applicant's Staff Report, Section IV.N, Cal-Am has a rate assistance program for qualifying water consumers that will help defray increased water costs associated with the Project. Cal-Am has also proposed Special Condition 13, which would expand upon the current ratepayer assistance program and benefit more lower income customers.

- Staff also contends that the public will be adversely affected because sand mining operations at the CEMEX site will cease on the proposed site and the property will be set aside for public benefit. (Staff Report, pp. 151-152.) But staff ignores the current reality of the site conditions. Cal-Am selected this site in part because the area was already disturbed and industrialized. (See Applicant's Staff Report, Section IV.L.)

    - Further, prior to the CEMEX site becoming open for public access, a government agency or non-profit entity approved by the Commission must purchase the property. It is unclear when that would occur or what the exact scope of use for the site would be. (See *ibid*.)

- Moreover, the Project would have a nominal effect on public use of the area. The Project components will only occupy 0.06 percent of the 400-acre CEMEX site, with some minimal additional occupation for recommended maintenance activities approximately every five years. (See Applicant's Staff Report, Section IV.L.) None of the areas impacted by the Project's construction or operation, including those maintenance activities, would impede beach use or access. (*Ibid.*; Final EIR/EIS, pp. 3-59, 4.8-33.)

- As discussed in Section A, *supra*, and in Applicant's Staff Report, Section IV.F, Cal-Am's HMMP also proposes restoration activities on the CEMEX site which would provide significant improvements to that area of dune ecosystem because no restoration or enhancement of the area is otherwise proposed, required or funded under the Settlement Agreement. (See Section A, *supra*; Applicant's Staff Report, Section IV.F.) The Settlement Agreement does not require the future purchaser to use or manage the property for ESHA preservation or restoration. (See Applicant's Staff Report, Section IV.F.) However, in its HMMP, Cal-Am has proposed areas for restoration that have not been identified for restoration under the Settlement Agreement. (*Ibid.*)

- The Staff Report also states that the PWM Expansion could provide a water supply adequate for current and expected future growth and that will allow Cal-Am to meet its obligations regarding reduced withdrawals from the Carmel River. (Staff Report, p. 151.)

  - As described in Section J of this Response and in Section IV.O of the Applicant's Staff Report, the PWM Expansion is not a feasible alternative because, among other things, it will not provide sufficient water to meet even the low demand number put forth by MPWMD. (See Applicant's Staff Report, Section J [discussing PWM Expansion's technological issues, uncertainty regarding the availability of source water for the PWM Expansion, inability to provide adequate water supply, and Monterey One Water's decision not to move forward with the project's development].)

- The Staff Report further contends that the PWM Expansion will better eliminate concerns regarding adverse effects to groundwater. (Staff Report, p. 152.) However, the Project will not adversely affect groundwater supplies in the SVGB, as described in Section E, *supra*, and in the Applicant's Staff Report, Section IV.J. The Commission's independent hydrogeologist and the Final EIR/EIS confirmed that the Project will not impact Marina's supply wells (see Staff Report, p. 68), and that the Project will withdraw primarily seawater from the SVGB—not groundwater that is usable for irrigation or human consumption without treatment. In addition, the Commission's independent hydrogeologist confirmed that the OWP of the Project's source water would range between 88-99% under reasonable assumptions, consistent with the EIR/EIS's conclusions. (See Applicant's Staff Report, Section IV.J.)

3. Mitigation to the Maximum Extent Feasible

- Staff asserts that because the Project does not meet the first two tests under section 30260, it is not necessary to consider the third test. Nevertheless, Staff claims that adverse environmental effects have not been "fully mitigated." (Staff Report, p. 153.)

    - Although the Staff Report uses the phrases interchangeably, the Coastal Act and its regulations do not require that impacts be "fully mitigated,", but rather requires that impacts are mitigated to the "***maximum extent feasible***."[13] (See, e.g., 14 Cal. Code Regs., § 13053.5, subd. (a); see also *id.*, §§ 13328.1, 13356, subd. (b)(2), 13540, 13666.4.) Similarly, the City's LIP states that, for CDPs, the City's Planning Commission shall consider "feasible mitigation measures which substantially reduce significant impacts of the projects as described in any applicable EIR." (LIP, p. 24.)

    - As discussed above in Section A and in the Applicant's Staff Report, Section IV.F, the extent of ESHA impacted will be less than staff identifies in the Staff Report. Instead of the approximately 35 acres staff claims, the Project will only impact approximately 17.5 acres, and all but 2.2 acres only would be temporarily impacted.

    - Further, Cal-Am will implement the CPUC's MMRP and has proposed additional mitigation in its HMMP and Special Condition 5 to address staff's additional ESHA concerns. (See Section A *supra*; Applicant's Staff Report, Section IV.F.) With implementation of these measures and conditions, impacts to ESHA will be mitigated to the maximum extent feasible. (See *ibid*.)

    - In addition, Cal-Am has proposed a separate mitigation program specific to vernal ponds, which would be required under proposed Special Condition 7. (See Section B *supra*; Applicant's Staff Report, Section IV.G.) As a result, potential impacts to vernal ponds would be mitigated to the maximum extent feasible.

    - Finally, potential impacts to coastal hazards, coastal waters, visual resources, and public access are mitigated also to the maximum extent feasible through Special Conditions 3, 8, 9, 10, and 11. (See Section A, C, G, I, *supra*; Applicant's Staff Report, Section IV.F, IV.H, IV.I, IV.L, IV.M.)

- Because Cal-Am's Project meets each of the three tests under Coastal Act section 30260, the Commission should approve the Project.

---

[13] As explained above, "feasible" means "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors." (See Pub. Resources Code, § 30108.) The City's Zoning Ordinance definition of "feasible" is substantively identical to the Coastal Act's definition. (Marina Municipal Code, § 17.41.110.)

A. Environmentally Sensitive Habitat Areas ("ESHA")

- MCWD argues that Cal-Am incorrectly estimates the Project's potential impacts to ESHA by using the wrong standard for temporary impacts, and that, "[a]s determined by the City's biologists, Cal-Am would need to provide at least 50.72 acres of habitat to mitigate the impacts to ESHA within City's jurisdiction." (MCWD Letter, pp. 4, 6.) Further, MCWD argues that regardless of the extent of ESHA impacts, the Project remains inconsistent with Marina's LCP because it impacts "any ESHA." (*Id*., p. 4.)

    - MCWD incorrectly states that Cal-Am is using the wrong standard for temporary impacts. Cal-Am's position is that temporary impacts to be those impacts on habitat resulting from construction that can be fully restored to pre-disturbance conditions following completion of construction, such as impacts from construction staging, laydown, trenching areas, and other work space that will not be occupied by permanent facilities during Project operation. For these type of activities, restoration work will occur concurrent with Project construction, sequencing work to ensure that the impacts are temporally limited. Therefore, these construction-related impacts are correctly identified as temporary.

    - As explained above in Attachment B, Section A of this Response, the impacts to ESHA were previously overestimated in the Final EIR/EIS and have been significantly reduced because the CPUC approved a smaller desalination project than was studied as the project in the EIR/EIS, subsequent design drawings have been prepared, and more detailed biological assessments have defined the scope of biological resource impacts. Therefore, the acreages provided in Attachment B, Section A show the full scope of impacts to biological resources including ESHA in the Coastal Zone.

    - In addition, as explained above in Attachment B, Section A of this Response, the Project conforms to the LCP's habitat protection policies because the Project would not result in substantial adverse impacts to sensitive natural communities, including ESHA, during Project construction or operations with the implementation of feasible and enforceable mitigation measures.

    - Further, because the Project is a coastal-dependent industrial facility that would not result in a substantial adverse impact on sensitive habitats, the Project may be sited in an area defined as primary habitat without violating the City of Marina's LCP and the Coastal Act. (Pub. Resources Code, § 30260; see also Attachment B, Sections A, K; Applicant's Staff Report, Sections IV.F, IV.P.)

- MCWD contends that it is unclear whether Cal-Am has considered impacts to secondary habitat. (MCWD Letter, p. 5.)

    - Contrary to MCWD's contention, Cal-Am's HMMP very clearly considers impacts to secondary habitat. As the HMMP provides "[f]or purposes of this analysis, this document assumes that both primary and secondary habitat would correspond with the CCC's definition of ESHA." (HMMP, p 3-3.) Further,

HMMP Table 3-1 Permanent and Temporary Impacts to Special-Status Biological Resources specifically identifies the acreage of secondary impacts to the Special-Status Biological Resources, HMMP Table 3-3 Mitigation Requirements by Biological Resource identifies the amount of mitigation that is necessary for secondary impacts by resource category, and HMMP Table 3-4 Total Impact Acreages and Mitigation Requirements by Project Components summarizes the total mitigation necessary for secondary impacts. (See HMMP p 3-6 – 3-7 and 3-9 – 3-10.) As provided in Table 3-4, the HMMP proposes to mitigate for 4.457 acres of impacts to secondary habitat. Accordingly, it is very clear that Cal-Am considered and proposed mitigation for impacts to secondary habitat as part of the HMMP. MCWD's comment is entirely without basis.

- MCWD asserts that construction of the Project's slant wells will result in the long-term loss of 7 acres and temporary loss of 2 acres. (MCWD Letter, pp. 5-6.) MCWD further argues there would be additional losses as a result of the future need to relocate wells due to sea level rise and coastal erosion. (*Id*., p. 6.) According to MCWD, Cal-Am must provide evidence or commit that future sites for the replacement slant wells would not be located in ESHA; otherwise, staff must consider the ESHA impacts permanent. (*Ibid*.)

    - Contrary to MCWD's assertion, construction of the Project's slant wells would result in only 2.2 acres of permanent impacts to ESHA and 6.2 acres of temporary impacts. (See Attachment B, Section A; Applicant's Staff Report, Section IV.F.)

    - In addition, as explained in Applicant's Staff Report, Sections IV.F and IV.H, and above in Attachment B, Sections A and C, it is speculative to assess at this time where or how Cal-Am would replace or relocate its wells after their 25-year operating life because technological advancements over the next 25 years could enable the location of alternative wells in locations that are not feasible today. If any relocation or replacement is necessary, Special Condition 9 would require that Cal-Am seek an amendment from the Commission. Further, by the time Cal-Am needs to decommission the wells authorized by this CDP, Cal-Am would need to apply to the Commission for authorization to replace or relocate the wells, and the Commission would need to consider whether the proposal would result in additional ESHA impacts based on the proposed well locations.

- MCWD argues that pipeline construction would result in at least 35 acres of ESHA impacts, and that it is unknown how much ESHA would be impacted by the installation of a liner within the Monterey One Water outfall pipeline. (MCWD Letter, p. 6.)

    - As shown above in Attachment B, Section A of this Response, the Project will not result in 35 acres of ESHA impacts associated with pipelines as MCWD claims, but rather would potentially result in impacts to only 9 acres outside of the CEMEX site associated with pipelines—all of which would be temporary impacts. (See Attachment B, Section A; see also Applicant's Staff Report, Section IV.F.)

- Moreover, as described in Applicant's Staff Report, Section IV.F, Cal-Am has proposed a feasible, less-impactful alternative to install a protective liner throughout the Monterey One Water outfall. The alternative spray lining method would involve minimal groundbreaking activities outside of the Coastal Zone, and the application of the liner would occur entirely within the pipeline itself. (See *ibid*.) Under proposed Special Condition 4, Cal-Am would be required to implement this alternative liner method to avoid impacts to Coastal Zone resources, including ESHA.

- MCWD claims that Cal-Am's proposed mitigation is not permitted under the Coastal Act because "section 30240 does not permit a process by which the habitat values of an ESHA can be isolated and then recreated in another location." (MCWD Letter, p. 5 [quoting *Bolsa Chica Land Trust. v. Super. Ct.* (1999) 71 Cal.App.4th 493, 507].)

  - Contrary to MCWD's assertion, Cal-Am does not propose to "recreate" ESHA elsewhere as a means to be consistent with provisions in Marina's LCP and Coastal Act section 30240 prohibiting non-resource dependent uses in ESHA. Rather, Cal-Am has proposed all feasible mitigation measures to ensure that impacts to ESHA are mitigated to the maximum extent feasible under the Coastal Act and Marina's LCP. (See Applicant's Staff Report, Section IV.F.) Despite proposing all feasible mitigation measures the Project would remain inconsistent with Coastal Act section 30240. Proposing mitigation in another location for permanent impacts is entirely appropriate outside of the context of a Coastal Act section 30240 consistency evaluation. (See, e.g., *Masonite Corp. v. County of Mendocino* (2013) 218 Cal.App.4th 230, 238-239 [permitting offsite mitigation]; see also *Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 279-280 [same].) Therefore, the HMMP's proposal to mitigate for permanent impacts at the CEMEX site in another area of the CEMEX site is permitted under the Coastal Act.

  - Pursuant to Coastal Act section 30260, because the Project is a coastal-dependent industrial facility, the Commission may consider approving the Project notwithstanding potential inconsistencies with Marina LCP and Coastal Act policies regarding habitat protection. One of the tests under Section 30260 is whether the Project's potential impacts are mitigated to the maximum extent feasible.

    - As explained in Applicant's Staff Report, Section IV.P, the Project's potential impacts to ESHA are mitigated to the maximum extent feasible because Cal-Am would implement the CPUC's robust MMRP, Cal-Am's proposed HMMP, and proposed Special Conditions 5, 7.

- MCWD contends that areas identified for mitigation in the HMMP are already slated for preservation or restoration after sand mining activities cease at the CEMEX site. (MCWD Letter, p. 7.) Accordingly, MCWD claims that Cal-Am's proposed mitigation would not yield additional habitat beyond what would otherwise occur and would actually result in a net loss of ESHA. (*Ibid*.)

- As explained in Attachment B, Section A the areas proposed for restoration under the HMMP at the CEMEX site are located entirely within areas that are not identified for restoration under the Settlement Agreement or Reclamation Plan. Absent the implementation of the HMMP by Cal-Am no restoration or enhancement of these areas is otherwise proposed, required, or funded.

- MCWD claims that all ESHA mitigation requires buffer areas, but Cal-Am failed to provide buffers in its HMMP. (MCWD Letter, p. 7.)

    - Contrary to MCWD's contention the HMMP included buffer areas from the pipelines and facilities. (HMMP, p. 1-1.) Specifically, the HMMP provided for a 25-foot work areas on both sides of the centerline of most pipelines and around facilities. (*Id*.) Work area limits along the Castroville pipeline are 30 feet from the centerline on each side. (*Id*.) Accordingly, the HMMP accounted for buffers from the Project's pipelines and facilities.

- MCWD argues that Cal-Am has not provided assurance that the proposed restoration activities at the CEMEX site would occur or that the mitigation would be consistent with the goals of the entity ultimately purchasing the site. (MCWD Letter, p. 7.) Further, MCWD argues that Cal-Am has not proposed a long-term management plan or mitigation to restore the CEMEX site after the useful life of the Project has expired. (*Ibid*.)

    - As explained in Attachment B, Section A and Section IV.F of the Applicant's Staff Report, because the CEMEX site has not yet been purchased by a Commission-approved entity, Cal-Am has proposed Special Condition 5 to address any uncertainty regarding the CEMEX site closure and subsequent transfer to a purchaser as well as long-term management of the restoration area.

- MCWD claims that agricultural runoff will reduce the success of the HMMP.

    - As explained in Attachment B, Section A and Section IV.F of the Applicant's Staff Report, Cal-Am has proposed Special Condition 6, which requires Cal-Am to submit a plan for Executive Director review and approval prior to permit issuance, which will detail the plan for the discontinuation or alternative management for the agricultural runoff. Therefore, any concerns regarding agricultural runoff will be fully addressed.

- MCWD claims that the HMMP is inadequate because the California Department of Fish and Wildlife and the US Fish and Wildlife Service have been left out of the process. (MCWD Letter, p. 6.)

    - Contrary to MCWD's claims, Fish and Wildlife have always been involved in the process of developing the Project's mitigation program. In fact, the US Fish and Wildlife Service have issued Biological Opinion dated October 18, 2018 on which the HMMP was based, and the California Department of Fish and Wildlife have issued an Incidental Take Permit for the Project on December 19, 2019. (See ITP No. 2081-2018-027-04.)

B. Coastal Hazards

- MCWD's Letter argues that the Final EIR/EIS's sea-level rise analysis was superseded by the state's and Commission's more recent guidance that projects higher sea level elevations occurring more quickly. (MCWD Letter, p. 8.)

    - The Final EIR/EIS was prepared based on the best available science at the time. Since that time, the Ocean Protection Council and the Commission have updated their sea-level rise guidance. (See, e.g., June 30, 2020 Letter to Commission, pp. 10-11.) Cal-Am and staff have both evaluated the Project based on this more recent guidance and found that the Project as proposed is consistent with applicable LCP and Coastal Act policies.

    - MCWD references an August 2020 Legislative Analyst's Office Report[1] that it claims represents new state guidance that sea level rise will be higher and faster than previously expected. (MCWD Letter, p. 8.) But this report relies on the very same state guidance, such as the Ocean Protection Council's State of California Sea-Level Rise Guidance 2018 Update, which AECOM and staff have already reviewed and used to update the Project's coastal hazards analysis. MCWD's claim that the report constitutes new information is meritless.

- MCWD argues that the Project is not coastal-dependent pursuant to Coastal Act section 30260. As more fully explained in Section J, MCWD is wrong. The Project is a coastal dependent development as defined by Coastal Act section 30101, which states that a coastal-dependent development or use "means any development or use which requires a site on, or adjacent to, the sea to be able to function at all."

- MCWD states that LCP policies must account for at least 50 years of safety and stability. Although the Project, with Special Conditions, would be safe and stable for 50 years, the LCP and Coastal Act only require that a Project is protected for its economic life. This understanding is shared by Commission staff. (Staff Report, p. 61 ["the proposed well site locations would allow the wells to avoid hazards from coastal erosion during their expected operating life and are therefore consistent with the above-referenced LCP provisions"].) Here, the substantial evidence shows and staff agrees that the Project would be protected for the economic life of the slant wells.

    - The practical effect of MCWD's position would be that any development planned for less than 50 years near the beach would be prohibited, regardless of whether that development would be impacted by wave erosion. This is both nonsensical and inconsistent with the LCP's language and intent, which is meant to ensure that developments are sited to be protected from coastal hazards during their economic lives. (See Staff Report pp. 54-55.) Here, the slant wells would be protected during their operational/economic lives of 20 to 25 years. (*Id.* at p. 61.)

---

[1] Legislative Analyst's Office, "What Threat Does Sea-Level Rise Pose to California?" (Aug. 2020), https://lao.ca.gov/reports/2020/4261/sea-level-rise-081020.pdf.

- MCWD further claims that the soft measures included in Special Condition 8 proposed by Cal-Am to prevent sand burial are unrealistic to avoid the long-term effects of dune recession. MCWD's contention is not only entirely unsupported by any expert analysis, but is contradicted by the City of Marina and the Commission's guidance documents.[2] Soft measures, such as revegetating and monitoring, are dune restoration practices commonly understood to mitigate dune recession. (June 30, 2020 Letter to Commission, p. 13.)

    - MCWD further argues that if the soft measures fail, any hard measures such as sand fencing, would cause additional impacts. (August 14, 2020 MCWD Letter, p. 9.) However, as described above and in Cal-Am's June 30, 2020 letter, the likelihood of the wells being affected by coastal erosion or sand burial is extremely limited – only two wells could potentially be affected by dune migration during their economic lives. (June 30, 2020 Letter to Commission, p. 12-13.) Those impacts would be mitigated through Special Condition 8. Evaluating other measures at this time is entirely speculative and, if necessary, would be the subject of further Commission review and conditions based on actual circumstances. Additionally, because not all wells are necessary for operation, potentially impacted wells could be decommissioned if ultimately necessary without impacting Project operations. (See Final EIR/EIS, p. 4.2-72; June 30, 2020 Letter to Commission, pp. 12-13, 14.)

    - Finally, MCWD claims that not analyzing potential hard measures now constitutes improper deferral of mitigation. (MCWD Letter, p. 9.) MCWD's continued attempt to impose CEQA principles applicable to EIRs onto the Commission's review is groundless. The CEQA Guidelines state that "[f]ormulation of mitigation measures should not be deferred until some future time." (CEQA Guidelines, § 15126.4(a)(1)(B).) Neither the Coastal Act nor the LCP include any such provision. The Commission's role in issuing coastal development permits is to determine whether "the proposed development is in conformity with the certified local coastal program" and other applicable Coastal Act policies. (Coastal Act, § 30604.) Conformance with Section 30253 of the Coastal Act is a Coastal Act policy, not a CEQA threshold.

    - Even so, under CEQA, the specific details of a mitigation measure "may be developed after project approval when it is impractical or infeasible to include those details during the project's environmental review provided that the agency (1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that

---

[2] City of Marina Local Coastal Program, Land Use Plan, p. 21, 61-62 (2013) ("The impact of development on areas already subject to wind erosion problems is low to moderate and can be mitigated through the permit process (e.g., geotechnical investigation prior to permitting development, revegetation with appropriate groundcovers, provision of 'boardwalk' accessways, sand fences, etc.)"), https://cityofmarina.org/DocumentCenter/View/10046/LUP-with-figures---complete; see also June 30, 2020 Letter to Commission, p. 13.

can feasible achieve that performance standard and that will be considered, analyzed, an potentially incorporated in the mitigation measure." (CEQA Guidelines, § 15126.4(a)(1)(B).) Here, Special Condition 8 meets all of these requirements by committing Cal-Am to annual monitoring of dune migration and implementation of specific types of restoration and stabilization activities as necessary, which would be reviewed and approved by the Executive Director prior to implementation. Further, Special Condition 8 provides that if measures are necessary that could impact ESHA, they would be separately permitted and ESHA impacts would be mitigated at a 3:1 ratio. The measure also provides for the possibility of removal of the well entirely if necessary. Therefore, Special Condition 8 ensures that potential dune migration and windblown sand impacts can be fully mitigated or avoided, and is not improper deferral under CEQA.

- Additionally, to ensure that the Project remains consistent with the LCP's coastal hazards provisions, Special Condition 5 requires Cal-Am to return to the Commission for a CDP amendment should there be a need to replace or relocate any slant wells.

C. Protection of Coastal Waters and Marine Resources

- Contrary to MCWD's assertions, the Project would not involve the placement of fill in coastal waters, and therefore, would not trigger Coastal Act Section 30233. As discussed in the Final EIR/EIS, the Project components that MCWD has taken issue with are temporary in nature and limited in scope, and potential impacts to receiving coastal waters, if any, would be minimal. Furthermore, the Project and associated brine discharges would have minimal impacts on receiving coastal waters, which would be mitigated below a level of significance.

- MCWD argues that the full extent of impacts to coastal waters and marine resources is unknown because Cal-Am "failed to include critical project components in its CDP application." (See MCWD Letter, p. 10.) MCWD argues that because Cal-Am has not included the outfall work as part of its CDP application, it is not presently known how exactly the brine would be processed and discharged into the ocean, and how that would impact coastal waters. (See *id*., p. 79.)

    - MCWD has not identified the "critical project components" that it alleges were excluded from Cal-Am's CDP application. To the extent MCWD's contention relates to the M1W outfall, Cal-Am thoroughly discussed the extent of the outfall's impacts to coastal waters and marine resources in its June 30 Letter to the Commission, in response to similar inquiries by Staff. (See June 30 Letter to Commission, pp. 16-17.)

    - As Cal-Am has repeatedly maintained, aside from the WEKO seal clamp replacement on the nearshore portion of the outfall, work on M1W's outfall is separate from the Project components before the Commission and may be separately conditioned when M1W applies for a CDP for that work (if a CDP is necessary). Even so, as Cal-Am explained in its June 30 Letter to the

Commission, the impacts associated with the potential structural changes to the outfall were fully described and analyzed in the Final EIR/EIS. (Final EIR/EIS, pp. 4.3-109 to 4.3-110; see also *id*., Appx. D1 (Roberts 2017); *id*., Appx. D3 (Trussel Tech); June 30 Letter to Commission, pp. 17-18.) Construction impacts would be minor and temporary, design specifications would be reviewed and approved by Monterey bay National Marine Sanctuary *before* implementation of the retrofit work, and benthic communities are expected to recover to baseline conditions as a result of any potential disturbance. (Final EIR/EIS, p. 4.3-109.)

- As a further precaution, Applicant's Staff Report includes a Special Condition to ensure that all applicable water quality standards related to the outfall are met. The condition requires that prior to operation of the Project, the Applicant must demonstrate that discharges from the outfall would comply with the Ocean Plan and applicable water quality requirements by demonstrating that:

  - (1) a Coastal Development Permit or Amendment has been obtained and implemented for any necessary work on the Monterey One Water outfall related to the Project's discharges; and/or

  - (2) Permittee has implemented other measures consistent with Final EIR/EIS Mitigation Measure 4.3-5, as necessary, outside of the Commission's jurisdiction.

- With respect to project impacts to coastal waters and marine resources generally, these impacts have been thoroughly examined in the Final EIR/EIS, and reiterated in Cal-Am's June 30, 2020 Letter. (See Final EIR/EIS, pp. 4.3-1 to 4.3-129, 4.5-1 to 4.5-72, 5.5-29 to 5.5-82, 5.5-110 to 5.5-137; June 30 Letter to Commission, pp. 16-18.)

- MCWD argues that the Project's seafloor anchors, buoys, and other mooring instruments constitute the placement of "fill" in open coastal waters, for purposes of Coastal Act section 30233. (See MCWD Letter, pp. 10-11.)

  - In support of this contention, MCWD cites to three prior applications, claiming that "the Commission has historically regarded seafloor anchors, mooring, and other devices as 'fill' under section 30233." (MCWD Letter, p. 11.) As described below, each of these examples involves work that is substantially greater in magnitude and duration than the Project components MCWD has identified. MCWD cites to these applications as an attempt to distort application of the Commission's precedent. In fact, a review of the applications that MCWD has cited confirms that the Commission would not generally consider the Project components at issue in this application to be "fill" for purposes of the Coastal Act.

  - MCWD cites to the following applications in attempting to characterize certain Project components as fill in coastal waters:

- Application No. 9-16-1153, involving installation of up to four 700-pound anchoring devices on the seafloor for a period of up to three years.[3]

- Application No. E-12-012-A1 involving installation of 80 anchoring devices, the majority of which would either be "metal like anchors or 12-foot long helical screw anchors that would be *drilled into the seafloor*."[4]

- Application No. 5-03-151-A1, involving the placement of "six one-ton concrete blocks on the ocean floor."[5]

  - Each of these applications proposes the placement of substantially larger objects or a substantially greater number of objects within coastal waters than the Project calls for. Work required for the Project's seafloor anchors, buoys, and mooring instruments is temporary in nature and limited in scope, and potential impacts to receiving coastal waters, if any, would be minimal. As such, ***the precedent that MCWD cites to in no way suggests that the Project components MCWD has identified would involve the placement of "fill" in coastal waters for purposes of the Coastal Act***. To the contrary, the precedent suggests that the Commission would not generally consider the temporary and minor work that the Project entails, as involving the placement "fill" in coastal waters.

- MCWD further suggests that the Project would adversely impact ocean water quality due to seasonal unavailability of wastewater for mixing with brine discharges and insufficient impact mitigation. (MCWD Letter, pp. 79-80.) For these reasons, MCWD concludes that the final method for discharge is unknown, has not been fully analyzed, and there will not be sufficient wastewater available for mixing with the brine discharges. (See *id.*, p. 80.)

  - With respect to impacts associated with brine discharges, the Project's potential environmental impacts from brine discharges were fully analyzed in the Final EIR/EIS. (See June 30 Letter to Commission, pp. 94-95.) As Cal-Am explained in its June 30, 2020 Letter to the Commission:

    - "The Project's potential effects on ocean water quality and marine life were analyzed in detail in the Final EIR/EIS. Specifically, Impact 4.3-5 assessed whether the Project's operational brine discharge would violate water quality standards or waste discharge requirements, or degrade ocean water quality. (Final EIR/EIS, pp. 4.3-95 to 4.3-113.) As discussed therein, the Final EIR/EIS concluded that implementation of the Project

---

[3] Staff Report, Application No. 9-16-1153 (April 21, 2017), available at: https://documents.coastal.ca.gov/reports/2017/5/w9a/W9a-5-2017-report.pdf (pp. 3, 7).

[4] Staff Report, Application No. E-12-012-A1 (July 13, 2018), available at: https://documents.coastal.ca.gov/reports/2018/7/f11a/f11a-7-2018-report.pdf (pp. 10, 15).

[5] Staff Report, Application No. 5-03-151-A1 (July 12, 2006), available at: https://documents.coastal.ca.gov/reports/2006/7/W16a-7-2006.pdf (p. 8.).

could potentially cause exceedances of Ocean Plan water quality objectives for the ammonia and cyanide under certain operational conditions when wastewater volumes co-mingled with the brine are low. For an additional thirteen constituents, the Final EIR/EIS determined that there is not enough information to assess concentrations at the edge of the zone of initial dilution. Therefore, the Final EIR/EIS conservatively concluded that Ocean Plan water quality objectives could potentially be exceeded during operations for some operational discharge scenarios.

- However, the Final EIR/EIS determined that Impact 4.3-5 would be less than significant with implementation of Mitigation Measure 4.3-5 (Implement Protocols to Avoid Exceeding Water Quality Objectives), which requires Cal-Am to perform an extensive water quality assessment prior to Project implementation. (Final EIR/EIS, p. 4.3-104.) Operational discharges that cannot be demonstrated to conform to the Ocean Plan water quality objectives may only be released following implementation of additional design features, engineering solutions, and/or operational measures that ensure compliance with these objectives.[6] (*Id*., p. 4.5-64.) In other words, no exceedance of Ocean Plan objectives will occur because no discharges will be permitted unless the water quality assessment confirms that the discharges comply with the Ocean Plan. The Commission did not comment on or object to Mitigation Measure 4.3-5 in its comments on the EIR/EIS."

- Additionally, Impact 4.3-4 considered whether the Project would violate water quality standards or waste discharge requirements or degrade water quality from increased salinity as a result of brine discharge from the operation of the Project desalination plant. In order to address this concern, the Final EIR/EIS imposes Mitigation Measures 4.3-4, which requires the applicant to implement a monitoring and reporting plan in order to ensure that operational discharges from the Project are in compliance with applicable Ocean Plan salinity standards. (Final EIR/EIS, p. 4.3-93.) The plan will be approved by the Regional Water Board and MBNMS *prior to* implementation. (*Ibid.*) Moreover, monitoring will be conducted for one year *prior to* the commencement of operational discharges and will continue until at least five years after operational discharges commence. (*Id.*, p. 4.3-94.)

[6] The Final EIR/EIS also described the potential design features and operational measures that could be employed, such as retrofitting the existing outfall diffuser, additional pre-treatment of source water to the Desalination Plant component of the Project, treatment of discharge, flow augmentation, and end gate modification. (Final EIR/EIS, pp. 4.3-106 to 4.3-108.) The Final EIR/EIS also analyzed the potential secondary impacts of these potential design features and operational measures, and determined that those secondary impacts would be less than significant. (*Id*., pp. 4.3-109 to 4.3-113.)

- As discussed in the Final EIR/EIS, implementation of these mitigation measures would ensure that impacts relating to water quality standards, waste discharge requirements, or ocean water quality, as a result of brine discharges from the Project, would be less than significant. Accordingly the Final EIR/EIS has thoroughly examined the effects that the desalination plant would have on water quality and implemented adequate mitigation to minimize any potential adverse effects.

- MCWD reiterates concerns that the California Department of Fish and Wildlife (CDFW) raised regarding potential impacts of the Project on sensitive habitants and special status biological resources. In doing so, MCWD falsely suggests that "agencies with authority over marine protected areas have not yet reviewed the project…" (MCWD Letter, p. 80.)

  - As Cal-Am has previously noted, the Final EIR/EIS evaluated potential Project impacts on biological resources in detail and concluded that the Project would not result in a significant impact on marine biological resources with implementation of the mitigation measures identified. (Final EIR/EIS, pp. 4.5-47, 5.5- 134; June 30 Letter to Commission, pp. 82-84.)

  - In addition, as discussed in Attachment B, Section A, CDFW and U.S. Fish and Wildlife have been involved in the process of developing the Project's mitigation program and CDFW has issued an Incidental Take Permit for the Project on December 19, 2019. (See ITP No. 2081-2018-027-04.)

  - In its response, MCWD states that to "[its] knowledge, agencies with authority over marine protected areas have not yet reviewed the project to determine whether it would impact marine species or whether the project is even permittable under the relevant laws." MCWD has overlooked or ignored the fact that Monterey Bay National Marine Sanctuary, a federal agency that is part of the National Oceanic and Atmospheric Administration and whose mission is to "understand and protect the coastal ecosystem… of the Monterey Bay National Marine Sanctuary," prepared the Final EIR/EIS in conjunction with the CPUC. This basic oversight underscores the haphazard nature of MCWD's allegation.

D. Groundwater Resources

1. Adequacy of Existing Groundwater Modeling

- MCWD argues that the Final EIR/EIS's modeling has significant limitations and cannot accurately calculate OWP, thereby underestimating the amount of fresh water that the Project will extract. (MCWD Letter, p. 21; see also *id*., pp. 83-84.) Thus, the Commission must conduct additional investigation and modeling. (*Id*., pp. 12-13, 25.)

  - MCWD's arguments and additional modelling requests are based on assumptions and its own technical analyses that have been rejected in numerous other administrative and judicial proceedings, and are contrary to the findings of the Commission's own technical consultant.

- The extensive groundwater modeling for the Final EIR/EIS involved a multi-year, peer-reviewed effort that conservatively analyzed the Project's OWP and potential impacts to groundwater supplies in the SVGB. (See June 30 Letter to Commission, Att. A, pp. 20-22.)

- Further, as described in Applicant's Staff Report, Section IV.J, the Final EIR/EIS's modeling adequately characterized the Project's potential impacts to groundwater resources in the SVGB and the Project's estimated OWP. The EIR/EIS's OWP estimates are consistent with the 2020 Weiss Report's results for scenarios using reasonable groundwater input assumptions.

- The additional modeling MCWD suggests would only duplicate the extensive groundwater modeling and analyses performed to-date, and thus, is not required. The Commission is "not required to exhaust all suggested testing" before approving the Project. (See *Cadiz Land Co. v. Rail Cycle* (2000) 83 Cal.App.4th 74, 102.)

- MCWD suggests that even the 2020 Weiss Report's conclusions have limited value because Weiss could not fully evaluate the Project's potential groundwater impacts using a new groundwater model "due to a lack of funding and time." (MCWD Letter, pp. 14, 20; see also *id*., p. 73.)

    - There is no need to conduct additional investigation and modeling beyond what Weiss performed, much less for the costs proposed, because the 2020 Weiss Report's findings for modeling scenarios – where it used reasonable parameters and assumptions – confirm the Final EIR/EIS's conclusions. (See Applicant's Staff Report, Section IV.J.)

    - Further, "[p]revious and current modeling results are consistent with field data collected during pumping of the Test Slant Well over a three-year period from April 2015 to February 2018." (HWG Comments on Weiss Report, p. 3.) Thus, "[t]here is no need to further refine estimates of OWP within a range of 88 to 99%." (*Ibid*.)

    - Although Cal-Am maintains that additional groundwater modeling by Weiss was unnecessary in the first instance, Commission staff appropriately directed Weiss to modify the existing model before embarking on a most ambitious and expensive path that would likely prove unnecessary. (See 2020 Weiss Report, p. 3-1 ["To address the recommendations contained in [Weiss's 2019] technical report in potentially less time than would be needed if the field work was included, it was decided that the NMGWM^{2016} would be revised and implemented prior to the field work to see if a range of OWP and capture estimates could be calculated that would account for any reasonable variation in the range of possible aquitard configurations and discontinuities."].)

        - Notably, the 2020 Weiss Report does not suggest that the Commission must conduct transient modeling, as MCWD claims. Rather, the 2020

Weiss Report explains that, should the Commission feel more modeling is necessary to refine the Project's OWP, calibrated transient modeling could be the next step. (See 2020 Weiss Report, p. 5-2.) As explained in Applicant's Staff Report, Section IV.J, and throughout this Response, additional modeling is not required.

- MCWD argues that the 2020 Weiss Report is flawed because it does not address MCWD's comments on Weiss' Scope of Work for the groundwater modeling. (MCWD Letter, p. 15.) According to MCWD, Weiss should have: (i) conducted additional field work to better define hydrogeologic conditions; (ii) incorporated the airborne electromagnetic ("AEM") data and Fort Ord groundwater salinity data; (iii) incorporated seaward gradients in the 180-Foot Aquifer consistent with the applicable Groundwater Sustainability Plan ("GSP"); and (iv) evaluated the impacts of CEMEX's sand mining operations on the Final EIR/EIS's modeling and data from the test slant well. (Id., pp. 15-16.)

    - The Commission is not required to conduct every type of modeling and analysis that MCWD requests.[7] (See *Cleveland Nat. Forest Found. v. San Diego Assn. of Govts.* (2017) 3 Cal.5th 497, 512 [citations omitted].)

    - ***Investigation into Hydrogeologic Conditions.*** MCWD ignores that the 2020 Weiss Report assumed hydrogeologic conditions and other parameters favorable to MCWD's position, such as seaward gradients in the Dune Sand Aquifer. With the exception of unrealistic assumptions regarding flat or seaward gradients in the 180-Foot Aquifer and above-average rainfall recharge, the resulting OWP estimates were generally consistent with the Final EIR/EIS's estimates. (See 2020 Weiss Report, pp. 2-3, 4-9; see also Applicant's Staff Report, Section IV.J.)

    - ***AEM Studies and Fort Ord Salinity Data.*** For the reasons set forth in Applicant's Staff Report, Section IV.J, additional modeling is not required to incorporate the results of MCWD's AEM studies or the Fort Ord data.

    - ***Seaward Gradients in the 180-Foot Aquifer under SGMA.*** SGMA does not require a flat or seaward gradient in the 180-Foot Aquifer. (See HWG Comments on Weiss Report, pp. 6, 9.) Rather, SGMA "requires that the extent and magnitude of seawater intrusion not be exacerbated compared to current conditions, but does not require that existing seawater intrusion be mitigated/remediated." (*Ibid*.)

---

[7] MCWD argues that MCWD and the City of Marina asked for this additional investigation as part of Marina's consideration of Cal-Am's local CDP application, but that "Cal-Am refused." (MCWD Letter, p. 20.) However, Cal-Am did not refuse to conduct any additional investigation. Rather, Cal-Am disagreed with MCWD's and Marina's position that supplemental environmental review of the Project's potential groundwater impacts was required—a position that was and continues to be incorrect and belied by the record, as described below.

- Further, the "hypothetical construction of a flat to seaward gradient in the 180-Foot Aquifer and 400-Foot Aquifer (based on an incorrect assumption about SGMA) is inconsistent with the groundwater elevation minimum thresholds and measurable objectives in the [GSP]." (*Id*., p. 2 [underlining in original].)

- In addition, the 2020 Weiss Report confirmed it could take decades to centuries to achieve a flat or seaward gradient in the 180-Foot Aquifer through the implementation of SGMA. (See Applicant's Staff Report, Section IV.J; see also Attachment B, Section E.)

- ***Impact of CEMEX Operations on EIR/EIS's Modeling.*** For the reasons set forth in Applicant's Staff Report, Section IV.J, the net effect of the CEMEX operations on the test slant well was to *lower* salinity levels, not increase OWP as MCWD suggests.

- MCWD suggests that Cal-Am and the Commission cannot rely on the HWG's critique of Weiss' Scope of Work because the Final EIR/EIS's superposition modeling was not peer-reviewed except by the HWG. (MCWD Letter, p. 25.)

  - As explained in Applicant's Staff Report, Section IV.J, the Project's groundwater modeling was subjected to extensive peer-review, and all HWG work product was peer-reviewed by the CPUC's EIR/EIS consultant team. (See also Final EIR/EIS, pp. 4.4-6, 8.2-27.)

  - Further, the HWG's critique of the Weiss Report and other evaluations of groundwater issues constitute substantial evidence upon which the Commission may rely. (CEQA Guidelines, § 15384, subd. (b) ["Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts"].) "While there may be conflicting opinion as to the need for additional [modeling], that is not fatal to the [environmental review]." (*Cadiz*, *supra*, 83 Cal.App.4th at p. 101; see also *Save Cuyama v. County of Santa Barbara* (2013) 213 Cal.App.4th 1059, 1069 [county could rely on expert's conclusions regarding hydraulic impacts despite differing opinions by EPA and petitioner's expert].) The Commission is not required to "correctly solve a dispute among experts." (*Cadiz*, *supra*, 83 Cal.App.4th at pp. 101-102.)

2. No Significant New Information Regarding Groundwater Impacts Requires the Commission to Perform Supplemental CEQA Review

- MCWD argues that significant new information regarding the Project's potential groundwater impacts requires the Commission to perform supplemental environmental review under CEQA. (See MCWD Letter, pp. 16, 26-28, 73.) In particular, MCWD identifies the 2020 Weiss Report, 2017 and 2019 AEM studies, and Fort Ord salinity data.

- The triggers for further environmental review are not satisfied here, and, thus, the Commission is not required to conduct additional environmental review regarding the Project's potential groundwater impacts.

    - Public Resources Code section 21166 unambiguously states that "[w]hen an environmental impact report has been prepared for a project pursuant to this division, ***no subsequent or supplemental environmental impact report shall be required by the lead agency or by any responsible agency***" unless certain events occur. (Pub. Resources Code, § 21166 [emphasis added].)

    - The triggers for additional environmental review are narrowly limited to: (1) substantial project changes that will require major revisions to the previous EIR; (2) substantial changes regarding project circumstances that will require major revisions to the previous EIR; or (3) new information of substantial importance that was not known or could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified. (CEQA Guidelines, § 15162, subd. (a).) However, subsequent project changes or new information must "require major revisions of the previous EIR . . . ***due to the involvement of new significant environmental effects or a substantial increase in the severity*** of previously identified significant effects."[8] (*Ibid.* [emphasis added].) Additionally, where new information arises, it must be of substantial importance, not have been known and could not have been known at the time the EIR was certified, and show "either that the project will have one or more significant effects not previously discussed in the EIR or that significant effects previously examined will be substantially more severe than shown in the EIR." (*A Local & Regional Monitor v. City of Los Angeles* (1993) 12 Cal.App.4th 1773, 1800 [internal citation omitted].)

- *First*, the 2020 Weiss Report's conclusions are generally consistent with the Final EIR/EIS's evaluation of the Project's OWP. (See Applicant's Staff Report, Section IV.J.) Therefore, the 2020 Weiss Report is not significant new information requiring additional environmental review.

    - Moreover, Cal-Am's return water obligations are not mitigation for any environmental impact. (See Final EIR/EIS, p. 8.2-13.) Rather, OWP and return water are relevant to Cal-Am's compliance with the Agency Act. (See *ibid*.)

- *Second*, the AEM data does not constitute significant new information. The CPUC evaluated and rejected the 2017 AEM study as part of its review of the

[8] "The term 'significant effect' on the environment is defined in the CEQA Guidelines as 'a substantial, or potentially substantial, *adverse change* in any of the *physical conditions* within the area affected by the project . . . .'" (*Fund for Envtl. Def.*, *supra*, 204 Cal.App.3d at p. 1552 [citing CEQA Guidelines, § 15382] [emphasis in original].)

Project. (See Applicant's Staff Report, Section IV.J; see also CPUC Decision D.18-09-017, Appx. J.) Similarly, the 2019 AEM study merely repeats the same general flawed conclusions as the 2017 AEM study. (See Applicant's Staff Report, Section IV.J; see also HWG Comments on AGF Final Report on the 2019 Airborne Electromagnetic Survey of Selected Areas Within the Marina Coast Water District (June 26, 2020).) Thus, the AEM surveys are not significant new information requiring additional environmental review.

- *Third*, the Fort Ord data are not new. In response to MCWD's same comment during the Marina Planning Commission process, the HWG explained that the Ford Ord data is not "new information" following the CPUC's approval of the Project "as it has been collected from the same wells for many years." (See HWG Comments (Apr. 12, 2019), p. 3.) Most importantly, however, the HWG confirmed that the Ford Ord data is irrelevant to the Project's groundwater modeling and impacts because the wells are "not located in the potential MPWSP project impact area." (*Id*., p. 11.) Accordingly, the Fort Ord data is neither new nor significant, and, thus, does not warrant further environmental review.

- MCWD argues that the AEM study has now been peer-reviewed, and, thus, the Commission should consider it in evaluating the Project's groundwater impacts. (See MCWD Letter, pp. 26-27.)

  - As Section IV.J. of the Applicant's Staff Report explains, the AEM studies and "data" are of limited utility and technically insufficient to characterize "fresh" groundwater. Upon reviewing the 2019 AEM study, the HWG found "[t]he use and interpretation of data in this matter [] ***inappropriate and deeply troubling***." (HWG Comments on AGF Final Report on the 2019 Airborne Electromagnetic Survey of Selected Areas Within the Marina Coast Water District (June 26, 2020), p. 1.)

  - Further, the Commission is entitled to rely on the HWG's assessment of the AEM studies; it is not required to "correctly solve a dispute among experts." (*Cadiz*, *supra*, 83 Cal.App.4th at pp. 101-102; see also *Save Cuyama Valley, supra*, 213 Cal.App.4th at p. 1069.)

- MCWD argues that monitoring well data constitutes significant new information confirming that groundwater gradients in the Dune Sand Aquifer have changed from landward to seaward, and that seaward gradients are required in the 180-Foot Aquifer pursuant to SGMA. (MCWD Letter, p. 34.)

  - ***Dune Sand Aquifer Gradient.*** As HWG explained in response to MCWD's ***same comments last year***, "[e]xamining the data from the **entire** Monterey Peninsula Water Supply Project (MPWSP) monitoring network, and for the period throughout the long-term pumping period, there is no clear seaward gradient over the project area in the DSA during this period (2015-2018)." (HWG Response to Marina Planning Commission (Jan. 25, 2019), p. 2.) "The Fall 2018 data, similar to Fall 2017 data, indicates that the Dune Sand Aquifer gradient is landward

between the CEMEX monitoring wells and MW-8S, and locally seaward between the CEMEX monitoring wells and MW-7S." (*Id*., p. 5.) "While there may be localized and seasonal variations in Dune Sand Aquifer hydraulic gradients, the net result has been and continues to be sea water intrusion within the area encompassed by the MPWSP monitoring well network." (*Id*., p. 2.) Therefore, MCWD's information is not new.

- Regardless, even if the Dune Sand Aquifer gradient is seaward, the Project's source water would still have an OWP ranging from 88-99%. (See HWG Comments on Weiss Report, p. 1; see also Applicant's Staff Report, Section IV.J.) Because that OWP range is consistent with the EIR/EIS's analysis, information regarding purported changes in the Dune Sand Aquifer groundwater gradient is not significant information requiring additional environmental review.

- ***180-Foot Aquifer.*** SGMA's requirements and the Salinas Valley Basin GSP are not significant new information. The CPUC considered SGMA's impact when evaluating the Project's potential impacts. (See, e.g, CPUC Decision D.18-09-017, Appx. J, pp. 18-19.)

  - Further, as explained in above in Attachment B, Section E, SGMA does not require a flat or seaward gradient. "[T]he occurrence or implementation of conditions leading to a flat to seaward hydraulic gradient in the 180-Foot and 400-Foot Aquifers is neither required under SGMA nor specified in the 180-400-Foot Aquifer Subbasin GSP." (HWG Comments on Weiss Report, p. 9.) Thus, hypothetical flat or seaward gradients in the 180-Foot Aquifer following implementation of the GSP is not significant new information.

- MCWD contends that the 2020 Weiss Report constitutes significant new information regarding the Project's capture zone that shows the Project will create groundwater impacts "over many square miles and extract significant quantities of fresh water from the basin." (MCWD Letter, p. 35; see also *id*., pp. 83-84.)

  - As an initial matter, a 3,000 mg/L TDS standard is not appropriate to delineate fresh water because it would not be suitable for drinking water or irrigation unless treated. (See Applicant's Staff Report, Section IV.J.) Indeed, the Staff Report recognizes that a 3,000 mg/L TDS standard delineates groundwater that would be "suitable for drinking water, ***if treated***." (See Staff Report, p. 70, fn. 64 [emphasis added].) Rather, regulations under the Safe Drinking Water Act designate the Secondary Maximum Contaminant Levels, or Consumer Acceptance Levels, for TDS in drinking water as 500 mg/L. (See *id*., fn. 63; Applicant's Staff Report, Section IV.J.)

  - As the HWG explains, the 2020 Weiss Report depicts "Fresh Water Capture Zones," but these zones are misleading because "most of the water is still coming from the ocean," not from inland. (HWG Comments on Weiss Report, p. 5.) This

finding is consistent with the Final EIR/EIS's analysis and, thus, is not new. (See Final EIR/EIS, p. 4.4-70 [explaining that because the slant wells are located along the coast, their capture zone would pull in primarily seawater].)

- Further, although the 2020 Weiss Report identifies capture zones of varying sizes, capture zones are influenced by local conditions, including groundwater gradients. (See Final EIR/EIS, p. 4.4-65.) Thus, the use of unreasonable assumptions or inputs not representative of actual local conditions will impact the resulting capture zone in the model. (See *ibid.*; see also Applicant's Staff Report, Section IV.J.)

- Based on years of monitoring well data and extensive modeling, the Final EIR/EIS concluded that the Project "would extract primarily seawater and smaller volume of highly brackish ambient groundwater from a localized coastal capture area." (Final EIR/EIS, p. 4.4-69 to 4.4-70.) Because the slant wells would be located along the coast, "seawater would be the primary source of recharge, and the regional inland gradient would preclude inland groundwater in the Dune Sand Aquifer and the 180-Foot Aquifer from being drawn to the capture zone." (*Ibid.*)

3. Ocean Water Percentage ("OWP")

- MCWD asserts that the 2020 Weiss Report demonstrates that the Final EIR/EIS's modeling was not conservative and did not accurately bookend the estimated OWP range. (MCWD Letter, p. 19.) According to MCWD, Weiss predicted OWP ranges from 86.1% to 97.4% based on "currently observed seasonal variations in the landward hydraulic gradient" in the Dune Sand Aquifer; the resulting average OWP of 91.7% is below the Final EIR/EIS's long-term range OWP estimate of 93% to 99%. (*Id.*, p. 21.)

  - MCWD incorrectly construes the EIR/EIS's estimates. The OWP range estimated in the Final EIR/EIS is 87-99% (Final EIR/EIS, p. 4.4-56), which is consistent with the 2020 Weiss Report's results assuming seaward gradients in the Dune Sand Aquifer and reasonable rainfall recharge. (See HWG Comments on Weiss Report, p. 1 ["Assumed seaward gradients in the Dune Sand Aquifer do not result in any significant difference in OWP results."]; see also *id.*, pp. 2, 3.)

  - The 2020 Weiss Report's results show that "OWP exceeds 88% for the assumed seaward gradient in the [Dune Sand Aquifer] using reasonable assumptions for other model inputs (e.g., landward gradient in the 180-Foot Aquifer, which represents current, historical, and projected future conditions; rainfall recharge that is less than 50% of average annual total rainfall)." (HWG Comments on Weiss Report, p. 3; see also Applicant's Staff Report, Section IV.J.)

- MCWD suggests that, based on the 2020 Weiss Report, the OWP would decrease to 70.8% under a flat gradient and would decrease even further under seaward gradients in the 180-Foot Aquifer. (MCWD Letter, pp. 22, 34.)

- The OWP estimates provided in the 2020 Weiss Report for a flat to seaward gradient in the 180-Foot Aquifer would take "many decades or even centuries in real-world conditions. The [] model does not consider the large volume of saline water in storage in the 180-Foot Aquifer . . . that would have to be replaced by fresh water before the OWP at the Pumping well field would begin to decrease, and approach the [] OWP calculated by the model." (2020 Weiss Report, p. 4-3.)

- Further, "[t]he OWP calculated for the Project well field output under the 0.00 [flat] gradient . . . will only gradually be approached as the existing salt water flows seaward; ***it will not "instantaneously" reach the 65 to 75 percent range calculated by the model***." (2020 Weiss Report, p. 4-12 [emphasis added].) It would take decades to centuries before such an OWP range is reached. (See *id*., p. 4-3.)

- For a detailed discussion of hypothetical groundwater gradients in the 180-Foot Aquifer and the 2020 Weiss Report's conclusions regarding OWP under such scenarios, see Applicant's Staff Report, Section IV.J.

- MCWD contends that CEMEX's operations during the test slant well pumping period could have impacted the Final EIR/EIS's modeling of OWP by increasing the predicted OWP. (MCWD Letter, pp. 22-23.) Further, MCWD argues that CEMEX's operations could have elevated water levels, thereby decreasing the amount of groundwater drawn the Project could cause. (*Id*., p. 23.)

    - As explained in Applicant's Staff Report, Section IV.J, the EIR/EIS accounted for CEMEX's operations in evaluating the Project's OWP and potential groundwater impacts. (See also HWG Comments on Technical Appendices/Attachments to Letters Submitted by MCWD and City of Marina (Aug. 15, 2018), pp. 30-31; Final EIR/EIS, Appx. E3, pp. 49-53.)

- MCWD argues that the 2020 Weiss Report shows that the Final EIR/EIS overstated predicted OWP and, in turn, understated Cal-Am's return water obligations, which raises public welfare concerns in the form of increased costs to ratepayers. (MCWD Letter, pp. 38-39.)

    - In approving the Return Water Settlement Agreement, the CPUC explained that Cal-Am—not ratepayers—would incur the costs for meeting its return water obligation if that obligation "is increased due to a greater OWP than that estimated in the FEIR/EIS." (CPUC Decision D.18-09-017, p. 192.) For a detailed discussion of Cal-Am's return water obligations and potential impacts to Cal-Am ratepayers, see Applicant's Staff Report, Sections IV.J & IV.N.

- MCWD claims that the CPUC acknowledged that the Project's source water component would need to be reevaluated if (1) pumping from inland areas is reduced to the point that the groundwater system is in equilibrium; and (2) pumping depressions are reduced such that there is no longer a landward gradient. (MCWD Letter, p. 21.)

- As an initial matter, the CPUC was quoting the State Water Board's 2013 review of the Project ("2013 State Water Board Report," EIR/EIS, Appx. B2), not imposing any sort of condition on the Project.

- Further, MCWD ignores that, in the same paragraph, the CPUC confirms that "***[m]ost of the water entering the slant wells would still come from the ocean if the gradient were seaward rather than landward as it is today***." (CPUC Decision D.18-09-017, Appx. J, p. 17 [emphasis added].) Indeed, the 2020 Weiss Report confirms that OWP would average around 91.5% assuming a seaward gradient in the 180-Foot Aquifer that does not currently exist. (See 2020 Weiss Report, pp. 4-11 to 4-12, 5-1 to 5-2.) Instead, the 2020 Weiss Report confirms that a seaward gradient could not exist for decades to centuries given the volume of existing seawater in the 180-Foot Aquifer and ocean recharge. (See *id.*, p. 4-3.)

4. <u>Groundwater Salinity</u>

- MCWD asserts that water with more than 500 mg/L TDS is not "useless," as most groundwater requires some treatment or blending before it is used for drinking water. (MCWD Letter, pp. 28-29; see also *id*., pp. 83-84.) Moreover, "with the exception of the elevated nitrate concentrations, all the groundwater sample results meet drinking water standards for potable supplies." (*Id*., pp. 28-29.) Further, elevated nitrate levels does not indicate seawater intrusion, but rather some other "source of recharge that contributes a contaminant." (*Id*., p. 29.)

    - The Staff Report and MCWD's own argument confirm that water with TDS levels exceeding 500 mg/L need treatment before consumption as drinking water or use in irrigation. (See Staff Report, p. 70.)

    - Further, MCWD is wrong when it claims that "with the exception of the elevated nitrate concentrations, all the groundwater sample results meet drinking water standards for potable supplies." (MCWD Letter, p. 29.) Final EIR/EIS Table 8.2.8-1 shows groundwater samples from MPWSP monitoring wells located within the slant well capture zone exceeding drinking water standards for TDS and chloride. (See Final EIR/EIS, p. 8.2-48.)

    - In addition, as MCWD implicitly recognizes, groundwater data from the monitoring wells show elevated nitrate levels indicative of some source of contamination. (MCWD Letter, p. 29.) Whether this contamination is a result of seawater intrusion is irrelevant to the fact that the water still requires treatment before use as drinking water or in irrigation.

    - Finally, MCWD ignores the groundwater data showing chloride concentrations at levels twice the National Secondary Drinking Water Regulation (250 mg/L) and that exceeds the concentration for water to be considered of 'Class III – injurious or unsatisfactory' quality for agricultural irrigation (350 mg/L)." (CPUC Decision D.18-09-017, Appx. J, p. 20.) Groundwater quality data from the test slant well indicates that groundwater in the Project area contains between 11,680

mg/L to 16,037 mg/L—over 45 times the National Secondary Drinking Water Regulation. (Final EIR/EIS, p. 8.5-877.)

5. Monterey County Water Resources Agency Act Compliance

- MCWD contends that the State Water Board did not confirm that the Project is consistent with the Agency Act in the 2013 State Water Board Report. (MCWD Letter, p. 31.)

    - Cal-Am never argued that the State Water Board has authority to implement the Agency Act. MCWRA is the agency responsible for interpreting and enforcing the Agency Act. (See June 30 Letter to Commission, pp. 24, 27.)

    - The State Water Board made a finding consistent with that understanding in the 2013 State Water Board Report. (Final EIR/EIS, Appx. B2, p. 40 [although "it does not appear that the Agency Act . . . operate[s] to prohibit the Project," "[t]he State Water Board is not the agency responsible for interpreting the Agency Act or MCWRA's ordinances"].)

- MCWD argues that the 2013 State Water Board Report is flawed for three reasons. First, the State Water Board relied on Cal-Am's "inaccurate representation of groundwater conditions." Second, the State Water Board focused on "incidentally extracted usable groundwater," not "fresh water withdrawn," in reaching its opinion. The Project is not feasible if Cal-Am is required to return all "incidentally extracted usable groundwater." Third, the Agency Act does not differentiate between "usable groundwater" and "groundwater." (MCWD Letter, pp. 31-32.)

    - *First*, the State Water Board did not rely on "Cal-Am's inaccurate representation of groundwater conditions," but rather relied on "the available technical information" provided by the CPUC, who requested the State Water Board's input on whether Cal-Am has the legal right to extract desalination feedwater for the Project. (Final EIR/EIS, Appx. B2, pp. 1, 63-65.)

    - *Second*, MCWD's distinction between "usable groundwater" and "fresh water" is a distinction without a difference. The water withdrawn by the Project's slant wells is not potable water and is not suitable for human consumption or irrigation without treatment. (See Applicant's Staff Report, Section IV.J; see also Final EIR/EIS, Appx. B2, p. 47 ["Water that is currently unusable, due to its location in the Basin and corresponding quality, could be rendered usable if desalinated and would thus be surplus to current water supplies in the Basin."].)

        - Further, as described above, MCWD's reliance on a 3,000 mg/L TDS standard to delineate "fresh" water is inappropriate because such water is not potable without treatment. (See Attachment B, Section E; see also Final EIR/EIS, p. 4.4-70 [seawater intrusion has degraded groundwater within the Project capture zone, rendering it "unusable for potable water supply due to its high salinity."].)

- *Third*, as explained in Applicant's Staff Report, Section IV.J, the Project will extract primarily seawater; any groundwater extracted would be returned to the SVGB consistent with Cal-Am's return water obligations. (See also Final EIR/EIS, p. 4.4-70.) Cal-Am's return water obligations do not differentiate between "groundwater" and "usable groundwater," but depend on the amount of "non-seawater" extracted. (See CPUC Decision D. 18-09-017, pp. 103-112 [explaining that any "non-seawater" extracted from the SVGB will be returned to the basin as part of Cal-Am's Agency Act obligations].)

- MCWD argues that the Return Water Settlement Agreement, including the 1:1[9] return water ratio, does not mitigate the Project's groundwater impacts. (MCWD Letter, pp. 32, 35.)

    - As Cal-Am explained in its June 30 Letter, Cal-Am's return water obligations are not mitigation for environmental impacts. (See June 30 Letter to Commission, p. 29; see also Final EIR/EIS, p. 8.2-13 ["The purpose of the return water element of the project is not to alleviate or address any environmental effects."].)

    - Further, MCWD provides no legal authority for its assertion that a 1:1 return water ratio is insufficient. MCWRA, as the agency vested with interpreting and enforcing the Agency, agreed to the terms of the Return Water Settlement Agreement (see Final EIR/EIS, Appx. H), and has the authority to enforce Cal-Am's compliance with the Agency Act—not the Commission.[10]

6. <u>Water Rights</u>

- MCWD contends that the Commission is not bound by dicta in the CPUC's Decision regarding water rights. (MCWD Letter, pp. 30, 33, 72-73.) Although MCWD recognizes that the Commission lacks jurisdiction to determine the Project's water rights, MCWD claims that the Commission still must evaluate whether significant new information exists that affects the feasibility of Cal-Am's ability to obtain water rights. (*Id*., p. 33.) According to MCWD, water rights are "now being litigated in the Monterey County Superior Court." (*Ibid*.)

    - As the Staff Report explains, no water rights are necessary for the extraction and use of seawater from the SVGB. (Staff Report, p. 70.) And as MCWD concedes,

---

[9] "[F]or every one AF of 'usable' groundwater extracted, it must only be replaced with one AF of desalinated water." (MCWD Letter, p. 32.)

[10] MCWD also argues that Cal-Am assumes that compliance with the Agency Act constitutes compliance with other groundwater laws, the Coastal Act, CEQA, and SGMA. (MCWD Letter, p. 32.) Cal-Am never suggested that its compliance with the Agency Act constitutes compliance with other applicable laws. Rather, Cal-Am explained that its return water obligations under the Agency Act are not mitigation for environmental impacts under CEQA and that the Project is consistent with Coastal Act section 30231. (See June 30 Letter to Commission, p. 29.)

the issue of water rights is outside the Commission's jurisdiction. (MCWD Letter, p. 33.)

- Further, nothing has changed since the CPUC approved the Project that renders the Project infeasible because of water rights. The pending litigation MCWD refers to pertains to a case filed by the City of Marina against CEMEX, Cal-Am, and MCWRA pursuant to a 1996 annexation agreement. (*City of Marina v. RMC Lonestar, et al.,* Monterey Superior Court Case No. 20CV001387.) In that case, MCWD, a party to the 1996 annexation agreement, filed a cross-complaint with causes of action against Cal-Am related to water rights issues. Cal-Am believes MCWD's claims are without merit and filed a demurrer to MCWD's claims on September 9, 2020.

    - MCWD's claims are not ripe because the Project is not completed and Cal-Am is not presently extracting water. Further, until the Project pumps water, it is impossible to determine if MCWD's water rights would be infringed. Any determination of water rights is premature until the Project is complete and operating.

    - Moreover, although the CPUC did not adjudicate Cal-Am's or others' water rights as part of its review of the Project, the CPUC did determine the legal framework applicable to the setting of the Project's water rights. The framework explains that Cal-Am does not need to obtain water rights to extract seawater. With respect to brackish groundwater extracted by the Project, the CPUC declared that Cal-Am could develop appropriative groundwater rights if the Project extracts otherwise unusable groundwater without harm to existing lawful users, and that any fresh water is returned to the Basin. MCWD cannot revisit that framework through this litigation.

- Thus, Commission staff's assessment of water rights – that none are necessary for the extraction and use of seawater – is consistent with the framework set forth in the CPUC's Decision. MCWD's pending cross-complaint does not call into question the feasibility of the Project on the basis of water rights.

- MCWD argues that the State Water Board did not actually determine that Cal-Am has or will develop the necessary water rights to operate the Project, but rather spoke in general terms about what Cal-Am must show to obtain water rights. (MCWD Letter, p. 30.) Moreover, MCWD claims that the 2013 State Water Board Report was premised on the assumption that there is no usable groundwater in the Project area, and that the Project wells would extend under Monterey Bay and extract only seawater. (*Id*., pp. 31, 33.) Finally, MCWD argues the State Water Board issued the Report prior to the passage of SGMA, rendering the Report outdated. (*Id*., p. 31.)

    - As Cal-Am explained in its June 30 Letter, the State Water Board confirmed that Cal-Am *could* develop the necessary water rights to operate the Project. (June 30 Letter to Commission, pp. 26-27.) Cal-Am did not represent that the State Water

Board has already made a water rights determination, as Cal-Am understands that such a determination would come with operation of the Project in the future.

- Moreover, as explained above, the 2013 State Water Board Report relied on "the available technical information" for the Project in rendering its opinion. (Final EIR/EIS, Appx. B2, pp. 1, 63-65.) That information demonstrated (and is still accurate today) that the seawater intrusion has degraded groundwater within the Project capture zone, rendering it "unusable for potable water supply due to its high salinity." (Final EIR/EIS, p. 4.4-70; see also Applicant's Staff Report, Section IV.J.)

- Finally, MCWD provides no support or explanation for its assertion that the passage of SGMA meaningfully changes the 2013 State Water Board Report or otherwise invalidates the State Water Board's conclusions in that report. The Project remains consistent with SGMA and would promote SGMA's goals by preventing further seawater intrusion into the SVGB.[11] (See CPUC Decision D.18-09-017, Appx. J, pp. 18-19.)

7. <u>Relocation of the Project's Slant Well Network</u>

- MCWD claims that Cal-Am could use horizontal wells for a reduced size project, with the wells located outside of the Coastal Zone. MCWD also argues that, according to Cal-Am, the slant wells are not "coastal dependent" because the OWP would fall within the same predicted range regardless of slant well length. (MCWD Letter, pp. 37-38.)

  - The CPUC already considered horizontal wells as an alternative intake technology for the Project. The EIR/EIS explained that the use of horizontal wells on the CEMEX site would involve the installation of more than 2,500 feet of pipeline, which presented physical and technical feasibility issues. (Final EIR/EIS, Appx. I1, pp. I1-6 to I1-7.) If Cal-Am were to use horizontal wells outside of the Coastal Zone, ***more*** pipeline would be required, increasing the physical and technical feasibility challenges discussed in the EIR/EIS. In addition, the EIR/EIS explained that the use of horizontal wells would not avoid or minimize any of the impacts associated with the proposed slant wells. (*Ibid*.)

  - Moreover, as Applicant's Staff Report, Section IV.J explains, at the coast, seawater entering the slant wells has the shortest and least restricted pathway through the overlying seafloor deposits. (See Final EIR/EIS, p. 4.4-65.) Further, in their proposed location, the slant wells would have a zone of capture with a western extent just offshore where the drawdown would be deepest, creating more flow of seawater to the slant wells. (*Ibid*.) Additionally, the drilling technology

[11] Contrary to MCWD's assertions that the Project would exacerbate seawater intrusion (MCWD Letter, p. 83), the Project will prevent further seawater intrusion from migrating inland, thereby providing significant benefits to the Monterey Peninsula, the agricultural community of Castroville, and CSIP by safeguarding groundwater resources for agricultural uses. (See Applicant's Staff Report, Section IV.N.)

involved in installing slant wells generally limits wells to a maximum length of several hundred feet. (See Applicant's Staff Report, Section IV.J.) Thus, to capture groundwater contaminated by seawater intrusion effectively, the slant wells cannot be moved further inland and outside of the Coastal Zone.

8. Groundwater-Dependent Ecosystems

- MCWD argues that there are vernal ponds and wetlands that are groundwater dependent ecosystems ("GDE"s) and that the vernal ponds and wetlands are located in areas that will experience significant drawdowns from the Project. (MCWD Letter p. 17.) MCWD notes that if the vernal ponds are connected to the underlying groundwater they could be significantly impacted by the Project and that additional field work and modeling is needed to assess these potential effects. (*Ibid.*) MCWD further states that the "only evidence in the record indicates these vernal ponds and wetland areas are connected to the underlying groundwater" and that without additional information the Staff Report cannot address whether the Project is consistent with Coastal Act and LCP policies regarding vernal ponds. (*Id.*, p. 18.)

    - As discussed above in Attachment B, Section B, Cal-Am submitted a detailed analysis regarding the vernal ponds, which demonstrates that the vernal ponds are not likely to be hydraulically connected to the Dune Sand Aquifer from which the Project will pump water, and therefore are unlikely to be impacted by the Project. Nevertheless, Cal-Am proposes Special Condition 7, which would require implementation of an Adaptive Management Program whereby the ponds would continue to be evaluated prior to Project operations. If it is determined that the ponds could be adversely affected from Project pumping, the Adaptive Management Program requires implementation of wetland resiliency, enhancement, or restoration activities to ensure that there would be no adverse effects associated with the Project. Therefore, the analysis requested by MCWD has been prepared and the Commission has sufficient evidence to conclude that any impacts to the vernal ponds will be mitigated to the maximum extent feasible.

- MCWD also argues that an alternatives analysis is required. As noted in Section I a complete analysis of alternatives has been prepared and the PWM Expansion is not a feasible alternative to the Project. Consistent with CEQA Guidelines Section 15126.6 the alternatives analyzed in the Final EIR/EIS include a reasonable range of alternative including those that would not have resulted in drawdowns in the vicinity of the vernal ponds and wetlands. In addition, as noted above, with implementation of Special Condition 7 potential impacts to the vernal ponds would be reduced to the maximum extent feasible.

E. Energy Consumption & Climate Change

- MCWD argues that Mitigation Measure 4.11-1 cannot reduce the Project's carbon footprint to zero because the measure requires the purchase of offsets, contending that *Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467 ("*Golden Door II*") invalidated a similar mitigation measure. (MCWD Letter, pp. 39-40.)

MCWD fundamentally misunderstands the *Golden Door II* court's holding, as well as Mitigation Measure 4.11-1.

- MCWD contends that in *Golden Door II*, the "main problem with the offset mitigation measure was that it lacked sufficient safeguards to ensure the offsets were 'real, permanent, verifiable, and enforceable,'" because the measure did not identify protocols for the measure's identified registries to implement. (MCWD Letter, p. 39-40.) In *Golden Door II*, the County of San Diego attempted to argue that because its measure was "substantially similar" to California's cap-and-trade program (this is what the MCWD letter refers to as the CARB-approved registry), the offset credits purchased under the measure were "real, permanent, verifiable, and enforceable" and therefore contained performance standards under CEQA. (*Golden Door II*, *supra*, 50 Cal.App.5th at p. 511.) Because compliance with cap-and-trade was the basis for the County's argument that its measure was sufficient under CEQA, the court looked to cap-and-trade standards, including whether the measure included rigorous rulemaking procedures for offset protocols like the cap-and-trade program. (*Id*., pp. 511-515.) Accordingly, *Golden Door II* does not hold that the ***only*** way for an offset measure to comply with CEQA is to incorporate cap-and-trade requirements, and recognized that its holding was "necessarily limited to the facts of this case." (*Id*., p. 483.) Mitigation Measure 4.11-1 need not include CARB-approved protocols for cap-and-trade to comply with CEQA because unlike the measure in *Golden Door II*, it does not utilize cap-and-trade requirements as the basis for the measure's CEQA compliance.

  Indeed, Mitigation Measure 4.11-1 contains other performance standards to ensure that mitigation of GHG emissions occurs. Mitigation Measure 4.11-1 requires Cal-Am to submit documentation annually to the "CPUC demonstrating that the project's operational electricity use in the immediately preceding calendar year resulted in net zero GHG emissions." (FEIR, p. 4.11-20.) Should the CPUC determine that Cal-Am has not achieved net zero GHG emissions, the CPUC will provide to Cal-Am a notice to procure, submit, and retire offsets in an amount at least equivalent to the exceedance. (*Id*., p. 4.11-21.) The *Golden Door II* measure was overturned in part because it contained no such requirements for demonstrating that net zero GHG emissions were achieved or any enforcement mechanisms for the County of San Diego to ensure that mitigation was actualized.

- MCWD contends that Mitigation Measure 4.11-1 is "problematic" because it leaves the decision to move to the next loading order option up to Cal-Am "solely on what Cal-Am believes is 'reasonable,'" speculating that Cal-Am will "no doubt . . . select the cheapest option." (MCWD Letter, p. 40.) Cal-Am committed to quantify and describe the carbon footprint for all operational components, summarize available "state-of the art energy recovery and conservation technologies available for utility scale desalination facilities," and then implement "feasible energy recovery and conservation technologies." (FEIR, p. 4.11-19.) Should a technology be infeasible, the GHG Emissions Reduction Plan will "clearly explain why such technology is considered to be infeasible." (*Ibid*.) Only after Cal-Am has implemented all feasible conservational technologies will

Cal-Am implement Mitigation Measure 4.11-1 subsection (b) which provides the requirement that all operational electricity usage results in net zero GHG emissions. (*Id*., p. 4.11-20.) Specifically, Mitigation Measure 4.11-1(b) requires that Cal-Am adhere to the following loading order: 1) obtain renewable energy from on-site solar panels and/or the adjacent landfill-gas-to-energy facility; 2) purchase renewable energy from off-site sources within California such as PG&E or Monterey Bay Community Power; 3) procure and retire Renewable Energy Certificates for projects or activities in California; and 4) procure and retire Carbon Offsets. (*Id*., p. 4.11-20.) Cal-Am is required to "progress through the loading order on the basis of the options' physical and economic feasibility." (*Ibid*.) Cal-Am notes that the purchase of zero carbon electricity currently is, and likely will continue to be, a less expensive option than purchasing and retiring carbon offsets, rendering MCWD's concern that offsets will compose the entirety of Cal-Am's mitigation meritless.

- MCWD additionally argues that the PWM Expansion is the best alternative because it does not result in significant greenhouse gas emissions or energy impacts. (MCWD Letter, p. 40.) As discussed in Section I *infra*, the PWM Expansion's proposed use of landfill gas is facing obstacles placing into question the PWM Expansion's actual energy impacts. Further, as discussed in Section I, the PWM Expansion is infeasible and should not be considered as an alternative to the Project.

F. Public Access and Recreation

- MCWD's Letter claims that the Project would be inconsistent with the Coastal Act and LCP policies regarding public access and recreation. (MCWD Letter p. 41.) The MCWD Letter also argues that because the Commission has not yet approved a restoration and access plan pursuant to the CEMEX Settlement Agreement it is difficult to estimate the full extent of impacts. (*Ibid*.) Finally, the MCWD Letter claims there would be public access and recreation impacts associated with the outfall liner. (*Ibid*.)

  - As discussed above in Attachment A, Section IV.L:

    - Coastal Commission staff determined that the Project could conform with Coastal Act and LCP public access and recreation policies with the implementation of special conditions. (Staff Report, pp. 80-81.) Cal-Am has proposed Special Condition 10 to ensure that the Project is consistent with relevant Coastal Act and LCP policies regarding public access.

    - Evaluating the Project's impacts against what would occur as part of a not yet approved restoration plan under the CEMEX Settlement Agreement is the improper baseline for evaluating the Project's public access and recreation impacts.

    - Cal-Am has redesigned the outfall liner such that construction would not impact public access or recreation.

- Further, MCWD claims that Cal-Am's proposed Public Access Plan would not cure the Coastal Act and LCP inconsistencies and would constitute improper deferral of mitigation. (MCWD Letter, p. 41.)

    - The Project would only occupy 0.06 percent of the 400+ acre CEMEX site and would occupy an additional 0.25 acre of the CEMEX site periodically for maintenance, amounting to 2.2 acres over the course of the Project's life—accordingly the Project's impact on public access would be *de minimis*. The Staff Report agreed that a special condition could ensure that the Project is consistent with public access and recreation policies. (Staff Report, pp. 81-82.).

    - Despite the minor scope of potential impacts, Cal-Am proposed Special Condition 10, which ensure that the Project would be consistent with the Coastal Act and LCP. The Public Access Plan was prepared consistent with other Coastal Commission public access plans and does not constitute improper deferral of mitigation.[12] The proposed Public Access Plan specifically requires that Cal-Am prepare a detailed Public Access Plan indicating the location of construction and maintenance areas, staging areas, and access corridors on the CEMEX site. Accordingly, the Public Access Plan would ensure that the Project is consistent with public access and recreation policies.

    - Moreover, MCWD's attempt to impose CEQA principles regarding deferral of mitigation onto the Commission's review of LCP and Coastal Act consistency are baseless. CEQA states that "[f]ormulation of mitigation measures should not be deferred until some future time." (CEQA Guidelines, § 15126.4(a)(1)(B).) However, neither the Coastal Act nor the LCP include any such provision. The Commission's role in issuing coastal development permits is to determine whether "the proposed development is in conformity with the certified local coastal program" and other applicable Coastal Act policies—the Commission's role does not include conducting a review under CEQA. (Coastal Act, § 30604.)

- Therefore, consistent with the Staff Report conclusion, with the implementation of Special Condition 10 the Project would be consistent with Coastal Act and LCP policies related to public access and recreation.

G. Visual Resources

- MCWD contends that construction and operation of the project will adversely impact visual resources within the City of Marina and in the Coastal Zone. (See MCWD Letter, pp. 42-43.)

---

[12] For examples of similar recently imposed conditions requiring a plan or document prior to CDP issuance see Staff Report, CDP No. 5-19-1266 (June 18, 2020), https://documents.coastal.ca.gov/reports/2020/7/F17d/F17d-6-2020-report.pdf and Staff Report, CDP No. 6-20-0190 (July 23, 2020), https://documents.coastal.ca.gov/reports/2020/8/TH7b/TH7b-8-2020-report.pdf.

- ***MCWD's arguments are inconsistent with the Staff Report***. The Staff Report concluded that the Project "would not be on prominent ridgelines, and permanent development would mainly be hidden from public view." (Staff Report, p. 84.) The Staff Report further concluded that while "ongoing maintenance activity at the well head sites might be visible from nearby public locations, it would likely be limited in extent so that it would not conflict with the LCP's requirement that development below the ridgelines be limited in height and mass to blend into the face of the dunes." (*Ibid*.) Further, the Staff Report determined that while "[c]onstruction activities would have several temporary adverse visual impacts . . . none . . . [would] conflict with the LCP's or Coastal Act's visual resource policies." (*Ibid*.) The Staff Report further stated that "the Commission could adopt special conditions requiring that Cal-Am implement any additional measures needed to ensure . . . [the] Project would conform to . . . visual resource-related provisions." (*Ibid*.) In the Applicant's Staff Report, Cal-Am has proposed Special Conditions 11 to address staff's visual resources concerns. Special Condition 11 requires implementation of a Facility Design and Screening Plan and Special Condition 12 requires implementation of a Lighting Plan. Implementation of these two plans will ensure that the Project is consistent with applicable LCP and Coastal Act visual resources policies.

- ***MCWD's arguments are inconsistent with the Final EIR/EIS***. The Final EIR/EIS concluded that temporary construction activities for the Project would have a less than significant impact on visual resources. (Final EIR/EIS, p. 4.14-30 - 4.14-33.) While not required to avoid a significant impact, the Final EIR/EIS included Mitigation Measure 4.14-1 to ensure a clean and orderly construction site. (Final EIR/EIS, p. 4.14-33.) Mitigation Measure 4.14-1 requires basic daily site maintenance and construction area screening where appropriate. (Final EIR/EIS, p. 4.14-33.) Regarding permanent impacts, the Final EIR/EIS concluded that impacts would be less than significant with mitigation and included Mitigation Measures 4.14-3a (Facility Design) and 4.14-3b (Facility Screening) to ensure that Cal-Am will design the Project to avoid or minimize contrast with the surrounding setting and screen the facilities from public views to the extent feasible. (Final EIR/EIS, p. 4.14-42 - 4.14-43.)

- MCWD also contends that there would be visual impacts associated with the outfall liner construction work. (See MCWD Letter, p. 42.)

  - The Final EIR/EIS concluded that construction activities associated with the outfall liner would be less than significant. (Final EIR/EIS, p. 4.13-31.)

  - Further, as discussed herein, Cal-Am recently proposed an alternative approach to the outfall liner that would maintain the existing M1W outfall pipeline and avoid groundbreaking and impacts within the Coastal Zone. Specifically, Cal-Am has proposed excavating a single access point to the pipeline outside of the Coastal Zone and manually applying a protective spray liner throughout the pipeline's interior from the access point to the beach junction box. As a result of this change it would no longer be necessary for Cal-Am to excavate, open, and install a new

physical liner in the pipeline at ten locations along the M1W right-of-way and no above grade work would occur within the Coastal Zone. Accordingly, the new design of the outfall liner would entirely avoid any potential visual impacts within the Coastal Zone.

H. Environmental Justice

- MCWD asserts that the Project would provide water "far beyond the amount actually required to serve future demand," while providing "an incidental benefit . . . to Castroville Community Services District." (MCWD Letter, pp. 43, 44; see also *id.*, p. 45.) According to MCWD, resolving water quality problems for Castroville is not a Project objective and cannot offset the "environmental injustice" of locating more industrial development in Marina, which would bear all the burden and no benefit. (*Id.*, p. 44.)

    - As explained above in Attachment B, Section I and in the Applicant's Staff Report, the Project will protect the Peninsula's groundwater supplies in the SVGB and Seaside Groundwater Basin from seawater intrusion and provide a reliable drought-proof water supply for economic growth and much-needed affordable residential development. (See Applicant's Staff Report, Sections IV.J, IV.N, IV.P.) These are benefits that all residents of the Monterey Peninsula would enjoy, including residents in Marina.

    - Further, the Applicant's Staff Report describes in detail, the Project is appropriately sized to meet the Peninsula's projected future demand. (See Applicant's Staff Report, Section IV.O.)

    - Moreover, the Project's benefits to Castroville, a disadvantaged community, are significant. (See Applicant's Staff Report, Section IV.N.) Castroville's agricultural operations are vital to the region's economy. (See Dudek Memorandum, p. 6.) However, Castroville is facing serious water shortages due to seawater intrusion in the SVGB. (*Ibid.*) The Project will not only prevent further seawater intrusion in the SVGB, but will also reduce Castroville's need to pump water from the SVGB as a result of Cal-Am providing desalinated water to Castroville pursuant to the Agency Act and Return Water Settlement Agreement. (See Applicant's Staff Report, Section IV.N.)

    - Finally, as discussed in Section F, the Project's footprint in Marina is *de minimis*, and would permanently occupy only a quarter-acre on the 400+ acre CEMEX site. (Staff Report, p. 81; see also June 30 Letter to Commission, pp. 33-35; Applicant's Staff Report, Section IV.L.) Such a limited footprint would not create additional burden on the City of Marina.

- MCWD claims it would be an "injustice" to "impos[e] additional significant water costs on Cal-Am's customers, who are already paying the highest water rates in the nation." (MCWD Letter, pp. 44, 79.) MCWD argues that Cal-Am's data shows average bills increasing from $78/month to over $105/month before desalination, and that desalination

would add more than $41 to those monthly bills. "That outcome would result in Cal-Am's average customer paying $147 per month, nearly 50% more than the Food and Water Watch study's control amount, while still using less water." (*Id*., pp. 46, 79.)

- Desalination is expected to increase costs, but, as determined by the CPUC, this increase is necessary to achieve a safe and reliable source of water for the Peninsula. (CPUC Decision D.18-08-017, pp. 123-24.) With implementation of Special Condition 13, these costs would not be shouldered by low income customers. Because the Customer Assistance Program ("CAP") discount would increase from 30% to 50%, enrolled customers in single family homes could see a bill increase of only about $10 to $12 per month for desalination facility costs and financing. This would be a substantial reduction in monthly compared to customers who are not in the CAP program. Additionally, Special Condition 13 commits Cal-Am to contribute an additional $250,000 to the United Way to assist customers in having financial difficulties paying monthly bills.

- MCWD argues that its "own water supply will be threatened by the project's slant wells pumping 17,000 AFY in close proximity to Marina Coast's groundwater wells." (MCWD Letter, p. 44; see also *id*., p. 45.)

  - As explained above in Attachment B, Sections E and I, ***the Project will not impact Marina's municipal supply wells***. (See also Staff Report, p. 68; Applicant's Staff Report, Section IV.J.)

- MCWD contends that the Project will permanently impact "at least seven acres of unique Flandrian Dunes, including ESHA," as well as adversely affect the "freedom to enjoy such pristine open space, *free of cost*." (MCWD Letter, p. 44.) In addition, MCWD argues that Cal-Am's assertion that only a small area would be permanently fenced from public access misses the point about impacts to ESHA and impairing the public's access to all "presently-existing features of the property." (*Id*., p. 45.)

  - ***ESHA.*** Although the Project would be inconsistent with Marina LCP's habitat protection policies because the Project is not a resource-dependent use, the Final EIR/EIS determined that the Project would not result in a significant adverse ***physical*** impact to sensitive habitats. (See Attachment B, Section A.) Further, with implementation of the mitigation identified in the Final EIR/EIS, Cal-Am's HMMP, and the Special Conditions identified in the Applicant's Staff Report, potential impacts to ESHA would be mitigated to the maximum extent feasible. (See Applicant's Staff Report, Sections IV.F, IV.P.) The Project would conform to the LCP's habitat protection policies as supplemented by Coastal Act section 30260, which allows the Commission to approve the Project as a coastal-dependent industrial facility. (See *id*., Section IV.P.)

  - ***Public Access.*** As explained in Attachment B, Section G, the Project's presence is *de minimis* and as compared to "existing features of the property," would not prevent ***any*** public access because the CEMEX site is not currently publicly accessible. Further, although the Final EIR/EIS indicated that the disturbed area

from ongoing well maintenance would be 6 acres, that area has been reduced to 2.2 acres as a result of selecting the smaller desalination project and subsequent design drawings. (See Section A.) Therefore, any future, speculative impacts to public access and recreation are even smaller than previously analyzed.

- MCWD contends that Cal-Am's assertion that the Project would help prevent further seawater intrusion is based on flawed groundwater modeling in the Final EIR/EIS. (MCWD Letter, pp. 45-46.) According to MCWD, more modeling must be performed to incorporate the AEM and Fort Ord data. (*Ibid*.) MCWD also argues that a flat groundwater gradient "must be achieved during the life of the project under the SGMA." (*Id*., p. 46.)

    - ***Sufficiency of Groundwater Modeling.*** As explained in the Applicant's Staff Report, Section IV.J, the extensive groundwater modeling for the Final EIR/EIS involved a multi-year, peer-reviewed effort that conservatively analyzed the Project's OWP and potential impacts to groundwater supplies in the SVGB. (See also Attachment B, Section E; Attachment C, Section D.)

        - Further, as the Applicant's Staff Report explains, no additional modeling to incorporate the AEM studies and Fort Ord data is required or appropriate. (See Applicant's Staff Report, Section IV.J.) The AEM studies are flawed and inaccurately characterize "fresh" water in the SVGB, and the Fort Ord data are from outside the Project area. (See *ibid*.)

    - ***Groundwater Gradients.*** As explained in the Applicant's Staff Report, Section IV.J, SGMA does not require that groundwater gradients in the SVGB be flat or seaward. Rather, SGMA requires that existing seawater intrusion not be exacerbated. (See *ibid*.; see also Attachment B, Section E; Attachment C, Section D.)

- MCWD argues that the CPUC's rate determinations have no bearing on the Project's environmental justice impacts to the Marina, Fort Ord, and Seaside communities served by MCWD. (MCWD Letter, p. 46.)

    - While true that CPUC's "just and reasonable" rate determination does not affect potential impacts to communities served by MCWD and not Cal-Am, it is a necessary consideration when evaluating the Project's environmental justice impacts. The CPUC already considered the rate increases associated with the Project, acknowledged that they were not insignificant, but determined they were just and reasonable considering the need to supply reliable water to the Peninsula. (CPUC Decision D.18-09-017, pp. 19-20, 123-124.) The other environmental impacts allegedly borne by Marina, Fort Ord, and Seaside communities are separately addressed in Attachment B, Section I. (See also Applicant's Staff Report, Section N.)

- MCWD asserts that the Project is no longer required for Cal-Am to serve its customers and comply with the CDO. (MCWD Letter, p. 46.) Further, MCWD claims that the "No

Action or PWM Expansion alternatives meet most or all of the project objectives," with "little to no adverse environmental impact" and "far less cost to Cal-Am's customers." (*Ibid*.)

  - As thoroughly described in Attachment B, Section J, the PWM Expansion is not a feasible alternative and would raise a host of its own environmental impacts. A "No Action" alternative would also fail to meet project objectives and leave the Peninsula without a reliable water supply. (See, e.g., Applicant's Staff Report, Section O.)

- MCWD argues that the CPUC's provision of required CEQA and NEPA notices and meetings "provided scant real opportunity for engagement to hard-working, low-income citizens in Marina and the Ord Community." (MCWD Letter, p. 47.)

  - MCWD provides no support for its assertion that the CPUC's and Monterey Bay National Marine Sanctuary's public hearings as part of the Project's environmental review did not provide meaningful opportunities for Marina and Fort Ord residents to participate. As explained in the Applicant's Staff Report, Section IV.N, the public—including Marina residents—had ample opportunities to participate before the CPUC and other agencies regarding the Project's environmental review and ratesetting. (See also CPUC Decision D.18-09-017, Appx. J, Ex. A.) Numerous Marina residents and organizations participated in those proceedings.

- MCWD argues that Cal-Am does not explain what environmental justice policies would be frustrated by the public acquisition of the Monterey District system. (MCWD Letter, pp. 47-48.)

  - MCWD ignores that acquisition of Cal-Am's water delivery system in Monterey could cost more than $1 billion. (See June 30 Letter to Commission, pp. 43-44.) These costs would necessarily be borne by ratepayers and would likely result in rate increases substantially in excess of those estimated from the Project. Thus, the disproportionate environmental justice impacts that MCWD alleges would result from the Project would likely occur many times over if a public takeover of the water system were to occur.

- MCWD claims that rates will be higher if the project were not operated at full capacity. (MCWD Letter, p. 77.)

  - As explained in Attachment B, Section J, the Project will be required to operate at or the expected 86% capacity to meet water demands within the Peninsula. However, even if the Project operates at a reduced capacity, how much the water facility produces (or does not produce) is not a material variable in rates that customers are charged, except for minor, incremental operating and maintenance costs. Thus, whether the project produces 2,000 acre feet or 10,000 acre feet of water each year, the amount needed to be recovered annually from customers for to repay physical construction costs, including set financing repayment

requirements, and annual operation and maintenance costs essentially remains the same. Based on available information, the CPUC approved a rate increase of about $37-$40 per month for the average Cal-Am customer in a single-family residence for the desalination facility, and that increase is not tied to per acre foot water costs. That is why the CPUC found that approving a smaller 4.8 MGD desalination facility would not result in any "significant, if any, cost savings to ratepayers" and determined that alternative was not feasible. (CPUC Decision 18-09-017, p. 129.)

- MCWD alleges that rates are increasing as conservation increases, and that this must be addressed through a change to pricing structure that would need to be approved by the CPUC. (MCWD Letter, p. 78.)

    - MCWD is correct that the CPUC has sole jurisdiction over ratemaking and any change of this nature would need to be considered through an entirely separate process. (MCWD Letter, p. 78.) As Cal-Am has previously explained, water conservation and reduction in water use can have the unintended consequence of increasing water prices because water utilities generally have high fixed costs associated with infrastructure, improvements, staff, and maintenance. This situation is not unique to Cal-Am; on average, about 70 percent of a water utility's revenue is devoted to fixed costs. When sales are reduced as a result of water conservation, the variable costs go down, but the fixed costs remain, so the cost of each unit of water must increase to support the fixed costs and keep the water utility's finances stable. While customers who conserve will always pay less than those who do not, they may not see substantial reductions in monthly bills due to conservation because the fixed costs remain. (See June 30 Letter to Commission, p. 93.)

- MCWD also states that Cal-Am has not provided information regarding how much water its customers use or how much they pay altogether for their water. (MCWD Letter, p. 79.)

    - Cal-Am has provided ample information on how much water its customers use and how much they pay for the water based on average use and average costs. (See Dudek Memorandum, pp. 3-4; June 30 Letter to Commission pp. 37, 92-93.)[13] Moreover, Attachment B, Section I and the Applicant's Staff Report, further describe the costs to customers who are eligible for Cal-Am's Customer Assistance Program. For example, because the discount associated with the Customer Assistance Program, as proposed under Special Condition 13, will increase from 30% to 50%, water bills for enrolled customers will actually decrease after Project implementation.

I. Assessment of Alternatives

[13] Additional information regarding rates in the Monterey service area is available here: https://www.amwater.com/caaw/Customer-Service-Billing/Water-Rates/Monterey-District.

1. Interpretation of Coastal Act Sections 30233 and 30260

- MCWD asserts that Coastal Act sections 30233 and 30260 and CEQA require the Commission to consider complete alternatives to desalination facilities, relying on guidance documents issued by the Commission. (MCWD Letter, pp. 48-49, 67-68.)

    - MCWD misleadingly cites two guidance documents issued by the Commission for the proposition that an alternatives analysis may be "need[ed] to evaluate whether using or providing a public water source is a feasible option" and that the Commission's policy is to consider complete alternatives to desalination under Coastal Act sections 30233 and 30260. (MCWD Letter, pp. 48-49.) The Commission's policy statements do not support MCWD's claims.

        - First, the policy statements affirm that section 30233 only applies to projects involving any diking, dredging, of filling in coastal waters. (See *Briefing on the Applicability of Coastal Act Policies to Public and Private Desalination Facilities*, dated February 20, 2003, p. 7 ["Section 30233(a) requires in part that projects involving fill in coastal waters be allowed only under particular conditions."] [emphasis added]; *Desalination and the Coastal Act*, dated March 20, 2004, p. 30 ["*To place fill in coastal waters*, a proposed development must fall within one of the eight categories listed under Coastal Act section 30233"] [emphasis added].) As explained in Applicant's Staff Report, section 30233 does not apply to the proposed Cal-Am Project because the Project does not propose diking, filling, or dredging of coastal waters. (Applicant's Staff Report, Section IV.I.)

        - Second, the policy statements affirm that section 30260 is limited to considering alternative locations. (See *Briefing on the Applicability of Coastal Act Policies to Public and Private Desalination Facilities*, dated February 20, 2003 ["Section 30260 states that coastal-dependent facilities may be permitted . . . if there are no feasible, less environmentally damaging *alternative locations*."] [emphasis added]; *Desalination and the Coastal Act*, dated March 20, 2004, p. 30 [noting section 30260 asks "[a]re *alternative locations* infeasible or more environmentally damaging?"] [emphasis added].) Further, as discussed in the Staff Report Response, there is no feasible alternative project that better protects public trust resources. (Applicant's Staff Report, Section IV.P.)

    - As explained in the Applicant's Staff Report, Section IV.O, Coastal Act section 30233 does not apply to the Proposed Project. (See Pub. Resources Code, § 30233, subd. (a); June 30, 2020 Letter to Commission, pp. 45-46.) Here, the Project does not involve any diking, dredging, or filling of open coastal waters—as such, section 30233 does not provide the Commission with any authority to consider whether there is a "feasible less environmentally damaging alternative" to the Project. (June 30, 2020 Letter to Commission, p. 46; Section C, *supra*.) Even if certain components did constitute "fill"—which they do not—the

Commission's authority would be limited to review of alternatives as to those components, not wholesale alternatives to the entire Project. (June 30, 2020 Letter to Commission, p. 46.)

- Similarly, the plain language of section 30260 grants the Commission the authority to consider only "***alternative locations***" for coastal-dependent facilities—nothing in this section permits the Commission to assess wholesale project alternatives. (June 30, 2020 Letter to Commission, pp. 46-47; see also Attachment B, Section J.1.) Further, as discussed in Attachment B, Section J.1, the Commission is limited to considering alternatives only within the Coastal Zone.

2. <u>Feasibility</u>

- MCWD argues that the PWM Expansion is "ready to be approved and implemented in short order," asserting that while the M1W Board declined to certify the Final SEIR on April 27, 2020, in a second vote at that meeting, the M1W expressly voted against denying certification of the Final SEIR and terminating further action on the PWM Expansion. (MCWD Letter, p. 49.)

  - First, MCWD ignores that a letter from M1W to Cal-Am explicitly confirmed that the M1W Board had, on April 27, 2020, taken action "denying certification" of the Final SEIR for the PWM Expansion. (See June 8, 2020 M1W Letter to Cal-Am, p. 1.)

  - Second, MCWD's assertion that the PWM Expansion can be implemented in short order wholly ignores the fact that M1W lacks the funding to correct the deficiencies identified in the PWM Expansion SEIR, which prompted the M1W Board to deny certification of the SEIR. (See Applicant's Staff Report, Section IV.O.1.) As stated by M1W itself, "[M1W] does not have additional budget funds at this time for dealing with any additional deficiencies that have been identified . . . or could be identified in the future. [M1W] has suspended all of the remaining contracts on these matters to prevent further consultant expenditures." (See May 20, 2020 M1W Board of Directors Staff Report, p. 1.) Moreover, as explained in M1W's August 20, 2020 letter to the Commission, M1W has suspended all work on the PWM Expansion. (See August 20, 2020 M1W Letter, p. 3.)

  - Finally, before M1W could certify the PWM Expansion SEIR, it must recirculate the SEIR to provide for public notice and comment regarding significant new information, including the post-2013 wastewater or "WWTP" flow data recently disclosed by M1W. (See Applicant's Staff Report, Section IV.O.1; see Attachment B, Section J.2.b; Pub. Resources Code, § 21092.1; CEQA Guidelines, § 15088.5.) Similarly, as discussed below, M1W has proposed the potential construction of additional deep wells. Initially, M1W anticipated adding a third deep injection well, but is now discussing adding a fourth. (See August 31, 2020 M1W Board of Directors Meeting, at 1:14:20 to 1:22:10 [discussing amending bid

request for the third deep injection well to include construction of a fourth deep injection well], available at https://montereyonewater.org/290/Audio-Recordings-of-Board.) Should M1W choose to construct these wells, it would again be required to revise and recirculate the PWM Expansion SEIR to permit public notice and comment regarding the impacts associated with these wells. (See Applicant's Staff Report, Section IV.O.1.) There is no reason to believe that M1W will be able to suddenly pick up the pieces of the PWM Expansion and approve and implement a complex water treatment system "in short order."

- MCWD asserts that the M1W Board did not deny certification of the Final SEIR due to deficiencies in the SEIR's environmental analysis, but rather that the agenda packet for the M1W Board's April 27, 2020 meeting contained detailed responses to Cal-Am comments on the SEIR. (MCWD Letter, pp. 49-50.)

    - Contrary to MCWD's claims, M1W has expressly acknowledged that the following significant deficiencies remain unaddressed in the SEIR that was provided to the M1W Board for certification:

        - The SEIR did not adequately address comments expressing concern that M1W cannot document the quantity and reliability of the source water available for the PWM Expansion;

        - The SEIR fails to support its conclusions regarding long-term water supply and demand, which are contrary to the CPUC demand determination and estimates from Peninsula cities;

        - The SEIR fails to properly evaluate potential impacts to agricultural water supplies due to reductions in available agricultural irrigation water because of the Expansion;

        - The SEIR does not evaluate the PWM Expansion as either an alternative to or a cumulative project with the Project. (May 20, 2020 M1W Board of Directors Staff Report, p. 2; August 12, 2020 Cal-Am Letter to Commission.)

    - M1W staff has stated that they do not have the funding to fix these deficiencies, and has therefore halted all work on the PWM Expansion. (See May 20, 2020 M1W Board of Directors Staff Report, p. 1.) It does not appear that M1W intends to or is capable of correcting these significant deficiencies in the near future.

- MCWD asserts that the Commission was required to consider the PWM Expansion as an alternative to the Project because there is "ample new information demonstrating that PWM Expansion is a feasible alternative." (MCWD Letter, p. 50.)

    - MCWD does not point to any new information demonstrating that the PWM Expansion has become a feasible Project alternative. In fact, just the opposite has occurred. In an August 20, 2020 letter to the Coastal Commission, M1W provided new information regarding wastewater flows from 2014 to 2019, that

were not previously available to the public or analyzed in the SEIR for the PWM Expansion. In an August 23, 2020 memorandum (the "August 23, 2020 Hazen Memo"), Hazen & Sawyer evaluated the new flow information and found that the new flow information only further confirmed the conclusion that source water for the PWM Expansion is inadequate and speculative and that the Expansion is not a feasible alternative to Cal-Am's Project. This analysis built upon the Hazen & Sawyer memorandum provided to the Commission on August 11, 2020, which reached the same conclusion (the "August 11, 2020 Hazen Memo").

- Moreover, M1W's new information regarding wastewater flows, which would provide a significant proportion of the source waters for the PWM Expansion, itself constitutes significant new information under CEQA.

    - Under CEQA, when "significant new information" is added to an EIR after the public notice and comment period, but before certification of the EIR, the lead agency must provide notice of an additional public comment period before certifying the EIR. (Pub. Resources Code, § 21092.1; CEQA Guidelines, § 15088.5; *Save Our Peninsula Committee*, 87 Cal.App.4th 99, 130; *Cadiz Land Co. v Rail Cycle* (2000) 83 Cal.App.4th 74, 95.)

    - Appendix I to the PWM Expansion Final SEIR does not consider post-2013 WWTP flow data, which demonstrates a consistent trend of decreasing WWTP flow to source the PWM Expansion, despite the fact that M1W apparently possessed this data when preparing the Final SEIR. (See August 23, 2020 Hazen Memo, p. 4; see Applicant's Staff Report, Section IV.O.1.) Accordingly, overall demand for the source waters listed for the PWM Expansion far exceeds available supplies in both Normal/Wet years and Dry years. (August 23, 2020 Hazen Memo, p. 6.) This newly released post-2013 WWTP flow information constitutes significant new information under CEQA because M1W must identify and analyze available water sources for the Expansion in order to demonstrate whether that project is feasible or whether potential environmental impacts could result. Regardless of where this new water is sourced, its diversion to the PWM Expansion could generate a significant new impact, which has yet to be evaluated. Likewise, by not including post-2013 WWTP flow data, which appears to have been in M1W's possession for years, M1W has created a document "so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded." (See CEQA Guidelines, § 15088.5, subd. (a)(4).) Because the public was unable to accurately analyze whether the PWM Expansion could achieve its stated purpose, the Final SEIR failed in its fundamental purpose as an informational document by excluding this crucial information from public consideration. As a result of all of these flaws, the Final SEIR will need to be revised and recirculated for public comment, a process that could add at least an additional six to twelve

months or more to the project's timeline—further demonstrating that the PWM Expansion is not a feasible alternative.

- Similarly, M1W has proposed the potential construction of additional deep wells in an attempt to resolve the injection refusal issues currently faced by the Phase I PWM. Initially, M1W anticipated adding a third deep injection well, but is now discussion adding a fourth. (See August 31, 2020 M1W Board of Directors Meeting, at 1:14:20 to 1:22:10 [discussing amending bid request for the third deep injection well to include construction of a fourth deep injection well], available at https://montereyonewater.org/290/Audio-Recordings-of-Board.) Should M1W choose to construct these wells, it would again be required to revise and recirculate the PWM Expansion SEIR to permit public notice and comment regarding the impacts associated with these wells. (See Applicant's Staff Report, Section IV.O.1.)

- MCWD contends that the PWM Expansion satisfies each of the alternative feasibility criteria under CEQA and the Coastal Act, and is in fact more feasible than the Project. (MCWD Letter, pp. 50-53.)

  - As further explained below, the PWM Expansion has not been demonstrated to be a feasible project and should not be considered an alternative to the Project. (See Applicant's Staff Report, Section IV.O.1; see also June 30, 2020 Cal-Am Letter to Coastal Commission, Att. A, Section I.2.)

    a. "Capable of Being Accomplished in a Successful Manner"

- MCWD takes issue with Cal-Am's statement that the serious concerns with technology proposed for use in the Phase I PWM means that the PWM Expansion is not capable of being accomplished in a successful manner. Instead, MCWD argues that M1W has addressed each of Cal-Am concerns regarding the Phase I PWM and states that "there is no evidence suggesting that the issues raised by Cal-Am cannot be resolved." (MCWD Letter, pp. 50-51.)

  - As noted in the Applicant's Staff Report, the Phase I PWM continues to face significant, ongoing technological issues preventing the project from operating at full capacity, including sinkholes and/or subsidence, and injection refusal. (See Applicant's Staff Report, Section IV.O.1.) As a result, M1W estimates that current annual injection volume for Phase I PWM is only 2,030 afy—less than 58 percent of the 3,500 afy allocated for Cal-Am under the Water Purchase Agreement ("WPA"). (August 12, 2020 Cal-Am Letter, p. 2.)

  - In response to Cal-Am's concerns regarding inadequate injection rates from the Phase I PWM, M1W has proposed costly repairs to the shallow wells, final commissioning of the deep wells, and the addition of a third, and possibly a fourth, deep injection well. (August 12, 2020 Cal-Am Letter, p. 2.) However, it is not clear that these proposed actions will allow the Phase I PWM to operate at its expected capacity. In fact, M1W has recently been forced to propose the

addition of a fourth deep injection well, as the previously proposed third well is apparently inadequate to remedy injection refusal issues. (See August 31, 2020 M1W Board of Directors Meeting, at 1:14:20 to 1:22:10 [discussing amending bid request for the third deep injection well to include construction of a fourth deep injection well], available at https://montereyonewater.org/290/Audio-Recordings-of-Board.) Given that Phase I PWM and PWM Expansion would utilize the same technology, the technological concerns associated with the Phase I PWM apply equally to the PWM Expansion, and it is likely that M1W would also be forced to propose a similar continuing cycle of fixes for the PWM Expansion as is often the case for groundwater replenishment projects. (See Applicant's Staff Report, Exhibit 23, September 10, 2020 Hazen Memo, p. 5.)

- MCWD claims that concerns regarding availability of source waters for the PWM Expansion were fully addressed in Appendix M to the Final SEIR, and that there is far greater uncertainty regarding the Project's source waters. (MCWD Letter, p. 51.)

    - MCWD admits that PWM Expansion source water is "subject to certain seasonal variability." (MCWD Letter, p. 51.)

    - As Cal-Am has previously explained to the Commission, the water rights that M1W claims are available for the PWM Expansion in SEIR Appendix M are not permanent water rights, but instead are merely interruptible use entitlements, and many of those entitlements are disputed by the holders of the water rights. (August 12, 2020 Cal-Am Letter, p. 4.) The following issues remain regarding claimed PWM Expansion source waters: ARWRA source waters; questionable modifications of source waters; disputed agricultural source waters; source water quality issues; and overestimation of water supplies during drought years. (*Id.*, pp. 4-5.)

    - Regarding source waters, M1W, the Stoldt Memo, and MCWD do not account for the risks of using wastewater as a primary water source for the PWM Expansion—wastewater is subject to significant variability according to demand and drought conditions. (August 11, 2020 Hazen Memo, pp. 6-7.) Appendix I to the PWM Expansion SEIR fails to account for WWTP flows since 2013, or the fact that WWTP flows have been decreasing on the Peninsula, and thereby overstates available wastewater flows that may be used as source water. (*Id.*, p. 7.) Indeed, data regarding wastewater flows was entirely unavailable until it was provided by M1W in its August 20, 2020 letter to the Commission. Under a corrected WWTP flow analysis using this new information, there would be significantly depressed WWTP source water supplies for the PWM Expansion in Normal/Wet years, and no flow available for Phase I PWM and PWM Expansion during Dry years. (August 23, 2020 Hazen Memo, p. 6.) Moreover, the significant new information regarding wastewater flow data post-2013 requires recirculation of the PWM Expansion Final SEIR for renewed notice and comment. (Pub. Resources Code, § 21092.1; CEQA Guidelines, § 15088.5; *Cadiz Land Co.*, *supra*, 83 Cal.App.4th at p. 95.)

- With respect to surface water flows, recent data from the U.S. Geological Survey shows that average surface water flows in the Reclamation Ditch are lower than assumed in the Final SEIR, and therefore the SEIR overstates the availability of Reclamation Ditch flow as source water for the Phase I PWM and the PWM Expansion. (August 11, 2020 Hazen Memo, p. 11.) Moreover, agricultural flows have decreased by one-third in recent years, meaning that monthly flows to the Blanco Drain and the Agricultural Wash Water are also below what is projected in the SEIR. (*Ibid.*)

- Updated Figure 4 in the August 23 Hazen Memo shows that when lower WWTP and Reclamation Ditch flows are accounted for, demand for source waters identified for the PWM Expansion far exceeds available supplies in Normal/Wet years and in Dry Years. (August 23, 2020 Hazen Memo, p. 6.) Without an adequate source water supply, the Peninsula will have to choose between supplying source water for the PWM Expansion or for the CSIP system. (August 11, 2020 Hazen Memo, pp. 13-14.)

- Finally, the PWM Expansion fails to comply with state mandates specifically designed to ensure that water suppliers are capable of providing a drought-proof supply in the face of advancing climate change. Specifically, Governor Newsom's 2020 Water Resilience Portfolio's makes clear that water supplies must plan for prolonged drought conditions, and "[d]evelop strategies to protect communities and fish and wildlife in the event of a drought lasting at least six years."[14] As discussed above, during Normal/Wet years and in Dry years, the PWM Expansion will have inadequate source waters, and this deficit will only increase during prolonged periods of drought—as such, the Expansion does not achieve Governor Newsom's water supply resilience goals. Only the Project is capable of providing a reliable, drought-proof supply to the Monterey Peninsula.

b. "Within a Reasonable Period of Time"

- MCWD argues that while the PWM Expansion may not be implemented before the CDO deadline, "the evidence shows that PWM Expansion could be implemented long before the [Project]," and therefore can be completed within a reasonable period of time. To support this argument, MCWD again notes that the M1W Board rejected a motion to cease work on the PWM Expansion. (MCWD Letter, pp. 51-52.)

  - MCWD does not provide *any* evidence to support its assertion that the PWM Expansion can be implemented before the Project. Moreover, the M1W Board has denied certification of the PWM Expansion SEIR, which must now be recirculated to account for the significant new information disclosed by M1W regarding wastewater flow data and the potential additional deep injection wells. (Pub. Resources Code, § 21092.1; CEQA Guidelines, § 15088.5; *Cadiz Land Co.*,

[14] 2020 Water Resilience Portfolio (July 2020), p. 26, available at https://waterresilience.ca.gov/wp-content/uploads/2020/07/Final_California-Water-Resilience-Portfolio-2020_ADA3_v2_ay11-opt.pdf.

supra, 83 Cal.App.4th at p. 95.) Coupled with the fact that M1W does not possess the funding to correct deficiencies in the SEIR, and M1W's order to its staff to suspend work on any aspect of the PWM Expansion (see August 20, 2020 M1W Letter to Commission, p. 3), it is clear that ***the Expansion has now been delayed indefinitely.***

- MCWD claims that the Commission is not bound by the CDO deadline in determining whether the PWM Expansion is a feasible Project alternative. (MCWD Letter, p. 76.)

    - Without a feasible water supply, Cal-Am cannot provide a supply to replace its Carmel River withdrawals, which it is currently obligated to cease by the December 31, 2021 CDO deadline. The State Water Board CDO provides that the conditions thereto, as well as conditions set forth in previous iterations of the CDO, "shall remain in effect until (a) Cal-Am certifies, with supporting documentation, that is has obtained a permanent supply of water that has been substituted for the water illegally diverted from the Carmel River and (b) the Deputy Director for Water Rights concurs, in writing, with this certification." (State Water Board Order WR 2016-0016, p. 27.) As such, if Cal-Am does not obtain a new, permanent supply to replace its Carmel River withdrawals by the CDO deadline, the CDO conditions, including the moratorium on new service connections mandated by the 2009 State Water Board CDO, will remain in effect. The Commission must consider the CDO deadline, as failure to meet the CDO milestones would result in severe consequences for Cal-Am and its customers, including continuation of the service connection moratorium and the potential for mandatory rationing and further restrictions on water usage. (See Final EIR/EIS, pp. 5.4-10 to 5.4-11.)

c. <u>"Taking Into Account Economic, Environmental, Social, and Technological Factors"</u>

- MCWD argues that the PWM Expansion would "cost much less" than the Project, and would save Monterey Peninsula ratepayers millions of dollars. (MCWD Letter, p. 52.)

    - While PWM Expansion would cost somewhat less than Cal-Am's Project, it will not provide sufficient water to meet Peninsula water demand (even the low demand numbers advocated by MPWMD), and therefore it is not a feasible alternative. It also should be noted that Phase I PWM is facing significant cost overruns, which will be passed onto Cal-Am ratepayers. The CPUC approved a rate of $1,720 or less per-acre-foot for Phase I PWM water—as of June 2020, M1W stated that at the current projected delivery of 2,030 afy, costs would increase to $3,678 per-acre-foot. (August 12, 2020 Cal-Am Letter, p. 3.) Even under M1W's best case scenario, after repairs to the shallow wells, commissioning of deep wells, and the addition of a third deep well, costs would be $2,508 per acre-foot—a nearly 50 percent increase from the rate approved by the CPUC. (*Ibid.*)

- Moreover, MCWD fails to acknowledge that costs to Cal-Am's customers for Cal-Am's Project already have been established by the CPUC based on the capital costs to build the facility, the cost of long-term operations and maintenance, and the cost of financing, and are not materially affected by the per acre-foot cost of water. (See Applicant's Staff Report, Section IV.O.1.) Based on available information, the CPUC approved a rate increase of about $37-$40 per month for the average Cal-Am customer in a single family residence for the desalination facility, and that increase is not tied to per acre-foot water costs. That is why the CPUC found that approving a smaller 4.8 MGD desalination facility would not result in any "significant, if any, cost savings to ratepayers" and determined that alternative was not feasible. (CPCU Decision 18-09-017, p. 129.)

- MCWD asserts that the PWM Expansion is environmentally superior, for purposes of the Commission's alternatives analysis, because unlike the Project, the PWM Expansion is situated entirely outside the coastal zone. (MCWD Letter, p. 52.)

  - MCWD's argument is entirely circular—the Commission cannot assess a Project alternative that is situated entirely outside the coastal zone, while simultaneously ignoring any environmental impacts of such a project that take effect outside of the coastal zone. MCWD cannot have its cake and eat it too. The Commission is not authorized to analyze the impacts of projects located outside of its jurisdiction – the coastal zone – and thus, cannot purport to assess the PWM Expansion's environmental impacts against those of the Project. (See *Sierra Club v. Cal. Coastal Com.* (2005) 35 Cal.4th 839, 860; *Schneider v. Cal. Coastal. Com.* (2006) 140 Cal.App.4th 1339, 1347; June 30, 2020 Cal-Am Letter to Commission, p. 47.)

  - Moreover, MCWD assumes, without any evidence, that projects situated outside of the coastal zone are inherently environmentally superior to projects within the coastal zone. It is a gross overgeneralization to assume that a project located outside the coastal zone has fewer environmental impacts, without first conducting a complete analysis of that project's effects.

  - Further, to the extent that Coastal Act section 30260 permits the Commission to analyze alternative project locations, such analysis is limited to alternative locations ***within*** the Commission's coastal zone jurisdiction. Nothing in the Coastal Act permits the Commission to analyze the relative environmental impacts of siting projects at locations ***outside*** the coastal zone.

  - MCWD fails to recognize that, with the implementation of proposed special conditions, the Project is consistent with all of the policies set forth in the Coastal Act and the Marina LCP, except for those related to ESHA. (See Applicant's Staff Report, Section IV.O.1.) Moreover, the Project would incorporate mitigation measures to the maximum extent feasible to reduce impacts to ESHA. (*Ibid.*) In contrast, significant questions regarding the impacts of the PWM Expansion remain unresolved and caused the M1W Board to deny certification of the Final SEIR for the Expansion. (*Ibid.*) Further, M1W has to this point failed

to evaluate the potential impacts from seawater intrusion to the SVGB, should the PWM Expansion be constructed in lieu of the Project. (*Ibid.*) Finally, as explained by the Seaside Groundwater Basin Watermaster, without supplemental supplies that only the Project can provide, the Watermaster cannot maintain adequate groundwater levels in the Basin to "avoid seawater intrusion and irreversible loss of Basin storage." (See August 12, 2020 Seaside Groundwater Basin Watermaster Letter to Commission, p. 1; see also Applicant's Staff Report, Section IV.O.2.) Without the additional water to be supplied by the Project, it is likely that seawater intrusion within the Seaside Basin will worsen and cause the loss of available Basin storage, resulting in potentially significant impacts to groundwater resources. (See Applicant's Staff Report, Section IV.P.) Therefore, substantial evidence does not demonstrate that the Expansion will have fewer environmental impacts compared to the Project.

- MCWD claims that the CPUC's analysis of the Project in the EIR/EIS is "not relevant" to the Commission's review of the Project's environmental impacts under the Coastal Act. (MCWD Letter, p. 52.)

    - As the lead agency, the CPUC reviewed the Project and its environmental impacts over a six-year-long administrative process. Throughout this process, the CPUC engaged federal, state, and local agencies, members of the public, and other stakeholders. Dozens of parties, including MCWD, became parties to the CPUC proceedings, enabling them to participate in legal briefing and oral arguments, join in technical workshops on various Project issues, and offer written and oral evidence taken under oath. When the CPUC issued the Final EIR/EIS, MCWD appealed it to the California Supreme Court, arguing in part that the Project would have adverse environmental impacts. The California Supreme Court found CPUC's analysis and approval adequate. (Order Denying Petitions for Writ of Review, *Marina Coast Water District, et al. v. Public Utilities Commission*, Case No. S253585 (Aug. 28, 2019).) The analysis set forth in the EIR/EIS is therefore no longer subject to challenge and as such, as a CEQA responsible agency, the Commission is required to consider and rely upon the CPUC's and EIR/EIS's evaluation of the Project's impacts. (See CEQA Guidelines, §§ 15096, subds. (a), (f).) As a responsible agency for the Project, the Commission's CEQA authority is inherently limited to considering and avoiding only those impacts caused by Project components within the Commission's coastal zone jurisdiction. (See, e.g., Pub. Res. Code, § 21002.1, subd. (d) ["A responsible agency shall be responsible for considering only the effects of those activities involved in a project which it is required by law to carry out or approve."]; CEQA Guidelines, §§ 15042, 15096, subd. (g)(1) ["When considering alternatives and mitigation measures, a responsible agency is more limited than a lead agency. A responsible agency has responsibility for mitigating or avoiding only the direct or indirect environmental effects of those parts of the project which it decides to carry out, finance, or approve."].)

- In response to Cal-Am's argument that the PWM Expansion is socially infeasible because it will deprive the disadvantaged community of Salinas of valuable agricultural wash

water, MCWD argues that M1W has made clear that there is not currently any method by which the agricultural wash water can be put to beneficial use by Salinas residents. In the alternative, MCWD contends that M1W has rights to adequate source water for the PWM Expansion without use of agricultural wash water. Finally, MCWD argues that even if the PWM Expansion did rob Salinas residents of agricultural wash water, the Project will cause comparatively more harm to disadvantaged communities by "jeopardizing the sole source of drinking water" for these communities." (MCWD Letter, pp. 52-53.)

- Salinas continues to dispute M1W's rights to use the City's agricultural wash water for the PWM Expansion, and argues that the ARWRA only permits M1W to use agricultural produce wash water for Phase I PWM, and not the Expansion. (January 29, 2020 City of Salinas Letter.) The City further explained that these water sources will not be available for use by the PWM Expansion because "the City fully intends to use available agricultural wash water for its own purposes, including to support farmers, ranchers and the City's agriculture industry, as determined by the City in its sole and absolute discretion." (*Id.*, p. 2.) The Commission therefore should not consider the agricultural wash water as an available water source for the Expansion Project.

- MCWD's contention that M1W has rights to adequate source water for the PWM Expansion, without using agricultural wash water, is incorrect. As discussed in Cal-Am's Response to Staff Report, the analyses provided by proponents of the PWM Expansion already fail to demonstrate that the Pure Expansion has reliable sources of water necessary to meet demand on the Monterey Peninsula, even when assuming MPWMD's lowest 10,855 afy demand. (Attachment B, Section J.3.)

- Finally, MCWD's claim that the Project is "jeopardizing the sole source of drinking water" for Salinas residents is without merit. As discussed in the Applicant's Staff Report, extensive studies have been performed as part of the Project's CEQA review before the CPUC, which have concluded that the Project's well field would have relatively limited effects on nearby groundwater supplies conditions in the SVGB, and negligible or no effect on regional groundwater supplies. (See Applicant's Staff Report, Section IV.J.) Moreover, the Commission's own independent hydrogeologist confirmed that Project operation will not adversely affect groundwater supplies. (*Ibid.*)

- MCWD claims that there is no evidence that the PWM Expansion is technically infeasible and that the Phase I PWM "has not faced any 'technological roadblocks.'" MCWD further claims that there is uncertainty regarding the Project's proposal to use slant well technology to draw in brackish groundwater for desalination. (MCWD Letter, p. 53.)

    - MCWD's claim that Phase I PWM has not faced any technological difficulties is simply false. As described above, due to a serious of technological issues, including sinkholes and subsidence in the shallow wells and injection refusal in the deep wells, the Phase I PWM's injection rate continues to be far below the

3,500 afy promised to Cal-Am under its existing WPA with M1W. (See Applicant's Staff Report, Section IV.O.1; see also Attachment B, Section J.2.a; August 12, 2020 Cal-Am Letter, p. 2.)

- Further, MCWD ignores that operation of the Project's test slant well has demonstrated the technical feasibility of slant well technology, and at least two other projects in California have similarly conducted successful tests as a method of supplying source water to desalination facilities. (See Applicant's Staff Report, Section IV.O.1.) Moreover, subsurface slant wells, such as those planned for the Project, are the type of intake technology preferred by the state resources agencies, including the Commission, for desalination facilities under the California Ocean Plan. (See California Ocean Plan, Section III.M.2.d(1)(a).)

3. Use of MCWD Pipeline

- MCWD argues that there is not sufficient capacity in the MCWD pipeline for use to transport Project product water, and that Cal-Am has not demonstrated that it could feasibly construct a product water pipeline running parallel to MCWD's, rendering the Project infeasible. (MCWD Letter, pp. 53-54.)

  - As a threshold matter, the March 10, 2009, Potable Water Wheeling Agreement between Cal-Am and MCWD, as well as Water Code sections 1810-1814, entitle Cal-Am with the legal right to use this shared pipeline while there is sufficient capacity available in the pipeline. (See June 30, 2020 Cal-Am Letter to Commission, pp. 54-55.) This shared pipeline has adequate capacity to serve CalAm's uses given that the Project will produce 6.4 mgd of desalinated water and the capacity in the Shared Pipeline is 15.9 mgd on an average day and 14.3 mgd at peak hour. (*Ibid.*) MCWD's arguments to the contrary have been rejected by the CPUC and the California Supreme Court. (See Order Denying Petitions for Writ of Review, *Marina Coast Water District, et al. v. Public Utilities Commission*, Case No. S253585 (Aug. 28, 2019).)

  - In any case, as acknowledged by the Staff Report, in the event that MCWD continues to unreasonably refuse to permit Cal-Am to exercise its right to utilize the pipeline, Cal-Am has proposed to construct an additional product water conveyance pipeline, running parallel to the shared pipeline. (See Staff Report, pp. 112-13; June 30, 2020 Cal-Am Letter to Commission, p. 55.) Approvals for this proposed parallel pipeline will come before MPWMD at its October Board meeting. (See July 31, 2020 MPWMD Board of Directors Final Minutes, p. 1.) There is no reason to believe that MPWMD will not issue approvals for the pipeline. As a result, Cal-Am's ability to utilize the shared pipeline, or to obtain approvals for a new parallel pipeline, will not cause contribute to uncertainty regarding the Project's operations.

4. Supply and Demand

- MCWD claims that Cal-Am's demand numbers submitted to the CPUC in its general rate case support a finding of decreased demand, and that recent analyses submitted to the Commission support the 2019 Staff Report's conclusions on supply and demand. (MCWD Letter, pp. 54, 82-83.)

    - MCWD's contention demonstrates a misunderstanding regarding the purpose of a general rate case, which is to forecast revenue—not plan a long-term water supply system. The rate case is intended to calculate the revenue required for the next three years and propose rates necessary to meet that revenue requirement. To support the calculation, the rate case includes tables used to forecast customers, water sales and operating revenues over that time period. As specifically noted in the 100-day update for Monterey, "There is no forecasted growth in the Central Division due to the Moratorium." (July 1, 2019 Cal-Am application for CPUC's General Rate Case A1907004, Exhibit A, p. 302, available at https://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M308/K837/308837881.PDF) Table 3.14 in the update therefore uses the same total annual number of 9,789.4 acre-feet for 2019, 2020, 2021 and 2022. (*Id.* at 317.) Forecasting sales for three years is not the same as planning a water supply system to meet long-term needs, and does not consider issues like maximum month demand – which was a critical factor in the CPUC's demand determination for the Project. (See Applicant's Staff Report, Section IV.O.2; CPUC Decision D.18-09-017, pp. 21-24.) A supply that barely met an average annual demand number over a few year period would still be unable to meet maximum demands.

    - MCWD's contention also ignores the fact that only Cal-Am's Project can meet Peninsula water demand even under the most conservative demand estimate as presented by MPWMD to the Commission. As demonstrated in the Applicant's Staff Report, even assuming the low demand figure proposed by MPWMD (10,855 afy), when ASR is accounted for at a realistic level, or when WWTP flows and Reclamation Ditch flows are accounted for based on current flow data, the Pure Water Expansion cannot meet the Peninsula's water demand. (Applicant's Staff Report, Section IV.O.2; September 10, 2020 Hazen Memo, p. 6.) When these two scenarios are combined, which is certain to occur, the Peninsula is left in a perpetual water supply deficit that the PWM Expansion cannot satisfy. (*Id.*)

        a. CPUC Determinations of Supply and Demand

- MCWD contends that the Commission is not bound by the CPUC's determination of supply and demand in Cal-Am's Monterey service area, and can "consider the changes in demand and supply circumstances" since the CPUC issued its decision on the Project in 2018. MCWD claims that MPWMD, instead, should be afforded "greater weight" in its calculations of supply and demand. (MCWD Letter, pp. 54, 55, 82-83.)

    - MCWD's claims demonstrate a misunderstanding of the law. As Cal-Am explained in its June 30, 2020 Letter to Commission, the CPUC's determinations of appropriate levels of supply and demand in Cal-Am's service area cannot now

be second-guessed by the Commission, MPWMD, or any other agency. (See June 30, 2020 Letter to Commission, pp. 56-57.) As previously explained, "[T]he jurisdiction to determine the adequacy of service actually being rendered by a public utility under its franchise is vested exclusively in the [CPUC] when it has elected to determine whether the service is inadequate." (*California v. Super. Ct.* (1976) 56 Cal.App.3d 399, 408; see also *City of Oakland v. Key System* (1944) 64 Cal.App.2d 427, 435.)

- MCWD claims that these authorities stand only for the proposition that the CPUC is the exclusive agency for determining whether Cal-Am is providing adequate services to its customers—this is a distinction without a difference. By definition, the CPUC cannot determine adequacy of service to a public utility's customers without determining current and future levels of supply and demand for such public utility. In this case, the CPUC carried out its explicit statutory mandate to determine the adequacy of service in Cal-Am's service area, and thereby reached binding determinations of supply and demand in the area. The CPUC's decision has been upheld by the California Supreme Court, and is now final.

b. Critiques of the Stoldt Memo

- Relying on the Mayer Report, MCWD claims that the January Hazen Memo, which Cal-Am used in critiquing the Original Stoldt Memo, contains "numerous errors, mischaracterizations, and incorrect conclusions." (MCWD Letter, p. 55.)

  - MCWD's claims regarding the January Hazen Memo are refuted by the August 11, 2020, August 23, and September 10, 2020 Hazen Memos. The August 11, 2020 Hazen Memo explains that the January Hazen Memo was written to reflect the substantial concerns with assuming lower Peninsula water demands that do not adequately analyze the range of uncertainty in water availability in the area. (August 11, 2020 Hazen Memo, p. 16.) The higher demands included in the January Hazen Memo are warranted to provide a buffer for uncertainty, which WaterDM and MPWMD have been unwilling to address. For example, Water MD and MPWMD have avoided updating the flow data for the PWM Expansion to the reflect the project's actual supply of source water and instead assume that all paper water rights are fully available. (*Ibid.*) Indeed, as a matter of good engineering principles, supply and demand planning for the Monterey Peninsula, which is continuously dependent on new sources of water, requires planners to analyze these risks and apply an appropriate level of reliability and resiliency. (*Ibid.*) In contrast, it is MPWMD and WaterDM's analyses that rely on outdated and inaccurate flow data for the PWM Expansion, overestimate the availability of ASR water, and presume increased water conservation without the implementation of more stringent measures, which actually contain "numerous errors, mischaracterizations, and incorrect conclusions." (See MCWD Letter, p. 55.)

  - If there was any doubt as to the veracity of the January Hazen Memo, those concerns were dispelled when M1W released the post-2013 wastewater flow

information that was absent from the PWM Expansion's Final SEIR. Using this new information, Hazen and Sawyer confirmed their prior conclusion that "there is not enough wastewater flow to support the WM Phase One and the PWM Expansion as a reliable source of water supply for the Peninsula." (August 23, 2020 Hazen Memo, p. 3.)

- Finally, in Response to the Staff Report, Hazen and Sawyer provided additional analysis, including Appendix A, which offers a comprehensive accounting of water supply and demand on the Monterey Peninsula, accounting for different scenarios based on the variability in Cal-Am's water supply. Like Hazen and Sawyer's prior analyses, Appendix A demonstrates that when ASR supplies are described at reasonable levels, the PWM Expansion cannot meet the lowest demand estimates set forth by the MPWMD of 10,855 afy. Similarly, when WWTP and Reclamation Ditch flows to the Phase I PWM and PWM Expansion are reduced to account for recent data, the Expansion cannot meet the lowest estimate of demand in Cal-Am's service area. (September 10, 2020 Hazen Memo, p. 6.)

c. The Stoldt Memo's Supply and Demand Estimates

- MCWD argues that the Stoldt Memo's demand estimates, and the 2019 Staff Report's reliance on such estimates, were reasonable, and claims that the Supreme Court's rejection of MCWD's and Marina's challenges to the CPUC's decision do not "freeze" customer demand. Rather, MCWD claims that whether the Commission can revisit the CPUC's determination of supply and demand is controlled by a "three-part test" set forth in *San Diego Gas & Electric Co. v. Superior Court* ("*Covalt*") (1996) 13 Cal.4th 893. (MCWD Letter, pp. 55-56.)

  - MCWD does not explain the relevance of the *Covalt* case, nor does this case appear to provide any support for the proposition that the Commission can override the CPUC's binding determinations of supply and demand in Cal-Am's service area. Rather, *Covalt* is concerned with whether Public Utilities Code section 1759, which vests exclusive jurisdiction in the California Supreme Court and the courts of appeal to review any determination by the CPUC, permits a private plaintiff to file an action for damages against an electrical utility. (See 13 Cal.4th at p. 903.)

- MCWD claims that the CPUC's determinations of future supply and demand are outdated and inflated, and argues that the Mayer Report's estimates of supply and demand for 2040 (between 10,412 and 10,983 afy) are based upon AMBAG estimates of future population growth. (MCWD Letter, p. 56.)

  - As discussed above, the CPUC's determinations of supply and demand in the Cal-Am service area are binding and cannot now be second-guessed by MCWD, the Commission, or any other entity. (*California v. Super. Ct.*, *supra*, 56 Cal.App.3d at p. 408; *Key System*, *supra*, 64 Cal.App.2d at p. 435; see also June 30, 2020 Letter to Commission, pp. 56-57.)

- With respect to the Mayer Report's estimate of future demand based upon AMBAG future population growth, MCWD fails to explain why such a method would yield more accurate projections of future demand than the methodology utilized by the CPUC, which required specific and thorough determinations of future supply based upon demand associated with Pebble Beach buildout, projected economic recovery, and existing legal lots of record. (CPUC Decision D.18-09-017, pp. 50-51.)

    - By generalizing based upon broad AMBAG growth projections, the Mayer Report fails to account for these factors specific to Cal-Am's service area, including the above facets of future demand assessed by the CPUC, and artificial demand depression caused by the moratorium on new service connections.

    - Moreover, as stated by the City of Monterey, projecting future demand based upon AMBAG population growth is improper—AMBAG's growth scenario, established six years ago, does not consider current and future legislative mandates to increase affordable housing construction. (February 4, 2020 City of Monterey Letter to MPWMD, p. 1.)

- MCWD argues that while Cal-Am's customers have already reduced their annual water use by 30 percent, the Mayer Report demonstrates that Cal-Am customers can further reduce their consumption by 0.26 percent annually, resulting in a further decrease in demand. (MCWD Letter, p. 83.)

    - Any argument that Cal-Am customers can further reduce their water usage below already historically-low levels is not only wholly speculative, it unreasonably assumes that existing water conservation measures will result in increased conservation without the implementation of more stringent measures, such as moratoriums and water rationing. (August 11, 2020 Hazen Memo, p. 17.)

    - Cal-Am has already heavily invested in water conservation programs, as well as funding research into water loss and loss detection in order to cut water usage. (*Ibid.*) Cal-Am's customers are considered some of the most water efficient users in the State of California. (See CPUC Decision D.18-09-017, p. 28; June 30, 2020 Letter to Commission, p. 99.)

    - MCWD and the Mayer Report ignore the fact that the Project was specifically designed to obviate the need to implement even more stringent water conservation measures, which would put additional strain on Cal-Am's customers, Peninsula businesses, the local and regional economy, and the ability to meet state-mandated housing goals.

        d. Stoldt's Prior Statements

- MCWD attempts to dismiss the fact that Stoldt has adopted conflicting positions of Peninsula supply and demand over time, attributing these positions to "changing circumstances." (MCWD Letter, p. 56.)

    - As discussed in Cal-Am's June 30, 2020 Letter to Commission, MPWMD General Manager Stoldt has developed a track record of taking inconsistent positions regarding Monterey Peninsula water demands depending on the circumstances and as described in further detail below, provided the Commission with a manipulated memorandum intended to bolster his recent positions regarding Peninsula supply and demand. (See June 30, 2020 Letter to Commission, p. 60.) For example, although the Stoldt Memo asserts that Monterey Peninsula demand estimates should be reduced due to implementation of various water conservation efforts, which Stoldt argues represent a permanent reduction in demand, Stoldt previously argued that recent decreases in demand should not be used to justify reductions in Cal-Am's diversion limits, because these reductions were likely due to extensive water conservation campaigns that could not be assumed permanent. (*Ibid.*) Likewise, in a series of emails regarding the State Water Board proceedings, Stoldt argued that depressed demand levels seen in recent years cannot be used to justify reductions in Cal-Am's diversions from the Carmel River because drought awareness and corresponding cuts in water were likely to fade, economic activity on the Peninsula had been cut due to implementation of the CDO, and demand rebounds were likely once drought conditions abate. (*Ibid.*) The Stoldt Memo is based on the exact opposite assumptions. These contradictions demonstrate that the only "changing circumstance" that explains Stoldt's conflicting water demand reasoning is an intent to frustrate Cal-Am's Project. As a result, it is inappropriate to rely on the Stoldt Memo, particularly where supply and demand already has been evaluated and determined through an unbiased, public evidentiary process before the CPUC.

e. <u>PWM Expansion and Maximum Month Demand</u>

- MCWD argues that implementation of the PWM Expansion, without the Project, will provide sufficient water to meet maximum month demand in Cal-Am's Monterey Service area. MCWD further contends, based on the Mayer Report, that Cal-Am "confuses peak capacity operations calculations" with "planning for an adequate future water supply on an annual basis." MCWD argues that regulations requiring calculations of peak capacity do not apply to estimates of current and future annual demand. (MCWD Letter, p. 56.)

    - As discussed in the Applicant's Staff Report, the proper way to ensure adequate capacity is by calculating demand based on maximum month demand, as required by the California Waterworks Standards (Cal. Code Regs., tit. 22, § 64554, subds. (a), (b)(2)). (Applicant's Staff Report, Section IV.O.2.) MPWMD's conclusion that the Pure Water Expansion can meet maximum daily demands and peak hourly demand relies on the availability of drought reserves to meet such demand. However, MPWMD also assumes that no drought conditions will occur on the Monterey Peninsula between now and 2034, allowing for the buildup of such

reserves. This assumption is untenable in light of the fact that California has experienced a drought in every decade over the last century, and recharge of groundwater reserves is essentially unavailable under drought conditions. (*Ibid.*) Moreover, as Hazen and Sawyer have explained, MPWMD focused on the distinction between maximum day demand and annual demand, but avoids assessing the long-term historical data in determining future demands for the Monterey Peninsula. (See August 11, 2020 Hazen Memo, p. 16.) In any case, even when using the most conservative 10,855 afy demand projection prepared by MPWMD, which was not calculated based on maximum month demand, only Cal-Am's Project would be able to meet demand in Cal-Am's service territory. (See Applicant's Staff Report Section IV.O.2; September 10, 2020 Hazen Memo, p. 6.)

- MCWD claims that Cal-Am currently has sufficient available supplies to manage its peak demand periods, even if Cal-Am does not have an additional supply by 2022. (MCWD Letter, pp. 56-57, 74, 83.)

    - MCWD does not provide any evidence to support this claim, and ignores the CDO deadlines. Moreover, MCWD's argument ignores serious concerns over the reliability of Cal-Am's existing water supplies. The concerns are addressed in detail in Applicant's Staff Report, Section IV.O.2, and demonstrated in the September 10, 2020 Hazen Memo, Appendix A, but are summarized below.

        - First, the ASR has not proven itself capable of building up a drought reserve to consistently deliver 1,300 acre-feet, and for the last 15 years, average annual storage of ASR is approximately 138 afy, with average annual storage of ASR at 352 afy over the last five years. These amounts are not sufficient storage to provide 1,300 acre-feet annually over a multi-year drought. Therefore, Cal-Am cannot rely on ASR to meet peak demand periods. (See Applicant's Staff Report, Section IV.O.2; September 10, 2020 Hazen Memo, Appx. A.)

        - Second, due to technical issues and decreasing wastewater flows, PWM Phase I cannot be relied upon to supply Cal-Am's service with the currently projected 3,500 afy. (See Applicant's Staff Report, Sections IV.O.1, 2; September 10, 2020 Hazen Memo, Appx. A.) In fact, due to technical issues regarding PWM Phase I's injection wells, PWM Phase I is currently only capable of producing 2,030 afy, which is less than 58 percent of the 3,500 afy the project was intended to produced. (See Applicant's Staff Report, Section IV.O.1, 2.) Additionally, as discussed above, decreasing source water flows for PWM Phase I cast further doubt on the project's ability to supply the Peninsula. (See *ibid;* September 10, 2020 Hazen Memo, Appx. A.) Due to this trend, PWM Phase 1 does not offer a reliable source of water for Cal-Am to meet peak demands.

        - Finally, MCWD claims that Cal-Am will have sufficient water supplies provided it can prudently manage the Seaside Groundwater Basin storage

capacity. (MCWD Letter, pp. 56-57.) This argument ignores the fact that in 2019, the Seaside Groundwater Basin Watermaster, which is tasked with protecting and managing the Basin, identified the Project as "the only project before [it] that will protect the Seaside basin" by replenishing the Basin and ensuring that protective water levels are maintained. (October 4, 2019 Seaside Groundwater Basin Watermaster Letter to Commission.) On August 12, 2020, the Watermaster echoed its support for the Project, finding that "the MPWSP is necessary to meet the long-term water demands of the Monterey Peninsula," and "[n]o other project has been identified to reliably meet the communities' water needs sufficiently to get the community out from under the State Water Board's Cease and Desist Order." (August 12, 2020 Seaside Groundwater Basin Watermaster Letter to Commission, p. 1.) This is because the Watermaster concluded that the Basin will require replenishment of an additional 1,000 afy over the next 25 years in order to achieve protective water levels. (*Id.*, p. 2.) As a result, Cal-Am will likely be forced to withdraw less than the 744 afy from the Basin that it is currently entitled to. (Applicant's Staff Report, Section IV.O.2.) Water from the Seaside Basin simply cannot be relied upon for Cal-Am to meet peak demand periods as MCWD claims.

f. ASR Water Supplies

- MCWD claims that Cal-Am's arguments regarding unreliability of ASR water supplies is "misleading," asserting that: (1) the CPUC's 2016 approval of the new Monterey Pipeline means that only water year 2016-2017 and later should be considered in analyzing ASR recovery volumes and (2) that Cal-Am's ASR permits 20808A and 20808C permit it to withdraw up to 5,326 afy, and are estimated to yield an average of 1,920 afy for injection. MCWD therefore contends that an average ASR injection and recovery rate of 1,300 afy is "reasonable." (MCWD Letter, p. 57.)

    - MCWD's claim that ASR permits 20808A and 20808C are estimated to yield an average of 1,920 afy for injection ignores the fact that the face values of these permits have been the same since the ASR permits were first issued, but the ability to actually divert water to ASR is conditioned. As a result, the ability for Cal-Am to withdraw water under these permits should be based on historic diversion numbers, not the entitlements established by the permits. Paper water is not sufficient to supply the Peninsula. Water rights must result in actual water flows.

    - The Mayer Report's projection of drought conditions only occurring one year out of five is wholly unreasonable and ignores changing conditions in California, including global climate change. Indeed, as Hazen and Sawyer explained, ASR water availability is reduced to 63 percent in a single dry year and further reduced to 4 percent following three consecutive dry years, which means that ASR does not meet Water Code reliability standards (five consecutive historic driest years) or Governor Newsom's 2020 Water Resilience Portfolio (consideration of a drought lasting six years). (August 11, 2020 Hazen Memo, pp. 5.)

- The actual data surrounding ASR speaks for itself. Over the past 15 years, ASR has stored an average of 138 acre-feet annually. Over 15 years, there is only 700 acre-feet claimed as stored—and only twice has the system injected more than the 1,300 afy claimed by MPWMD. (August 11, 2020 Hazen Memo, pp. 5, 19.)

- MCWD also contends that storage data after the CPUC's 2016 approval of the Monterey Pipeline should be considered. While there is no requirement to limit review of ASR historical information, data from the last five years reveals that average annual storage of ASR is still only 352 afy. (August 11, 2020 Hazen Memo, pp. 5; Applicant's Staff Report, Section IV.O.2.) This does not change Hazen's conclusions about the availability of ASR as a water supply, particularly in drought years.

- Indeed, as shown in Appendix A of the September 10, 2020 Hazen Memo, when ASR supplies are described at reasonable levels, the PWM Expansion cannot meet even the lowest demand estimates set forth by the Stoldt Memos of 10,855 afy. (September 10, 2020 Hazen Memo, Appx. A.)

g. PWM Expansion Ability to Meet Regional Housing Goals

- MCWD argues that the 190 afy required to meet regional housing goals is accounted for in the Mayer Report. MCWD therefore concludes that the PWM Expansion can provide a supply sufficient to meet regional housing goals. (MCWD Letter, pp. 57-58.)

  - As discussed above, the CPUC has already made binding determinations of Monterey Peninsula supply and demand, and the Mayer Report fails to demonstrate that Peninsula supply, with PWM Expansion but without the Project, can meet this demand. In reality, only the Project can provide an adequate, reliable, and permanent supply to ensure that regional housing requirements are met. Assuming it functions properly at all times, the PWM Expansion can only meet current water demands, without reasonable growth. (See August 11, 2020 Hazen Memo, pp. 5-6.) PWM Expansion is simply incapable of providing the additional 190 afy that MPWMD concedes is necessary to meet the Peninsula's RHNA goals.

  - Moreover, the 190 afy figure quoted by MCWD substantially understates the water required to meet demand related to regional housing goals.

    - The City of Monterey projects a need for 1,700 additional housing units by 2030, which represents a need for an additional 255 afy—which is 75 percent more than the need projected by MPWMD and quoted by MCWD for the entire region. (See February 4, 2020 City of Monterey Letter to MPWMD, p. 1.)

    - This 255 afy figure is just for one Peninsula city—including actual housing projections from other cities on the Peninsula only further increases the actual amount of water needed for housing. New RHNA

numbers for the Monterey Peninsula will be released in December 2023 and are anticipated to include substantial increases in required housing because of the State's ongoing housing crisis. Indeed, the Bay Area's updated RHNA, issued in June 2020, reflects a 135 percent increase in required housing over the previous period.[15] There is no scenario under which PWM Expansion can provide the water supply needed for this housing.

- Moreover, the recently enacted provisions of the Housing Accountability Act and Housing Crisis Act provide for stricter enforcement of affordable housing goals throughout California. (See Cal. Gov. Code §§ 65589.5, subds., (d), (f)(1), (k)(1), 66300, et seq.) As such, there is an additional onus on Peninsula governments to construct significant additional affordable housing, and ensure that there is an adequate water supply available for that housing.

- Finally, there is currently a moratorium on new service connections on the Monterey Peninsula—this effectively prohibits the construction of additional affordable housing, which would create new water demand. If an adequate water supply is not secured and the moratorium is not lifted, no additional water will be made available for housing growth. Notably, even with the moratorium in place, housing-related demand for water on the Monterey Peninsula continues to grow.

    - In response to a request from MPWMD, several Monterey Peninsula cities provided projections for near-term housing water needs from the Cal-Am system—given that the CDO remains in place, these projections are related solely to metered properties. (See August 4, 2020 MPWMD Policy Advisory Committee Action Items, p. 1.) In response, the responding cities projected a need for an additional 88-95 afy for metered properties—as noted by MPWMD, this total does not include several key jurisdictions. (*Ibid.*) As a result, MPWMD is seeking 75 afy of relief from the CDO to accommodate this demand from the cities. (*Ibid.*) Plainly, housing-related need for water will only continue to grow, and only a new permanent water supply, with demonstrable ability to meet the needs in Cal-Am's service area, will lift the CDO and moratorium. Such demand from population growth is reflected in MCWD's own 2020 Water Master Plan, which shows that MCWD's average annual demand is expected to nearly double by 2042.[16] The PWM Expansion is not a

---

permanent water supply, nor is it adequate to provide water to satisfy state-mandated housing needs.

h. Stoldt's Doctored Memo

- MCWD calls Cal-Am's arguments regarding the exhibit doctored by Stoldt that was used in the 2019 Staff Report "frankly ridiculous." MCWD refers to a letter from its own President to support its claim that Stoldt's doctored memo was "properly based on currently available information." (MCWD Letter, p. 58.)

    - Despite MCWD's apparent indignation, the fact remains that MPWMD General Manager Stoldt modified a draft technical memorandum prepared as an exhibit to the PWM Expansion Draft SEIR without identifying his modifications as changes to the original, in order to support the 2019 Staff Report's claims regarding ASR supply. (See June 30, 2020 Letter to Commission, p. 63.) As previously explained, it appears that Stoldt intentionally manipulated the technical memorandum to make it appear that the memorandum's authors had concluded that the ASR reserve could provide a supply to withstand a four-year drought by 2034. (*Ibid.*) Stoldt's efforts to manipulate the draft technical memorandum, and the conclusions that he added thereto, remain improper, and should not have been used by Commission staff to bolster unsupportable claims regarding the viability of ASR supplies. (*Ibid.*)

5. PWM Expansion Conformity to Project Objectives

- MCWD argues that the PWM Expansion is the only alternative capable of meeting all primary and secondary project objectives, and that most Project objectives can be met even by a No Action alternative. MCWD claims that current supplies should be sufficient to meet demand from Cal-Am's customers for at least the next ten years. (MCWD Letter, pp. 58-59.)

    - As explained in Cal-Am's June 30, 2020 letter to the Commission, the PWM Expansion is not capable of satisfying the Project objectives, and therefore cannot be a feasible alternative to the Project. (June 30, 2020 Letter to Commission, pp. 63-68; see Attachment B, Section J.4.) The fact remains that the PWM Expansion does not provide enough water to meet the CPUC-determined levels of demand in Cal-Am's Monterey District service area, an essential prerequisite to satisfying most of the Project objectives. (See *id.*, pp. 63-67; see also October 15, 2019 Cal-Am Letter; January 2020 Hazen Memo.)

        - Moreover, even under the depressed demand estimates put forward by Stoldt and MCWD, Peninsula water supply with the PWM Expansion, but without the Project, would barely suffice to meet current demand assuming all water supplies are working perfectly – which is wholly unrealistic. (June 30, 2020 Letter to Commission, pp. 58-60; see Applicant's Staff Report, Section IV.O.2.) Again, as explained by the CPUC, the PWM Expansion would satisfy the basic purposes of the

Project "***only in conjunction with construction of a desalination plant of some size within five to fifteen years***" and would merely delay the necessary implementation of a desalination project of some size. (CPUC Decision D.18-09-017, Appx. C, p. C-71 [emphasis added].)

- With respect to the claim that the Project cannot meet the primary project objectives due to MCWD's intransigence regarding Cal-Am's use of the shared pipeline, existing permits clearly permit Cal-Am to utilize the pipeline, and the pipeline has ample excess capacity to convey Project water. (See June 30, 2020 Cal-Am Letter to Commission, pp. 54-55.) Regardless, if needed, Cal-Am may construct an additional, parallel pipeline to convey Project water—approvals for that potential parallel pipeline will come before MPWMD in October 2020. (See Applicant's Staff Report, Section IV.O.3.)

- MCWD's claim that the PWM Expansion can satisfy Project objectives, and that compliance with Carmel River diversion limits and Seaside Basin pumping limits can be satisfied even without a new supply, assumes that both ASR and Phase I PWM operate at full capacity at all times. Given the significant shortfalls in ASR injection in Dry years, and the current deficiencies in Phase I PWM treatment and injection of product water, this assumption is wholly untenable. (See August 11, 2020 Hazen Memo, pp. 6, 17.) Even with full ASR, Phase I PWM, and PWM Expansion supplies, Peninsula water supplies would barely suffice to meet Stoldt's low demand estimates and would place Cal-Am's customers at serious risk if any one of these supplies should fail. (*Id.*, p. 6.)

- On the contrary, the Project is the only proposed water supply solution that is capable of providing the Cal-Am service area with reliable and sustainable water supplies across a series of probable scenarios, including prolonged drought conditions, limited wastewater flows, deficient Phase I PWM injection, limited agricultural drain flows, flows from the Sand City Desalination Plant, and potentially deficient flows from ASR supplies. (Applicant's Staff Report, Section IV.O.2; September 10, 2020 Hazen Memo, Appx. A [demonstrating that when ASR supplies are described at reasonable levels or WWTP and Reclamation Ditch flows to the Phase I PWM and PWM Expansion are reduced to account for recent data, the Expansion cannot meet even the lowest estimate of demand in Cal-Am's service area].)

- MCWD again turns to the status of the PWM Expansion, claiming that M1W has shown that adequate source water supplies are available, and that the PWM Expansion Final SEIR remains "substantially complete," such that the PWM Expansion can move forward when the M1W Board is prepared to take up the matter again. (MCWD Letter, p. 59.)

    - MCWD's claim that the PWM Expansion is ready to move forward at a moment's notice is divorced from reality. In truth, significant doubts remain as to the PWM Expansion's feasibility.

        - First, contrary to MCWD's assertions, source water for the Expansion is anything but secure, and the claimed "water rights" for the Expansion consist mainly of interruptible use entitlements, many of which are disputed by the actual holders of the water rights. (August 12, 2020 Cal-Am Letter, p. 4.) Significant evidence demonstrates that M1W drastically overestimates the availability of source waters for the PWM Expansion. (See Applicant's Staff Report, Section IV.O.2.)

        - Moreover, wastewater flows, upon which the PWM Expansion would heavily rely, have been decreasing steadily in recent years, and analyses by Hazen & Sawyer demonstrate that WWTP flows to the PWM Expansion would be heavily depressed in Normal/Wet years, and flows to Phase I PWM and the PWM Expansion would be completely unavailable in Dry years. (August 23, 2020 Hazen Memo, p. 6.) Recent wastewater flow data provided by M1W only supports these conclusions.

    - Further, there is no evidence that M1W can simply approve the PWM Expansion at a moment's notice. (See Applicant's Staff Report, Section IV.O.1; Section B.2, *supra*.) In truth, there remain significant deficiencies in the Final SEIR for the PWM Expansion, and M1W currently lacks the funding to correct these flaws. (See May 20, 2020 M1W Board of Directors Staff Report, p. 1.) M1W staff have also been ordered to cease any work on the PWM Expansion. (See August 20, 2020 M1W Letter, p. 3.) There is no reason to believe that the PWM Expansion Final SEIR, and therefore the Expansion itself, will be approved at any time in the near future.

- MCWD argues that there remains significant doubt in the Project's construction schedule due to: (1) issues related to a Project source water pipeline, (2) a lack of a CDP for the brine outfall liner, and (3) a lack of a right to pump source water for the Project and related litigation of Cal-Am's water rights. (MCWD Letter, p. 59.)

    - As discussed above, Cal-Am's existing agreements permit it to utilize the shared pipeline with MCWD, and there is sufficient capacity in the pipeline to accommodate Project water. (See June 30, 2020 Cal-Am Letter to Commission, pp. 54-55.) Moreover, Cal-Am remains able to pursue construction of a parallel Project water pipeline, if MCWD continues to refuse to honor its agreements regarding the shared pipeline.

    - With respect to the M1W outfall, Cal-Am has proposed an updated liner installation method, whereby Cal-Am would install a spray-on liner from within the pipeline itself. (See August 18, 2020 Cal-Am Letter to Commission.) This method would involve no ground disturbance within the Coastal Zone of the City of Marina or the County, and therefore would not require Cal-Am to obtain a CDP. In fact, Cal-Am has proposed Special Condition 4 would require Cal-Am to implement this proposed spray-lining method prior to the commencement of Project operations since it is a feasible alternative. (See Applicant's Staff Report, Section IV.F.) This would guarantee that the outfall liner work will result in no

adverse impacts to environmentally sensitive habitat areas, and therefore this future Project component does not raise substantial concerns regarding Project certainty.

- Finally, Cal-Am's rights to Project source water will have no impact on the Project's construction schedule. The EIR/EIS has already examined Cal-Am's potential water rights to the Project, and determined that Cal-Am could develop appropriative rights to that portion of the Project's source water that will be extracted from the Salinas Valley Groundwater Basin. (See June 30, 2020 Cal-Am Letter to Commission, p. 26; Final EIR/EIS, pp. 2-32 to 2-34.)

    - Moreover, in 2013, the State Water Board, the agency charged with primary responsibility for regulating state water resources (Water Code, § 174; Pub. Resources Code, § 30412), determined that Cal-Am can develop all necessary water rights to operate the Project. (See June 30, 2020 Letter to Commission, pp. 26-27; CPUC Decision D.18-09-017, p. 80.) Despite MCWD's allegations, and the City of Marina's frivolous lawsuit, Cal-Am's ability to develop water rights to Project feedwater do not pose any barrier to Project implementation.

- MCWD argues that Cal-Am's "recalcitrance" in following the CPUC's order to consider PWM Expansion if the Project is delayed, along with its "unwillingness" to discuss the terms of a purchase agreement for PWM Expansion water, constitute the primary barrier to PWM Expansion implementation. (MCWD Letter, pp. 59-60.)

    - MCWD blatantly ignores the myriad flaws in both the PWM Expansion and the Phase I PWM, including a lack of secure water rights for Expansion source water, the numerous technical difficulties faced during Phase I PWM construction and startup, and the fact that work on the PWM Expansion has ceased completely and that project is now indefinitely delayed. (See Attachment B, Section J.2.)

    - Further, MCWD's claims of Cal-Am's recalcitrance in following the CPUC's orders with respect to the PWM Expansion are unfounded. In truth, Cal-Am has met with M1W and MPWMD on multiple occasions to discuss a WPA for PWM Expansion product water. (See Applicant's Staff Report, Exhibit 30, p. 1.)

        - However, Cal-Am determined that it would not, at that time, pursue a WPA for PWM Expansion water, given significant uncertainties in Expansion source water availability, environmental impacts, permitting requirements, source water, funding, and product water pricing. (*Id.*, p. 2.) MCWD provides no additional evidence to demonstrate that Cal-Am is "unwilling" to discuss a WPA for PWM Expansion water, should the Expansion somehow prove to be a feasible source of water to the Monterey Peninsula.

    - Moreover, any WPA for the PWM Expansion would be required to include more stringent performance guarantees to provide adequate assurances to Cal-Am and

its customers that the Expansion water would be produced as promised, and greater protections in the event that Expansion water is not or cannot be produced at necessary levels to meet the Peninsula's water demand. (See Applicant's Staff Report, Section IV.O.2.) Such performance guarantees would include a guarantee of the full production volume of PWM Expansion water, and a full indemnification for Cal-Am against any risk, liability, or penalties in the event that the PWM Expansion fails to provide an adequate water supply. (*Ibid.*; see also May 9, 2020 Cal-Am Letter to M1W, p. 5.) In the absence of such guarantees, Cal-Am would be forced to bear the risk of the PWM Expansion not meeting its supply promises, which could cause Cal-Am to draw additional water from the Carmel River resulting in substantial penalties. (See Applicant's Staff Report, IV.O.3.)

6. Overall Adverse Project Effects

- MCWD claims that the Commission is not bound by the CPUC's analysis of the Project's environmental impacts in the EIR/EIS. (MCWD Letter, p. 60.) As discussed above, as a CEQA responsible agency, the Commission is required to consider the CPUC's—the lead agency— analysis of the Project's environmental impacts. (See Section I.2.c; see also CEQA Guidelines, §§ 15096, subds. (a), (f).)

- MCWD argues that even if neither the Project nor the PWM Expansion is implemented by January 1, 2022, Cal-Am may still comply with the legal limit on its Carmel River withdrawals, even without an extension of the CDO. (MCWD Letter, pp. 60, 74, 83.) MCWD further argues that the No Action alternative and the PWM Expansion would result in fewer adverse impacts than the Project (*Ibid.*)

    - For the reasons discussed in Applicant's Staff Report, Section IV.O.2, MCWD's statement that Cal-Am can meet its water supply obligations without a supplemental supply is simply false. Additionally, as explained in an August 12, 2020 letter submitted to the Commission by the Seaside Groundwater Basin Watermaster, if no action is taken (i.e., neither the proposed Project nor the PWM Expansion is adopted), protective water levels will not be achieved and the Seaside Groundwater Basin will not be protected against seawater intrusion. (August 12, 2020 Seaside Watermaster Letter, p. 4.) An additional 1,000 acre-feet of replenishment water is needed to prevent seawater intrusion in the Paso Robles and Santa Margarita Aquifers. (August 12, 2020 Seaside Watermaster Letter, p. 4.) This additional supply is critical to achieving protective water levels in the Seaside Basin, and cannot be achieved without the implementation of reliable, long-term water supply. As such, the Watermaster expressly concluded that the Project "is the only possible supplemental water project . . . that is capable of providing the additional water supply" needed to protect the Basin. (*Ibid*.) Further, the Watermaster determined that "[w]ithout the quantities of supplemental supplies from the [Project], CAW and other Seaside Basin pumpers may not be able to meet the pumping reductions called for in the Seaside Basin Decision." (*Id.*, p. 3.)

- MCWD contends that the Project faces a greater risk of delay than the PWM Expansion, arguing that the Phase I PWM is on track to deliver the planned total of 3,700 afy once shallow wells have stabilized and third deep well has been installed. (MCWD Letter, p. 60.)

    - MCWD fails to acknowledge significant, ongoing technical deficiencies in the Phase I PWM, as well as the overwhelming likelihood that the PWM Expansion will face similar barriers to construction and operation. (See Attachment B, Section J.2.a.)

        - As explained above, sinkholes and subsidence are affecting the Phase I PWM shallow wells, and these wells are not currently injecting any water and are likely to only ever operate at 25 percent capacity. (August 12, 2020 Cal-Am Letter, p. 2.)

        - Moreover, Phase I PWM deep injection wells are only operating at rates of 70 percent or less due to injection refusal, and therefore M1W estimates that current annual injection volume for Phase I PWM will only be 2,030 afy, or less than 58 percent of the 3,500 afy allocated to Cal-Am. (*Ibid.*)

        - Solutions proposed by M1W to address these technical flaws—repairs to shallow wells, final commissioning of deep wells, and construction of a third well which will not begin until November 2020—would increase Phase I PWM project costs by as much as $13 million. (*Ibid.*) Most recently, M1W has identified the probable need for a fourth deep well, the timing of which remains uncertain. (See August 31, 2020 M1W Board of Directors Meeting, at 1:14:20 to 1:22:10 [discussing amending bid request for the third deep injection well to include construction of a fourth deep injection well], available at https://montereyonewater.org/290/Audio-Recordings-of-Board.)

        - Finally, some source waters for Phase I PWM, including critical agricultural wash water, have not been used since startup and present additional technical challenges. (*Ibid.*)

    - The Phase I PWM will clearly continue to experience significant delays and cost overruns, and there is every reason to believe that the PWM Expansion will face similar barriers to implementation. MCWD's claims that the Project will face greater delays than the PWM projects ignore these realities.

7. <u>"No Action" Alternative</u>

- MCWD argues that if the Commission denied Cal-Am's application, Cal-Am would likely pursue the PWM Expansion, and that this would be a reasonable outcome. (MCWD Letter, p. 61.) As discussed in the Applicant's Staff Report, Section IV.O, the PWM Expansion is not a feasible alternative.

- MCWD further argues that under a No Action alternative, as a result of Cal-Am's customer's conservation efforts and an expanded ASR project with MPWMD, Cal-Am is capable of supplying its customers' needs for the next decade, while still complying with the State Water Board CDO. (MCWD Letter, p. 61.)

    - As discussed in the Applicant's Staff Report, Section IV.O.2, despite its ratepayers' conservation efforts, Cal-Am will be at a significant deficit without a new supply without the adoption of the proposed Project. The no action alternative is not feasible for the same reasons the PWM Expansion is not feasible. (See Applicant's Staff Report, Section IV.O.5.) Only Cal-Am's Project is capable of providing an adequate water supply to meet current and expected future demands and allow the water system to conform to the state's design and capacity requirements. Other supplies relied upon by MCWD and other project opponents, including ASR supplies, are not reliable – particularly in times of drought – and cannot be counted on to provide the necessary water supplies to serve even MPWMD's demand projections for Cal-Am's service area. (See *id.*, Section IV.O.2.)

8. <u>Alternative Slant Well Locations</u>

- MCWD argues that "feasible alternative location and technologies" for intake wells exist and should be considered that will reduce impacts to ESHA and groundwater and will be located outside the coastal zone. (MCWD Letter, p. 75.)

    - MCWD ignores the fact that the EIR/EIS already considered, and rejected, alternative intake well locations, and concluded that locating the Project's slant wells at the CEMEX site is the environmentally superior alternative. No new information has been provided that would change the CPUC's conclusion.

        - As explained in Cal-Am's responses to questions posed by Commissioners at the November 14, 2019 Commission hearing on the Project, the EIR/EIS and the CPUC examined the feasibility of constructing intake systems at both the Moss Landing and Potrero Road sites. (See June 30, 2020 Cal-Am Letter to Commission, pp. 84-86.)
