        - In both cases, the EIR/EIS found the alternative intake systems to be infeasible—a slant well system located at Potrero Road would draw excessive quantities of groundwater from the Salinas Valley Groundwater Basin and would result in significant and unavoidable impacts to marine and terrestrial biological resources due to capture of groundwater that would otherwise flow into Elkhorn Slough, while locating open ocean intakes at Moss Landing would result in increased impacts to marine habitat and biological resources related to intake construction and operation, as compared to the Project. (Final EIR/EIS, pp. 5.4-14, 5.4-19, 5.4-21, 5.4-39, 5.4-50, 5.6-4, 5.6-6.)

- Given these increased impacts, the EIR/EIS concluded that siting intake systems at either Potrero Road or the Moss Landing Site would not "offer an overall environmental advantage over the proposed project," and thereafter selected the Project, with a slant well system at the CEMEX site, as the environmentally superior alternative. (*Id.*, pp. 5.6-6, 5.6-8.) The CPUC affirmed this decision, concluding that no Project alternatives are feasible, capable of meeting Project objectives, or reducing significant Project-related impacts. (CPUC Decision D.18-09-017, pp. 79-80.)

  - Moreover, despite its claims that feasible alternative locations and technologies for the Project's slant wells exist, MCWD fails to identify ***any*** possible locations outside of the coastal zone where Cal-Am could feasibly locate a subsurface intake system.

  - Finally, even ignoring the EIR/EIS's thorough evaluation of alternative Project intake technologies and sites, an agency need not consider "every conceivable alternative" to a project. (CEQA Guidelines, § 15126.6, subd. (a); *Citizens of Goleta Valley v. Bd. of Supervisors* (1990) 52 Cal.3d 553, 556.) Instead, the selection and consideration of project alternatives is governed by a "rule of reason." (CEQA Guidelines, § 15126.6, subd. (a).) "[T]he discussion of alternatives need not be exhaustive," and need not analyze every alternative recommended by third parties. (*Sierra Club v. City of Orange* (2008) 163 Cal.App.4th 523, 548; *Cherry Valley Pass Acres & Neighbors v. City of Beaumont* (2010) 190 Cal.App.4th 316, 354-355.) Given the EIR/EIS's consideration and rejection of a range of alternative intake systems and sites, there is no reason to further evaluate the possibility of unspecified intake system sites outside the coastal zone.

- MCWD argues that the Project's intake wells could function "equally well" outside the coastal zone, and that the wells would likely need to be moved inland to account for sea-level rise, and therefore the Project is not "coastal dependent." (MCWD Letter, p. 75.)

  - MCWD does not provide any evidence to support its claims that the slant wells could feasibly function in a location outside of the coastal zone, nor does MCWD provide any proposal for inland locations where the slant wells could feasibly be sited. What's more, the CPUC did not identify any such locations in its six-year CEQA review of Cal-Am's Project, in which MCWD was a major participant. MCWD's argument that alternative well locations should be reviewed now by the Commission is nothing but a red herring.

J. Coastal Act Section 30260 Override for Coastal-Dependent Facility

1. General Legal Framework

- MCWD contends that the Commission retains limited appellate jurisdiction and cannot rely on Coastal Act section 30260 to approve the Project because the only basis for this

type of appeal is whether a project is consistent with the LCP. (MCWD Letter, pp. 61-63.)

- MCWD's jurisdictional argument has been properly rejected by staff (Staff Report, pp. 147-148), and the California Court of Appeal in MCWD's challenge to the Commission's grant of a CDP allowing Cal-Am to locate its test slant well on the CEMEX site—the very same location where the Project's wells will be located. (See *MCWD v. Cal. Coastal Com.* (2016) 2016 WL 6267909.) Marina's LCP must be applied consistent with the Coastal Act and state policy. (See *McAllister v. Cal. Coastal Com.* (2009) 169 Cal.App.4th 921, 931; *MCWD*, 2016 WL 6267909, at *13.)

- Furthermore, as the Staff Report explained, Marina's LCP incorporates Coastal Act section 30260 to determine permissible uses at the proposed Project site. (See Staff Report, pp. 147-148.) The LCP permits coastal-dependent uses in already disturbed areas and "states that this designation is consistent with section 30260." (*MCWD*, 2016 WL 6267909, at *13; see Land Use Plan, p. 38; see also Marina Municipal Code, § 17.41.160 [includes coastal-dependent industrial uses within the coastal conservation and development district].)

- Therefore, the Commission may properly conduct an analysis and approve Cal-Am's Project under Coastal Act section 30260.

2. <u>Qualification as a Coastal-Dependent Industrial Facility</u>

- MCWD argues that section 30260 does not apply because the Project is not "coastal-dependent." (MCWD Letter, p. 63.)

  - As the Staff Report correctly concludes, the Project is a coastal-dependent industrial facility. (See Staff Report, p. 149.) The Project involves the processing of raw materials (water) and must be located adjacent to Monterey Bay to extract *primarily seawater* from beneath the seafloor. (*Ibid.* [rejecting claims that the Project will be primarily drawing brackish water].) In addition, the Project's Source Water Pipeline is necessary to convey that water to the desalination facility. (*Ibid.*) Further, the Project will use the M1W outfall to convey the facility's brine discharges into coastal waters. (*Ibid.*) If the Project were moved away from the coast, the entire basis for and underlying analysis of the Project would change. (See Final EIR/EIS, p. 4.4-56.)[17]

- MCWD further argues that Cal-Am cannot rely on its use of the M1W outfall to show that the Project is coastal-dependent because, according to MCWD, Cal-Am asserts that the outfall is not relevant to its CDP applications. (MCWD Letter, p. 63.) MCWD

[17] This is also consistent with the Court of Appeal reasoning in *MCWD I*, which concluded that the "test slant well meets the [City's] LCP's definition of a coastal-dependent industrial facility." (2016 WL 6267909, at *13.)

conflates the various outfall-related aspects of the Project and misconstrues Cal-Am's position.

- As described below in Section K of this Response, Cal-Am's proposed spray-lining work to maintain the integrity of the existing outfall pipeline is not development under the Coastal Act, or alternatively, is exempt from CDP requirements. Although the outfall lining work is not part of the CDP applications pending before the Commission, Cal-Am has nonetheless proposed Special Condition 4, which requires Cal-Am to obtain all necessary approvals for the outfall lining work and to implement the spray lining method to the pipeline to avoid impacts to coastal resources. (See Applicant's Staff Report, Section IV.F.)

- The aspects of the outfall maintenance that will occur in the Coastal Zone, such as the replacement of the outfall clamps along the beach, are included in Cal-Am's local CDP application and, thus, are before the Commission as part of Appeal No. 9-19-0918. (See Applicant's Staff Report, Section IV.F.)

- The fact that Cal-Am did not include the outfall lining work as part of its CDP application does not mean the outfall pipeline and Cal-Am's use of the pipeline to convey brine discharge is not coastal-dependent.

3. <u>Alternative Locations</u>

- MCWD argues that the PWM Expansion is a feasible alternative and that there are also alternative locations for the Project's slant well network outside of the Coastal Zone. (MCWD Letter, pp. 63-64.)

  - As explained in detail in the Applicant's Staff Report, Sections IV.O and IV.P, and above in Section I, the PWM Expansion is not a feasible alternative, and the proposed location for the slant wells is the environmentally superior alternative location.

4. <u>Public Welfare</u>

- MCWD asserts that Cal-Am simply argues that not approving project would adversely affect public welfare because it "would have no other options for complying with the CDO and could not supply sufficient water to its water district." (MCWD Letter, p. 64.) This is a complete oversimplification of Cal-Am's position. Additionally, MCWD contends that the Project will actively harm the public "for numerous reasons." (*Ibid.*) Not only does MCWD fail to specify what these "numerous reasons" are, but MCWD is also incorrect.

  - As explained in detail in the Applicant's Staff Report, Section IV.P, and Attachment B, Section K, the Project would have numerous benefits to the public and denial of the Project would result in detrimental effects to the public welfare.

5. <u>Mitigation to the Maximum Extent Feasible</u>

- MCWD asserts generally that Cal-Am has not shown "that impacts have been mitigated to the maximum extent feasible," and that Cal-Am has not provided certain information "to evaluate critical project components."[18] (MCWD Letter, p. 64.)

    - As explained in detail in the Applicant's Staff Report, Section IV.P, and Attachment B, Section K, the Project's potential impacts will be mitigated to the maximum extent feasible. For example, implementation of the CPUC's mitigation measures, Cal-Am's HMMP, Cal-Am's Adaptive Management Program for Vernal Ponds, and proposed Special Conditions 5, 7 will assist in ensuring that impacts are mitigated to the maximum extent feasible.

      Further, contrary to MCWD's assertions (MCWD Letter, p. 64), Cal-Am is not refusing to provide critical information regarding impacts resulting from the installation of the outfall liner. As explained in Attachment B, Section [Outfall], the outfall work for M1W is outside the scope of Cal-Am's CDP application. Nonetheless, Cal-Am has proposed Special Condition 4 to require installation of the outfall liner using the spray-lining method to avoid potential impacts to coastal resources. (See Applicant's Staff Report, Section IV.F.)

K. Proposed Outfall Liner

- MCWD incorrectly contends that the failure to consider the proposed outfall lining work in the current CDP application amounts to improper "piecemealing" of environmental review for Project elements within the Coastal Zone. (MCWD Letter, pp. 11, 64-66, 71-72.)

    - Here, the CPUC, as lead agency, already prepared, circulated, and adopted the Final EIR/EIS for the entire Project, which includes a detailed discussion of the impacts related to the most environmentally impactful methodology proposed for the outfall pipeline lining work. (See Final EIR/EIS, pp. 4.13-33 to 4.13-36.) Thus, no element of the Project is evading environmental review.

        - The authorities MCWD cites to support its claim that a second CDP for the outfall lining work would result in improper "piecemealing" are inapposite. MCWD's cases involve CEQA lead agencies failing to analyze the environmental impacts of development so related to the project under consideration that it must be considered a "single project" or the "whole of an action" under CEQA. (CEQA Guidelines § 15378, subd. (a); see e.g. *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 732; *Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora* (2007) 155 Cal.App.4th 1214,

[18] MCWD no longer argues that impacts be "fully mitigated." Instead, impacts need only be mitigated to the "maximum extent feasible." (See, e.g., 14 Cal. Code Regs., § 13053.5, subd. (a); see also id., §§ 13328.1, 13356, subd. (b)(2), 13540, 13666.4.)

1226.) Consistent with these cases, the Final EIR/EIS analyzed the impacts associated with the outfall pipeline lining work.

- Further, the section of the CEQA Guidelines upon which MCWD relies also states that "[t]he term 'project' refers to the activity which is being approved and which may be ***subject to several discretionary approvals*** by governmental agencies. ***The term "project" does not mean each separate governmental approval***." (CEQA Guidelines § 15378, subd. (c) [emphasis added].) The CDP application at issue here is not its own "project," but merely one of several discretionary approvals for the larger Project. MCWD does not cite any authority holding that such independent, discretionary approvals, which are not on their own projects, must be made at the same time under a single proceeding.

- MCWD's piecemealing argument also ignores the limited role responsible agencies play during a project's environmental review. Here, the Coastal Commission is acting as a responsible agency; the CPUC was the Project's lead agency under CEQA. Generally, "[a] responsible agency may refuse to approve a project in order to avoid direct or indirect environmental effects ***of that part of the project which the responsible agency would be called on to carry out or approve***." (CEQA Guidelines § 15042 [emphasis added].) Accordingly, a responsible agency "complies with CEQA by considering the EIR or negative declaration prepared by the lead agency and by reaching its own conclusions on whether and how to approve the project involved." (CEQA Guidelines § 15096, subd. (a).) This division of authority between lead and responsible CEQA agencies may result in separate approval processes for individual elements of a larger project that are developed in different jurisdictions, but it does not necessarily mean a project has been improperly piecemealed. Here, the public and decisionmakers have been appraised of the worst-case potential impacts of the outfall liner work via the Final EIR/EIS. In addition, Cal-Am has proposed Special Condition 4 requiring it to obtain the specific approvals needed to install the spray-on lining to the M1W outfall and to install the spray-on lining before commencing Project operations.

- Notably, the Coastal Commission has previously required multiple CDPs or CDP amendments for different stages of a single project's construction.

  - For example, in its September 26, 2019 Staff Report for the San Onofre Nuclear Generating Station (SONGS) Units 2 and 3 Decommissioning Project, staff imposed a special condition that "would require the applicant to return within six months of completion of the proposed project with a permit amendment application that includes the proposed removal, to the extent feasible, of all remaining onshore structures at SONGS that may be exposed in the future due to coastal processes or that otherwise would have coastal impacts if they were to remain." (September 26, 2019 Staff Report re Songs Units 2 and 3 Decommissioning, p. 2.) This special condition was part of a practical approach to separate approvals within a larger project, and MCWD offers nothing to

suggest that the Coastal Commission is barred from adopting a similar approach here.

- Like the above example, proposed Special Condition 4 would require Cal-Am to submit a complete application for a new or amended permit for the outfall liner work if the proposed "spray-on" liner method, described below, is not feasible. (See Applicant's Staff Report, Section IV.F.)

- Finally, MCWD's piecemealing claims do not consider that the spray-on lining work as proposed by Cal-Am and required by Special Condition 4 is not "development" within the meaning of the Coastal Act, or, in the alternative, would be exempt from CDP requirements as a repair or maintenance activity. (August 17, 2020 Letter to Commission, pp. 2-3.) Accordingly, it is unlikely the outfall pipeline lining would even require a CDP.

  - Cal-Am's proposed outfall lining work does not meet the definition of "development" under Public Resources Code section 30106. Cal-Am does not propose to build or expand any existing structure related to the outfall pipeline, but would simply apply a coating to the outfall pipeline's interior to protect against future corrosion. If any groundbreaking activities did occur, they would be in the unincorporated County, outside of the Coastal Zone. Finally, the work would not involve the discharge or disposal of waste through the outfall. (August 17, 2020 Letter to Commission, p. 3.) Indeed, as discussed in Attachment B, Section F, the Staff Report acknowledges that the proposed "spray on" method for the outfall lining work "would be done almost entirely within the outfall and would involve no ground disturbance within the coastal zone of the City or the County." (Staff Report, p. 45.)

  - Even if the outfall pipeline lining did constitute "development" under the Coastal Act, the work would nevertheless be exempt from CDP requirements as "[r]epair or maintenance activities that do not result in an addition to, or enlargement or expansion of, the object of those repair or maintenance activities." (See Pub. Resources Code, § 30610, subd. (d).) Likewise, the Coastal Act exempts work for "any necessary utility connection." (Pub. Resources Code, § 30610, subd. (f).) Here, the proposed outfall pipeline lining would fall under these exemptions. In fact, the Staff Report acknowledges that the proposed outfall pipeline lining work ***could be accomplished without any CDP***. (See Staff Report, p. 112.)

L. Scope of the Commission's Authority

- MCWD argues that the Commission's role as a CEQA responsible agency does not excuse the Commission from considering whether feasible alternatives exist that could avoid or substantially lessen environmental impacts. (MCWD Letter, pp. 68-70.)

  - As explained in Attachment B, Section J, contrary to MCWD's assertions, the Commission's authority as a CEQA responsible agency is limited. (See, e.g., Pub. Res. Code, § 21002.1, subd. (d); Cal. Code Regs., Tit. 14, Div. 6, Ch. 3

("CEQA Guidelines"), §§ 15042, 15096, subd. (g)(1) ["When considering alternatives and mitigation measures, a responsible agency is more limited than a lead agency. A responsible agency has responsibility for mitigating or avoiding only the direct or indirect environmental effects of those parts of the project which it decides to carry out, finance, or approve."]; see also June 30 Letter to Commission [listing cases].) Therefore, the Commission is limited to its jurisdiction—the Coastal Zone—in evaluating the Project and alternatives under CEQA.

- Further, supplemental environmental review is prohibited unless one of three specific triggers is satisfied. As explained above in Section D of this Response, the triggers for supplemental environmental review have not been satisfied here. (See Attachment C, Section D [citing Pub. Resources Code, § 21166; CEQA Guidelines, § 15162, subd. (a).) Thus, the Commission is not required to conduct supplemental environmental review.

- MCWD contends that Cal-Am has suggested that the Commission, as a CEQA responsible agency, "is not only permitted but *required* to consider project components in isolation from the rest of the project." (MCWD Letter, p. 70 [emphasis in original].)

  - MCWD misconstrues the "project" at issue and Cal-Am's argument. "The term 'project' refers to the activity which is being approved and which may be ***subject to several discretionary approvals*** by governmental agencies. ***The term "project" does not mean each separate governmental approval***." (CEQA Guidelines § 15378, subd. (c) [emphasis added].) The CDP application at issue here is not its own "project," but merely one of several discretionary approvals for Cal-Am's larger Project. MCWD does not cite any authority holding that such independent, discretionary approvals, which are not on their own projects, must be made at the same time under a single proceeding.

  - In addition, the division of authority between CEQA lead and responsible agencies may result in separate approval processes for individual elements of a larger project that are developed in different jurisdictions, but it does not necessarily mean a project has been improperly piecemealed. (See Attachment C, Section K.) Indeed, here, the CPUC, as lead agency, already prepared, circulated, and adopted the Final EIR/EIS for the entire Project. Thus, no element of the Project has evaded environmental review by the lead agency, and the Commission is limited to considering only those aspects of the Project within its permitting jurisdiction.

- MCWD argues that "enforcement of private contract provisions and the Agency Act are not within the CPUC's jurisdiction," such that the Commission is not precluded from considering such issues independently. (MCWD Letter, p. 73.)

  - As the Applicant's Staff Report, Section J explains, MCWRA is vested with the authority to interpret and enforce the Agency Act, including Cal-Am's compliance with the Agency Act.

- It is unclear what "private contract provisions" MCWD is referring to, but to the extent MCWD is referring to the Return Water Settlement Agreement, the CPUC approved the Agreement and has authority over the ratesetting provisions contained therein. (See CPUC Decision D.18-09-017, Appx. H.) MCWRA then has the authority to ensure Cal-Am is complying with the Agency Act by meeting its return water obligations as set forth in the Return Water Settlement Agreement.

- Ultimately, none of these issues fall within the Commission's jurisdiction, which is limited to those Project components located within the Coastal Zone, which are specifically identified in the Staff Report. Further, the Commission is only responsible for assessing the Project's consistency with the Coastal Act and applicable LCPs in determining whether to approve or deny Cal-Am's CDP application. (See Pub. Resources Code, § 30200; see also *Charles A. Pratt Construction Co. v. Cal. Coastal Com.* (2008) 162 Cal.App.4th 1068, 1075.) Thus, the Commission's review is limited to Project components within the Coastal Zone and potential impacts to Coastal Zone resources. (See June 30 Letter to Commission, p. 81.)

- MCWD claims that, in arguing for deferral to the State Water Board on matters of water quality, Cal-Am is "asking the Commission to forego thorough review of the [Project's] potential groundwater impacts." (MCWD Letter, p. 73.)

  - Cal-Am has never argued that the Commission should forego reviewing the Project's potential groundwater impacts. Rather, Cal-Am explained that the Project's existing groundwater data is extensive and the Final EIR/EIS's groundwater modeling conservatively evaluated the Project's potential groundwater impacts such that additional modeling is neither required nor appropriate. (See June 30 Letter to Commission, pp. 21-23, 82.) In other words, the Commission should review the existing, robust record in reviewing the Project's consistency with the Coastal Act's groundwater protection policies—not perform additional, unnecessary groundwater modeling.

    - Indeed, the State Water Board has reviewed the existing groundwater record for the Project, and concluded that the modeling "already conducted, revised, and relied upon by the Public Utilities Commission . . . provides a conservative overprediction of the volume of shallow, inland water that the Project would capture during full operation." (See Letter from Eileen Sobeck, State Water Board, to John Ainsworth, Coastal Commission (May 8, 2020), p. 3.) As a result, "State Water Board staff's opinion remains that the groundwater impacts of the Project will not be any greater than those stated, analyzed, and mitigated under the Public Utilities Commission's certified Final EIR," even if additional modeling is conducted. (*Id.*, p. 3.)

M. Role of Other Agencies

- MCWD argues that the CPUC is not playing any further role with respect to the Project. (MCWD Letter, p. 73.) MCWD is wrong.

    - Following its approval of the Project, as the lead agency the CPUC oversees Cal-Am's compliance with the MMRP. (CPUC Decision D.18-09-017, p. 161.)

    - Further, the CPUC is charged by statute with exclusive jurisdiction to oversee Cal-Am's ratesetting and determine utility supply and demand. (See June 30 Letter to Commission, p. 83.) "[T]he jurisdiction to determine the adequacy of service actually being rendered by a public utility under its franchise is vested exclusively in the [CPUC] when it has elected to determine whether the service is inadequate." (See *Citizens Utilities Company of California v. Super. Ct.* (1976) 56 Cal.App.3d 399, 408; see also *City of Oakland v. Key System* (1944) 64 Cal.App.2d 427, 435.) Therefore, only the CPUC has the authority to make binding determinations as to the levels of supply and demand within Cal-Am's service area. (See June 30 Letter to Commission, p. 83 [citing CPUC Decision D.18-09-017, pp. 167-171, 194-195].)

    - Accordingly, the CPUC has a continued role over the Project.

- MCWD argues that Cal-Am "overstates the power of the [State Water Board] in relation to the existing moratorium on new water connections." (MCWD Letter, p. 74.) According to MCWD, it is the CPUC—not the State Water Board—that has the power to lift the moratorium as soon as Cal-Am determines it has sufficient water supplies to replace its Carmel River withdrawals. (*Ibid*.)

    - As explained in Cal-Am's June 30 Letter to the Commission, the CDO that the State Water Board adopted in 2009 imposed a moratorium on new service connections and certain increases in use until Cal-Am obtained sufficient alternative water supplies. (See State Water Board Order WR 2009-0060, p. 59; see also June 30 Letter to Commission, pp. 83-84.) In 2016, the State Water Board approved an amended CDO that would maintain Cal-Am's effective diversion limit from the Carmel River from the start of water year 2015-2016 until December 31, 2021, as long as Cal-Am meets defined Project approval and construction milestones. (See State Water Board, Order WR 2016-0016, p. 19.) Currently, the State Water Board oversees Cal-Am's compliance with the CDO's milestones. (*Id*., pp. 20-21.)

    - Further, MCWD is simply wrong. The ***State Water Board***—not the CPUC—imposed the moratorium and has the power to lift it provided that Cal-Am certifies that it has secured sufficient permanent water supplies for its Monterey service district. (See *id*., p. 27.)

        - The CPUC decision MCWD cites recognizes as such. Decision 11-03-048 is a CPUC Decision "***to recognize [the] moratorium mandated by the State Water Resources Control Board***." (See CPUC Decision D.11-03-048, p. 1 [emphasis added].) The decision directs Cal-Am to acknowledge

the moratorium ordered by the State Water Board in Cal-Am's tariffs; it does not give the CPUC the authority to lift the State Water Board-imposed moratorium.

- In fact, MCWD's assertion that the CPUC will lift the moratorium when Cal-Am files an advice letter is belied by the text of Decision 11-03-048, which requires that Cal-Am file an advice letter after it has received concurrence from the State Water Board. "Cal-Am is directed to file an advice letter removing this tariff provision when it receives a ***written concurrence of the Depute Director of Water Rights of the State Water Sources Control Board*** with Cal-Am's finding that a permanent supply of water is ready to serve as a replacement for the unlawful diversions of Carmel River water." (CPUC Decision D.11-03-048, p. 2 [emphasis added].)

- In sum, MCWD's assertion that the State Water Board has no further role to play with respect to enforcing the CDO and current moratorium on new service connections is belied by the CDO's plain terms and the very CPUC decision upon which MCWD relies.

ATTACHMENT D

ALTERNATIVE MOTION AND RESOLUTION TO APPROVE COASTAL DEVELOPMENT PERMITS NOS. A-3-MRA-19-0034 AND 9-19-0918

The Applicant requests that the Commission approve Coastal Development Permits Nos. A-3-MRA-19-0034 and 9-19-0918 for the Monterey Peninsula Water Supply Project as submitted by the Applicant, subject to the Standard and Special Conditions within Sections II and III of the Applicant's Staff Report, included as Attachment A to the Applicant's letter dated September 11, 2020.

To approve the Project pursuant to the Applicant's request, the following Motions are in order:

Motion for Appeal A-3-MRA-19-0034: I move that the Commission **approve** Coastal Development Permit A-3-MRA-19-0034 for the development proposed by the applicant subject to conditions.

Moving Commissioner's Recommendation of Approval: I recommend a **YES** vote.

RESOLUTION TO APPROVE WITH CONDITIONS CDP A-3-MRA-19-0034 ON APPEAL:

The Commission hereby approves Coastal Development Permit A-3-MRA-19-0034 and adopts the findings set forth in Section IV of the Applicant's Staff Report, included as Attachment A to the Applicant's letter dated September 11, 2020 on the ground that the development as conditioned will be in conformity with the City of Marina Local Coastal Program and Coastal Act access and recreation policies. Approval of the permit complies with the California Environmental Quality Act because either 1) feasible mitigation measures and/or alternatives have been incorporated to substantially lessen any significant adverse effects of the development on the environment, or 2) there are no further feasible mitigation measures or alternatives that would substantially lessen any significant adverse impacts of the development on the environment.

Motion for CDP 9-19-0918: I move that the Commission **approve** Coastal Development Permit Application No. 9-19-0918 for the development proposed by the applicant subject to conditions.

Moving Commissioner's Recommendation of Approval: I recommend a **YES** vote.

RESOLUTION TO APPROVE COASTAL DEVELOPMENT PERMIT NO. 9-19-0918:

The Commission hereby approves Coastal Development Permit 9-19-0918 and adopts the findings set in Section IV of the Applicant's Staff Report, included as Attachment A to the Applicant's letter dated September 11, 2020 on the ground that the development as conditioned will be in conformity with the policies of Chapter 3 of the Coastal Act. Approval of the permit complies with the California Environmental Quality Act because either 1) feasible mitigation measures and/or alternatives have been incorporated to substantially lessen any significant adverse effects of the development on the environment, or 2) there are no further feasible mitigation measures or alternatives that would substantially lessen any significant adverse impacts of the development on the environment.

Subject:	Monterey Herald Commentary on Cal Am's Desal

Hello Coastal Commissioners and Staff,

This was published August 23rd in the Monterey Herald. It has new information concerning the Carmel River and the state's CDO. It also explains what's going on with Castroville and Cal Am's desal. I hope you will find it valuable.

The numbers used in the article came from the Monterey Peninsula Water Management District. You can see the staff notes here https://www.mpwmd.net/wp-content/uploads/WSP-June-1-2020-Item-2-Revised.pdf

Commentary: Cal Am Pits Castroville Against the Peninsula

By **MELODIE CHRISLOCK**

There's great news to report! The Pure Water Monterey project has injected the required 1,000 acre-feet of operating reserve into the Seaside Basin. This allows Cal Am to begin delivering water in September.

And Pure Water Monterey's start-up issues are quickly being resolved. A third injection

well is in process and will increase injection volume. The full 3,500 acre-feet that Pure Water Monterey was designed to provide will be available by December 2021.

How does this affect the Carmel River and the State's Cease and Desist Order? Our 5-year average draw from the river is 6,314 acre-feet. We are legally allowed to use 3,376 acre-feet. With the addition of 3,500 acre-feet from Pure Water Monterey, we will have a surplus of over 500 acre-feet by December 2021. There will be no fines and no rationing. The long-standing problem of overdrafting the Carmel River is very close to resolution. Due to our conservation and Pure Water Monterey, we have solved the problem. The numbers don't lie.

However, while we've solved the Carmel River problem, this will not give us the water we need for growth or lift the moratorium on new water hook-ups. And it will not allow payback of the Seaside Basin overdraft. That's why we need the additional 2,250 acre-feet from the expansion of Pure Water Monterey.

The expansion is more than enough water for decades of growth at a fraction of the cost of desal, and it could be completed in about 18 months. But Cal Am is blocking the expansion because it earns a 9.2% rate of return on capital investments like this desal plant.

But why is Castroville arguing for Cal Am's desal project? Wasn't this a water supply for the Peninsula?

The big problem is that the source water for Cal Am's desal is 100% groundwater, not ocean water. This desal would need to draw over 17,000 acre-feet per year from the Salinas Valley Groundwater Basin near Marina. But the Agency Act that governs this critically overdrafted Basin states, "For the purpose of preserving the balance, no groundwater from the basin may be exported for any use outside the basin."

So Cal Am came up with a scheme that gave Castroville 700 acre-feet as a trade-off to keep some water in the basin in an attempt to satisfy the Agency Act. How does putting back 700 acre-feet make up for illegally exporting 17,000 acre-feet?

You think that's crazy? Eric Tynan's recent letter "Reality Check" claims Castroville is doing the Peninsula a favor by taking this 700 acre-feet of desalinated water off our hands every year at $110 an acre-foot. But the cost of this water is estimated at $7,000 an acre-foot. Castroville is asking the Peninsula to pay $6,890 per acre-foot to subsidize their water. That's a subsidy of almost $5 million a year! Who came up with this plan? We can't afford that kind of generosity when Cal Am is already charging us a fortune for water. Our bills are already the highest in the nation, and this desal plant would double them.

No one argues that Castroville has a seawater intrusion problem. But whose

responsibility is it to solve this? Why aren't the growers in Castroville and the city of Salinas stepping up to solve a problem they helped create?

How can you ask Monterey Peninsula ratepayers to pay $1.2 billion for a desal plant they don't need to solve a seawater intrusion problem for Castroville?

This 700 acre-feet for Castroville is the reason that powerful Salinas Valley agricultural interests want to force this desal plant on the Peninsula. And Cal Am is using their influence on the Monterey One Water Board to block the Pure Water Monterey Expansion.

Re: Deny Cal Am development permit for Monterey Peninsula Water Supply Project

Dear Members of the Coastal Commission and Staff,

Please reject Cal Am's application for a coastal-development permit for the Monterey Peninsula Water Supply Project (MPWSP).

The Cal Am's project would moot a technically superior, cheaper, and environmentally preferred alternative water supply project that avoids the serious problems of the MPWSP.

Cal Am seeks to exploit the Salinas Valley Groundwater Basin, the sole potable water source for the City of Marina and its diverse residents. The project will cause grave harm in this basin.

An independent analysis by licensed professional engineer of hydrogeology and modeling, Barbara Ford (paid for and distributed by Water Plus), found significant modeling errors in two studies funded by Cal Am as part of its EIR. These errors distorted the data in the studies and produced inaccuracies as to project feasibility and environmental safety.

This faulty modeling was nevertheless relied upon in Cal Am's draft EIRs and reported without correction to the CPUC.

As noted by Ford, the Cal Am hydrogeologist admits that Cal Am's project will ruin Marina's water source, stating,

> But the slant well pumping is designed to replace freshwater in the Dune Sand/A Aquifer unit and 180-ft aquifer with seawater over some unreliably quantified aquifer volume and timeframe based on the HydroFocus report excerpt presented below:
>
> > ... When the pumps are turned on, the wells initially extract the existing ambient mix of native groundwater in storage, but as pumping continues the wells extract increasing proportions of infiltrating recharge from the ocean. The ocean recharge gradually replaces the ambient water within the capture zone, and moves within the capture zone toward the well but does not spread beyond the capture zone. In map view, the capture zone is a 2-dimensional surface that delineates the underlying aquifer volume where *ocean water replaces ambient groundwater and ultimately becomes the primary water source to the wells* [emphasis added].
>
> Because the slant well pumping is designed to replace aquifer freshwater with seawater, *the pumping necessarily results in an increase in seawater intrusion into aquifer areas still containing freshwater* [emphasis added]. (Cal Am draft EIRs 2015, 2017, Appendix E-2, p. 36)

That is, the "aquifer areas still containing freshwater," vital to Marina's water supply, will inevitably be spoiled by seawater intrusion.

This admission by Cal Am's hydrogeologist is a startling walkback of the corporation's consistent claim that the project will not worsen seawater intrusion, but instead draw fresh water into Marina's upper aquifers.

Cal Am's aggressive hegemony into an aquifer to which it has no legal rights and its faulty, self-serving hydrogeological assertions have cost our local cities, agencies, and citizens tremendous time, money, anxiety, and doubt about the future.

Low-income Marina has been forced to defend its affordable water supply from deep-pocketed corporate interests that would destroy it.

As advocates for all California residents, charged to pursue equity and social justice as well as environmental integrity, please let justice be done.

Very truly yours,

Margaret Davis

Coastal Commission Public comment August 11, 2020

Jonas Minton

I'm Jonas Minton with the Planning and Conservation League. I'm pleased to hear that Secretary Blumenfeld shares the goal of returning water to the Carmel River. That is a cause I have devoted myself to for the past 20 years. And in that time illegal diversions have been reduced 85%.

I do note that it was not CALEPA, not Fish and Game and not NMFS that got this started. I am the person who initiated and pursued the Cease and Desist Order calling CALAM into account. There is no person on the planet more dedicated to keeping water in the Carmel River.

However the desal project is not needed to accomplish the goal that Secretary Blumenfeld and I share. I have years of experience that allow me to cut to the bottom line for you. When I served as Deputy Director of the California Department of Water Resources a regular part of my responsibilities was to review supply and demand balances.

The key date in the Cease and Desist Order is December 31, 2021. That is when CALAM must stop all of its illegal diversions.

Slide please

Here is the bottom line balance sheet. CALAM reports that its average annual diversions over the past 5 years have been 6,313 acre feet. They have an undisputed legal right to 3,376 acre feet. Phase One of Pure Water Monterey will provide them 3,500 acre feet. That will leave CALAM with an actual surplus of 563 acre feet.

The bottom line is that CALAM's own data prove the desal project is not needed for CALAM to comply with the Cease and Desist Order and to achieve the goal Secretary Blumenfeld and I share. Thank you.

Tom Luster
California Coastal Commission

Re: Response to Cal Am's June 30, 2020 letter to Tom Luster

Dear Tom,

I hope it's clear to the Commission that Cal Am is the only obstacle to the expansion of Pure Water Monterey. Without a water purchase agreement from Cal Am, the project cannot obtain financing and move forward. Cal Am is blocking progress on this project.

The Pure Water Monterey Expansion would make Cal Am's proposed desal unnecessary. Killing the competition is a strategy we've all come to expect from corporate America, but this is a public water supply. For Cal Am to say that the PWM Expansion is wholly infeasible is an absolute lie.

What is true is that Cal Am asked the Monterey One Water Board NOT to certify the Expansion's SEIR in a last-minute letter to the Board.

There were no environmental reasons not to certify the SEIR. Any environmental impacts were mitigated. Remember this is the expansion of an already existing and permitted potable groundwater replenishment project with a state of the art water purification plant. The EPA said it was a model they wanted to use nationally.

Cal Am's June 30, 2020 letter to the Commission refuting the November, 2019 Coastal Commission staff report stated that your staff "severely understates the PWM Expansion's own potential environmental effects. Notably, the M1W Board denied certification of the PWM Expansion's SEIR based on inadequate analysis of that project's environmental impacts."

What environmental impacts? There was absolutely no basis not to certify the SEIR. There were no environmental issues, and Monterey One's CEQA attorney repeatedly and publicly reminded the Board of this fact. With no negative environmental impacts to cite, the issues the Board raised were not real. They were false concerns used as excuses to justify their refusal to certify the SEIR.

The PWM Expansion SEIR certification was clearly not denied on environmental grounds. In fact, certification was not denied at all. The SEIR has simply not yet been certified. This was a decision based on politics, not environmental issues. It was all political theater and false statements to give guilty board members cover for refusing to certify the SEIR. The whole point was to use the lack of certification against the Expansion to influence the Coastal Commission's upcoming decision. Cal Am's letter is clear evidence of this strategy.

But why would Monterey One board members back Cal Am's desal over the agency's own award-winning project? Agricultural interests on the Monterey One Board are sabotaging their project to secure 700 AFY of desalinated water that Cal Am has promised to the Castroville Community Services District.

Castroville has a seawater intrusion problem that is threatening its municipal wells. Farmers and the City of Salinas have overdrafted their groundwater resources creating this seawater intrusion problem in Castroville. Cal Am has given them a cheap solution, desalinated water for a $110 an acre-foot. That is the real reason the SEIR was not certified. But why should Monterey Peninsula ratepayers be asked to foot the bill for a $1.2 billion desal plant they don't need to solve a problem they didn't create?

Cal Am asked Monterey One not to certify the SEIR, essentially bribing vulnerable members with 700 AFY of cheap water. Now Cal Am turns around and uses the outcome of its manipulation to claim that the project is environmentally inadequate because the SEIR was not certified.

The reasons given for not certifying the Pure Water Monterey SEIR had nothing to do with environmental impacts, and they were simply not true. I want to set the record straight on the issues below.

- Monterey One can provide the promised volume of water. The full 3,500 AFY from Pure Water Monterey will be available by the State's CDO deadline of December 2021. Pure Water Monterey was designed with four deep injection wells to store this water in the Seaside Basin. To keep cost down, only two wells were built. It has become clear in the start-up phase that a third well is needed. Monterey One is in the process of adding this 3rd well to increase the injection volume to 3,500 AFY.

- Source water rights are secure. Monterey One has the legal rights to the source water needed for the Pure Water Expansion. Most of this is municipal wastewater. About 16% is polluted agricultural runoff from the Blanco Drain and Reclamation Ditch. This is the only agricultural water used. Monterey One has contractual rights to this. It has been made clear that the agricultural wash water from the City of Salinas is not needed and would not be used in the Expansion. This is another false argument that was raised and refuted by Monterey One staff.

- Water quality has been addressed. The Division of Drinking Water under the State Water Resources Control Board has already permitted the use of agricultural runoff as source water for Pure Water Monterey. It is already being used in the initial project. The inclusion of this source water would not result in lingering pesticides in the PWM Expansion product water.

- Cal Am continues to claim the Pure Water Monterey Expansion is not enough water. But three separate reports funded by three public agencies have all concluded that the Expansion can protect the Carmel River and provide a drought-proof water supply

sufficient to meet the Monterey Peninsula's current and future demands for decades. The CPUC with a little help from Cal Am got this wrong.

• Cal Am looks to the CPUC for past justification of its position on the PWM Expansion. After the CPUC asked Monterey One Water to provide a report on the Expansion, they decided it wasn't sufficiently developed for them to consider at that time, but they expressed interest in its potential. No analysis of environmental impacts was ever done. To say the CPUC concluded that the PWM Expansion was not a feasible alternative to desalination is misleading. Time has passed, and new information is available. The PWM Expansion now has a sound SEIR waiting to be certified.

In closing, on behalf of the 4,000 plus local members of Public Water Now, we hope you will see the wisdom in denying Cal Am's permit for this oversized, overpriced, environmentally damaging desal project. Our public agencies working together have solved our water supply problem with Pure Water Monterey and its Expansion.

The Monterey Peninsula wants the most affordable and environmentally conscious water supply project. In our view, that is the Pure Water Monterey Expansion.

Thank you,

Melodie Chrislock

California Coastal Commission

Commission Chair, Steve Padilla, Commissioners, Tom Luster and Staff

Subject: Request for Denial of California-American Water Company (CalAm) Coastal Development Permit Application

Dear Chair Padilla, Commissioners, Tom Luster and Staff,

With respect and gratitude to our Founding Fathers who created this great democratic republic for "We the People", I herein voice deep concern for the critical issue coming before you for decisive deliberations on September 17, 2020, namely, the California-American Water Company (CalAm) application for a coastal development permit in support of its Monterey Peninsula Water Supply Project (MPWSP).

As an original co-founder of Citizens for Just Water, a party to the CPUC MPWSP proceeding, I urgently bring to your attention essential facts that should inform your decision to deny the MPWSP coastal development permit on the basis that this project is environmentally unjust and, if approved, would supplant a much more viable and environmentally preferable alternative water supply project that is free of the many downside defects that invalidate the MPWSP.

In 2014 the State of California enacted the Sustainability Groundwater Management Act (SGMA) to restore, protect, and preserve the 21 critically over drafted groundwater basins and other potentially threatened water supply sources that worsened to the point that legislation became necessary to ensure water safety, conservation and reliability. The Salinas Valley Groundwater Basin is on this list, with the freshwater Perched Dune Sand and Dune Sand Aquifers being under siege due to the MPWSP slant well pumping of freshwater from these precious aquifers that provide the sole potable water supply source for the City of Marina and its citizens.

An independent licensed professional engineer specializing in hydrogeology and modeling has conducted an analysis of two separate studies CalAm funded as part of its two draft Environmental Impact Reports for the MPWSP, conducted by consultants Geoscience Support Services, Inc. (Geoscience) and HyrdroFocus Inc., respectively. These CalAm EIR analyses provided much erroneous modeling that distorted the data, providing inaccurate information pertaining to the feasibility and environmental safety of the MPWSP.

Dr. Ron Weitzman, President of Water Ratepayers of the Monterey Peninsula (aka Water Plus), conscious of the vital importance of accurate modeling, hired an independent licensed professional engineer specializing in hydrogeology and modeling, to conduct a thorough analysis of the two CalAm hydrogeological studies.

Dr. Ron Weitzman, a Princeton University statistician specializing in linear and stochastic modeling, contracted engineer firm, GeoHydroScience, llc's expert, Barbara Ford, to perform an objective, independent analysis of the slant well operations as well as assess the reliability of analysis in the CalAm reports. This study revealed the faulty modeling and erroneous,

inaccurate data contained in the two CalAm draft EIR's and modeling in Appendix E-2 from 2015 and 2017. Unfortunately, those reports comprised flawed analysis that became part of the official FEIR analysis reported to the CPUC. As Professional Engineer Barbara Ford stated in her final published report, Dr. Weitzman had understood that the MPWSP objective was that the test slant well would not cause additional seawater intrusion; he had requested that any available information from the consultants' (GeoScience and HydroFocus) reports that did not support his understanding be included in the report. Directly taken from the GeoHydroScience, llc report:

> "Review of the consultants' reports identifies that seawater intrusion would increase. The increase in inland extent due to creation of a cone of depression from pumping was not reliably determined in the consultants' model. But the slant well pumping is designed to replace freshwater in the Dune Sand/A Aquifer unit and 180-ft aquifer with seawater over some unreliably quantified aquifer volume and timeframe based on the HydroFocus report excerpt presented below (pg. 36):
>
> > 'A capture zone refers to the three-dimensional volume of aquifer that contributes the water extracted by the wells. When the pumps are turned on, the wells initially extract the existing ambient mix of native groundwater in storage, but as pumping continues the wells extract increasing proportions of infiltrating recharge from the ocean. The ocean recharge gradually replaces the ambient water within the capture zone, and moves within the capture zone toward the well but does not spread beyond the capture zone. In map view, the capture zone is a 2-dimensional surface that delineates the underlying aquifer volume where ocean water replaces ambient groundwater and ultimately becomes the primary water source to the wells.'
>
> Because the slant well pumping is designed to replace aquifer freshwater with seawater, the pumping necessarily results in an increase in seawater intrusion into aquifer areas still containing freshwater." Pp.24-25

Alarmingly, the CPUC failed to even mention the Dune Sand Aquifers in its certification approval document for the MPWSP. The HydroFocus report stands as the 'Achilles heel' of the MPWSP because its own hydrogeologist confirmed that the CalAm slant well was designed to "replace freshwater with seawater", which necessarily has the outcome that the Salinas Valley Groundwater Basin Dune Sand Aquifers and other aquifers will experience seawater intrusion into freshwater aquifers if the MPWSP is allowed to proceed. This gross oversight and failure to consider all the ramifications of the hydrogeological evaluations has cost our communities huge financial and emotional capital expended in citizen and city defense of its precious water supply source against an avaricious for-profit non-local corporation that has no compunction about blatantly depleting the freshwater supply belonging to a community outside its jurisdiction. This is the reason for the outrage and massive citizen investment in time, energy and funds to struggle against this environmental injustice.

In addition to SGMA, the State of California requires that all available water resources be used to ensure adequate drought-proof water supply and avoidance of wasting valuable water sources, such as rain and agriculture runoff. This is another justification for supporting Pure Water Monterey Expansion, that is the environmentally preferable water supply alternative to the MPWSP. Pure Water Monterey Expansion has solid confirmed studies attesting to its feasibility and viability as a water supply source for decades to come, without all the unreliable and destructive elements of the MPWSP.

I pray that finally our citizens' voices will be heard and environmental justice accorded. We regret that so much effort and repetition of input has had to be submitted, but our voices have to matter; our voices have to make a difference as the agencies involved must be responsible to "We the People".

Thank you for your invaluable work for our communities. We salute you for validating the public good and supporting environmental justice. We urge you to seriously support the environmentally preferable water supply alternative, Pure Water Monterey Expansion, and deny the CalAm MPWSP coastal development permit.

Very respectfully,

s//Margaret-Anne Coppernoll//

This is going to email addresses of Commissioners and key staff, and by hard copy to all others.

I appreciate your patience and your service.

I'm George Riley. I am an elected member of the Monterey Peninsula Water Management District (MPWMD). Although I am on the Board, I am speaking as an individual. I speak for myself. I speak as a ratepayer.

Ocean desal is a water supply of last resort! Why? High cost, immense energy demands, unmitigated environmental impacts, no proven track record.

Cal Am has tried two desal proposals before this current one. Both failed. And left stranded costs of $32 million on ratepayers. (ML pilot desal - $12M; and REPOG - Regional Deal Project - $20M) The current desal is worse because of startling deficiencies. It lacks 3 infrastructure components – pump station, a pipeline bypass, brine discharge liner. It lacks water rights. It is located in a state-designated over-drafted basin. It relies on stale data. It faces litigation.

Current deficiencies show that Cal Am and its desal are not ready for approval.

I want to add two points:

First, the Water Management District, my District, is committed to the recycled water project, called Pure Water Monterey Expansion. a) My District advanced $1 million to complete the SEIR. b) My District adopted a professional and vetted water demand and supply report that factually states that Monterey Peninsula water needs are far less than Cal Am and the CPUC predicted. c) And my District recently officially endorsed the recycled water expansion over Cal Am's desal, and communicated this decision to this Commission. d) The Pure Water Monterey Expansion is very much alive with the District.

Second, less than one year ago, in September 2019, the US Dept of Energy announced a $100 million national research grant to advance desal technology and engineering. The lead agency is Berkeley Livermore Labs. The purpose is to make desal more affordable, more efficient and

more reliable. This is an indirect reminder that Cal Am's desal is not economically and environmentally ready for prime time.

Please, do not support a project of last resort ahead of other options. Please, wait for more desal options from the $100 million national research commitment before allowing Cal Am's experimental coastal desal project to proceed.

George T. Riley

Hello Tom. Below are my comments with two slides that I provided during the Public Comment period at today's Coastal Commission meeting. Please share them with Commission staff who advise the Commission on environmental justice issues.

Thank you.

Jonas Minton

Coastal Commission Public Comment June 10, 2020

Jonas Minton, Planning and Conservation League, (916) 719-4049 jminton@pcl.org

My comments are about systemic racism in the context of CALAM's proposed desalination project. Yes, there is a real nexus.

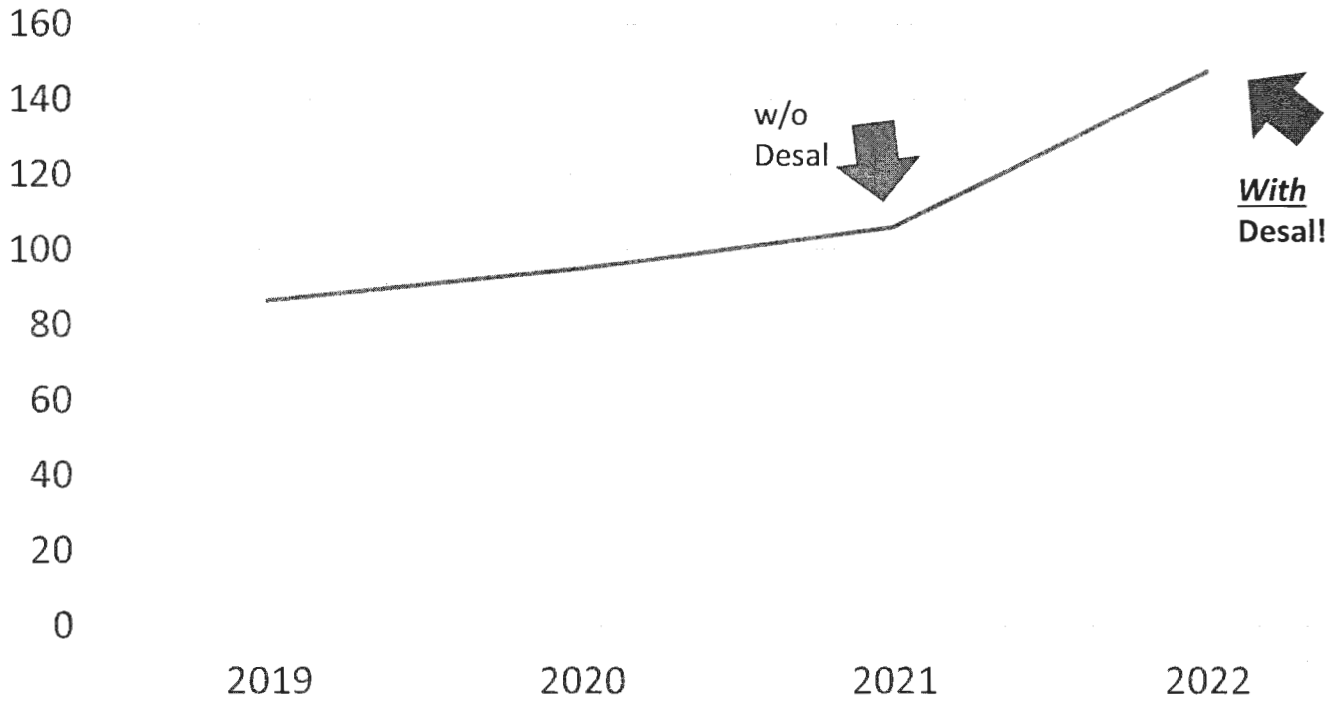
Systemic racism is not limited to policing. It extends to economic racism.

(Slide 1 please) Let's look at CALAM's customers. On this chart you can see the major difference in family income between CALAM's white customers and people of color. Pebble Beach is 91% white with a median family income of $99,788. Carmel is also 91% white with a median income of $90,734, On the other hand the City of Seaside is 77% NON WHITE with a median income of just $57,653. The City of Marina would receive no water from the project but would suffer the greatest impacts. Its population is 65% NON WHITE, with median family income of $60,410.

(Slide 2 please) CALAM ratepayers already have some of the highest rates in the entire nation. If you approve the desal plant their water costs rates would skyrocket to more than $147 per month.

Although these are major rate increases, many predominantly white customers in affluent areas like Pebble Beach and Carmel would be able to afford it. But for many people of color in Seaside this could be a straw that breaks their back.

The Monterey Peninsula has water supply alternatives that will not impose such huge economic burdens on disadvantaged people. The desal project is not one of them.



George Floyd, may you rest in peace. Now it's our responsibility to fight for peace and economic Justice.

Thank you.

Racial and Economic Inequality

	% White	% Non-white	Median Annual Family Income
Pebble Beach	91	9	$99,788
Carmel-by-the-Sea	91	9	$90,734
Marina	35	65	$60,410
Seaside	23	77	$57,653

Rate Spike if Desal is Approved

Dear California Coastal Commission and Staff,
I am forwarding my comments to you that were sent to the State Water Resources Control Board earlier today.

Michael Kennedy
Marina, CA

Begin forwarded message:

> **From:** Mike <mgk333@sbcglobal.net>
> **Date:** June 8, 2020 at 2:27:35 PM PDT
> **To:** Joaquin Esquivel <joaquin.esquivel@waterboards.ca.gov>, Sean Maguire <sean.maguire@waterboards.ca.gov>, Dorene D'Adamo <dorene.dadamo@waterboards.ca.gov>, Laurel Firestone <laurel.firestone@waterboards.ca.gov>, tam.doduc@waterboards.ca.gov
> **Cc:** Thomas Gibson <Thomas.Gibson@resources.ca.gov>, Mark Gold <mark.gold@resources.ca.gov>, Scott Morgan <scott.morgan@water.ca.gov>, David Sandino <David.Sandino@water.ca.gov>, Mathew Dumloa <Matthew.Dumlao@ltg.ca.gov>
> **Subject: Please Support the Monterey One Pure Water Recycling Project**
>
> Mr. Esquivel and State Water Resources Control Board Members,
>
> As a proposed remedy to the water situation on the Monterey Peninsula, Cal Am is pushing for industrial slant wells on the soon-to-be-closed CEMEX sand mining site in Marina.
>
> The proposed slant wells have three perilous concerns -- legal, environmental and economic:
>
> 1. Legally - Cal Am has absolutely no water rights in Marina
> 2. Environmentally - Cal Am's illegal water grab will permanently harm Marina's groundwater aquifers and coastal ecosystem.
> 3. Economically - The experimental slant wells will commit the Cal Am ratepayers to even higher water bills
>
> But there is clearly a win-win solution that will satisfy both the Peninsula ratepayers *and* the people of Marina and the Ord communities that is worthy of serious consideration:
>
> Expansion of the Monterey One Pure Water Recycling Project.
>
> The current Monterey One Pure Water Recycling Project already involves Cal Am and will create necessary water and replenishment of the Seaside Basin.
>
> Expansion of the Pure Water Recycling Project is a win-win because:
>
> - Expansion of the Pure Water Recycling Project will be much less expensive than the harmful and illegal slant wells. Over 30 years, Cal Am's desal will cost an estimated **$1.2 billion**; the Pure Water Monterey Expansion will cost exponentially less, only $190 million.

- With the Pure Water Monterey Recycling Project, there will be no intrusion into -- and no permanent damage of -- Marina's sole source of water.

- The Cal Am slant wells desalination project uses **6.5 times more energy** than the Pure Water Monterey Expansion project.

- The Cal Am slant well desalination will produce **six to seven million gallons per day** of brine discharged into the Monterey Bay, while the Pure Water Monterey project will produce **only 0.5 million gallons per day**of concentrate (much less dense than brine) discharged into the bay.

- The Cal Am slant wells create permanent damage to environmentally sensitive habitat areas; the Pure Water Monterey project is not on the shoreline and has no ESHA impacts.

Please reject the unproven, experimental slant wells and focus on the expansion of Pure Water Monterey that is a viable remedy with regional cooperation and support.

Respectfully,
Michael Kennedy
Marina, CA

Subject: Support for Kathy Biala's 5 June 2020 Letter to the State Water Board & Others

To: State Water Resources Control Board and Others Addressed in Kathy Biala's 5 June 2020 Letter
From: Ron Weitzman, President, Water Ratepayers Association of the Monterey Peninsula (aka Water Plus)
Subject: Support for Kathy Biala's 5 June 2020 Letter re Cal Am's Lack of Water Rights in the Salinas Valley
Date: 6 June 2020

The following excerpt on the issue of water rights from the 26 May 2020 Application for a Rehearing on the Denial of Intervenor Compensation to Water Plus provides strong support for Kathy Biala's letter:

V. CAL AM HAS NO GROUNDWATER RIGHTS IN THE SALINAS VALLEY

Here are the comments ALJ Haga made on this issue: "Water Plus failed to make a significant contribution to the Water Rights issue. Water Plus did not substantially contribute to the issue of water rights because the Commission did not adopt any portion of any argument made by Water Plus." Only the last part of the last sentence (underlined by me) of these comments is true, and that is truly unfortunate. Water Plus in fact made a significant contribution on this issue. In filings prior to D.18-09-017, it showed why the

beneficial-use doctrine[1] and the return-water provision could not make up for the lack of water rights (see 12 November 2019 Claim). The 6 March 2020 Comments by Water Plus provides a succinct summary:

"Adjudication has provided the CEMEX site of the MPWSP [Monterey Peninsula Water Supply Project] with water rights to only 500 acre-feet per year[2] but, until CEMEX is gone, Cal Am does not have even those water rights in the Salinas Valley. Nor does the beneficial-use doctrine substitute for the lack of water rights when applied to the Dune Sands freshwater aquifer, which supplies much of the MPWSP source water.

"The MPWSP was one of three options considered for a desalination project in 2010 when the choice made was not for that option, but for the RDP [Regional Desalination Project]. Though both were to be located in the City of Marina, the two projects differed in important respects. The most impactful difference is that Cal Am was to own the desalination plant in the MPWSP and the Marina Coast Water District ("Marina Coast') was to be the owner in the RDP. With Marina Coast's having and Cal Am's not having water rights in the valley, that difference was a primary reason for the choice of Marina Coast's project over Cal Am's.

"Having water rights in the valley made it possible for Marina Coast to satisfy the Agency Act[3] without a requirement for return water. Instead of return water, Marina Coast agreed to forgo the use of one of its freshwater wells in the Salinas Valley and to export only desalinated seawater while retaining all freshwater obtained from brackish project wells.

"Yet another difference stemming from the ownership difference between the two projects is that Marina Coast could use subsurface intake via vertical wells to avoid the entrapment of sea life whereas Cal Am, because of its lack of groundwater rights, had to use slant wells under the sea or the shore which could enable the entrapment of sea life [in aquifers between their well-intake site and their terminus at sea].

"Because of these and other differences [including the cost of water, $2,250 per acre-foot for the RDP vs. $$7,688 per acre-foot for the MPWSP], Water Plus since 2010 has supported the RDP and since 2012 has opposed the MPWSP."

VII. ALTERNATIVE PROJECTS

Here are ALJ Haga's comments on this issue: "None of Water Plus's recommendations regarding alternatives or claims regarding contaminated source water was adopted by the Commission in any ruling or decision in this proceeding." That assertion is true, but it is an unfortunate truth that has confounded the MPWSP from its very beginning. This is why.

The MPWSP and all the alternative projects considered in the EIR are inferior to one that was explicitly and unaccountably excluded from consideration. That is the RDP, which in 2010 swiftly, in less than a year, traversed all hurdles that have hobbled the MPWSP for eight years now. Different from the MPWSP, the RDP:

(1) being publicly owned, satisfied the Monterey County desalination ordinance;

(2) did not violate the state Agency Act because it retained within the valley the freshwater component of brackish groundwater while exporting only desalinated seawater;

(3) for the same reason, did not require highly controversial return water;

(4) did not require unlawful exacerbation of seawater intrusion into valley aquifers to provide project source water, its owner Marina Coast having groundwater rights in the Salinas Valley;

(5) for the same reason, did not require the use of costly and unproven slant wells to extract mostly or solely seawater;

(6) did not have to entertain the partial and currently- disputed [though also currently necessary] expanded use of recycled water to control costs; and,

(7) not having to surmount all these and other[4] hurdles [e..g., higher capital costs], could charge ratepayers $2,250/$7,688 or 29 percent of what the MPWSP could charge per unit of desalinated water.

The RDP obviously had not been excluded from consideration for reasons of merit. This is the alternative project that Water Plus strongly preferred, but its exclusion from consideration by Cal Am has made moot any focused argument Water Plus might make in its favor.

Subject: Support the Pure Water Monterey (PWM) Expansion; Oppose Cal Am's desal

Attention: California Coastal Commissioners:

Please resist the State Water Resources Control Board (SWRCB) and their current pressure on you (CCC) to grant the Coastal Development Permit for Cal Am's slant well desal project.

The City of Marina and the Marina Coast Water District should be commended for their sensible decision to support the Pure Water Monterey Expansion Project rather than CalAm's proposed construction of a slant well desalination plant because the pure water project affordably secures clean water for the coastal area. We oppose the CalAm desalination plant because it:

- Puts the Salinas Valley Groundwater Basin at risk according to a Stanford University and Marina Coast Water District Study.
- Permanently damages sensitive habitat, which violates environmental justice policies of the CCC and EPA.
- Violates the city of Marina's certified Local Coastal Program and Coastal Act Policies related to: public access, marine/ocean resources, recreation, prevention of erosion and geological instability concerns.

The problems listed above can be avoided by implementing the Pure Water Monterey Expansion Project, which has Sierra Club endorsement and avoids expensive construction.

We urge the Commission to:

- Deny the CalAm proposed construction of a desalination plant.
- Give thoughtful consideration to the more environmentally friendly and cost effective Pure Water Monterey Expansion Project.

Sincerely,

William and Judy Strojny,
Residents of Monterey County

Dear Commissioner and Board

As a 59 Year resident of Marina I'm very upset about what Cal Am is trying to do to our coast line what is left of it. I have pictures of it when it was great and plenty full of sand , but Cimex plant took care of that , and now we have almost no beach. Here comes Cal Am and they now want to rake away what we have left, by building Slant Wells and taking our Water also from our Aquifers. Marina Citizens are mainly middle class folks and a mixer of the world around us. You name it and we have that nationality in this city.

Here comes your Executive Director Eileen Sobeck's letter of May 8th. 2020. was quoted in our local papers implying that your agency only sees one Solution to meeting the CDO and wants the CCC to approve Cal AM's desal plant.

Sobeck's comment of the Coastal Commission reinforced this, . Her whole argument is based on the FALSE assumption that Cal Am's desal must be build to meet the CDO.

Please Support the project that can lift the moratorium sooner and at a LESS Environmental and ECONOMIC COST. Pure Water Monterey Expansion.

This way No creatures are deprived of their habitat and Marina Citizens are not losing they WATER , to a company that is just out to make MONEY FOR THEIR SHARE HOLDERS on the Back of minorities and Seniors.

Please look at everything with a new vision.

Thank you

Sincerely

Mrs. Elisabeth M. Billingsley

401 Sunset Pl.

Marina, CA 93933-3314

Subject:	No desal please

To the members the California Costal Commission:

Whew, we are still working on this issue. Please don't get tired of our persistence and **do** understand that most people/customers in the Monterey area do not want Cal Am to build a desal plant. We don't want to pay for something that is **not necessary** to our health and safety in order to exaggerate Cal Am's worth. It is an **extremely expensive** solution.

We **do support expansion** of Pure Water Monterey.

I have collected signatures on petitions, attended meetings, donated money to efforts, and even attended the November 2019 meeting in Half Moon Bay, in support of ending Cal Am's choke hold on our water supply. My most recent bill was over $500.00.

You have sufficient information, staff reports, and by now understand the underlying components of local, citizen efforts to put the desal plant request on a shelf until actually needed. **It is not needed now or for a very long time, if ever.**

Thank you,
Tamara Harris, Monterey Ca.

Desal project has two big holes in proposal

In all of its 242 pages, the Public Utility Commission's decision certifying Cal Am's proposed desalination project does not even once mention the freshwater Dune Sand Aquifer which, according to the project's Environmental Impact Report, is the source of almost half the water required for desalination even though Cal Am has no rights to any fresh groundwater in the Salinas Valley.

Although the 180-foot aquifer is to provide only the remainder of the source water, according to the EIR, the PUC's certifying document considers that aquifer to be the sole source of water for the project.

Despite the likely occurrence of entrapment of minute sea life in the seawater-intruded 180-foot aquifer between its well-intake site and its terminus at sea, the project's EIR fails even once in all of its 12,590 pages to examine whether the project would cause any possible sea life entrapment though avoidance of entrapment is the very reason for the project's use of costly subsurface rather than common open-ocean intake,

These two killer holes should be sufficient to sink Cal Am's desal ship.

— Ron Weitzman, Carmel

Subject:	Letter Requesting Denial of the California American Water Company's Coastal Development Permit for Monterey Peninsuala Water Supply Project
Attachments:	Coppernoll CCC Letter Final #18 to Tom Luster and CCC Commissioners Ex Parte re Request to Deny CalAm Coastal Development Permit May 8 2020-1.docx

Dear California Coastal Commission Chair Steve Padilla, Vice-Chair Donne Brownsey, Commissioners, Tom Luster, and Staff:

Please accept the attached letter for your consideration. It contains extensive history and background information pertaining to my request that the California Coastal Commission deny California American Water Company's Coastal Development Permit for its Monterey Peninsula Water Supply Project. There are substantive reasons for this request that are outlined in detail in the attached letter.

Thank you very much for your thoughtful review of the information and your superb work for all our communities.

I wish that you and yours all remain safe and well during this difficult shelter-in place period, and long afterwards as well.

Very respectfully,
Margaret-Anne Coppernoll, Ph.D,

May 8, 2020

California Coastal Commission Chair Stephen Padilla, Vice-Chair Donne Brownsey, Commissioners (Ex Parte), Tom Luster and Staff

SUBJECT: Request Denial of California American Water Company's Application for Monterey Peninsula Water Supply Project (MPWSP) Coastal Development Permit

Dear Commission Chair Padilla, Vice-Chair Brownsey, Commissioners (Ex Parte), Tom Luster, and Staff:

It is with a heavy heart that I write this letter to you. At issue is the future of our local water supply, but the concern is much deeper. Please bear with me as this lengthy discussion is meant to aid understanding of the dire, complex situation our communities are facing. It is not an exaggeration to say that our survival is at risk. I take this time to explain details because this California Coastal Commission (CCC) hearing is a most important one for our future existence. Your patience and support are significant factors in our quest for justice, truth, and fairness. You have a most grave responsibility to ensure this public right is upheld.

During the most recent Monterey One Water (M1W) board of directors meeting on April 27, 2020, the M1W board of directors held a "weighted" population-based vote 11-10 in favor of denying certification of the Final Supplemental Environmental Impact Report for the Pure Water Monterey (PWM) Expansion recycled water project, which was officially designated a back-up plan to the California American Water Company (CalAm) Monterey Peninsula Water Supply Project (MPWSP).

This vote came after both the M1W board of directors and the Monterey Peninsula Water Management District (MPWMD) board of directors had unanimously voted to proceed with hiring consultants and staff to work on finalizing the Supplemental Environmental Impact Report (SEIR) for the PWM Expansion water recycling project with an expenditure of one million dollars from taxpayer dollars. The FSEIR took more than a year to complete, to include public reviews and extended review periods.

After what has been considered a monumental step in the right direction to provide a viable, less expensive, and more environmentally safe potable water supply resource for our area, which has long been under the pressure of a California State Water Resources Control Board (SWRCB) Cease and Desist Order (CDO) to limit draw from the Carmel River, CalAm suddenly demanded that FSEIR certification be denied. This surprise turnabout came despite more than 170 citizens having submitted letters to the M1W board urging certification to ensure PWM and its PWM Expansion would be ready to go should CalAm not be successful in obtaining its coastal development permit from the California Coastal Commission (CCC), or in building its desalination facility. More citizens spoke at public comment also to urge FSEIR certification. Our local elected state legislature and city public officials likewise submitted letters supporting FSEIR certification as did many businesses and nonprofit organizations. Certification was a very

big deal. Approval would have brought much deserved relief after a long, strenuous journey to find a sufficient, sustainable and affordable water supply solution with little or no adverse environmental impacts. This denial was a crushing, painful disappointment.

After CalAm realized the CCC wanted to conduct further investigations into serious MPWSP issues that were brought to light during staff research and public input, CalAm began a campaign to discredit the PWM Expansion water recycling project because it surmised that this water recycling expansion project would indeed be a more viable, timely, less expensive, and more environmentally safe water supply shortage solution than its desalination project. CalAm consistently insisted on moving forward with its MPWSP, at great cost to its ratepayers, because it had secured from the California Public Utilities Commission (CPUC) approval to charge its customers capital asset surcharges at 9.2 %, providing a very handsome profit for CalAm and its shareholders. This lucrative opportunity emboldened CalAm to exert much pressure, both politically and financially, on the public as well as M1W board members who could ensure MPWSP success. While the PWM Expansion would provide future water security and a means to lift the State CDO, thus avoiding water rationing and high penalty fees for failing to meet the 31 December 2021 deadline to limit draw from the Carmel River, the PWM Expansion would have the added advantage of removing the moratorium on new water hook-ups and housing developments. To solidify its position, CalAm accorded lower special pricing to the hospitality sector as a way to ensure loyal support.

Another prong in this complex saga is the disregard, indeed the disrespect, CalAm consistently displays for citizens' legal and constitutional rights. Political machinations behind the scenes have been driving certain nefarious actions to undermine this invaluable new water supply source. These activities serve to demoralize whole communities that constantly struggle to bring to fruition what Monterey Peninsula residents have been seeking for decades – a drought-proof, secure potable water supply source that protects both the Carmel River and the Seaside Basin, but also the Salinas Valley Groundwater Basin (SVGB) that is on California's critically over drafted groundwater basin list. This basin, just as the Carmel River, is home to many species that depend on it, such as the South-Central Coast Steelhead trout, an endangered species. The state now requires communities seek alternate methods to preserve all water resources, such as wastewater, reclamation water, and agriculture runoff, as a way to protect the Monterey Bay Marine Sanctuary, preserve freshwater aquifers, and provide drought-proofing.

Certain sectors refuse to accept these and other scientific sources showing there is sufficient source water for agriculture interests and for the Castroville Community Services District's Castroville Seawater Intrusion Project (CSIP), as well as ample water for future growth, that is, approximately 3,700 acre-feet surplus to the PWM Expansion's 2,250 acre-feet needed for the Monterey Peninsula. The staff reports, consultant reports, and confirmation facts from experts, all are to no avail due to CalAm's efforts to move forward at all and any cost with its desalination plant. The desalination plant will deposit brine in the Monterey Bay Sanctuary; it

will deplete and contaminate the precious freshwater Dune Sand Aquifers, in violation of the Sustainable Groundwater Management Act (SGMA), and greatly increase green gas emissions, exacerbating climate change.

All these unfavorable situations can be avoided by implementing the PWM Expansion recycled water project, which will provide 2,250 additional acre-feet (PWM, prior to expansion, supplies 3,500 acre-feet) at vastly lower prices for ratepayers, creating a plentiful water supply until 2043. This is a win-win for our communities.

CalAm could have chosen to be part of this win-win scenario had it agreed to negotiate a reasonable water purchase agreement for the PWM Expansion water recycling project. CalAm is still in charge of the core PWM recycled water project, along with its M1W and co-partner, MPWMD, so it could have provided rock-solid options for its customers, relieving much anxiety over water security. Instead it chooses a rancorous, divisive one. This is the direct result of a wrong-headed motive. Leadership demands caring about those entrusted to its organization, in this case, water customers and Peninsula citizens.

MPWMD General Manager, David Stoldt, conducted extensive research and rigorous analysis to produce a top-notch report on water supply and demand status to support initiation of the PWM Expansion water recycling project SEIR, which received unanimous approval from both M1W and MPWMD boards, to proceed to the SEIR process and completion.

After the CCC's staff recommendation to deny the CalAm Coastal Development Permit became known, CalAm began publicly excoriating David Stoldt and his supply and demand report that upheld data and evidence showing ample water supply through 2043. To placate the highly public CalAm criticism, David Stoldt went back to the drawing board to revise the report, yet the results for future water supply calculations remained the same, affirming the original report findings. PWM Expansion would indeed satisfy water demand through 2043. Still, CalAm, desperate to build an excessively priced, highly shareholder profitable, and aquifer depleting and contaminating desalination plant, continued to undermine the PWM Expansion project.

This CalAm campaign to sabotage its own approved back-up plan, came to a combative head at the M1W board meeting on April 27, 2020. CalAm supporters and loyal board members succeeded in denying FSEIR certification, as stated above. This was a terrible miscarriage of justice and a disregard for taxpayers'/ratepayers' dollars. During the meeting, CalAm and its supporters publicly rebuked staff and both M1W and MPWMD general managers, shamelessly accusing them of failing to do adequate research or answer questions. While the criticisms were patently untrue, this scathing public reproof was part of the CalAm strategy to defeat PWM Expansion because it fears CCC permit denial.

CalAm had convinced the M1W board to change the PWM Expansion designation from "replacement plan" to "back-up plan", for the same reason. On face value this appears to be merely a linguistic or semantics play on words, but CalAm obdurately insisted on swapping "replacement" with "back-up", precisely because CalAm fears the PWM Expansion project will

necessarily replace the MPWSP if the CCC denies its permit application. Making it a back-up plan gives the impression that the MPWSP remains the principal attraction that cannot be replaced.

Killing the PWM Expansion water recycling project's chances to move forward would make CalAm's desalination plan the one and only water supply shortage solution available. Ironically, the PWM Expansion project, coupled with the core PWM project, is the only water supply option that can realistically meet the State CDO, thus saving much future travail and costs. It is the most cost-effective option, likely saving ratepayers approximately $1 billion. For CalAm to risk there being no option at all is not only reckless, but also selfish and short-sighted. It is certainly unseemly to attempt to coerce the CCC into an untenable position. Plus, it is unkind to underestimate the integrity, wisdom, and well-researched staff efforts to produce the best recommendation, which is the CCC's fiduciary responsibility for our coastal resources.

One reason for the anti-FSEIR certification position was that the FSEIR failed to address cumulative impacts of its operation together with the entire MPWSP, another disingenuous point to derail the FSEIR. There was never a goal to operate both the PWM Expansion project and the MPWSP simultaneously. That action would be foolhardy and prohibitively expensive and wasteful. Other CalAm anti-FSEIR arguments included claiming questions were not answered or items covered already in the approved PWM original EIR had not been addressed in the FSEIR. Bringing up such points at this juncture is misleading to the public and hypocritical. The M1W board had sufficient time to examine the SEIR (over a year) and the FSEIR was based on extensive review of all aspects prior to the meeting of April 27, 2020. Logically, and legally, the FSEIR had no requirement to address items already examined and approved in the original PWM EIR. Overturning or defeating the PWM Expansion water recycling project was CalAm's key objective. This was CalAm's "do-or-die" ambush action to safeguard the MPWSP and guarantee success.

Why would CalAm change course to denounce the PWM Expansion project after having praised and approved it as a back-up plan for its desal plant? Because the CCC staff had based, in part, its recommendation to deny the CalAm coastal development permit on the meticulously researched Stoldt "Water Supply and Demand Report" that confirmed a plentiful water supply for the Monterey Peninsula, projected to last until at least 2043 with the PWM Expansion. During this timeframe, other new water technologies and water sources could be explored and hopefully developed.

MPWMD General Manager, David Stoldt, has received public acclaim for his brilliant analysis and dedication to evaluating all aspects of our water issues in order to find a solid solution under stressful conditions. His counterpart at M1W, General Manager, Paul Sciuto, has been similarly respected and appreciated. Both M1W and MPWMD boards of directors received public praise for their significant and productive work, to include exemplary role modeling of harmonious collaboration and cooperation. Their staffs received kudos at every turn for their excellent work ethic. This exceptional example was an amazing inspirational paradigm for our

community, giving much hope for the future. Incredibly, under CalAm's influence, the April 27, 2020 M1W board meeting nightmare dashed dreams and broke hearts. It shocked meeting participants and shattered self-esteem of dedicated staff. In a word, it was a brutal experience, a reprehensible breach of the public faith, that included the flouting of a legal contract to accord a deserved and earned expanded representation on the M1W board for Marina citizens. Again, this episode speaks to CalAm's fear that Marina's additional vote could influence the next agenda item to discuss the FSEIR certification. Marina was in favor of certification. Under obvious CalAm influence, the Marina vote was wrongly contested and shot down.

The extreme politicization of our water system is unacceptable as it violates our citizens' constitutional rights and deprives them of legitimate, responsible representation.

After accepting the work for the first phase of PWM, which is in the process of providing 3,500 acre-feet of recycled water to the Seaside Basin where it will be stored for later use, CalAm now criticizes and denounces PWM Expansion that it earlier agreed to have as a back-up plan. The back-up plan came about due to multiple problematic issues related to the MPWSP, with a lack of water rights, overestimation of demand, and the critically over drafted SVGB being high on the list.

The CEMEX property location for CalAm's planned future MPWSP additional six slant wells is important to the CalAm coastal development permit application deliberations. The CCC co-signed the tri-party resolution with the City of Marina and the State Lands Commission to preserve the CEMEX property for conservation and recreational use only, thus precluding any further industrial development after the CEMEX sand-mining operations close this year. This action was in accordance with the City of Marina's Local Coastal Plan. In addition to its lack of water rights to the SVGB aquifers, CalAm cannot proceed to build a desalination plant on the CEMEX property where its test slant well is currently located, and where it plans, according to its FEIR, to install six more slant wells. Furthermore, slant well technology has not been successfully used anywhere in the world for desalination, to my understanding. Sadly, CalAm is, and has been, using Marina as an expensive experimental "guinea pig".

It is significant that the CalAm EIR expressly noted that if CalAm could not prove it had water rights, then its MPWSP would be deemed "infeasible", resulting in demolition of its test slant well, project decommissioning, and project demise. The California Public Utilities Commission (CPUC) has paid minimal attention to this critical aspect of the test slant well experiment, even providing misinformation in its MPWSP Decision document, more than likely because its charter pertains to utility pricing; water rights do not come under its purview or authority, despite water rights having been explicitly included in the EIR (chapter 2 and/or 4).

Actually, MPWSP's validity and legitimacy depend on the crucial pivotal issue of water rights. The EIR states that the issue of water rights is an integral component of the feasibility of the MPWSP, a fact confirmed in the CPUC MPWSP Certification Decision, 18-09-017 dated September 13, 2019. In a manifest stunning omission in its MPWSP certification process, the

CPUC shockingly left out any reference to the Dune Sand Aquifer, despite this freshwater aquifer's paramount importance to the certification analysis and CEQA guideline requirements. This dismissive attitude and serious error alone should disqualify that MPWSP certification. Where is the oversight for agency actions? For such an urgent matter to only be discussed over a few cursory pages, without any substantive legal backup, is astounding. The specious argument the CPUC gives to justify the desalination plant and slant wells is a cause for dismay and much worry about the integrity of this governmental body that holds so much power over our lives.

The water rights issue is a major reason CalAm devised the return water plan to circumvent the Monterey County Water Resources Agency Act that prohibits exporting aquifer water out of the Salinas Valley Groundwater Basin (SVGB). A biting contention for Marina and Ord Community citizens is that the water CalAm plans to extract from Marina's SVGB aquifers would not be returned to Marina's aquifers. Instead, Marina's water would be extracted from its SVGB aquifers only to then be transported over to Castroville and the CSIP (Castroville Seawater Intrusion Project) in the Castroville Community Services District. Castroville, in the meantime, has already started receiving recycled water from Marina Coast Water District and Pure Water Monterey, making, in my humble opinion, these two agencies helpful neighbors. Unsurprisingly, Marina and the Ord Communities find this CalAm return water plan to be most inequitable.

CalAm has consistently alluded to its ability to acquire appropriative water rights, but that is absolutely not the case, as CalAm cannot usurp the water rights from overlying groundwater rights owners and users. Also, there is no permit for appropriative water rights. The SVGB is critically over drafted, thus it precludes CalAm acquiring any permitted water rights as well. As stipulated in the CUPC MPWSP Decision, referenced above, "For CalAm to possess appropriative water rights to the brackish water under a 'developed water' legal basis, whereby project essentially created a new water source, CalAm would need to demonstrate that its extraction and beneficial use of the water source would not harm other legal users of water." (page 81). First, the MCWD, Marina, the Ord Communities, and other users, are without a doubt already being "injured and harmed" by the CalAm taking of their sole potable water supply source, the SVGB, via its test slant well. CalAm's experimental test slant well has been persistently causing seawater intrusion during its operations, thus also injuring and harming the Ag Land Trust Armstrong Ranch, that is adjacent to Marina and the CEMEX property. Second, this fallacious reasoning that CalAm can possess "appropriative water rights to the brackish water under a 'developed water' legal basis" is another "abracadabra" way to feign water rights. To use this water as part of its "return water" plan, claim it as a beneficial use, and then assert brackish water (groundwater) is a new "developed water" source, is part of CalAm's bizarre linguistic games, its invalid, baseless claims, and its arrogant posturing to obtain support for the MPWSP. "Mother Nature" gifts us our groundwater. CalAm cannot create or "develop" groundwater, neither brackish nor fresh, ergo, CalAm has no legal basis either. The CPUC statement also confounds California Constitution law with Agency Act law. Third, CalAm is

acting as though we are living in the Wild West days, when "jumping gold mine claims" was rampant. But our groundwater is much more precious than gold. The CalAm "water grab" is all the more despicable because Marina's and the Ord Communities' very survival depends on the Salinas Valley Groundwater Basin water - it is their only potable water supply source.

Furthermore, the CPUC discussion on water rights is inherently contradictory. The ocean water percentage (OWP) will be such that there will hardly be any freshwater left at all in the SVGB aquifers in less than a few years' time due to the continual slant well pumping, even more so with the addition of six more slant wells. Moreover, the CPUC water rights section describes subsurface ocean intake, whereas in reality CalAm repositioned the slant well, moving it inland to the CEMEX property, where CalAm then inserted it into the freshwater Dune Sand Aquifers and the 180-Foot Aquifer. While there is brackish groundwater in the 180-Foot aquifer, all brackish water is still State-defined as groundwater and contains chemical composition as such. Brackish groundwater can be treated and has beneficial use, a use that should be reserved for SVGB overlying water rights owners.

As the CPUC Decision asserts, water rights is a project feasibility issue, as was also stated in the project EIR/EIS, as previously noted. While this CPUC Decision states that the CalAm return water will "ultimately benefit the SVGB, so CalAm will perfect legal water rights for the project", the discussion below proves without any doubt that the exact opposite is the case: CalAm will not by any stretch of the imagination be able to perfect any water rights. Instead of benefiting the SVGB, CalAm's MPWSP will do devastatingly irreversible harm to the SVGB. This is a major reason negatively affected Marina citizens, and others, are fighting so valiantly and forthrightly to protect the SVGB and their water rights, as the legal owners of the overlying water rights to the SVGB aquifers. This is an uncontestable proven fact. No where in its project certification decision document does the CPUC even allude to the Dune Sand Aquifer that the MPWSP fully intends to completely contaminate and deplete of its freshwater. Contradicting itself from statements made on pages 80-82 and 151, the CPUC states: "The cost of the MPWSP desalinated water is relatively expensive and becomes more so the greater the return water obligation. The authorized plant is reasonable as long as the desalination plant does not become a vehicle for unreasonable amounts of return water at increasing costs to CalAm ratepayers." Accounting for Dune Sand Aquifer freshwater in the early years of the project, that will be true, but later the need for return water will theoretically diminish to near zero, because, as cannot be emphasized enough, CalAm slant wells will totally eliminate all freshwater but a tiny fraction existing in the aquifers, unless serious remediation takes place, which would disqualify the MPWSP per the CPUC stipulation above that the cost to ratepayers must not be excessively high due to unreasonable amounts of return water. To replenish the aquifers would be monumentally expensive, but by that time, CalAm would have claimed total control of the SVGB aquifers via seawater intrusion, its intended design. The following below stated facts reveal the undeniable harm CalAm's MPWSP intends to inflict on Marina and Monterey Peninsula citizens and ratepayers, and the conniving methodology CalAm created to mislead the CPUC and all decision makers and stakeholders in our water issue struggles.

To diminish the amount of calculated return water it must legally return to the SVGB, CalAm placed its electrical conductivity sensor monitoring device, which measures total dissolved solids (TDS) from the test slant well intake volume, at the top of the 180-Foot aquifer. This placement avoids any freshwater measurement intake from the higher elevation Dune Sand Aquifer, which sits above the 180-Foot aquifer. This measuring technique allows CalAm to falsify the true amount of freshwater that it must return to the SVGB because the freshwater is not mixed in with and measured along with the brackish water TDS intake volume from the 180-Foot aquifer. CalAm can take much more freshwater from the Dune Sand Aquifer without including it in any of the test slant well intake TDS volume measurements, thus using data that greatly reduces the amount of return water it must put back into the SVGB, thereby decreasing costs.

This perfidious aquifer freshwater TDS volume component data falsification allows CalAm, in the future, to extract a massive amount of freshwater from the SVGB because six additional slant wells would dramatically increase the freshwater volume extracted from the Dune Sand Aquifers, which includes the Perched Dune Sand Aquifer. However, as revealed later on, the projected additional six slant wells will in time tragically completely obliterate the majority of aquifer freshwater due to seawater intrusion. Slant wells, as the AEM scientific survey discussed below proved, cause seawater intrusion. This "return water" is a masterful ruse to dupe Monterey County residents. The so-called "generous" act of returning aquifer water extracted is in reality a means to promote CalAm's desalination plant to Salinas Valley residents and growers: if all aquifer water is seawater intruded, then desalination becomes a "Cartier Must." Like the wolf in sheep's clothing, CalAm is not shy about its plan to "devour" Marina Coast Water District (MCWD). Once the SVGB aquifers are hopelessly seawater intruded, MCWD will cease to exist, as it is a public water company delivering SVGB potable water to its communities. Once this groundwater is totally contaminated, CalAm will be the sole purveyor of desalinated water to the entire region, making MCWD's business obsolete, tragically ending its invaluable affordable SVGB potable water supply to Marina and the Ord Communities. CalAm has unabashedly admitted that this is its ultimate goal. We urge the CCC to act before such tragic "injury and harm" can occur.

Most importantly, the new state mandate, the Sustainable Groundwater Management Act (SGMA), enacted into law in September 2014, requires groundwater level changes to stop seawater intrusion. This means groundwater levels have to be high enough so that seawater cannot sweep into aquifers, thereby respecting natural separation boundaries. Slant wells cause subsidence, or a lowering of groundwater levels. The California Department of Water Resources (DWR) found that subsidence is particularly bad in parts of the Central Valley. This SGMA law protects the critically over drafted SVGB and provides support for opposing CalAm's return water plan. The return water project would continue to deplete freshwater reserves from the SVGB; it would be detrimental to the health of the SVGB and should not be implemented.

CalAm mismanaged its assets in the Carmel River, and later abused its water privileges In the Seaside Basin to the point court adjudication became necessary. There is every reason to believe, based on CalAm history, that the SVGB will suffer a similar fate. Of the two basins, only the SVGB is already on the California critically over drafted groundwater basin list, a very salient fact, thereby making the SVGB particularly vulnerable to CalAm's slant well pumping. Despite CalAm's insistence that it takes brackish water only from the SVGB aquifers at the CEMEX property location, CalAm's faulty measuring of aquifer freshwater for future return water purposes belies the CalAm "fact" that it is only taking brackish water from the aquifers. CalAm purposely placed its electrical conductivity monitoring device such that it avoids Dune Sand Aquifer freshwater TDS measurements, as noted above, which accounts for this deception and alteration of reality.

It is important to restate that all groundwater, brackish included, is defined as groundwater. Groundwater total dissolved solids (TDS) have a chemical composition different from seawater, which is mostly sodium chloride or table salt, while, in the absence of seawater intrusion, groundwater's TDS have a chemical composition of calcium, instead of sodium, chloride. This chemical composition differential was discussed in hydrogeologist Hopkins's technical memorandum, which is part of the CCC public record. This example of CalAm's methodology for measuring TDS for SVGB return water purposes is yet another poignant illustration of CalAm's deceitful practices, malevolent intentions towards its ratepayers, and its discourtesy towards our communities and concomitant precious natural resources alike. CalAm's "return water concept" plan serves to underscore its suspect objectives. Even the contrived concept of "return water" is a CalAm admission that it is taking aquifer water, not ocean water. The test slant well pulled in water from the CEMEX wash ponds, which are ocean water mounded inland from the ocean. This occurrence allowed CalAm to strengthen its claim it was taking ocean water. With CalAm, duplicity seems to be unending.

An additional problem for Calam Peninsula ratepayers is that Castroville and the CSIP, the beneficiary of the return groundwater plan, will receive approximately 700 acre-feet while paying a mere $110 an acre-foot. Compare that to the price tag for Peninsula ratepayers: a whopping $6,000 - $8,000 an acre-foot or approximately $4 million per year. That is one fundamental reason the Salinas Valley agriculture industry representatives on the M1W board are against certification of the FSEIR. Perhaps these board members scream too loudly that "they must have their 700 acre-feet of desal water or the Peninsula will not get any water." Their "no" vote on the PWM Expansion water recycling project FSEIR is a reflection of CalAm's, and their fear that the desalination plant coastal development permit will fail as a result of the latest CCC staff recommendation to deny the CalAm Coastal Development Permit application, and its recommendation to CalAm to withdraw, and perhaps later resubmit, its application. In response, CalAm requested a ninety-day extension, for which the CCC graciously scheduled a hearing in August 2020.

Based on grave concerns about the CalAm test slant well, in addition to the tri-party resolution cited above (page 5, para 4), the City of Marina Planning Commission denied CalAm's permit request for its MPWSP, admonishing CalAm for its past record of deceit, faulty data and modeling, misinformation, lack of transparency, and untrustworthiness. CalAm then applied to Marina City Council for a permit, but then withdrew its application, accusing Marina of prejudicial bias on the part of certain council members. CalAm deceived the City of Marina when it presented faulty data and modeling for its test slant well; it deceived the City of Marina when it said the slant well would extract water from subsurface ocean intake, even though it had moved the slant well further inward to be placed directly into the 180-Foot and the Dune Sand Aquifers, blowing freshwater out into the Monterey Bay in violation of the California Constitution, Article X, Section 2. Then CalAm, to circumvent the Agency Act, as indicated above, and to Marina's chagrin, devised a plan to extract aquifer water from the SVGB expressly to deliver it over to Castroville and its CSIP, a most important act for agricultural interests due to the exceptionally low price of $110 an acre-foot, a point worth repeating due to its essential unfairness to Peninsula ratepayers, whose disadvantageous water bill would be a significantly higher $6,000 - $8,000 an acre-foot. This CalAm return water plan represents a crucial advantage to the Salinas Valley area businesses and residents. Naturally, board members representing Castroville and Monterey North County were easily swayed to go along with CalAm's specious claim that the PWM Expansion water recycling project cannot provide sufficient water, therefore, the MPWSP is absolutely indispensable. Having the prospect of such a good deal at the expense of CalAm ratepayers is hard to pass up.

What is more, it is unneighborly that CalAm and its supporters do not mention the fact that the Marina Coast Water District (MCWD) and PWM have already been supplying Castroville with 1,700 acre-feet of recycled water annually. Nor do they acknowledge the support received from MCWD and Marina and Seaside citizens who endured disruptions to streets and vehicle circulation movement for the installation of new water delivery conveyance pipelines to transport water to the Seaside Basin, to the benefit of CalAm. Then again, CalAm has an agenda: desalination for high profit. To publicly denigrate PWM, and to deny Marina its lawful additional vote for citizen representation on the M1W board, are part of that agenda to achieve CCC permit approval for the MPWSP, partly by preventing PWM Expansion proponents from proceeding to FSEIR certification. In CalAm's viewpoint, certification is one step closer to approval of PWM Expansion and/or water purchase agreement negotiations for the project with CalAm. These M1W and MPWMD accomplishments, from CalAm's perspective, would reduce chances for CCC permit approval. Destroying chances for an alternative water supply solution brings CalAm closer to being the only game in town, the main attraction. Therefore, for CalAm, it is essential to eliminate, in a pre-emptive manner, all obstacles that threaten CalAm's success.

Another false CalAm claim is that the PWM Expansion takes water from agriculture interests, which would be unfair to Salinas growers and residents. Both claims are untrue. PWM Expansion will not touch source water reserved for residents, agriculture, SVGB, and SGMA, a

fact made clear in the FSEIR. CalAm disrespected Marina's inherent right to protect its sole water supply resource. After the City of Marina denied CalAm's permit application to install its test slant well at the Marina CEMEX property, CalAm brazenly invaded Marina's legal city jurisdiction without permission to violate Marina citizens' water rights and its Local Coastal Plan that protects endangered species' nesting habitats, like that of the Western Snowy Plover bird, the City of Marina's Mascot.

CalAm had also publicly undercut the current core PWM water recycling project, accusing PWM of missing water purchase agreement milestones for water delivery to the Seaside Basin. To adamantly be so vocally critical of PWM for a few hiccups in an operations schedule does strike a bitter chord of ungratefulness. As it turned out, this was another CalAm tactic to divert attention away from the fact that CalAm had neglected to install critical pumping stations for Carmel Valley, thus making any PWM water delivery to that area impossible. This CalAm failure to provide the necessary water delivery infrastructure for Carmel Valley is another glaring example of CalAm negligence and incompetence, two traits that continue to dishearten ratepayers. Covering up this deficiency revealed yet another negative aspect of CalAm's dishonesty and lack of transparency: its tendency to insincerely blame others to deflect focus on its own misdeeds.

The sudden switching of horses in mid-stream is directly related to CalAm's new founded fear that its permit will be denied. CalAm has had decades to create alternative water sources, but being a monopoly, it did not have to try very hard. It was able to cover up its many deficiencies and inefficiencies, but the looming State CDO deadline pressure brought many factors to light. Ratepayer outrage over unfair hidden costs, fees, and surcharges boiled to the surface. This crisis is the root cause of the current public water debacle.

As mentioned above, permit denial would deprive CalAm of massive future profits it envisions for its shareholders through high percentage surcharges on its capital assets, e.g., buildings and other structures, such as a desalination plant, extensive pipelines, pumping stations, construction equipment and vehicles, and slant wells. Those profits are in addition to the high water rates it charges residents, as opposed to the lower rates charged to the businesses in the hospitality sector. CalAm charged residential ratepayers for water they did not use when water conservation measures required water use restrictions during the extensive drought period. The Monterey Peninsula has the highest water rates in the United States, according to published studies on nation-wide water rates. Those benefiting from the residential tiered water rate system, the hospitality industry, are naturally supportive of CalAm. CalAm's bottom line is, regrettably, greed, which should never have a role in a public service utility that provides an essential-for-life product like water.

The cost of the MPWSP to Monterey Peninsula ratepayers and the residents of Marina and the Ord Communities would be staggering and life threatening. Marina and the Ord Communities would be at risk to lose their only potable freshwater supply source, the Salinas Valley

Groundwater Basin's Dune Sand Aquifer (including its perched part), the 180-Foot aquifer, and the 400-Foot aquifer, with the 900-Foot ancient aquifer being also at risk.

I urgently bring this challenging situation before you because many lives depend on your wisdom and visionary leadership. It takes courage, back bone, to withstand the pressures being brought to bear now, but human lives are far more valuable than one corporation's financial gain. That is what is at stake. The CalAm ravages endured so far are unsustainable and unjust. CalAm disregards citizen constitutional rights and basic human rights, such as affordable water; the higher the cost of water, the higher the cost of food production systems. With greater green gas emissions emanating from a desalination plant, the greater the climate change damage.

Whether or not Monterey Peninsula citizens can effectively challenge the FSEIR certification denial before the CCC August 2020 hearing, it is certain that the FSEIR can in the future gain certification because it has met all CEQA guideline requirements and passed environmental scrutiny. Both the M1W and MPWMD boards unanimously approved conducting the SEIR, which is simply a broadening of the approved core PWM EIR. Both boards unanimously approved spending $1 million of taxpayer funds for the FSEIR process. CalAm spent $350,000 of ratepayer funds on the SEIR. To deny FSEIR certification was an unconscionable act of betrayal of taxpayer and ratepayer rights, finances, and trust.

It is irresponsible and indefensible that the M1W board disregarded the MPWMD's request to approve FSEIR certification. While the MPWMD board vote was not unanimous (it was a 6-1 vote), a board majority urged certification approval. MPWMD invested $750,000 while M1W invested $250,000 in the FSEIR. It was only after receiving the CCC staff recommendation for CalAm permit denial last year that the trouble intensified, with CalAm heavily lobbying against its own recycled water project in order to ensure success, and avoid defeat, for its desalination plant at the scheduled CCC August 2020 hearing.

For this purpose, CalAm has steadfastly refused to sign a water purchase agreement for PWM Expansion. It primarily works to promote and reinforce its financial profit goal to build the desalination plant, no matter the risk to ratepayers. To this end, it was vital that CalAm discredit the Stoldt "Water Supply and Demand Report" because this report revealed, and definitely proved, that the proposed PWM Expansion water recycling project is a first-rate, feasible, ecologically sustainable alternative to desalination; and because the Stoldt report provided a basis for CCC recognition of the PWM Expansion water recycling project as a logical, prudent answer to the Peninsula's water shortage and State CDO challenges: Thus, the CCC's staff recommendation for CalAm permit denial.

There were, I believe, other significant MPWSP issues associated with the CCC staff recommendation, such as the new scientific data and information contained in the latest Stanford Aerial Electromagnetic (AEM) scientific study on seawater intrusion levels in the SVGB, with a focus on the CEMEX test slant well area. The AEM conclusively demonstrated, via actual

visual scientific evidence, that slant wells cause sea water intrusion. It is relevant to point out that in the past, CalAm had refused to allow an AEM survey in the vicinity of its test slant well. When the new AEM technology via helicopter became available, MCWD was able to deploy an AEM survey over the CEMEX property. That is the scientific study that demonstrated extensive and deliberate slant well seawater intrusion into SVGB aquifers. CalAm and its attorneys, as in the past, obstinately dismissed AEM scientific evidence, authenticated by highly respected scientific experts. CalAm publicly denigrated the AEM science at the last CCC hearing on the MPSWP, attempting to refute MCWD's public comment input that the latest AEM study provides new, important information. That information included scientific documentation on the location and amounts of freshwater existing in the SVGB aquifers.

There is now no doubt that a new, alternate water supply resource exists in the PWM Expansion project, which CalAm is so vehemently resisting. This is unfortunate because the PWM Expansion recycled water project is superior in every way to the MPWSP.

The very issues that plague the Carmel River basin would be the same for the SVGB, especially since this basin is on the state's critically over drafted groundwater basin list, and the steelhead trout is an endangered species in both the Carmel and Salinas rivers. This means if a permit is granted to CalAm, and CalAm succeeds in overcoming the seemingly insurmountable obstacles it faces, then the state surely will issue a Cease and Desist Order for the SVGB, putting the Monterey Peninsula in an even worse situation than the already precarious present one. In fact, as emphasized earlier, the State of California has enacted the Sustainable Groundwater Management Act (SGMA) to mandate aquifer protection, preservation, and replenishment.

CalAm's anticipated additional six new slant well water pumping stations would deplete SVGB aquifers at an alarming rate, contaminating them via forced seawater intrusion. This fact is behind the CalAm drive to install its desalination plant. Fatally seawater intruded aquifers would provide undeniable justification for desalination. I hope it is perfectly clear that CalAm's motives are directly contrary to the purpose of SGMA, that is, precisely, to protect SVGB aquifers from seawater intrusion! Furthermore, it should be brought to your attention that the CalAm hydrogeologist hired to evaluate the test slant well, Dennis Williams, is the inventor and patent holder of the technology used in the same test slant well that CalAm intends to replicate six times at the CEMEX property. This conflict of interest, another sly CalAm maneuver, seems to have been shrewdly and conveniently "overlooked."

Even worse than seawater intrusion is the political corrosive corruption that permeates and distorts perspectives in this entire water system history.

For all the cogent reasons stated herein, I ask that you stand firm in your staff's recommendation to deny CalAm's Coastal Development Permit application. The CCC staff deserve high praise for acting with integrity and faithful diligence in conducting their research, analysis, and findings, but also for the insightfulness and incisive ability to "see" the truth.

The crux of the matter at hand is that CalAm, having fooled so many decision makers up until this hugely important CCC staff recommendation and commission decision, is exactly this: CalAm has already signed a water purchase agreement with M1W for the existing, well-functioning PWM water recycling project, to the great joy of our citizens, and the satisfaction of the State of California mandate to use all water resources available as part of drought prevention measures, endangered species and sensitive habitats protection, and ocean-life preservation (Monterey Bay Marine Sanctuary). To clinch the water deal and solve once and for all the decades long agonizing search for answers, CalAm needs to use only one stroke of a pen: Sign the PWM Expansion water recycling project's water purchase agreement!!!

Why won't CalAm sign it??? Duh! Because it stands to make so much more money by fleecing ratepayers and stealing or contaminating Marina's sole potable water source, while providing at least for a while, cheap desalinated water to Castroville and agriculture industry interests in Salinas Valley, while also at the same time saddling Monterey Peninsula ratepayers with the hugely more expensive desalinated water. Giving the deal of the century to Castroville provides the "Achilles heel" key answer: Salinas Valley gets the ridiculously inexpensive recycled water. The cheaper promised future desal water deal for Castroville appears to be a ploy to lure Salinas Valley agriculture interests to CalAm's side. In the meantime, as said above, Castroville is already receiving the less expensive recycled water from MCWD and PWM.

Quoting the CPUC Decision referenced above, "Within 180 days of the date of this decision CalAm shall file a Tier 2 advice letter providing specific additional information and its assessment as to whether it intends to file an application with the Commission to pursue a Water Purchase Agreement (WPA) for additional water supply to be provided by a PWM expansion...for an amount no greater than 2,250 afy (above the 3,500 afy already approved)." CalAm waited until March 19, 2019 to respond, a few days beyond the 180 day CPUC deadline. In essence, CalAm stated in the Advice Tier 2 reply that even if it had sufficient information on hand, it did not have intentions to pursue a Water Purchase Agreement (WPA) for additional water supply to be provided by a PWM expansion, or file an application for such with the CPUC because it was securely confident that the MPWSP was on schedule and would have no difficulty meeting the SWRCB CDO deadline of December 31, 2021. For this reason, no PWM Expansion would be necessary. This CalAm Advice Tier 2 response letter confirms that CalAm does not have any intention, plan, or desire to negotiate or apply for a PWM Expansion or contemplate negotiations for a water purchase agreement with PWM or MPWMD, at least prior to a CCC decision on its coastal development permit in August.

Already desperate from the excruciating CalAm intransient push for desalination, distraught Monterey Peninsula citizens are planning to depart the area because they fear becoming homeless. Many already are. Fear inculcates CalAm's every move, and in turn, it infects the entire Monterey County. Now the only answer is to deny the CalAm permit. A water purchase agreement will naturally follow, whether it be with CalAm or a wiser, kinder enterprise.

The CCC, to its great credit, figured it out. The answer lies in requiring CalAm to sign the water purchase agreement for the PWM Expansion water recycling project. In the meantime, we just have to bar CalAm's wielding the money club, and keep its scandalous scams, "stab 'em in the back", mafia-like swindles of the century, from operating; no more bullying, no more profiteering at ratepayer expense. This sounds harsh, but it is the manifestly obvious truth that CalAm has succeeded in covering up its lies and "smoke and mirrors" circus tricks for way too long. The CCC staff gets it. "They got it right." I am so elated, and proud of the CCC, Tom Luster and his staff, that I can hardly finish writing this letter. Hip, Hip Hoorah, and countless Kudos for the CCC and its staff!

Strongly supporting opposition to the MPWSP, the CalAm EIR/EIS, coupled with the CPUC's own statements, provides the necessary information to conclusively demonstrate the infeasibility of the MPWSP, a fact that is absolutely vital to the case at hand: no obtainable water rights means no project feasibility. Additionally, in its attempt to avoid the need for water rights, the MPWSP will cause cumulative adverse impacts with irreversible seawater intrusion into potable groundwater resources and aquifers. The MPWSP will assuredly bring immitigable permanent harm and injury to our overlying water rights owners in Marina, the Ord Communities, Marina Coast Water District, and others, and, in general, be a continuing nuisance to our communities.

The conclusion should be that the MPWSP will not install any environmentally destructive slant wells or build an exorbitantly unaffordable desalination plant to ruin Monterey Peninsula water ratepayers, along with Marina's coastline and groundwater basin. The MPWSP will not extract any SVGB aquifer water, nor will it implement a return water plan. In other words, the MPWSP should not move forward.

CalAm's inapt objections vis-à-vis the FSEIR, and its contrariness towards its customers and Monterey Peninsula and Marina citizens, cannot obfuscate the truth. The truth remains that the FSEIR for the PWM Expansion water recycling project is solid and can pass muster. The PWM Expansion water recycling project, that augments the existing core PWM water recycling project, is a reliable, sound, worthwhile, and pragmatic potable recycled water resource for the Monterey Peninsula. It is a sustainable, safer, more cost-effective and far more environmentally friendly water project than the hugely expensive ($1.2 billion, including interest over the years), climate change exacerbating, and hydrologic cycle disruptive desalination plant.

In sum, the PWM Expansion recycled water project stands out as the best and far superior choice to meet the CDO and Monterey Peninsula water requirements for years to come.

Let's face facts. These "water wars" are akin to those early gold rush days, where in the end, there were no gold nuggets to be found in 'dem 'der hills, just as there will be no freshwater to be found in 'dem 'der aquifers! This letter is a Call to Action.

Please fulfill your duty for the public good. Unconditionally deny the CalAm MPWSP Coastal Development Permit. It is the ethically and environmentally right decision. The Monterey

Peninsula and Marina citizens will be forever grateful that you are good stewards of their trust. Our future survival heavily depends on your decision to do the right thing. You are our Hero! May God abundantly bless you all, and keep you safe and well during this COVID-19 pandemic crisis, and beyond.

Very respectfully,

Subject:	Article on Pure Water Monterey

Hello CC Commissioners and Staff,

We thought you would find this article on Pure Water Monterey (PWM) informative. PWM just recently began producing and storing 3,500 AF of potable water annually. Cal Am will begin delivering this water to its Peninsula customers in May 2020.

The Monterey Peninsula has waited decades for a new water supply, but it wasn't Cal Am who delivered it. Thanks to Monterey One Water this project will supply more than one third of the 9,700 AF we currently use. Only another 800 AF is needed to satisfy the state's CDO on the Carmel River. Cal Am customers on the Peninsula want to see this state-of-the-art water project expanded in place of the proposed desal plant.

The PWM Expansion is the most environmentally intelligent, cost effective solution to the Peninsula's water shortage. Its source waters are secure and drought proof. It does not adversely affect any groundwater basin or agriculture water. It tapes an unutilized water resource. It reduces wastewater discharge into the Monterey Bay Marine Sanctuary. The PWM Expansion uses 4 to 6 times less energy than desal. It's powered by renewable energy from landfill gas and emits a fraction of the greenhouse gas. It's appropriately sized to meet the Peninsula's current and future demand and it would cost us $1 billion less than Cal Am's proposed desal.

We hope you will consider this sound alternative to Cal Am's desal when it comes before you in June.

Enjoy the article.

California's 'Salad Bowl' Recharges Depleted Aquifer

A multi-partner water recycling project is helping Monterey, Calif., stabilize and replenish its dwindling groundwater supply. The project could serve as a model for shrinking aquifers in other regions of the country.

Subject: INVITATION TO TOUR 'Monterey Bay Regional Water Fixx" aka 21000 acre "Monterey Bay Estuarine Monument" ...
Attachments: sichuanreclaim.jpeg

Dear Chair Bochco and Commissioners,

Congratulations on your very successful, informative, innovative, and constructive "desal/PWM" public hearing yesterday!
Sorry I was unable to attend but listened and learned.

Wednesday morning I spoke to you very briefly about my 2 coastal related proposals/projects, the 21000 acre Monterey Bay Estuarine Monument (@ ww.dougdeitch.info) and consideration of possible Golden Gate damming (@ www.sipodemos.democrat) to address SLR risks and possible devastation to/of our statewide water, food, and real estate resources in the many trillions of dollars and worse.

In reference to possible Golden Gate damming, I have just recently made a submittal to the Google Bay Area Impact Challenge, for your information and review, @ https://www.facebook.com/photo.php?fbid=2489646811083674&set=a.154433724605006&type=3&theater (also included below)

In reference to the Monterey Bay Estuarine Monument, some highlights:
1. Creates 21000 acres of new ESHA
2. Includes a fully completed, operational, a very underutilized and both drought and SLR proof 31,000+/- acre foot per year water recycle plant in Castroville with it's water repurposed from ag to urban use (from actually this 31000 a/y/fr originated in the first place) to provide all urban water needed, now and in the future, SLR or no (because a closed loop system will be engineered and consructed, in/for the entire Monterey Bay regtion
3. Provide best possible ground water SLR, recharge, conservation, and overdraft protection conceivably possible with no new desal, recycling, slant wells etc, et al(?).
4. Fully opm (other people's money) funded by Prop 1 and reallocated rail bond funding.
5. 25 year old plus perfectly sucessful 43 acre "Pilot Project" to prove the concept "Farmlands back to wetlands ..." @ www.dougdeitch.com and www.dougdeitch.info (fb pages)

In the year 2000, I conducted a very informative and fun tour for the Sichuan Water Conservancy of the PRC (see attached and run down @ http://www.pogonip.org/sichuan.htm).

I would be very honored to extend this same invitation to both both the CCC and it's staff at any convenient time for you to take a tour and hear a more complete presentation of my two projects which, actually, is essentially a proposal with coastal nexus which affects and hopefully might provide the answers to the future keys in this era of SLR to water, food and real estate security, sustainability, and social justice and equity for our entire state.

Respectfully,
Best/health/tikkun olam

Food, water, and real estate security for our Golden State in this era of escalating and perhaps massive, rapid, and inexorable climate change and SLR ...

Who you gonna call?

Google Impact Challenge

Thank you for submitting an application to the Google.org Impact Challenge Bay Area. You'll find a copy of the submitted application below. We look forward to reviewing it and will be in touch as per the timeline on the website.

Overview: Please explain your project in one sentence. The vast majority of California's 36 million residents' water, food, and real estate resources/assets are inextricably connected to our Sierra snowpack, Delta, and San Francisco Bay. Without adequate and appropriate measures being taken in this era of unknown and perhaps future massive SLR, all these resources and the entire state 's ecology, economy, society, and people will be irretrievably devastated unless/until there are one or more Golden Gate dams constructed...

Impact: Who or what will your project impact and how? The water for 36 million state residents. The 8% Central Valley produced food on 1% of USA's arable acreage. The now unknown trillion$ in otherwise inundated/lost real estate assets resources...

Reach: How many people will be affected if successful and to what extent? The food/water/real estate resource, human, and other protections afforded by the Golden Gate dam(s) will very beneficially protect/positively affect the lives of hundreds of millions in California, USA, and Worldwide...

Innovation: What's innovative about your proposal and how does it differ from existing solutions? My approach unlike any others assumes our efforts at halting/perhaps even slowing climate change/SLR will be unsuccessful and that our only feasible survival strategy will be to adapt to it...

Scale: If successful, what will your project achieve in 5 years? My project will definitively determine if, when, and how many Golden Gate dams must/will be built to protect the vast majority of water, food, and real estate resources of California.

Feasibility: Have you identified the right team and plan for execution? A core team of scientists/experts such as Drs. Rignot, Mount, Englander, Griggs, Lund, Nichols, Earl, Postel, et al, and a few "civilians" such as myself, will determine team balance/plan...

Opportunity: How is your idea equitably impacting opportunities for healthy, playful, and thriving lives? "opportunities

for healthy, playful, and thriving lives", living with and adapting to SLR and climate change not being successful at changing it, are manifestly self evident? Imagine the alternative... www.sipodemos.democrat

What is the full, registered name of your organization? Pogonip Foundation, INC

In case your application is selected for a possible Award as part of the Challenge, how would you like us to refer to your organization on promotional materials and the Google.org Impact Challenge Bay Area website?
"Monterey Bay Conservancy" (a 501c California & Monterey Bay Water Policy Thinktank)

I certify Yes
I certify X

If your organization has a website, please provide the URL: http://www.facebook.com/MontereyBayConservancy

Impact: What would the impact of this project be, if successful? Please quantify the potential impact, and explain how you calculated your estimate. I already have in your initial questions ...

Stage: In what stage is your project presently? Is it an idea? Do you have a detailed plan? Have you developed a prototype or proof-of-concept? Have you received feedback on the idea from your intended beneficiaries? Is the product or project already implemented? At what scale? Conceptual stage, Introduced to SWRCB 10/16/2019 meeting. Please see www.sipodemos.democrat and view my comments ...

Problem: Tell us more about the problem you propose to address. Why did you choose to take it on? Approximately how many people are affected? How does it impact their lives? I watched this video clip in 2106 @ https://www.youtube.com/watch?v=DsjtEpAptVo and Dr. Eric Rignot @ https://vimeo.com/332486918

Innovation: Contextualize your idea: what other approaches have been tried in the past? What is the insight or innovation that differentiates your project, and how is it better than what already exists? None. Our local transhumanists think they are stronger than the forces of Mother Nature and our other "mothers", but they will eventually find out they are not and cannot control climate change and SLR. That's where people like I come in?

Usage: Why would a potential beneficiary or user choose to engage with your product or service? Simple logic, science, bundled with common sense, imho...

Team: What makes your core team best suited to tackle this project? We/I am the only one taking my approach and even looking at this probability(?) at all !!!

Growth: How could your project and its impact grow beyond what you've proposed in this application? By being the "Pilot Project" for the eventual damming of the Straights of Gibraltar due to SLR for the same rationales ...

Risks: What are the 1-2 most significant risks you anticipate in this project? How has your team planned to address them?
Risk 1. Salmon/Environmental extremism Plan to address: "Faith" ... please see "Salmon Fishing in the Yemen" clip @ https://www.youtube.com/watch?v=AGb4OT3Oiew
Risk 2. We will be too late ... Plan to address: Being megaproactive and out in front of all others, as one can already readily see that I am and have been for decades (eg. www.lawandorderliberal.org 1996) ... expedited by $1 million google grant to pay the best team of experts, technical minds, and other civilians, such as I ... egs: www.ourinconvenienttruth.com , www.douglasdeitch.com , www.douglasdeitch.net , www.thinkocalactlocal.com ; www.sanfranciscorealestate.com , and @ 11:25 @ www.thebestthatmoneycantbuy.org @ SWRCB 4/19/2016, etc

Partners: Organization-wide, who are your major partners or funders from the last 3 years, and how have you engaged with them? 0

Project Partners: On this project specifically, which partnerships are most critical for your success? What is the incentive for those organizations to partner with you? Have you worked with any of them before? State, Federal, and local government and eco and otherwise ngos and citizen groups/individuals and yes, I have extensive experience in dealing with them (eg: please see www.lawandorderliberal.net

Budget: If selected as a winner, how would your project utilize $500,000 in funding? Please provide an overview of your anticipated budget. If selected as the People's Choice winner, how would you use a $1,000,000 in funding? All for compensation for experts, studies, and other ancillary related and necessary expenses ... I have not developed a budget but would do so to be reviewed and accepted by google as a condition of receiving any grant.
How many full-time employees does your organization have? [N/A]

Recap: Final Elevator Pitch! You're riding the elevator and someone asks you about your project and why they should fund it. How do you respond? Remember, you're on the elevator so you don't have much time, but you do want them to understand what your project is, who it impacts and how, why it's innovative and why your organization is the best to implement it.
(San Francisco elevator?) My pitch: Have you ever heard of SLR? No? It's for sea level rise. How about climate change? Yes? They say it's getting warmer, the ice is melting, and the sea level is rising? Yes? Do you believe this? Yes? If the sea level rises just one foot and comes back in the Golden Gate, do you realize that the City, San Francisco Bay, and our entire state water system in the Bay, Delta, and our largest state water reservoir, our Sierra snowpack, along with trillions in inundated real estate assets would be burnt toast? No? Please do yourself a favor? Please watch the video at the bottom right corner on the page of any of my websites and think about the effect of a Golden Gate dam(s)?

Please include links to up to 3 articles, publications, videos, or other resources that support your proposal. (Optional)

Attachments: MCWD Post-Hearing Comments to Coastal Commission re MPWSP (00825340xA6BE4).pdf

Dear Mr. Luster:

On behalf of our client, the Marina Coast Water District, attached please find Post-Hearing Comments on Cal-Am's continued CDP proceeding, with attachments numbered 29-34.

Please do not hesitate to contact me or Sara Wan, copied here, if you have any questions or need additional information.

Sincerely,

Ruth Stoner Muzzin

Marina Coast Water District -

Post-Hearing Comments, Continued Support for Denial

on Appeal No. A-3-MRA-19-0034 by Cal-Am

Tentative Continued Hearing Date: **March 12, 2020**

Agenda: **TBD**

The MPWSP, as described in the FEIR and Cal-Am's CDP application, is infeasible; it cannot meet the objective of compliance with the SWRCB's CDO without additional infrastructure not identified in the Project description or the CPUC FEIR.

Cal-Am is required to curtail its Carmel River diversions for direct use in its Monterey District to 3,376 AFY starting January 1, 2022, while at the same time meeting its Monterey District's water demands. Prior to January 1, 2022, Cal-Am has operated a water system with the Carmel River being the primary water source so that Cal-Am's main water supply would historically flow from the south to the north, supplemented to a much lesser degree by Seaside Basin groundwater pumping in the north. Starting January 1, 2022, Cal-Am's predominant water supplies will come from the north and flow south. Shifting a water system's main supply from south to the north requires thorough planning and designs. Several existing Monterey District physical system limitations have now come to light.

During the CPUC's EIR process and at other times, Cal-Am has not been required to fully demonstrate how it intended to implement this major system flow change from south to north beginning on January 1, 2022. The emphasis has been on obtaining approval for the Monterey Peninsula Water Supply Project (MPWSP or Project), without considering how that major new water supply source would require Cal-Am to substantially change its water operations by the CDO deadline, which is now 2022. Marina Coast Water District (MCWD) has prepared the following schematics to illustrate the south to north shift and the way that shift away from almost total dependence on Carmel River flows will profoundly change Cal-Am's Monterey District operations beginning in 2022:

- **Schematic 1** (**Attachment 33**, p. 1) shows Cal-Am's existing conveyance system during the December through May time period ("winter" or "ASR Injection" period)[1] but with MPWSP desal flows added.

  What is important to note about Schematic 1 is that if the MPWSP is removed, the schematic shows the existing Cal-Am south-to-north operation in all months when there is no ASR water to be injected and the Carmel River supplies most of Cal-Am's Monterey District. The existing Forest Lake Reservoir tanks are used to re-regulate variable diversions from the Carmel River to meet demands to the north that are not served from the Seaside Basin.

- **Schematic 2** (**Attachment 33**, p. 2) shows Cal-Am's existing conveyance system during the December through May time period ("winter" or "ASR Injection" period) with MPWSP desal flows added, and with the addition of a 36" Cal-Am pipeline that actually appears to be a part of the MPWSP even though it is proposed to be built as a part of the Pure Water Monterey Expansion Project (PWM Expansion), which Cal-Am apparently

[1] State Water Resources Control Board ASR Water Right Permits 20808A and 20808C (**Attachment 34**) prescribe, at ¶ 5 of each permit, the injection or "Storage Season" for Carmel River water "to be collected to underground storage in Seaside Groundwater Basin" and the extraction period for the ASR water to be withdrawn from storage and used for direct use within the Monterey District.

otherwise opposes. See **Attachment 1**, Cal-Am Advice Letter 1231 informing the CPUC Cal-Am does not intend to pursue additional water supply from PWM Expansion.[2]

Schematic 2 also includes additional Cal-Am extraction wells that are proposed as part of PWM Expansion.

- **Schematic 3** (**Attachment 33**, p. 3) shows Cal-Am's existing conveyance system during the June through November time period ("summer" or "ASR Extraction" period) but with MPWSP desal flows added.

- **Schematic 4** (**Attachment 33**, p. 4) shows Cal-Am's existing conveyance system during the June through November time period ("summer" or "ASR Extraction" period) but with MPWSP desal flows added, and with the addition of a 36" Cal-Am pipeline that is proposed to be built as a part of the PWM Expansion.

  Schematic 4 includes additional Cal-Am extraction wells that are proposed as part of PWM Expansion, but which appear to be necessary for the MPWSP, along with the new Forest Lake Pump Station that Cal-Am is seeking to fund through its latest general rate case application to the CPUC.

  Importantly, Schematic 4 shows the new way that Cal-Am's system will apparently operate post-2021, with its primary water sources flowing from the north instead of from the south.

Comparing Schematic 4 with Schematic 1 reveals the dramatic shift in the majority of Cal-Am's water supply from south to north that will occur in 2022. As described below, Cal-Am has failed to adequately plan and design its distribution system to service this dramatic shift in water supply sources.

As the October 28, 2019 Staff Report correctly observed, Marina Coast Water District's determination that MCWD's potable water pipeline has insufficient unused pipeline capacity to convey MWPSP flows for the life of the Project presents an obstacle to Project feasibility. (Staff Report, pp. 81, 93.) Other feasibility issues include the lack of groundwater rights (see Staff Report, p. 98) as well as the groundwater pumping limitations of the 1996 Annexation Agreement among MCWD, the City of Marina, the owner of the CEMEX property and others (FEIR § 2.6.4, p. 2-43 ["it appears that the 500 afy groundwater withdrawal limitation may currently apply. . . "]). Comparing Schematics 1 and 3 with Schematics 2 and 4, makes it very evident that without the new 36" pipeline, proposed to be part of the PWM Expansion, the MPWSP is not feasible. In addition, it now also appears that a lack of pumping infrastructure in Cal-Am's Monterey District system **will make distribution of MPWSP flows throughout the full system infeasible without new infrastructure**. MCWD recently learned of this lack of pumping infrastructure through its litigation with Monterey County and Cal-Am over Monterey County's approval of certain MPWSP-related permits.

[2] Attachments 1-28 accompanied MCWD's comments on the application, dated Sept. 17, 2019, Oct. 7, 2019 and Oct. 15, 2019. MCWD also submitted preliminary comments in August of 2019 and comments in support of the Staff Report recommendation on Nov. 6, 2019.

(**Attachment 29**, excerpt of Sept. 5, 2019 Declaration of Ian Crooks, p. 13, lines 17-21 ["current physical system limitations are such that Cal Am cannot deliver water from all of its sources to all of its customers at the same time"].) A recent analysis of the system's daily and hourly peak demands by the Monterey Peninsula Water Management District (MPWMD) indicates that it is, and has been, also aware of this distribution obstacle. (Staff Report, Ex. 9, p. 1 [referencing the need for the Forest Lake Pump Station].)

Upon investigation, MCWD has discovered that demand in the southern portion of Cal-Am's Monterey District system will apparently exceed Cal-Am's legal limit on summer diversions from its southern-most and historically greatest water source, the Carmel River. For this reason, no amount of water from the MPWSP – or any water source to the north – can possibly bring Cal-Am into compliance with the SWRCB's orders ***unless*** additional facilities to move water from north to south are added to Cal-Am's system. Evidently Cal-Am never intended to fully comply with the CDO. Otherwise, for example, it would have included at least the newly-proposed Forest Lake Pump Station in its MPWSP plans.

In any event, Cal-Am seems to now acknowledge its major pipeline and pumping infrastructure problems. It now appears to be attempting to remedy the deficiencies. But Cal-Am's recently-developed fixes for the conveyance and pumping inadequacies of its Monterey District system – at least one of which appears to be necessary to achieve CDO compliance – were not included in its CDP application nor analyzed in the FEIR for the MPWSP, which merely relied upon Cal-Am's capacity assessment for the MCWD pipeline without response from MCWD. FEIR § 8.5.2, pp. 662, 771-712. The Project, as described, is infeasible for purposes of meeting the primary project objective of CDO compliance by eliminating Cal-Am's illegal Carmel River diversions while at the same time meeting the Monterey District's water demands.

A. Necessary Project Components were Omitted from the Project Description.

The CPUC's FEIR for the MPWSP does not appear to include all of the Project's necessary components. Specifically, components needed for operation of the MPWSP in order to comply with the SWRCB's decades-old limitation on Carmel River pumping that were not addressed in the FEIR consist of, at a minimum:

> (1) a new 36-inch conveyance pipeline proposed *as a part of PWM Expansion* to bring MPWSP desalinated water to Cal-Am's system for delivery to its customers or for storage in the Seaside Basin;
>
> (2) four additional new extraction wells proposed *as a part of PWM Expansion*, located outside the Coastal Zone within the adjudicated Seaside Subbasin, that would enable withdrawal of greater volumes of excess produced MPWSP desalinated water after storage in the Seaside Basin; and
>
> (3) a new pump station – the Forest Lake Pump Station – that would provide Cal-Am the pumping capacity needed to deliver desalinated and Seaside Basin-stored water from the north to customers in Carmel and Carmel Valley, particularly during the summer months

when Cal-Am's authorized Carmel River water diversion rates are at their lowest. (**Attachment 30**, PWM Expansion Draft SEIR, Figure 2-8; **Attachment 31**, excerpt of Direct Testimony of Ian C. Crooks in CPUC Application 19-07-004, pp. 194 and 211-212, referencing Forest Lake Pump Station.)

Cal-Am is now improperly attempting to remedy the design and operational deficiencies of its Project, as described in the FEIR, by seeking to implement these essential components of the Project through alternate means, i.e., PWM Expansion and Cal-Am's current general rate case. Such an "end-run" would thwart the transparency and public disclosure and analysis requirements of CEQA and the Coastal Act. It would also impermissibly piecemeal environmental review of the Project, which is prohibited under CEQA.

To the extent these new components are essential for implementation and proper operation of the desalination project, the new components must go through supplemental environmental review and approval before the CPUC as lead agency. This is regardless of whether the new components are also required in part for operation of other projects such as PWM Expansion. At least one of the new components – the Forest Lake Pump Station – will be required for Cal-Am to achieve timely CDO compliance while still meeting Carmel and Carmel Valley water demands, with or without the MPWSP. However, the Commission cannot approve the MPWSP based upon a project description that does not include essential Project components in the description of baseline conditions or in the cumulative impacts analysis. Without these components, the Project is infeasible at this time, and review at this time is premature.

The primary purpose of the MPWSP is to enable Cal-Am to comply with the SWRCB's CDO, enforcing water rights diversion limits that were established in 1995, while still providing a sufficient water supply to its Monterey District. There has been disagreement as to whether the excessive volume of water the MPWSP would produce is required in order to do so. (Staff Report, pp. 82-92, concluding PWM Expansion can provide sufficient supplies.) Cal-Am has continually and correctly emphasized the importance of the ASR Project to its water supply from 2022 on, yet as shown in MCWD's Schematic 2, when Carmel River ASR water must be delivered to storage in the Seaside Basin in compliance with the SWRCB water right permits, Cal-Am has not addressed how it will operate its MPWSP flows south at the same time ASR water needs to move north for injection. Building a new 36" pipeline as part of PWM Expansion does not solve the substantial pipeline congestion problem that would appear to be created in Cal-Am's New Monterey Pipeline. In addition, it appears Cal-Am does not dispute that without additional infrastructure components that were ***not analyzed in the FEIR***, Cal-Am will be unable to deliver, at the very least, sufficient water from non-Carmel River sources to its customers in Carmel and Carmel Valley. In the Monterey County Superior Court, responding to MCWD's request for a preliminary injunction to halt work on the MPWSP, Cal-Am submitted a declaration under penalty of perjury by its Vice President of Engineering stating that even if Cal-Am had additional water supplies available "current physical system limitations are such that Cal Am cannot deliver water from all of its sources to all of its customers at the same time." (**Attachment 29**, p. 13.) In other words, no matter how much water Cal-Am has access to

from sources to the north of its Monterey District, Cal-Am cannot presently deliver that water to the southern most areas of its Monterey District as required after December 31, 2021, when the existing Carmel River diversions drop substantially.

B. The Carmel/Carmel Valley Plumbing Problem – Need for New Forest Lake Pump Station.

Starting January 1, 2022, Cal-Am's annual limit on Carmel River withdrawals is 3,376 AFY. MCWD understands that summer demand for water in the southern areas of the service territory could then exceed this amount and/or be incompatible with seasonal pumping constraints on Cal-Am's Carmel River sources. The Commission must ask Cal-Am to explain how its various sources of water are conveyed and utilized seasonally throughout its system, and how Cal-Am intends to fully comply with the CDO by implementing a Project that, as described in its FEIR, is incomplete. Cal-Am has not been transparent with the Commission or any agency before which it has sought MPWSP approval, because it never disclosed the need for, or sought approval of, the Forest Lake Pump Station in connection with its attempts to comply with the CDO. Instead, funding for this piece of critical MPWSP infrastructure is buried in Cal-Am's latest general rate case application before the CPUC, with no explanation of when – if ever – the facility will undergo environmental review. (**Attachment 31**.)

Despite these absolute system operational impediments to Cal-Am's ability to comply with the CDO, it never included in the MPWSP project description the infrastructure necessary to overcome 1) its system water conveyance and distribution problems or 2) the lack of unused capacity available in MCWD's potable water pipeline for MPWSP desalinated water, after other priority uses. None of the new components – 36" pipeline, four extraction wells, Forest Lake pump station – were even mentioned, let alone analyzed, in the CPUC's FEIR for the MPWSP. Therefore, the CPUC has not authorized them under its Certificate of Public Convenience and Necessity (CPCN), nor were they included in the Project description. Consequently, the application is incomplete and it must be denied, if it is not withdrawn before the March 2020 Commission meeting.

C. With or Without the MPWSP, Cal-Am Requires the Forest Lake Pump Station to Achieve CDO Compliance.

With its latest three-year general rate case proceeding before the CPUC, Cal-Am is seeking approval of the expenditure of $2,470,000 and collection of that amount in rates for a new Forest Lake Pump Station to "raise the pressure in the transmission main from Forest Lake to Carmel Valley." (**Attachment 31**, p. 211.) The stated purpose of this new pump facility is to eliminate low-pressure areas and increase available fire flows. (Id. at pp. 211-212.) The Commission should verify whether Cal-Am has an existing pump at the Forest Lake Reservoir that can pump water from the Forest Lake Reservoir to Carmel and the Carmel Valley. Cal-Am's rationale of installing the new Forest Lake Pump Station to eliminate low-pressure areas and low fire flows would appear to indicate that those conditions currently exist at times when there are

insufficient flows coming downhill from the Carmel Valley. When Cal-Am is required to reduce Carmel River pumping to 3,376 AFY and the water supply sources shift from the south to the north, this new pumping station would appear to be needed during most of the year, as shown in Schematics 3 and 4. (**Attachment 33**, pp. 3-4.)

As far as MCWD has been able to determine, the proposed Forest Lake Pump Station is ***the first time*** since Cal-Am initially proposed a desalination facility in 2004 that Cal-Am is proposing to build any infrastructure that would relieve this plumbing problem and allow Cal-Am to reduce its Carmel River system pumping to the legal limit of 3,376 AFY that the SWRCB established in 1995. The more the Commission and others drill down to closely examine the details of Cal-Am's proposed MPWSP, the more flaws in Cal-Am's assumptions, plans, and designs are revealed. The MPWSP as described in the FEIR and as approved by the CPUC is not feasible and cannot be built and operational by the CDO deadline.

On the other hand, PWM Expansion is a feasible alternative that can provide a sufficient source of water for CDO compliance, provided the Forest Lake Pump Station is installed, and PWM Expansion can do so sooner and at far less cost than the MPWSP.

D. Cal-Am's New Fix for its Inability to Use the MCWD Potable Water Pipeline – Build a New PWM Expansion Pipeline to Parallel the MCWD Pipeline.

When Cal-Am applied to the CPUC for permission to construct the MPWSP, it originally proposed to construct a new conveyance pipeline along Highway 1 to the City of Monterey; however, Cal-Am later elected to eliminate the southern portion of that pipeline. Without prior notice or consultation with MCWD, Cal-Am assumed it could utilize MCWD's existing potable water pipeline to move desalinated water into Cal-Am's Monterey District as part of the MPWSP. Cal-Am amended its project map by showing a blank space where the MCWD pipeline is located and then later changed its project map by adding an "existing pipeline" without identifying that the pipeline is 100% owned by MCWD and subject to other priority uses. (**Attachments 18 and 19** to MCWD's Sept. 17, 2019 comments.) The end result was that Cal-Am was wrong in its assumption that it could use MCWD's pipeline for the MPWSP. As MCWD has determined pursuant to the Joint Use of Capacity in Water Conveyance Facilities Statute (Water Code Section 1810 – 1814), there is not sufficient unused capacity in the existing MCWD pipeline to accommodate all of the pipeline's priority uses *and* full production from the MPWSP for the life of the Project. (See Staff Report, pp. 81, 93.) Cal-Am proposed no solution to this problem when it submitted its application to the Commission.

It appears Cal-Am now seeks to solve the MPWSP's lack of sufficient conveyance pipeline capacity by using a new potable water pipeline analyzed by Monterey One Water (M1W) as part of its Supplemental Environmental Impact Report (SEIR) for the PWM Expansion. Figure 2-8 of the Draft SEIR provides a schematic rendering of a proposed 36-inch conveyance pipeline for potable water to be installed parallel to and in the same right of way as the existing MCWD pipeline. (**Attachment 30.**) Aerial views of the

proposed pipeline location, as well as proposed locations for new extraction wells, are available at Draft SEIR Figures 2-2, 2-7 and Figure 1 of Appendix D. (**Attachment 32.**)

Based upon review of the SEIR, MCWD has concluded that the proposed 36-inch pipeline shown in Figure 2-8 of the ***PWM Expansion Draft SEIR*** would provide a substitute conveyance for Cal-Am's prior proposal to use MCWD's pipeline to ***convey potable water from the MPWSP to the Monterey Peninsula*** **during June through November. However, the new 36" pipeline only appears to shift Cal-Am's pipeline congestion problem further south during December through May when ASR water is moving north to be injected in the Seaside Basin at the same time MPWSP water would be trying to move south**. See MCWD's schematics illustrating seasonal system flows in the current Cal-Am system with the proposed MPWSP, versus system flows in the current Cal-Am system with the proposed MPWSP *and* with the PWM Expansion wells and pipeline. (**Attachment 33**, pp. 1-4 [Schematic 4 includes the new Forest Lake Pump Station].) This pipeline congestion problem could result in Cal-Am needing to inject much more desalinated water into the Seaside Basin than described in the FEIR. This greater volume of injected desalinated water appears to necessitate Cal-Am's four new proposed extraction wells, which are not needed for the PWM Expansion alone. Notably, the proposed new pipeline is greatly oversized if it was actually intended to convey solely PWM Expansion water, and the four new extraction wells are not required for that project either, as the Draft SEIR includes analysis of an environmentally superior alternative that eliminates two of the proposed wells. (Draft SEIR at Summary § S.5 and at § 6.2.2.[3]) Moreover, the new pipeline and wells are referred to by M1W as "Cal-Am Facilities." (See Draft SEIR at Summary § S.3 and at § 2.6.5.) The Commission should require Cal-Am to explain why these facilities that appear to be required for the MPWSP, but not for PWM Expansion, were omitted from the MPWSP proposal.

Importantly, none of the proposed PWM Expansion facilities were included as a part of the CPUC's environmental review for the MPWSP. If, as it appears, the proposed 36-inch potable water pipeline and/or the new extraction wells shown on Figure 2-8 of the PWM Expansion SEIR are components of infrastructure that are actually necessary for operation of the MPWSP, rather than PWM Expansion, then the FEIR for the MPWSP must be revised or supplemented to include review of the additional project components. For present purposes of the Commission's review, Cal-Am's application is incomplete and therefore the Commission should deny the application based on failure to fully describe the necessary components of the project and their collective cumulative impacts.

Hearing re *Ex Parte* Application:
Date: September 5, 2019
Time: 10:00 a.m.
Dept.: 15A

Action Filed: August 15, 2019

DECLARATION OF IAN C. CROOKS

I, Ian C. Crooks, declare:

1. I am the Vice President - Engineering at California-American Water Company ("Cal-Am"). I have personal knowledge of the facts set forth in this Declaration and, if called as a witness, could and would testify competently to such facts under oath.

2. In my capacity as Vice President - Engineering at Cal-Am, I am one of the individuals charged with the responsibility of designing and implementing Cal-Am's Monterey Peninsula Water Supply Project (the "MPWSP" or "Project"). Since August 2013, I have been involved in all day-to-day aspects of planning the Project. As such, I am extremely familiar with the requirements of the project, the timetable for the Project, and with all matters contained herein.

3. Cal-Am is a California water corporation and is regulated by the California Public Utilities Commission ("CPUC"). Cal-Am provides water and wastewater services to approximately 600,000 people throughout the State of California. Cal-Am has served the Monterey Peninsula since it took over the operation of California Water and Telephone Company in 1966. Cal-Am presently provides water service to approximately 100,000 businesses and residential customers in its Monterey County service area.

4. On July 6, 1995, the State Water Resources Control Board ("State Board") issued Order No. WR 95-10, which requires Cal-Am to eliminate certain unauthorized water diversions from the Carmel River. In 2009, the State Board issued Order No. WR 2009-0060, which requires Cal-Am to take additional measures to cease unauthorized diversions from the Carmel River and to terminate such diversions by December 31, 2016. In 2016, the State Board, through Order No. WR 2016-0016 ("Amended CDO"), extended Cal-Am's deadline to cease unauthorized diversions to December 31, 2021. The amended CDO requires the development of an alternative water supply project—such as the MPWSP—in order to replace Carmel River supplies. It includes several milestones for developing the MPWSP, with the intent of having the Project operational by the end of 2021. In particular, the CDO requires "[s]tart of construction for any of the CalAm Components of the [MPWSP] Desalination Plant"—defined as "source

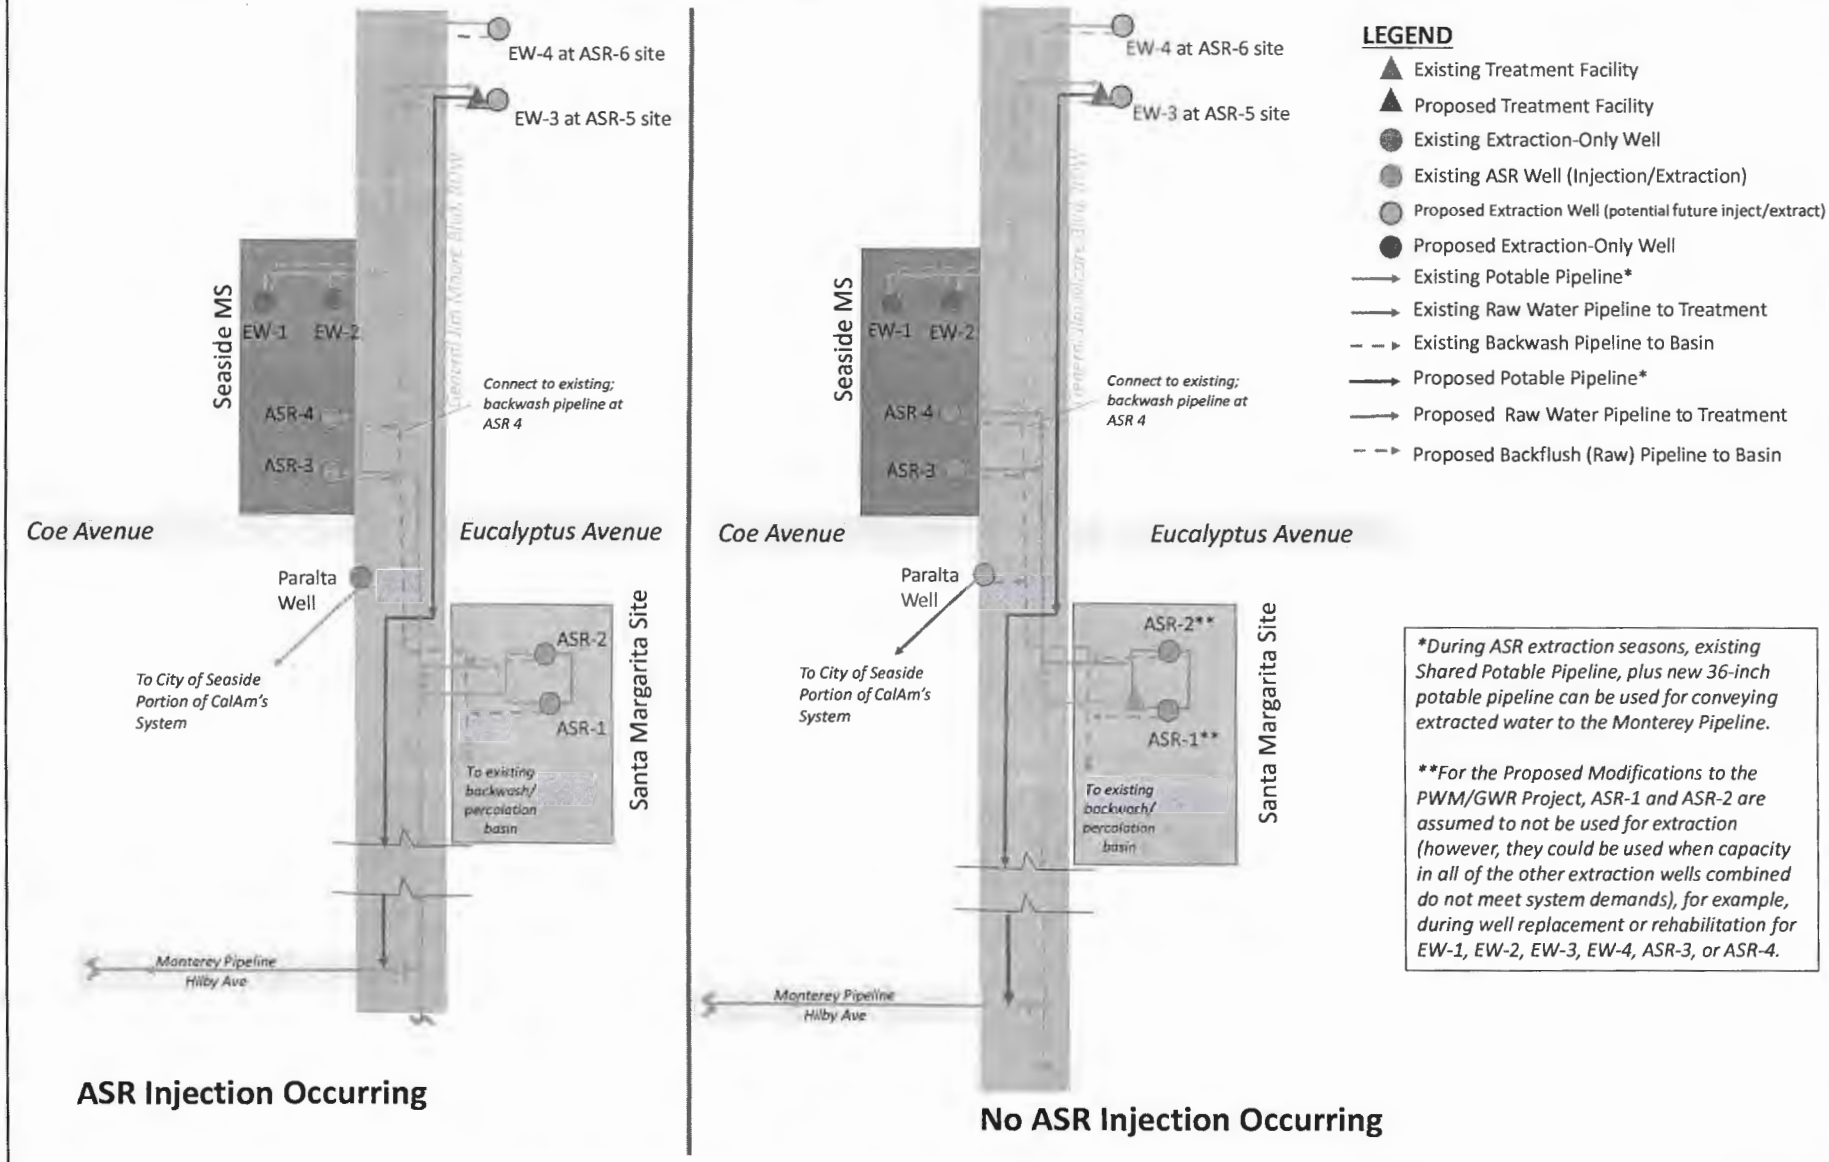
Peninsula Water Management District ("MPWMD") and Monterey One Water, Monterey One Water missed the first contractual requirement of July 1, 2019, to begin producing water from PWM. A true and correct copy of the Notice of Default is attached hereto as **Exhibit J**. It is likely that Monterey One Water will not meet its second contractual milestone for Cal-Am to begin delivering water to its customers by January 1, 2020 due to the delays in achieving the first milestone.

45. MCWD cites to a statement from an MPWMD representative alleging that failure to meet the Amended CDO's September 30, 2019, milestone would have no impact. (TRO App., at p. 10.) I disagree with the statement from the MPWMD representative. Failure to meet the September 30, 2019, milestone would result in a 1,000 afy reduction in Cal-Am's allowed Carmel River diversions, not only in the current year, but in 2020 and 2021. (Wilkins Decl., Ex. 18, p. 1428.) Moreover, failure to meet the September 30, 2019, milestone will likely mean that mandatory milestones in 2020 and 2021 will also be missed, given construction timeframes. Missing such milestones will result in additional 1,000 afy reductions on top of the reduction imposed for missing the 2019 milestone. And, as noted, the MPWSP would not be completed in time to meet the 2021 deadline to cease unauthorized diversions. Alternate water supplies simply are not available to replace such reductions. Moreover, even if temporary replacement supplies are available to offset missed milestone penalties, current physical system limitations are such that Cal Am cannot deliver water from all of its sources to all of its customers at the same time, making the supply available at certain times less than a simple sum of potentially available sources. My conclusion as Vice President - Engineering is that missing a milestone would have the potential to result in significant harm to our customers.

46. In addition, the CPUC found that failure to meet a CDO milestone would result in negative consequences for the Peninsula, due to the corresponding reduction in Cal-Am's allowable withdrawals from the Carmel River. (See Wilkins Decl., Ex. 16, p. 1294.)

47. Further, MCWD complains of the costs of the MPWSP. As explained in the testimony of Mr. Chris Cook before the County Board of Supervisors, Cal-Am is in the process of obtaining State Revolving Funds funding that will help to mitigate the future costs of

desalination for the Peninsula, and the Project has recently been accepted for funding by the Drinking Water State Revolving Fund program by recommendation of the State Board. We therefore expect total Project costs to be lower as a result of this low cost financing. A true and correct copy of Mr. Cook's testimony is attached hereto as **Exhibit K**.



48. Pursuant to the CPUC's Decision, Cal-Am wholly bears the risk of constructing the Project, and if Cal-Am fails to construct the Project, its costs will not be passed on to ratepayers. As stated in the CPUC's Decision, "If the project is not finished, or does not go online, it will not be placed in ratebase." (Wilkins Decl., Ex. 16, p. 1315.)

49. Any further delay in the Project's construction will significantly impair Cal-Am's ability to eliminate unauthorized diversions from the Carmel River, as construction needs to commence near term in order to make the 2021 deadline. If Cal-Am misses the CDO's 2021 deadline, serious fines and penalties could result, including administrative penalties of up to $10,000 per day for CDO noncompliance in certain drought years, and penalties for unlawful diversion of up to $1,000 per day and $2,500 per acre-feet of unlawfully diverted water in certain drought years. (See Wilkins Decl., Ex. 18, p. 1417.) Cal-Am could face over $4 million per year of violation in per-diem penalties, in addition to up to $2.5 million in penalties for every 1,000 acre-feet of unlawfully diverted water. (*Ibid.*)

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Executed this 5th day of September, 2019, at San Diego, California.

(FINAL APPLICATION)

I. INTRODUCTION

Q1. Please state your name and business address.

A1. My name is Ian C. Crooks. My business address is 655 W. Broadway, Suite 1410, San Diego, CA 92101.

Q2. By whom are you employed and in what capacity?

A2. I have been employed by California-American Water Company ("California American Water" or the "Company") since August 2013. In November 2016, I began serving as Vice-President of Engineering with responsibility for overseeing the Company's statewide engineering functions.

Q3. What are your responsibilities?

A3. I oversee the planning, programming, and implementation of the company's capital improvement program, and may provide guidance on the planning and budgeting of projects, and oversight of project administration, design, permitting and construction to ensure compliance with budgets, schedules, and regulations. Most recently, I have been

Table XV-D - Central Division Proposed New Capital Investment Projects

Project Code	Project Description	3-Yr Total	2021 Plant Expend.	2022 Plant Expend.	2023 Plant Expend.
I15-400138	13. Rancho Fiesta Tanks and Pump Station	$1,440,000	$0	$440,000	$1,000,000
I15-400141	14. New Carmel Valley Well	$1,500,000	$500,000	$1,000,000	$0
I15-400143	15. Forest Lake Pump Station	$2,470,000	$1,000,000	$1,470,000	$0
	Total Investment Projects	**$32,772,500**	**$8,750,000**	**$11,875,000**	**$12,147,500**

1. Project Code I15-400125, Main Replacement Program (2021-2026) (PROPOSED PROJECT)

Q208. Please describe this program.

A208. The Central Division has approximately 630 miles of water main in its distribution system. A large percentage of this pipe is nearing the end of its expected useful life. Much of this pipe has a smaller diameter than current standards and therefore impedes the ability of the system to deliver adequate fire flow; this pipe is also experiencing a higher rate of breaks and leaks, leading to water loss and disruption to customers.

In 2019, California American Water completed a Buried Infrastructure CBA and a CPS that included development of a detailed hydraulic model of the distribution system. A risk score was calculated for each pipe segment based on its physical condition, leak history, and hydraulic constraints (such as the ability to deliver recommended fire flow amounts). Based on these risk scores, a number of main replacement projects were recommended for inclusion in this program. The CBA identified 22 miles of main for replacement, as well as 10,500 feet for abandonment and 24,000 feet for lining to mitigate water age issues.

15. Project Code I15-400143, Forest Lake Pump Station (PROPOSED PROJECT)

Q222. Please describe.

A222. An existing pipeline, with diameters ranging from 24 to 30 inches, has historically conveyed water from Carmel Valley west to the Forest Lake Tanks. There are four high spots in Carmel where the pressure in this pipeline can drop below 20 psi, the normal lower operating limit for pipelines without customer service connections. California American Water has performed hydraulic modeling of this pipeline to evaluate the extent and severity of the low pressures. California American Water also installed field data loggers during February and March of 2019 to measure pressure over an extended period. Data from the model runs and the data loggers showed pressures as low as 4 psi during this test period. These conditions were observed while the water level in the Forest Lake Tanks was approximately 18 feet, or slightly more than half full. If the level in the tanks were 10 feet lower, which can occur during some conditions, the gauge pressure in the pipeline would have dropped to 0 psi. These pressures are extremely low and can lead to damage to the pipeline or the connecting valves and fixtures. The low pressures in this portion of the pipeline contribute to the low available fire flow in portions of Carmel. The low pressures can also lead to water quality contamination events if backflow devices are not working properly.

California American Water plans to construct a new pump station to raise the pressure in the transmission main from Forest Lake to Carmel Valley. The recommended location is at or near the site of the Forest Lake Tanks. By raising the HGL in the transmission main, this pump station would also raise the HGL for customers in this area. To prevent problems due to high pressure, the pump station should be designed to raise the pressure only high enough to address the critical low-pressure areas. Raising the HGL approximately 50 feet would allow the system to maintain 20 psi in the transmission main

even when the level in the Forest Lake tanks is at the lower end of the normal operating range.

The addition of this pump station would raise the water pressure in the transmission main above the 20-psi level that is normally considered a minimum operating level for pipelines without customer connections. Eliminating the existing low-pressure areas would increase the safety and reliability of the pipeline and would reduce the potential for contaminants to enter the distribution system. Addressing these low-pressure areas would also increase the available fire flow at hydrants in Carmel, particularly along Ocean Avenue at the upper end of the Forest Lake pressure zone. By maintaining a higher HGL in the transmission main, the pump station would increase the flow that could be delivered to these hydrants while maintaining a 20-psi residual pressure.

This project was identified in the 2019 Monterey County CPS. Additional information, justification, and documentation can be found in the Capital Investment Project Work Papers for this specific project.

E. Monterey County Wastewater District Proposed New Projects

Q223. Please provide summary of new projects.

A223. Below is a table summarizing the estimate expenditures by project and year.

Table XV-E – Monterey County Wastewater District Proposed New Capital Investment Projects

Project Code	Project Description	3-Yr Total	2021 Plant Expend.	2022 Plant Expend.	2023 Plant Expend.
I15-420004	1. Spreckels Boulevard Main Replacement	$310,000	$110,000	$200,000

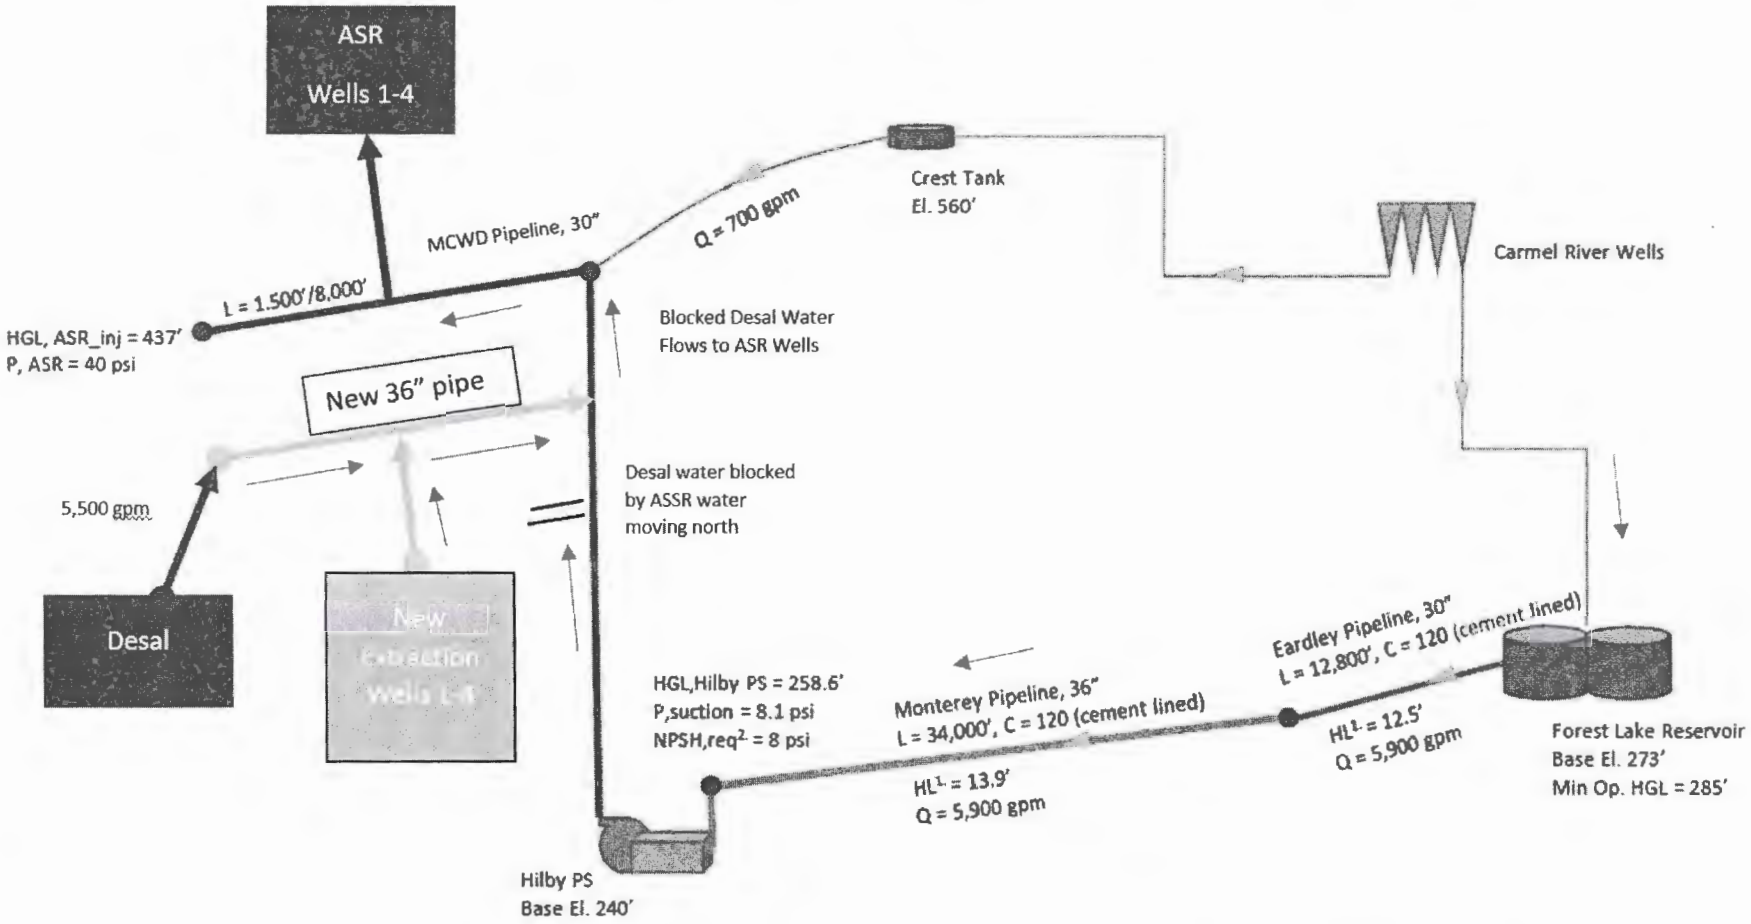
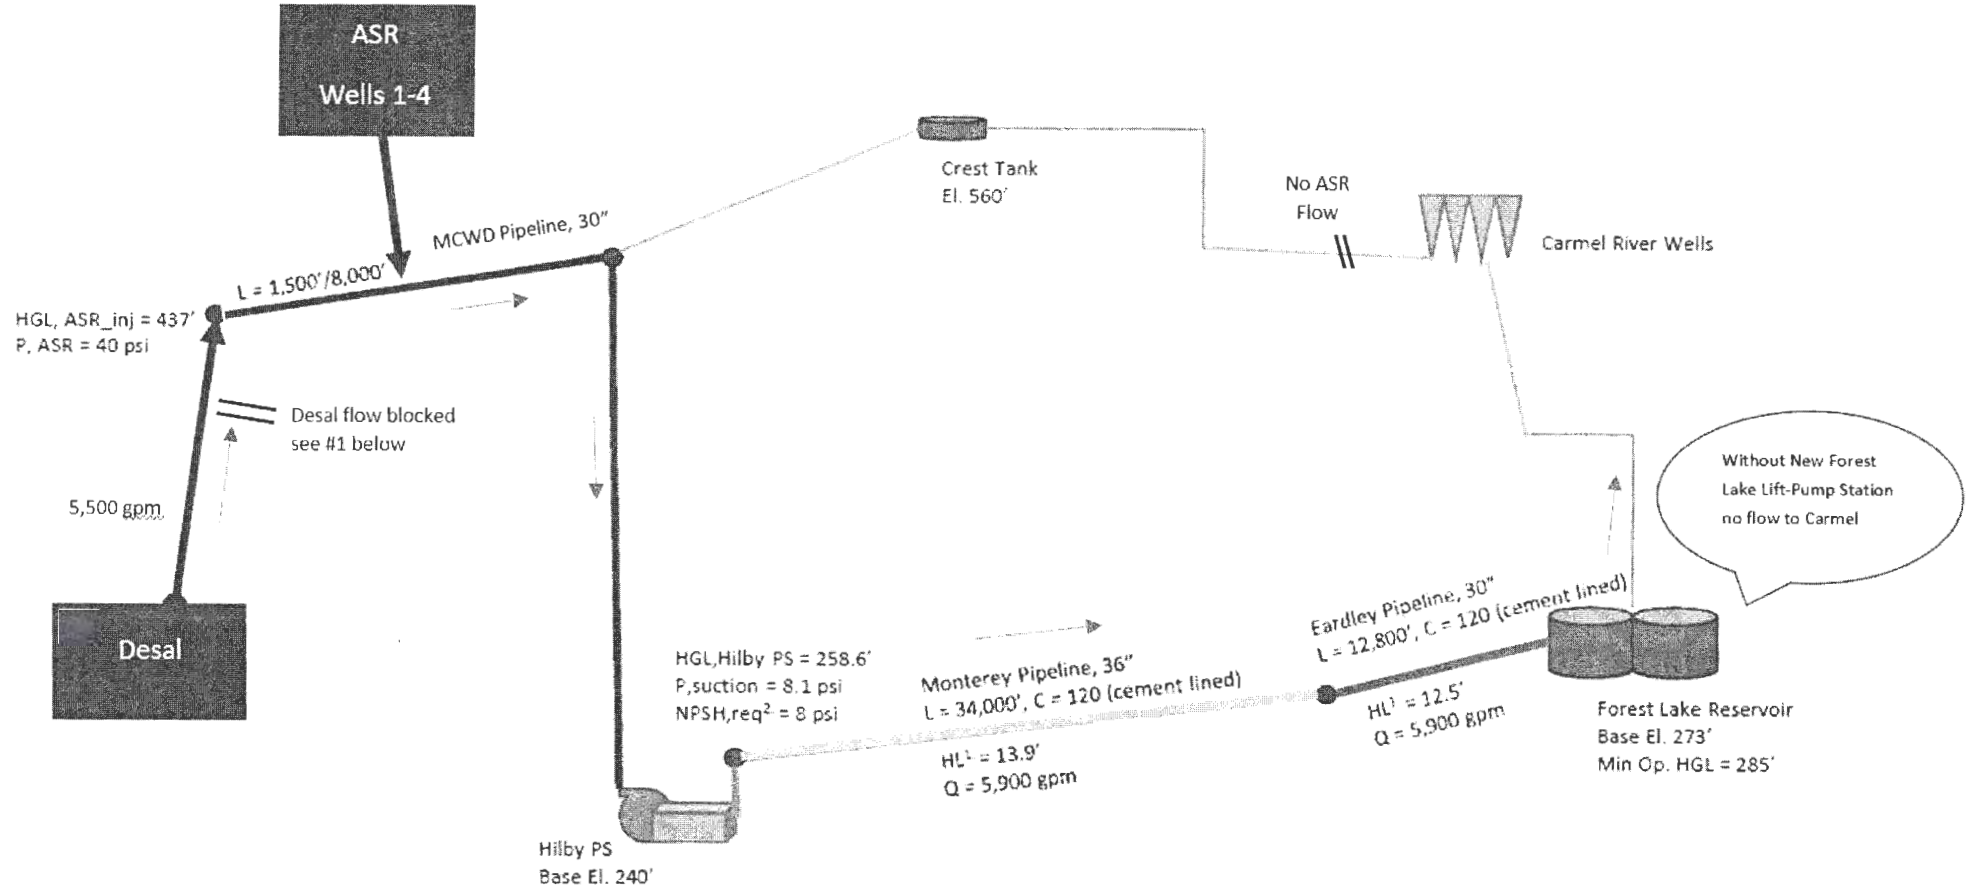
Attachment 33



SCHEMATIC 1: **Existing Conveyance** Plan with current MPWSP approval for **every December through May** time period ("Winter" or "ASR Injection" Period) starting 1/1/2022
Note: During December through May in drier water years, there may be no Carmel River water conveyed for injection in the Seaside Basin so then refer to the ASR Extraction Period schematic.

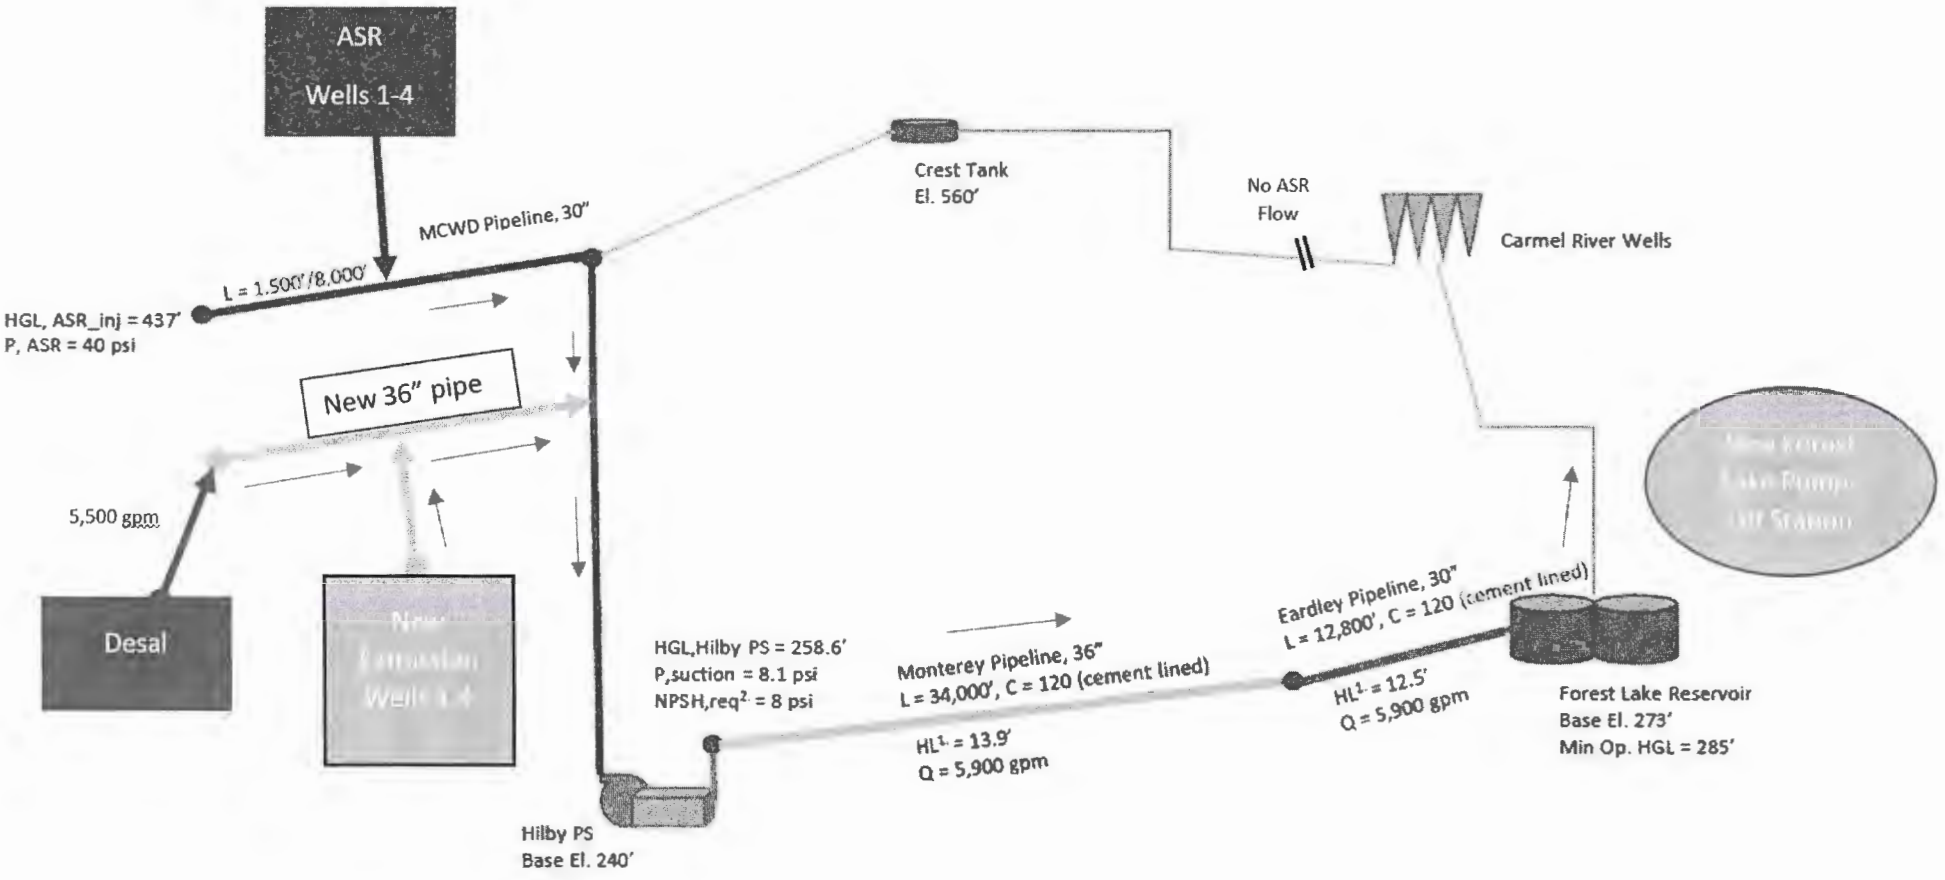
Existing Issues not Addressed in MPWSP approval:



1) No authorized Capacity for Desal water through 30" MCWD potable water pipeline – projected unused capacity not sufficient to convey desal water 24/7/365
2) Desal water cannot move south because (a) ASR water is moving north in the MCWD pipeline to be injected into the Seaside Basin via ASR Wells 1-4 and (b) not sufficient unused capacity in MCWD's pipeline [#1 above]. SWRCB ASR water rights permits requires all Carmel River water diverted for ASR must first be injected into the Seaside Basin and not for direct use by Cal Am customers.

SCHEMATIC 2: **New** if PWME Project approved and New Forest Lake Pump/Lift Station CPUC GRC approved) for **every December through May** time period ("Winter" or "ASR Injection" Period) starting 1/1/2022. Note: During December through May in drier water years, there may be no Carmel River water conveyed for injection in the Seaside Basin so then refer to the ASR Extraction Period schematic.

1) New 36" pipeline allows Desal water to bypass 30" MCWD potable water pipeline
2) New 36" pipeline allows ASR winter injection water to flow north at same time Desal water is flowing south. But Desal water flow blocked in New Monterey Pipeline by ASR water moving north in New Monterey Pipeline. Hilby Pump Station cannot pump Desal water south and ASR water north at the same time. That blockage also causes Desal water to do U turn and flow to ASR Wells 1-4.
3) Cal Am has not explained how excess Desal water will be injected into Seaside Basin via ASR Wells.
4) Four new extraction wells connected to new 36" pipe provide excess extraction capacity to tap into Seaside Basin (ASR, PWM, PWME, and Desal injected water)



SCHEMATIC 3: **Existing Conveyance** Plan with current MPWSP approval for **every June through November** time period ("Summer" or "ASR Extraction" Period) starting 1/1/2022

Existing Issues not Addressed in MPWSP approval:

1) No authorized Capacity for Desal water through 30" MCWD potable water pipe
2) Desal/Seaside Basin Water cannot flow past Forest Lake Reservoir to serve Carmel and Carmel Valley
3) Insufficient extraction capacity to tap into Seaside Basin for ASR, PWM, PWME, and Desal injected water

SCHEMATIC 4: **New** if PWME Project approved and New Forest Lake Pump/Lift Station CPUC GRC approved) for **every June through November** time period ("Summer" or "ASR Extraction" Period) starting 1/1/2022

1) New 36" pipeline allows Desal Water to bypass 30" MCWD potable water pipeline
2) New Forest Lake Pump-Lift Station allows Desal/Seaside Basin Water to move south past Forest Lake Reservoir to Carmel and Carmel Valley
3) Four new extraction wells connected to new 36" pipe provide excess extraction capacity to tap into Seaside Basin (ASR, PWM, PWME, and Desal injected water)

STATE OF CALIFORNIA
CALIFORNIA ENVIRONMENTAL PROTECTION AGENCY
STATE WATER RESOURCES CONTROL BOARD

DIVISION OF WATER RIGHTS

PERMIT FOR DIVERSION AND USE OF WATER

AMENDED PERMIT 20808A

Application 27614A of

Monterey Peninsula Water Management District and
California American Water
c/o Monterey Peninsula Water Management District
P.O. Box 85
Monterey, CA 93942-0085

filed on **December 16, 1982**, has been approved by the State Water Resources Control Board (State Water Board, Board or SWRCB) SUBJECT TO PRIOR RIGHTS and to the limitations and conditions of this permit.

Permittees are hereby authorized to divert and use water as follows:

1. Source of water

Source:	Tributary to:
(1) Carmel River	**Pacific Ocean**
(5-32) Carmel River Subterranean Stream	**Pacific Ocean**

within the County of **Monterey.**

2. Location of points of diversion, points of injection and points of recovery.

Points of Injection and Recovery (By California Coordinate System of 1983-Zone 4)	40-acre subdivision of public land survey or projection thereof	Section (Projected)	Township	Range	Base and Meridian
ASR-1 Injection & Recovery Well North 2,120,840 feet and East 5,734,970 feet	NE¼ of NE¼	23	15S	1E	MD
ASR-2 Injection & Recovery Well North 2,121,080 feet and East 5,735,250 feet	SE¼ of SE¼	14	15S	1E	MD

3. Purpose of use	4. Place of use	Section (Projected)	Township	Range	Base and Meridian	Acres
Municipal	Within the boundaries of Monterey Peninsula Water Management District					110,000

The points of diversion and place of use are shown on maps dated September 12, 2003 and filed with the State Water Board.

5. The water appropriated shall be limited to the quantity which can be beneficially used and shall not exceed **two thousand four hundred and twenty-six (2,426) acre-feet per annum** to be collected to underground storage in Seaside Groundwater Basin at a maximum instantaneous rate of **six and seven tenths (6.7) cubic feet per second** from **December 1** of each year to **May 31** of the succeeding year.

(0000005H)

6. The amount authorized for appropriation may be reduced in the license if investigation warrants.

(0000006)

7. Permittees' rights under this permit are junior to the rights of persons diverting water for reasonable beneficial use under valid and properly exercised riparian, overlying, and pre- and post-1914 appropriative claims of right which have a priority which is superior to the priority of Application 27614A.

(050T001)

8. Complete application of the water to the authorized use shall be made by December 1, 2020.

(0000009)

9. Progress reports shall be submitted promptly by Permittees when requested by the State Water Board until a license is issued.

(0000010)

10. Permittees shall allow representatives of the State Water Board and other parties, as may be authorized from time to time by said State Water Board, reasonable access to project works to determine compliance with the terms of this permit.

(0000011)

11. Pursuant to California Water Code sections 100 and 275, and the common law public trust doctrine, all rights and privileges under this permit and under any license issued pursuant thereto, including method of diversion, method of use, and quantity of water diverted, are subject to the continuing authority of the State Water Board in accordance with law and in the interest of the public welfare to protect public trust uses and to prevent waste, unreasonable use, unreasonable method of use, or unreasonable method of diversion of said water.

The continuing authority of the State Water Board may be exercised by imposing specific requirements over and above those contained in this permit with a view to eliminating waste of water and to meeting the reasonable water requirements of Permittees without unreasonable draft on the source. Permittees may be required to implement a water conservation plan, features of which may include but not necessarily be limited to (1) reusing or reclaiming the water allocated; (2) using water reclaimed by another entity instead of all or part of the water allocated; (3) restricting diversions so as to eliminate agricultural tailwater or to reduce return flow; (4) suppressing evaporation losses from water surfaces; (5) controlling phreatophytic growth; and (6) installing, maintaining, and operating efficient water measuring devices to assure compliance with the quantity limitations of this permit and to determine accurately water use as against reasonable water requirements for the authorized project. No action will be taken pursuant to this paragraph unless the State Water Board determines, after notice to affected parties and opportunity for hearing, that such specific requirements are physically and financially feasible and are appropriate to the particular situation.

The continuing authority of the State Water Board also may be exercised by imposing further limitations on the diversion and use of water by the Permittees in order to protect public trust uses. No action will be taken pursuant to this paragraph unless the State Water Board determines, after notice to affected parties and opportunity for hearing, that such action is consistent with California Constitution Article X, Section 2; is consistent with the public interest; and is necessary to preserve or restore the uses protected by the public trust.

(0000012)

12. The quantity of water diverted under this permit and under any license issued pursuant thereto is subject to modification by the State Water Board if, after notice to the Permittees and an opportunity for hearing, the State Water Board finds that such modification is necessary to meet water quality objectives in water quality control plans which have been or hereafter may be established or modified pursuant to Division 7 of the Water Code. No action will be taken pursuant to this paragraph unless the State Water Board finds that (1) adequate waste discharge requirements have been prescribed and are in effect with respect to all waste discharges which have any substantial effect upon water quality in the area involved, and (2) the water quality objectives cannot be achieved solely through the control of waste discharges.

(0000013)

13. This permit does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish & G. Code, §§ 2050 - 2097) or the federal Endangered Species Act (16 U.S.C.A. §§ 1531 - 1544). If a "take" will result from any act authorized under this water right, the Permittees shall obtain authorization for an incidental take prior to construction or operation of the project. Permittees shall be responsible for meeting all requirements of the applicable Endangered Species Act for the project authorized under this permit.

(0000014)

14. Permittees shall maintain records of the amount of water diverted and used to enable the State Water Board to determine the amount of water that has been applied to beneficial use pursuant to Water Code Section 1605.

(0000015)

15. This permit shall not be construed as conferring upon the Permittees right of access to the points of diversion.

(0000022)

16. Permittees shall consult with the Division of Water Rights and, within one year from the date of this permit, shall submit to the State Water Board their Urban Water Management Plan as prepared and adopted in conformance with Section 10610, et seq. of the California Water Code, supplemented by any additional information that may be required by the Board.

    All cost-effective measures identified in the Urban Water Management Plan and any supplements thereto shall be implemented in accordance with the schedule for implementation found therein.

(0000029A)

17. If it is determined after permit issuance that the as-built conditions of the project are not correctly represented by the map(s) prepared to accompany the application, Permittees shall, at their expense, have the subject map(s) updated or replaced with equivalent as-built maps(s). Said revision(s) or new map(s) shall be prepared by a civil engineer or land surveyor registered or licensed in the State of California and shall meet the requirements prescribed in section 715 and sections 717 through 723 of the California Code of Regulations, Title 23. Said revision(s) or map(s) shall be furnished upon request of the Chief, Division of Water Rights.

(0000030)

18. Permittees shall (1) install devices to measure the instantaneous rate and cumulative quantity of water diverted from the Carmel River and placed into underground storage and (2) install devices to measure the cumulative quantity of Carmel River water recovered from underground storage and placed to beneficial use. All measuring devices and the method of determining the quantity of water recovered from underground storage shall be approved by the State Water Board. All measuring devices shall be properly maintained.

(0060900) (0080900)

19. Permittees shall install, calibrate and maintain continuous flow measurement devices, satisfactory to the State Water Board, at the following locations in the Carmel River:

    a. Carmel River at the Highway 1 Bridge (River Mile (RM) 1.1)
    b. USGS Carmel River Near Carmel Gage (USGS 11143250; RM 3.2), maintained by USGS
    c. Carmel River at Sleepy Hollow Weir (RM 17.6)

    If any measuring device is rendered inoperative for any reason, all diversions under this permit shall cease until such time as the device is restored to service.

    In the event that the streamflow gage maintained by USGS is no longer available for streamflow measurements, Permittees (or successors-in-interest) are responsible for installing and maintaining an equivalent gage, satisfactory to the Chief, Division of Water Rights, as near as practicable to the present location of USGS near Carmel Gage. In the absence of such equivalent gage, all diversions must cease. These requirements shall remain in force as long as water is diverted by Permittees (or successors-in-interest) under any permit or license issued pursuant to Application 27614A.

(0060062BP) (0000204)

20. Within six months of the issuance of this permit, the Permittees shall submit a Compliance Plan for approval by the Chief of the Division of Water Rights that will demonstrate compliance with the flow bypass terms specified in this permit. The Compliance Plan shall include the following:

    a. A description of the gages and monitoring devices that have been or will be installed to measure streamflow and diversion to underground storage.
    b. A time schedule for the installation of these facilities.
    c. A description of the frequency of data collection and the methods for recording diversions, bypass flows and storage levels.
    d. An operation and maintenance plan that will be used to maintain gages and monitoring devices in good condition.

    The Permittees shall be responsible for all costs associated with developing the Compliance Plan, and installing and maintaining all monitoring facilities described in the Compliance Plan.

    The monitoring data shall be maintained by the Permittees for ten years from the date of collection and made available to the Chief of the Division of Water Rights upon request. Any non-compliance with the terms of the permit shall be reported by the Permittees promptly to the Chief of the Division of Water Rights.

    (0000070)

21. The priority of this permit shall be junior to any permit issued on the applications set forth in Table 13 of Decision 1632 or for the persons named in Table 13 of Decision 1632 for an amount of water not to exceed the quantity set forth in the column titled *"Quantity Reserved by SWRCB For Future Appropriations"*, or as modified in accordance with the procedures set forth in Decision 1632, Permit Condition 10.

    (0500800)

22. Permittees shall implement the Riparian Corridor Management Program outlined in the Monterey Peninsula Water Management District's November 1990 Water Allocation Mitigation Program until Application 27614A is licensed. Survey data and analysis of results shall be submitted annually to the California Department of Fish and Game for review and comment.

    (0490500)

23. For the protection of fisheries, wildlife, and other instream uses in the Carmel River, diversions under this permit shall be subject to maintenance of minimum mean daily instream flows, as agreed upon by the Permittees and the California Department of Fish and Game and National Marine Fisheries Service and stated in the document entitled, "Proposed Changes to Current Permit Conditions". Minimum mean daily instream flows are specified in Table A, required Ramp-Down flows are specified in Table B, and water year types for use with Tables A and B are specified in Table C. No water shall be diverted under this permit if the instream flows determined using Tables A, B and C are or would be reduced by such diversion below the designated rates. To ensure compliance with these conditions, by September 30 of each year, Permittees shall file a report with the Chief, Division of Water Rights, California Department of Fish and Game and National Marine Fisheries Service containing the following information:

    a. Dates during the previous period of December 1 to May 31 of the succeeding year when water was diverted under this permit; and
    b. Mean daily flows recorded at the three monitoring locations specified in Condition 20 during the same period.

    Water year types defined in Table C, Carmel River Water Supply Index, may be amended from time to time to include the most recent available hydrologic data. For the purpose of amending water year types in Table C, Permittees shall submit to the Chief, Division of Water Rights, a request to approve revisions to criteria to define normal or better, below normal, dry and critically dry year types.

    (0400500)

24. Until the project authorized by this permit becomes fully operational, Permittees shall continue to negotiate with California Department of Fish and Game to maintain, insofar as possible a minimum 5 cfs bypass flow below San Clemente Dam as measured at the Sleepy Hollow Weir.

(0400500)

25. To prevent stranding of spring and fall steelhead juveniles and smolts during critically dry conditions, Permittees shall continue to implement the Fisheries Mitigation Measure 4 outlined in the Monterey Peninsula Water Management District's November 1990 Water Allocation Mitigation Program ("Rescue juveniles downstream of Robles del Rio in Summer").

(0400500)

26. Permittees shall, in consultation with California Department of Fish and Game conduct studies to determine the effectiveness of fish rescue operations specified in the Monterey Peninsula Water Management District's November 1990 Water Allocation Mitigation Program. The results shall be submitted to the Chief, Division of Water Rights, for review and approval.

(0400500)

27. Permittees shall implement the Lagoon Mitigation Program outlined in the Monterey Peninsula Water Management District's November 1990 Water Allocation Mitigation Program. Annual reports shall be submitted to the California Department of Parks and Recreation, California Department of Fish and Game, and the Chief, Division of Water Rights for review.

(0400500)

28. No work shall commence and no water shall be diverted, stored or used under this permit until a copy of a stream or lake alteration agreement between the State Department of Fish and Game and the Permittees is filed with the Division of Water Rights. Compliance with the terms and conditions of the agreement is the responsibility of the Permittees. If a stream or lake agreement is not necessary for this permitted project, the Permittees shall provide the Division of Water Rights a copy of a waiver signed by the California Department of Fish and Game.

(0000063)

29. Permittees shall maintain in good working order all riparian irrigation systems owned or operated by Permittees under the Monterey Peninsula Water Management District's Water Allocation Program Environmental Impact Report, 5-Year Mitigation Program (November 1990) for use as needed during dry and critically dry water years.

This permit is issued and Permittees take it subject to the following provisions of the Water Code:

Section 1390. A permit shall be effective for such time as the water actually appropriated under it is used for a useful and beneficial purpose in conformity with this division (of the Water Code), but no longer.

Section 1391. Every permit shall include the enumeration of conditions therein which in substance shall include all of the provisions of this article and the statement that any appropriator of water to whom a permit is issued takes it subject to the conditions therein expressed.

Section 1392. Every permittee, if he accepts a permit, does so under the conditions precedent that no value whatsoever in excess of the actual amount paid to the State therefore shall at any time be assigned to or claimed for any permit granted or issued under the provisions of this division (of the Water Code), or for any rights granted or acquired under the provisions of this division (of the Water Code), in respect to the regulation by any competent public authority of the services or the price of the services to be rendered by any permittee or by the holder of any rights granted or acquired under the provisions of this division (of the Water Code) or in respect to any valuation for purposes of sale to or purchase, whether through condemnation proceedings or otherwise, by the State or any city, city and county, municipal water district, irrigation district, lighting district, or any political subdivision of the State, of the rights and property of any permittee, or the possessor of any rights granted, issued, or acquired under the provisions of this division (of the Water Code).

STATE WATER RESOURCES CONTROL BOARD

for James W. Kassel
Victoria A. Whitney, Chief
Division of Water Rights

Date: NOV 30 2007

TABLE A

MINIMUM MEAN DAILY INSTREAM FLOW REQUIREMENTS *(see Condition 23)*

Fall December 1- December 15	Winter December 16-April 15	Spring April 16-May 31
<u>All Water Year Types</u>[1] May divert with minimum bypass of **40** cfs at the Highway 1 gage.	<u>Normal or Better and Below Normal Water Years</u>[1] **For Normal or Better and Below Normal Water Years, an Attraction Day is defined as:** Estimated unimpaired flow[2] at the Highway 1 gage of **200** cfs or greater. **Prior to First Attraction Day:** Continue December 1-15 bypass flows. **During Attraction Day(s):** Bypass sufficient flow to maintain **200** cfs at the Highway 1 gage. **Following Attraction Day(s):** Ramp down bypass flows as indicated on Table B. Following the ramp-down period, bypass **90** cfs throughout the reach[3] between the Sleepy Hollow Weir gage and the USGS Near Carmel gage, and **60** cfs throughout the reach[3] between the USGS Near Carmel gage and the Highway 1 gage.	<u>All Water Year Types</u>[1] Bypass **80** cfs throughout the reach[3] between Sleepy Hollow Weir gage and the Highway 1 gage.
	<u>Dry and Critically Dry Water Years</u>[1] **For Dry and Critically Dry Water Years, an Attraction Day is defined as:** Estimated unimpaired flow[2] at the Highway 1 gage of **200** cfs or greater in January, **100** cfs or greater in February, and **75** cfs or greater in March. **Prior to First Attraction Day:** Continue December 1-15 bypass flows. **During Attraction Day(s):** Bypass sufficient flow to maintain **150** cfs at the Highway 1 gage. **Following Attraction Day(s):** Ramp down bypass flows as indicated on Table B. Following the ramp-down period, bypass the same as for wet, normal, and below normal water years.	

1 Water Year types are as specified in Table C.

2 For purposes of Table A, "estimated unimpaired flow" shall be defined as the measured mean daily flow at the specified gage plus the mean daily diversion by California American Water from the Carmel River and underlying alluvial aquifer upstream of that gage during the preceding five days.

3 Maintaining the specified flow at both the upper and lower gage associated with the specified reach is sufficient evidence that the rate is maintained throughout the entire reach. In the case of bypass flow required throughout the reach between the Sleepy Hollow Weir and Highway 1 gages from April 16 to May 31, the required bypass flow must also be maintained at the USGS near Carmel gage.

Source: Table A is based on Table 9 in Instream Flow Needs for Steelhead in the Carmel River, Bypass Flow Recommendations for Water Supply Projects Using Carmel River Waters, National Marine Fisheries Service, Southwest Region – Santa Rosa Field Office, June 3, 2002, page 32.

TABLE B
Carmel River Bypass Flows - "Ramp-Down" Flows

Minimum Mean Daily Instream Flows Following an Attraction Day or Days
(All Values in Cubic Feet Per Second)

	Between MPWMD Sleepy Hollow Gage and USGS Near Carmel Gage		Between USGS Near Carmel Gage and MPWMD Highway 1 Gage	
Days	Normal or Better and Below Normal Water Years	Dry and Critically Dry Water Years	Normal or Better and Below Normal Water Years	Dry and Critically Dry Water Years
0	200	150	200	150
1	175	125	175	125
2	150	100	150	100
3	125	90	125	80
4	90	90	100	60
5	90	90	80	60
6	90	90	60	60

Source: *Instream Flow Needs for Steelhead in the Carmel River, Bypass Flow Recommendations for Water Supply Projects Using Carmel River Waters*, National Marine Fisheries Service, Southwest Region - Santa Rosa Field Office, June 3, 2002, page 15.

Note: "Day 0" refers to an Attraction Day or Days. "Day 1" refers to the first day after an Attraction Day or Days. See Table A for the definition of an Attraction Day.

TABLE C
Carmel River Water Supply Index

Cumulative Unimpaired Carmel River Flow at the Sleepy Hollow Weir Site in Acre-Feet

Period	Water Year Type: Normal or Better	Below Normal	Dry	Critically-Dry
Oct	> 300	300 - 100	99 - 1	0
Oct - Nov	> 1,000	1,000 - 500	499 - 300	< 300

Oct - Sep	> 50,700	50,700 - 27,400	27,399 - 14,900	< 14,900

Expected Unimpaired Carmel River Flow at the Sleepy Hollow Weir Site in Acre-Feet Assuming 75% Reliability

Period	Water Year Type: Normal or Better	Below Normal	Dry	Critically-Dry
Nov - Sep	50,400	34,000	25,000	21,000
Dec - Sep	43,000	27,000	17,500	14,900
Jan - Sep	36,000	22,300	12,200	10,000
Feb - Sep	29,000	17,300	9,000	7,000
Mar - Sep	21,500	11,275	6,000	3,400
Apr - Sep	13,000	5,850	3,250	1,575
May - Sep	5,000	2,500	1,425	800
Jun - Sep	2,000	900	625	400
Jul - Sep	600	300	300	300
Aug - Sep	200	200	200	200
Sep	100	100	100	100

Notes:

1. "Cumulative" and "Expected" water year types are derived from the daily unimpaired flow record at the Sleepy Hollow Weir site simulated by the Monterey Peninsula Water Management District for Water Years 1902 through 1996.
2. Water Year types are based on selected exceedance frequencies. "Normal or Better" refers to flows that are equaled or exceeded 50% of the time. "Below Normal" refers to flows that are exceeded between 50% and 75% of the time. "Dry" refers to flows that are exceeded between 75% and 87.5% of the time. "Critically Dry" refers to flows that are exceeded 87.5% of the time.
3. The Water Supply Index shall incorporate a daily timestep so that it can be updated on a daily basis.

STATE OF CALIFORNIA
CALIFORNIA ENVIRONMENTAL PROTECTION AGENCY
STATE WATER RESOURCES CONTROL BOARD

DIVISION OF WATER RIGHTS

AMENDED PERMIT FOR DIVERSION AND USE OF WATER

APPLICATION 27614C PERMIT 20808C

of: Monterey Peninsula Water Management District and
California American Water
c/o Monterey Peninsula Water Management District
P.O. Box 85
Monterey, CA 93942-0085

The amended permit is being issued in accordance with the redelegations of authority (Resolution No. 2007-0057.) Therefore, an amended permit on **Application 27614C** filed on **December 16, 1982** has been approved by the State Water Board SUBJECT TO PRIOR RIGHTS and to the limitations and conditions of this amended permit

Permittees are hereby authorized to divert and use water as follows:

1. Source of water

Source:	Tributary to:
(1) Carmel River	**Pacific Ocean**
(5-32) Carmel River Subterranean Stream	**Pacific Ocean**

within the County of **Monterey.**

2. Location of points of diversion, points of injection and points of recovery.

Points of Diversion to Offstream Storage (By California Coordinate System of 1983-Zone 4)	40-acre subdivision of public land survey or projection thereof	Section (Projected)	Township	Range	Base and Meridian
(1) San Clemente Dam: North 2,053,010 feet and East 5,765,040 feet	**NW¼ of SW¼**	**24**	**17S**	**2E**	**MD**
(5) Canada Well: North 2,092,010 feet and East 5,715,190 feet	**NE¼ of SW¼**	**17**	**16S**	**1E**	**MD**

3. Purpose of use	4. Place of use	Section (Projected)	Township	Range	Base and Meridian	Acres
Municipal	**Within the boundaries of Monterey Peninsula Water Management District**					**110,000**

The points of diversion and place of use are shown on maps dated June 2008 and filed with the State Water Board.

The following acronyms are used in this permit:

Monterey Peninsula Water Management District – MPWMD or Permittee
National Marine Fisheries Service – NMFS
California Department of Fish and Game – DFG
California American Water – Cal-Am

5. The water appropriated shall be limited to the quantity which can be beneficially used and shall not exceed **two thousand nine hundred (2,900) acre-feet per a**nnum to be collected to underground storage in Seaside Groundwater Basin at a maximum instantaneous rate of **eight (8.0) cubic feet per second** from December 1 of each year to May 31 of the succeeding year.

(0000005H)

6. Permittees' rights under this permit are junior to the rights of persons diverting water for reasonable beneficial use under valid and properly exercised riparian, overlying, and pre- and post-1914 appropriative claims of right which have a priority which is superior to the priority of Application 27614C.

(050T001)

7. Complete application of the water to the authorized use shall be made by December 1, 2020.

(0000009)

8. This permit shall not be construed as conferring upon the permittees right of access to the points of diversion.

(0000022)

9. Cal-Am shall consult with the Division of Water Rights and, within one year from the date of this permit, shall submit to the State Water Board its Urban Water Management Plan as prepared and adopted in conformance with Section 10610, et seq. of the California Water Code, supplemented by any additional information that may be required by the Board.

   All cost-effective measures identified in the Urban Water Management Plan and any supplements thereto shall be implemented in accordance with the schedule for implementation found therein.

(0000029A)

10. If it is determined after permit issuance that the as-built conditions of the project are not correctly represented by the map(s) prepared to accompany the application, permittees shall, at their expense, have the subject map(s) updated or replaced with equivalent as-built maps(s). Said revision(s) or new map(s) shall be prepared by a civil engineer or land surveyor registered or licensed in the State of California and shall meet the requirements prescribed in section 715 and sections 717 through 723 of the California Code of Regulations, Title 23. Said revision(s) or map(s) shall be furnished upon request of the Deputy Director for Water Rights.

(0000030)

11. Permittees shall (1) install devices to measure the instantaneous rate and cumulative quantity of water diverted from the Carmel River and placed into underground storage and (2) install devices to measure the cumulative quantity of Carmel River water recovered from underground storage and placed to beneficial use. All measuring devices and the method of determining the quantity of water recovered from underground storage shall be approved by the State Water Board. All measuring devices shall be properly maintained.

(0060900) (0080900)

12. Permittees shall calibrate and maintain, a continuous flow measurement device, satisfactory to the State Water Board, at Carmel River at Highway 1 Bridge (River Mile 1.1)

    If any measuring device is rendered inoperative for any reason, all diversions under this permit shall cease until such time as the device is restored to service.

    These requirements shall remain in force as long as water is diverted by permittees (or successors-in-interest) under any permit or license issued pursuant to Application 27614C.

    (0060062BP) (0000204)

13. Within six months of the issuance of this permit, the permittees shall submit a Compliance Plan for approval by the Deputy Director for Water Rights that will demonstrate compliance with the flow bypass terms specified in this permit. The Compliance Plan shall include the following:

    a. A description of the gages and monitoring devices that will be installed or have been installed to measure stream flow and diversion to underground storage.
    b. A time schedule for installation of these facilities.
    c. A description of the frequency of data collection and the methods for recording diversions, bypass flows and storage levels.
    d. An operation and maintenance plan that will be used to maintain gages and monitoring devices in good condition.

    The permittees shall be responsible for all costs associated with developing the Compliance Plan, and installing and maintaining all monitoring facilities described in the Compliance Plan.

    The monitoring data shall be maintained by the permittees for ten years from the date of collection and made available to the Deputy Director for Water Rights, upon request. Any non-compliance with the terms of the permit shall be reported by the permittees promptly to the Deputy Director for Water Rights.

    (0000070)

14. The priority of this permit shall be junior to any permit issued on the applications set forth in Table 13 of Decision 1632 or for the persons named in Table 13 of Decision 1632 for an amount of water not to exceed the quantity set forth in the column titled *"Quantity Reserved by SWRCB for Future Appropriations,"* or as modified in accordance with the procedures set forth in Decision 1632, Permit Condition 10.

    (0500800)

15. Permittees shall implement the Riparian Corridor Management Program outlined in the MPWMD's November 1990 Water Allocation Mitigation Program until Application 27614C is licensed. Survey data and analysis of results shall be submitted annually to DFG for review and comment.

    (0490500)

16. For the protection of fisheries, wildlife, and other instream uses in the Carmel River, diversions under this permit shall be subject to maintenance of minimum mean daily instream flows as specified in Table A, Minimum Mean Daily Instream Flow Requirements. No water shall be diverted under this permit if the instream flows would be reduced by such diversion below the minimum mean daily flows specified in Table A. To ensure compliance with these conditions, by September 30 of each year, Permittees shall file a report with the Deputy Director for Water Rights, DFG and NMFS containing the following information:

    a. Dates during the previous period of December 1 to May 31 of the succeeding year when water was diverted under this permit; and
    b. Mean daily flows recorded at the Carmel River at Highway 1 Bridge gage.

TABLE A	
MINIMUM MEAN DAILY INSTREAM FLOW REQUIREMENTS	
December 1-April 15	**April 16-May 31**
Prior to Carmel River lagoon opening to the ocean [1]: May divert with minimum bypass of **40 cfs** at the Carmel River at Highway 1 Bridge gage. **Following Carmel River lagoon opening to the ocean:** May divert with minimum bypass of **120 cfs** at the Carmel River at Highway 1 Bridge gage.	May divert with minimum bypass of **80 cfs** at the Carmel River at Highway 1 Bridge gage.

[1] On December 1, if water in the lagoon is flowing to the ocean, the lagoon shall be deemed to be open to the ocean. If on December 1 water in the lagoon is not flowing to the ocean, the lagoon shall be deemed to be open to the ocean when the lagoon level drops rapidly from a stable elevation to a lower elevation as evidenced by the water surface elevation gage located at the Carmel Area Wastewater District effluent pipeline across the south arm of the lagoon. This elevation gage is operated by Monterey Peninsula Water Management District.

(0400500)

17. Until the project authorized by this permit becomes fully operational, permittees shall continue to negotiate with DFG to maintain, insofar as possible, a minimum 5 cubic feet per second bypass flow below San Clemente Dam as measured at the Sleepy Hollow weir.

(0400500)

18. To prevent stranding of spring and fall steelhead juveniles and smolts during critically dry conditions, permittees shall continue to implement Fisheries Mitigation Measure 3 as outlined in the MPWMD's November 1990 Water Allocation Mitigation Program ("Rescue juveniles downstream of Robles del Rio in summer").

(0400500)

19. Permittees shall, in consultation with DFG, conduct studies to determine the effectiveness of fish rescue operations specified in the MPWMD's November 1990 Water Allocation Mitigation Program. The results shall be submitted to the Deputy Director for Water Rights, for review and approval.

(0400500)

20. Permittees shall implement the Lagoon Mitigation Program outlined in the MPWMD's November 1990 Water Allocation Mitigation Program. Annual reports shall be submitted to the Department of Parks and Recreation, DFG, and the Deputy Director for Water Rights for review.

(0400500)

21. Permittees shall maintain in good working order all riparian irrigation systems owned or operated by permittees under the MPWMD's November 1990 Water Allocation Mitigation Program for use as needed during dry and critically dry water years.

(0400500)

22. Recovery of Stored Water: Not later than June 1 of each year, the amount of water to be recovered from groundwater storage during that year's June 1 through November 30 period shall be determined by permittees, in consultation with DFG and NMFS, using the following procedures.

    a. The maximum amount for recovery each year (pumping of water previously diverted from the Carmel River and injected in the Seaside Groundwater Basin) was determined to be 1,500 acre-feet, using the logic developed for the computer simulation made by MPWMD's Carmel Valley Simulation (CVSIM) model. In any year, an alternative recovery amount may be agreed upon by permittees, DFG, and NMFS. The selected recovery amount shall be deemed the "Determined Recovery Amount."

    b. To the maximum extent operationally feasible, during each recovery season, permittees shall use their best efforts to recover the Determined Recovery Amount.

    c. Each year at the end of the injection season, the amount of water injected into the Seaside Basin during the current injection season shall be calculated. If this amount equals or exceeds the Determined Recovery Amount, then the Determined Recovery Amount shall be recovered. Any water injected during the current injection season that is in excess of the Determined Recovery Amount shall be added to "Carryover Storage."

    d. If the total amount of water injected during the current injection season is less than the Determined Recovery Amount, and the Carryover Storage from previous injection seasons is sufficient to make up the difference, then the Determined Recovery Amount shall be recovered. In this case, water from Carryover Storage shall be produced to supplement water injected during the current injection season to meet the Determined Recovery Amount. Any water that is produced from Carryover Storage to meet the Determined Recovery Amount shall be subtracted from Carryover Storage.

    e. If the total amount of water injected during the current injection season is less than the Determined Recovery Amount, and the Carryover Storage from previous injection seasons is insufficient to make up the difference, then the Determined Recovery Amount cannot be met. Instead, the amount of water recovered that year will be the total amount injected during the current injection season plus the total amount of Carryover Storage, if any, from previous injection seasons.

    f. Following the above decisions, if the amount of water stored by injection in the Seaside Groundwater Basin exceeds 7,200 acre-feet on June 1, the amount in excess of 7,200 acre-feet shall be added to the amount available for recovery that year.

    g. The actual amount of water produced from storage for recovery each year shall be uniformly distributed over the recovery season, unless modified and agreed upon by permittees, DFG, and NMFS.

    h. The water produced by permittees from the Aquifer Storage and Recovery (ASR) wells will be used to offset production from the Carmel River that would otherwise occur during the low-flow season. In any year that ASR water is recovered and delivered to the California American Water Company (Cal-Am) distribution system, Cal-Am shall, to the maximum extent operationally feasible, reduce water diversion from its Carmel River sources. The amount of ASR water that is recovered each year shall be subtracted from Cal-Am's total annual diversion allowance from its Carmel River sources in excess of Cal-Am's recognized rights. This condition shall sunset when the Deputy Director of Water Rights concurs in writing that Cal-Am has obtained a permanent supply of water that has been substituted for water diverted in excess of Cal-Am's recognized rights pursuant to Condition No. 11 of Order WR 2009-0060.

i. The following procedures will be implemented to facilitate cooperative compliance monitoring of the reductions in dry season (June-November) diversions from the Carmel River Aquifer that will be offset by utilizing water recovered from the ASR wells:

1) Cal-Am will provide copies by e-mail of its weekly "Carmel Valley & Seaside Production Report" to one designated contact each for DFG and NMFS.
2) This e-mail report will show daily values in acre-feet of the water produced from each source, vs. daily targets. These daily targets are derived from the monthly production targets developed as part of the Cal-Am/MPWMD Quarterly Water Budget process.
3) If the amount of water produced differs significantly from daily targets for more than two weeks, the designated DFG or NMFS contact can choose to call for the four parties to meet and confer on ongoing Cal-Am operations during the first five business days of the succeeding month.

In any case, these production numbers are and will continue to be reviewed as part of the Cal-Am/MPWMD Quarterly Water Budget process, which includes two regularly scheduled quarterly meetings during the dry season between permittees, DFG, and NMFS. DFG's and NMFS' ability to call for a monthly meeting to review Cal-Am's patterns of production for compliance with the intended offset of Carmel River Aquifer diversions by production from the ASR wells, will be in addition to the regularly-scheduled Quarterly Water Budget Meetings.

(0080900)

ALL PERMITS ISSUED BY THE STATE WATER BOARD ARE SUBJECT TO THE FOLLOWING TERMS AND CONDITIONS:

A. The amount authorized for appropriation may be reduced in the license if investigation warrants.

(0000006)

B. Progress reports shall be submitted promptly by permittees when requested by the State Water Board until a license is issued.

(0000010)

C. Permittees shall allow representatives of the State Water Board and other parties, as may be authorized from time to time by said State Water Board, reasonable access to project works to determine compliance with the terms of this permit.

(0000011)

D. Pursuant to California Water Code sections 100 and 275, and the common law public trust doctrine, all rights and privileges under this permit and under any license issued pursuant thereto, including method of diversion, method of use, and quantity of water diverted, are subject to the continuing authority of State Water Board in accordance with law and in the interest of the public welfare to protect public trust uses and to prevent waste, unreasonable use, unreasonable method of use, or unreasonable method of diversion of said water.

The continuing authority of the State Water Board may be exercised by imposing specific requirements over and above those contained in this permit with a view to eliminating waste of water and to meeting the reasonable water requirements of permittees without unreasonable draft on the source. Permittees may be required to implement a water conservation plan, features of which may include but not necessarily be limited to (1) reusing or reclaiming the water allocated; (2) using water reclaimed by another entity instead of all or part of the water allocated; (3) restricting diversions so as to eliminate agricultural tailwater or to reduce return flow; (4) suppressing evaporation losses from water surfaces; (5) controlling phreatophytic growth; and (6) installing, maintaining, and operating efficient water measuring devices to assure compliance with the quantity limitations of this permit and to determine accurately water use as against reasonable water requirements for the authorized project. No action will be taken pursuant to this

paragraph unless the State Water Board determines, after notice to affected parties and opportunity for hearing, that such specific requirements are physically and financially feasible and are appropriate to the particular situation.

The continuing authority of the State Water Board also may be exercised by imposing further limitations on the diversion and use of water by the permittees in order to protect public trust uses. No action will be taken pursuant to this paragraph unless the State Water Board determines, after notice to affected parties and opportunity for hearing, that such action is consistent with California Constitution Article X, Section 2; is consistent with the public interest; and is necessary to preserve or restore the uses protected by the public trust.

(0000012)

E. The quantity of water diverted under this permit and under any license issued pursuant thereto is subject to modification by the State Water Board if, after notice to the permittees and an opportunity for hearing, the State Water Board finds that such modification is necessary to meet water quality objectives in water quality control plans which have been or hereafter may be established or modified pursuant to Division 7 of the Water Code. No action will be taken pursuant to this paragraph unless the State Water Board finds that (1) adequate waste discharge requirements have been prescribed and are in effect with respect to all waste discharges which have any substantial effect upon water quality in the area involved, and (2) the water quality objectives cannot be achieved solely through the control of waste discharges.

(0000013)

F. This permit does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish & G. Code, §§ 2050 - 2097) or the federal Endangered Species Act (16 U.S.C.A. §§ 1531 - 1544). If a "take" will result from any act authorized under this water right, the permittees shall obtain authorization for an incidental take prior to construction or operation of the project. Permittees shall be responsible for meeting all requirements of the applicable Endangered Species Act for the project authorized under this permit.

(0000014)

G. Permittees shall maintain records of the amount of water diverted and used to enable the State Water Board to determine the amount of water that has been applied to beneficial use pursuant to Water Code Section 1605.

(0000015)

H. No work shall commence and no water shall be diverted, stored or used under this permit until a copy of a stream or lake alteration agreement between the State Department of Fish and Game and the permittees is filed with the Division of Water Rights. Compliance with the terms and conditions of the agreement is the responsibility of the permittees. If a stream or lake agreement is not necessary for this permitted project, the permittees shall provide the Division of Water Rights a copy of a waiver signed by the State Department of Fish and Game.

(0000063)

This permit is issued and permittees take it subject to the following provisions of the Water Code:

Section 1390. A permit shall be effective for such time as the water actually appropriated under it is used for a useful and beneficial purpose in conformity with this division (of the Water Code), but no longer.

Section 1391. Every permit shall include the enumeration of conditions therein which in substance shall include all of the provisions of this article and the statement that any appropriator of water to whom a permit is issued takes it subject to the conditions therein expressed.

Section 1392. Every permittee, if he accepts a permit, does so under the conditions precedent that no value whatsoever in excess of the actual amount paid to the State therefor shall at any time be assigned to or claimed for any permit granted or issued under the provisions of this division (of the Water Code), or for any rights granted or acquired under the provisions of this division (of the Water Code), in respect to the regulation by any competent public authority of the services or the price of the services to be rendered by any permittee or by the holder of any rights granted or acquired under the provisions of this division (of the Water Code) or in respect to any valuation for purposes of sale to or purchase, whether through condemnation proceedings or otherwise, by the State or any city, city and county, municipal water district, irrigation district, lighting district, or any political subdivision of the State, of the rights and property of any permittee, or the possessor of any rights granted, issued, or acquired under the provisions of this division (of the Water Code).

STATE WATER RESOURCES CONTROL BOARD

James W. Kassel

for *Barbara Evoy, Deputy Director*
Division of Water Rights

Dated: NOV 30 2011

Open Letter to Tom Luster and the California Coastal Commission

Dear Mr. Luster:

As you may know, Water Plus has hosted weekly meetings since 2010 on our local water-supply problems. In addition to Water Plus, attendees at these meetings include members of Public Water Now and Citizens for Just Water. Because of the pandemic, we are now meeting by conference call every other week. At this morning's meeting, one of our major concerns was the possibility that your staff might recommend a 4.8 mgd desal project instead of the expansion of Pure Water Monterey. I am writing you now to address that concern.

We perceive the California Coastal Commission, the California Public Utilities Commission, and the State Water Resources Control Board as three state behemoths that might reach a settlement leaving each one a little unhappy but the powerless Monterey Peninsula residential ratepayers extremely unhappy, particularly if the settlement is for the 4.8 mgd over the Pure Water Monterey Expansion option. I hardly need to say that the choice of 4.8 mgd would not resolve the issue of environmental injustice, which is of great concern to the Coastal Commission. That being said, we seldom know whether our voices are seriously heard.

Our experience with the Coastal Commission in this regard has been more positive than it has been with the other two state agencies. I particularly thank you for your evident acceptance of our local argumenta on supply and demand, a smaller desal option being considered in the updated Weiss report. Now, I ask that you consider impacts on the environment of the 4.8 mgd option.

The MPWSP EIR does not include that option as one of its alternative projects. That is important because the exclusion of PWM Expansion as an alternative in the EIR is a reason the CPUC has resisted its consideration as a supply option. If a supplemental EIR includes one of the two options, it should also include the other, and in that event PWM Expansion would prevail on the issue of environmental justice.

It would also prevail on the issue of environmental impact. Perhaps the strongest argument I could make in support of that assertion is to share with you the report made by the hydrogeological consultant I hired to help me, as a statistician, locate the source of statistical data anomalies I found in the MPWSP EIR.

The source was the alteration of "parameter" values, especially horizontal and vertical conductivity, to improve the fit of the NMGWM model to data. The alteration of these parameters was so extreme that, according to my consultant, it made the model all but impervious to the recharge effects of the Salinas River and other surface-water sources, particularly on the Dune Sand Aquifer, perhaps the primary source of water for the MPWSP.

My consultant begins the conclusion of her report with this statement: "The MPWSP proposes slant well pumping to replace freshwater aquifers with seawater as a supply for the desalination plant. " That statement applies equally to the 4.8 mgd and the 6.4 mgd options. That statement alone should disqualify both of them.

If Geoscience or HydroFocus had used an inversion process in its model calibration, the result would not have produced the -.45 correlation (which should have been zero) between estimates and errors that alerted me to the data problem. I do not know whether Weiss used an inversion process in model calibration though his report mentions a number of them. I hope he did. Its use would have avoided many of the problems of the Geoscience and HydroFocus versions of the NMGWM model.

I trust this information proves helpful to you as you revise your staff recommendations to the Coastal Commission.

Respectfully,

Ron Weitzman

President, Water Ratepayers Association of the Monterey Peninsula (aka Water Plus)

1.0 Introduction

1.1 GeoHydroScience Objective

Modeling is essential for accurate prediction of the environmental impact of proposed slant well pumping in the California-American Water Company (Cal Am) Monterey Peninsula Water Supply Project (MPWSP). That project underwent two draft environmental impact reports (EIRs), one in 2015 and one in 2017.[1] Each report contained an appendix on modeling identified as Appendix E2. The first was prepared by Geoscience Support Services, Inc. (Geoscience) and the second by HydroFocus Inc. (HydroFocus), collectively referred to as the consultants. I have been informed by Dr. Ron Weitzman, president of Water Plus, a party to the proceeding on MPWSP, of the following:[2]

> The second Appendix E2 (H-E2) was created at least partly in response to critical comments on the first (G-E2) by Dr. Weitzman. The final project EIR contained H-E2 and a chapter (Chapter 6) consisting of responses to critical comments on the second draft, including comments by Dr. Weitzman on H-E2. According to Dr. Weitzman, the California Public Utilities Commission has not held any evidentiary hearings on the second draft or the Chapter 6 responses in the final EIR. Because Dr. Weitzman considers the EIR modeling to be seriously inadequate, as well as professionally uncontested, he has filed a lawsuit challenging the usefulness of the EIR to determine the environmental impact of MPWSP.

Under these circumstances, for assistance in that suit, Dr Ron Weitzman has hired Barbara Ford, PE[3] of GeoHydroScience llc, as an expert in hydrogeology and modeling to review both G-E2 and H-E2, and write a report critiquing the modeling described in them.

1.2 Information Reviewed

Because of the short timeframe as a consequence of Dr. Weitzman's communicated difficulty in acquiring assistance in California due to conflicts of interest, my review was necessarily limited to only the documents identified below:

---

[1] Communication with Dr. Weitzman on August 8, 2019.

[2] Ibid.

[3] Barbara Ford, author of this report, is a licensed Professional Engineer in Colorado.

- Water Ratepayers Association of the Monterey Peninsula and the State of California Amended Complaint for Damages and Civil Penalty and Demand for Jury Trial, Case No.:16CV001561, Draft April 12, 2019.
- Geoscience Support Services, Inc. April 17, 2015. Appendix E2 Monterey Peninsula Water Supply Project Groundwater Modeling and Analysis. Prepared for California American Water and Environmental Science Associates. It includes Appendix A - Luhdorff and Scalmanini, Consulting Engineers, March 2015. Monterey Peninsula Water Supply Project Using the Salinas Valley Integrated Ground and Surface Water Model. Prepared for Geoscience.

- HydroFocus, Inc., August 31, 2017. Appendix E2 North Marina Groundwater Model Review, Revision, and Implementation for Slant Well Pumping Scenarios. Prepared for Cal Am Monterey Peninsula Water Supply Project.

1.3 Information Not Reviewed

Of significance to this review, there is additional information that has not been reviewed for the reason stated. The following is a partial list of items not reviewed.

- Data and data analysis reports
- Source data
- Model files
- CEMEX model report and files
- Responses to Comments to the Final Environmental Impact Report

Accordingly, my report can only assess the model based on the information reviewed, together with weighing that information across the reports and against standard modeling practice, as appropriate.

The last item in the list, Responses to Comments, was made available to me on July 26, late in my review and only just prior to report preparation. While time did not allow for sufficient review of that document, I was able to identify that some concerns by other reviewers similar to my own were addressed to an unknown extent by the consultants (because of my limited time not allowing for a comprehensive review). To the extent that the consultants' comments have not adequately addressed, mitigated or corrected each of the items described in this report, my opinions on that particular item remain relevant.

2.0 Model

2.1 Reliance on Salinas Valley Integrated Ground and Surface Water model (SVIGSM)

The Geoscience modeling relied on an updated calibration of the SVIGSM model by its subcontractor, Luhdorff and Scalmanani, Consulting Engineers (LSCE). Geoscience extracted a portion of the area of the SVIGSM model to construct the North Marina Ground Water Model (NMGWM) and adapted it to estimate the drawdown impacts to the aquifer system resulting from proposed slant well pumping along the coast at the CEMEX site and the Potrero Road site. HydroFocus adopted the Geoscience model, adjusted parameter values among other revisions to produce a calibrated model, concluded that the NMGWM boundary conditions, pumping and recharge were in error and instead relied on superposition to predict drawdown from proposed slant well pumping.

The LSCE focus was as follows (excerpt from LSCE, p.1):

> This report focuses on documenting the extension and recalibration of the SVIGSM along with the predictive scenario results of the MPWSP generated by the SVIGSM with a focus on the influence the MPWSP has on Salinas River streamflow and interaction with underlying groundwater aquifers in the Pressure and East Side subareas of the Salinas Valley.

2.2 Limitations in SVIGSM Calibration

LSCE identified the methodology employed to update the SVIGSM calibration. Of significance, primarily because of the subsequent reliance on SVIGSM water levels for assignment of boundary conditions in NMGWM, the LSCE calibration was necessarily limited to only revising and updating system stresses including aquifer recharge and discharge, but excluded updating of the aquifer properties[4] because elements of the existing SVIGSM were inaccessible (see excerpt below, LSCE pg.2):

> The intent of the recalibration effort was to retain the existing model framework and aquifer properties as originally conceptualized by Water Resource and Information Management Engineering, Inc. (WRIME) and MCWRA due to the inability to obtain the SVIGSM source modeling code.

[4] such as hydraulic conductivity (K)/transmissivity (T), and specific storage (Ss)/storage coefficient (S); T and S reflect the K and Ss across the aquifer thickness.

Also from LSCE (pg. 11; underline added for emphasis):

> The intent of the model extension and recalibration effort was to retain the existing modeling framework and aquifer properties and <u>any adjustments that were necessary to recalibrate the model focused on recharge and discharge input values</u>.

Presumably LSCE would have chosen to update aquifer properties to capitalize on the new data available since the last SVIGSM calibration. LSCE provided the following SVIGSM output for the NMGWM model (excerpt, pg. 13):

> SVIGSM calibration outputs were provided to Geosciences for incorporation into the NMGWM. These outputs included monthly output of groundwater levels at SVIGSM nodes located along the edge of the NMGWM domain, groundwater pumping by element, deep percolation by element, and streambed infiltration by stream node. These data were incorporated into the NMGWM for use in model calibration.

LSCE modified the pumping in each model layer based on observed water level data, as described in the following excerpt (LSCE pg. 11):

> During the model calibration, the vertical distribution of groundwater pumping was adjusted to more closely simulate the observed conditions within all three (3) model layers based on water levels at calibration wells. Groundwater levels in each calibration well individually reflect conditions in distinct depth intervals corresponding with different model layers. Accordingly, the hydrographs of simulated and observed water levels for calibration wells were used as guidance in making adjustments to the vertical distribution of pumping for different time periods during the updated model calibration period.

While much of the LSCE data preparation for the model update was reasonable, this re-allocation of pumping during the calibration is problematic. It is not clear that this practice was done model-wide or only for select wells as the report did not provide sufficient information. If the justification for this application was for only wells which spanned multiple aquifers (multi-completion wells), a more defensible approach would have been to employ an equivalent method as that available in the Modflow multimode package, which dynamically allocates pumping depending on the layer water level (head), the transmissivity and the storage characteristics (if a transient model). Reallocation by using only the observed water level presumes the aquifer properties are known and correct in the model. If not, the pumping reallocation based on the observed water level as the guidance is incorrect. Because the NMGWM calibration would subsequently revise aquifer properties, while retaining the SVIGSM pumping allocation, but also in accordance with the observed water levels, the pumping allocation would be erroneous. Not only that, the calibrated aquifer properties would also be potentially erroneous, because of their dependence on the erroneous stress.

LSCE presented no stream gain-loss data in its report to support its estimation of the streambed infiltration used in the calibrated model, but like the pumping, it was a calibration parameter. But because stream gain-loss data was not presented, it is indeterminate if the calibrated recharge distribution was accurate. Sensitivity analysis of calibrated values was not presented, so the uncertainty is unquantified.

2.3 SVIGSM and NMGWM Inconsistencies

NMGWM is reliant on the recharge and discharge distributions from the updated SVIGSM calibration. Geoscience explicitly states adoption of those stresses, consistent with the LSCE report, as follows (excerpt from Geoscience report pg. 27):

> Monthly data for deep percolation from precipitation, stream recharge and groundwater pumping in the NMGWM area as well as the water levels assigned for the general head boundaries during the calibration period were obtained from the SVIGSM.

Geoscience describes the following calibration process (excerpt pg. 28):

> The calibration process involved adjusting model parameters until the model provided a reasonable match between the simulated and measured parameters. These aquifer parameters included horizontal hydraulic conductivity, vertical hydraulic conductivity, effective porosity, and the storage coefficient.

A side-by-side comparison of the aquifer properties in the two models (SVIGSM and NMGWM) is not presented by Geoscience or HydroFocus, and because LSCE did not present the aquifer properties in SVIGSM, I am unable to identify and evaluate the differences.

The properties are presumably different between SVIGSM and NMGWM as a consequence of subsequent parameter revisions during calibration by Geoscience and HydroFocus. Because of inadequate documentation in the Geoscience report, however, the extent to which a feedback loop between Geoscience and LSCE existed is not evident. It is possible that such feedback was employed and the water levels assigned at the NMGWM boundaries were consistent with the SVIGSM output, but, if employed, that process may have led to other errors, potentially of great relevance to the reliability of the model results. Only because HydroFocus included water level data in the southern area of the model (south of the Salinas River), was a major discrepancy revealed between the SVIGSM calculated water level elevations and those assigned by Geoscience along the boundary conditions. HydroFocus identified the error but did not correct it, and chose instead to abandon use of the calibrated head model for predictions of drawdown from slant well pumping, and employ superposition in its place.

2.3.1 Boundary Conditions

The consultants relied on the updated SVIGSM model-calculated water level distributions associated with an unknown set[5] of SVIGSM aquifer property values in order to assign the water level elevations along the general head boundaries (GHB) in the NMGWM model.

The GHB includes assignment of water levels and conductance terms to perimeter boundary cells, and its function is simulation of a head distribution and prevailing gradient at the NMGWM model boundary. Accurate representation of the GHB ensures that the water level elevations in the aquifer layers are equivalent between the parent SVIGSM and NMGWM models at the boundaries. But the consultants do not report the water level elevations at the GHB. LSCE included figures of the simulated potentiometric surface showing contours of the model-calculated spatial water level elevation in the 180-ft aquifer and the 400-ft aquifer, but did not include the Dune Sand/A Aquifer/Salinas Valley aquitard potentiometric surface (SVIGSM model layer 1a). Geoscience and HydroFocus included no figures of the interpreted or simulated potentiometric surfaces for any aquifer in NMGWM so the head assigned along the boundaries could not be determined. The failure to include these interpretations is contrary to standard model (conceptual and numerical) reporting.[6] Also contrary to standard model reporting was the absence of a conceptual water budget, how well the model adhered to that budget, and definition of the method used to calculate the GHB conductance terms.

Subsequent to boundary assignment using the SVIGSM results, Geoscience and HydroFocus[7] revised the aquifer properties inside of the model area, including along the boundaries. This likely resulted in a disparity between the water level elevation assigned at the boundary per SVIGSM and that inside of the NMGWM. But the disparity at the boundary would result in erroneous flow rates at the boundaries and, to an unquantified extent, erroneous water levels inside the boundary. HydroFocus concluded the error was significant, and, rather than correct the erroneous boundaries, abandoned the NMGWM physically-based head model in favor of a superposition model, where only the change to the water level (not the water level elevation or head) is calculated. The predictive modeling is described in Section 4.0 of this report.

---

[5] not included in the LSCE report appended to the Geoscience report

[6] Anderson, MP, WW Woessner and RJ Hunt 2015. Applied Groundwater Modeling Simulation of Flow and Advective Transport. Elsevier/Academic Press.

[7] It is assumed Geoscience altered the parameter values after importing the SVIGSM boundary water levels because the report does not distinguish otherwise. HydroFocus did alter the Geoscience NMGWM parameter values.

Pumping

The errors in pumping introduced during SVIGSM calibration described in the previous section were compounded in the Geoscience and HydroFocus calibrations.

Recharge

In order to accurately quantify the impacts during predictive modeling, there must first be an understanding of the stream-aquifer interaction for the conceptual model based on gain-loss data, followed by estimation of the stream-aquifer parameter values during calibration using that data, and, finally, quantification of the uncertainty in the calibrated parameter values based on sensitivity analysis. But the consultants do not present this data and analysis.

Stream gain-loss estimates were not presented in the Geoscience or HydroFocus reports. The reports do not present adequate information for the conceptual model pertaining to the stream aquifer interaction, nor where or how SVIGSM stream infiltration is assigned in the NMGWM model, and how well the NMGWM represents that relationship.

It appears[8] that historic gaged flow data along the Salinas River within the SVIGSM and NMGWM areas is available, but an explanation as to why gain-loss estimates have not been estimated and utilized in calibration of the respective ground water models was not provided. If such data is available, it is of high value because it reduces uncertainty in the estimated parameter values and reduces the non-uniqueness commonly confounding optimization. Non-uniqueness occurs when different combinations of parameter values match the observations equally well.[9] Furthermore, the predictions of drawdown from slant well pumping and the impact to the stream gain-loss is of critical interest, as identified in both the Geoscience and HydroFocus reports. The Geoscience and HydroFocus reports did not include a demonstration that the models accurately simulate the stream-aquifer interaction.

2.3.2 Model Layering

NMGWM includes a layer for the Dune Sand/Aquifer A aquifer[10] (layer 2), and a layer (layer 3) representing the Salinas Valley aquitard, where present. In contrast, SVIGSM combines the typically highly transmissive Dune Sand/Aquifer A unit and the very low

[8] on only a cursory review of USGS online data

[9] Hill, MC and CR Tiedeman 2007. Effective Groundwater Model Calibration. John Wiley & Sons, Inc.

[10] Layer 2 also houses Perched Aquifer, the Perched "A" Aquifer, the 35-ft Aquifer and the -2 ft Aquifer (HydroFocus report pg. 9) but in this report I will refer to the "Dune Sand/A Aquifer unit" for simplicity.

permeability aquitard into only one layer (1a), even where both occur vertically in the project area. Because LSCE did not present the aquifer properties of this lumped layer, the disparity in the SVIGSM and NMGWM cannot be evaluated.[11] Accurate representation of this uppermost aquifer layer including the Dune Sand/A Aquifer unit is critical to the calibration and predictions made using the model, including subsequent superposition modeling. The uppermost layer has expectedly the most (if not all) interaction with the recharge stresses, including stream gains and losses, precipitation recharge and other deep percolation.[12] Because SVIGSM revised the recharge distribution in its calibration, it is not evident that the inconsistent representation of the uppermost aquifer unit did not result in inaccurate representation of the recharge distribution. This may be another reason HydroFocus concluded the recharge distribution was erroneous, but this was not specified in its conclusion.

Geoscience and LSCE presented no calibration data for the Dune Sand/A Aquifer unit, although Geoscience was apparently aware of the existence of this data as shown in its Figure 96. Because Geoscience and LSCE did not include any calibration data in the Dune Sand/A Aquifer unit, the level of error remains unquantified.

3.0 Model Calibration

The description of the methodology employed for model calibration in the Geoscience and HydroFocus reports is incomplete. It is not possible to determine if Modflow 2000 was used for parameter estimation using inverse techniques, or was instead used deterministically. Parameter estimation using inverse techniques includes minimization of the objective function, consisting of the sum of the squared residual values, in order to optimize the coefficients of the independent variables, the parameters. (Note by Dr. Weitzman, who is a statistician: In statistics, the coefficients are called parameters; in hydrogeology, the independent variables are called parameters, its meaning here.) A residual (also called an error) is the difference between an observed and estimated value of the dependent (in statistics) or response (in hydrogeology) variable, which in this report is the water elevation in a well.

Modflow 2000 can be used for either approach. In hydrogeology, parameter estimation is the "calibration" process which adjusts aquifer and stress variables (typically including

[11] LSCE presented no information on the aquifer property values in the SVIGSM model so that a comparison could be made with that presented in the Geoscience and HydroFocus reports.

[12] Based on HydroFocus figures however, there may be stream infiltration to the 180-ft aquifer, although there was inadequate information in the report to make a conclusion.

the aquifer hydraulic conductivity, transmissivity, storage properties and recharge, among others) within reasonable ranges, to minimize the residuals in the observed and calculated response variables (i.e. the water level, also referred to as the head, and flux/flow of the water). Industry standard calibration was historically done deterministically, but for approximately the past 15 years, inverse techniques have become more commonly employed because of the benefits of the inverse methodology, including quantification of the parameter uncertainty and the sensitivities (coefficients of the parameters in the estimation equation determined during parameter estimation to reduce the difference between the observed and estimated or calculated values[13]) , as well as quantification of the uncertainty in predictions, among other documented benefits.[14]

Neither consultant states which of the two, or whether a combination of the two, was used to calibrate the models, critical to my review. It would have been assumed that the models were calibrated using inverse techniques in that the model is expectedly amenable to inversion.[15] The absence of enormous amounts of information generated by inverse modeling from the reports suggests that perhaps only deterministic methods were employed, sacrificing a valuable opportunity to better define the system through parameter optimization and uncertainty analysis. At a minimum, the identification of which calibration method was employed and, if not employed, a legitimate reason for not using inverse methods should have been included in the report.

The objective of the NMGWM model stated in the Geoscience report (pg.8) was to "evaluate the impacts of the proposed MPWSP on the Salinas Valley Groundwater Basin. Groundwater modeling was conducted to assess the impacts of MPWSP on the groundwater levels and the seawater intrusion".

Geoscience identified the following tasks to be completed in its scope of work (pg. 8):

- Collecting and analyzing historical geohydrologic data,
- Updating and recalibrating the North Marina Groundwater Model (NMGWM), including data gathered during the exploratory borehole work (GEOSCIENCE, 2014),
- Updating and recalibrating the Salinas Valley Integrated Ground and Surface Water Model (SVIGSM; see Appendix A)
- Developing a focused CEMEX Model for the CEMEX Site,
- Developing and running various MPWSP scenarios, and
- Preparing the modeling report.

[14] Hill, MC and CR Tiedeman 2007. Effective Groundwater Model Calibration. John Wiley & Sons, Inc.

[15] Dry cells in modeling can present difficulties for inverse modeling, but this model expectedly did not incur this difficulty to the extent that inverse methods would have been rejected *a priori*.

3.1 Data Deficiencies and Exclusion

While additional data collection was part of the task, Geoscience included no water level data for the Dune Sand/A Aquifer unit across the entire model area. But the Dune Sand/A Aquifer unit is one of the two primary units intended for pumping in the MPWSP. Geoscience did identify the existence of well data at Fort Ord (Figure 96), but excluded it from the calibration results in the model report. Because the expanse of this unit as represented in model layer 2 excluded water level data, the Geoscience NMGWM calibration for the Dune Sand/A Aquifer unit is associated with significant uncertainty, and predictions relying on the Geoscience calibrated model are concluded to be unreliable. Model bias is also evident in the 180-ft aquifer. Only when HydroFocus included the water level data (but only in the Fort Ord area south of the Salinas River), a poor calibration was revealed. But the calibration may be poor across other areas of the model where no water level data was available to inform the calibration. HydroFocus is correct in its assertion that the model in its current condition was unacceptable for its intended objective.

Geoscience described the CEMEX modeling in its report (April 17, 2015) but monitoring and testing of the CEMEX wells was initiated at nearly the same time as the report in early to mid-April 2015. It is unfortunate that the Geoscience CEMEX modeling was not delayed until after the testing which presumably would provide significantly better data for the model.[16] Because this data was not yet available, Geoscience relied on lower quality information from sediment texture curves, which included significant and untested assumptions, to derive the aquifer parameter starting values for calibration. But equipped with no water level data and no stream gain-loss data for calibration, the model representation of the Dune Sand/A Aquifer unit remained uncalibrated, so the presumably highly uncertain values used as initial values reasonably remained equivalent or nearly so to the final values.

HydroFocus presented calibration results using the CEMEX testing in which observed and calculated drawdown was presented for its model, the Geoscience model and the CEMEX model. But HydroFocus did not report the CEMEX test estimates of hydraulic conductivity (K); horizontal (Kh) or vertical (Kv)), or the estimated specific yield/storage estimate (Sy/S), or that the model used those values.[17] The model K and S values for either the HydroFocus model or the Geoscience model are not compared with the

[16] I am unfamiliar with potential constraints on the project schedule but the nearly contemporaneous report submittal and data acquisition is noted.

[17] See Figure 3.3d

valuable test-derived estimates. Of the three models, the CEMEX model most accurately simulated the test drawdown, which HydroFocus attributed to the better resolution in the CEMEX model.

The source data was not included in the reports. Neither consultant posted actual K or storage values from testing in their parameter zone maps. While HydroFocus did prepare a list of sources for its basis in the model parameter zone values, those sources are most often other modeling efforts. It is not known if the source K values are model-estimated or estimates from testing. Model-derived estimates of K through calibration, for instance, are of less reliability than a hydraulic conductivity (K) value derived from pumping tests. The consultants require that the reviewer must gather and review all source documents to extract the information that should be reported in the model report. Standard model reporting includes a description of the method used to estimate each aquifer parameter[18], which is absent in the reports.

3.2 Parameter Adjustment During Calibration

HydroFocus and Geoscience adjusted parameter values to minimize the difference between the observed and model-calculated (estimated))water levels during calibration. This minimization of the objective function (water level or head residuals (errors)) is but one measure of many in determination of the calibration quality and whether the model is a sufficiently accurate representation of the aquifer system. Calibration quality determination by assessing only the error in the water level residuals considers only a portion of the error information, and in this case likely a small portion of the error information. The NMGWM objective function is dependent on the water level data available, and, as described in previous sections, insufficient data was acquired, utilized and presented for the NMGWM model calibrations. Furthermore, the calibration process must only adjust parameters within reasonable ranges based on available data, and quantify the uncertainty in those parameter estimates during a sensitivity analysis.

But the NMGWM calibration is concluded to have significant errors besides those already presented, and they include unreasonable parameter values, insufficient data, and inadequate sensitivity analysis.

Because of these errors, the model is not concluded to be representative of the aquifer system. The model will be unreliable for predictions of impacts from slant well pumping, regardless of its ability to minimize the objective function.

[18] Anderson, MP, WW Woessner and RJ Hunt 2015. Applied Groundwater Modeling Simulation of Flow and Advective Transport. Elsevier/Academic Press.

3.2.1 Hydraulic Conductivity

Sensitivity analysis and confidence intervals for the calibrated parameter values are not reported in the consultants' reports. The uncertainty in the calibrated parameter estimates is not quantified.

Geoscience updated the CEMEX model subsequently in 2016, prior to the HydroFocus NMGWM calibration (2017), and presumably reflective of the high quality data from the pumping test performed in April 2015.[19] But HydroFocus did not identify the CEMEX aquifer test estimates of the horizontal (Kh) and vertical hydraulic conductivity (Kv) values in the report, and instead relied on other (often older) reports which appear to include predominantly modeling estimates of Kh and Kv.[20] The CEMEX monitoring well network for the test appears to have been particularly well suited for determination of Kh and Kv values.

In the CEMEX and Potrero Road sites, the Geoscience initial estimates of Kh and Kv were based on an assumed relationship between sediment texture and horizontal and vertical hydraulic conductivity. The method assumptions were not subsequently validated with the CEMEX aquifer test parameter estimates. Had the assumptions been subsequently validated, an opportunity would have existed to extend that demonstrated correlative relationship to other areas of the model. HydroFocus did not provide a post-audit of the validity of the approach and assumptions, or appear to rely on that method.

In the model area primarily east, south and southeast of CEMEX, the Kh and Kv values in the Geoscience and HydroFocus models are substantially different for the Dune Sand/A Aquifer unit, the Salinas Valley aquitard (SVA), and the 180-ft aquifer. The Kv changes include up to seven orders of magnitude reduction in the newly-interpreted low conductivity material in the HydroFocus model in layer 3 (SVA).

The mapped SVA (Salinas Valley aquitard) north of the Salinas River has a Kv value five orders of magnitude larger than this anomalous low Kv zone south of the river. Because this change was not associated with a defined lithologic reinterpretation in the HydroFocus report, the value appears to be unreasonable. The Kh and Kv of the Dune Sand/A Aquifer unit are also generally lower in this anomalous zone, although the Kh value is identical between the Dune Sand unit and the low conductivity zone, also

[19] The pumping test at CEMEX is concluded to have been performed in April 2015 based on the hydrographs presented in the HydroFocus report.
[20] See Figure 3.3d

potentially reflecting an unreasonable Kh value for the Dune Sand unit if it is permeable material.

This area is partially traversed and bordered by the Salinas River.[21] The low Kh and Kv will limit the hydrologic connection between the river and the aquifer. Because the stream-aquifer interaction along the Salinas River may be affected by the erroneous model values, and because stream gain-loss data were not presented for the calibration, the predicted impact to the River from slant well pumping is unreliable. HydroFocus excluded explicit representation of a portion of the Salinas River in this area of the model in its predictive modeling, as will be described in Section 4.0.

The Kh and Kv values in the 180-ft aquifer were also revised between the Geoscience and HydroFocus models significantly south of the Salinas River and near the southern boundary. The Geoscience Kh of 160 feet per day (ft/d) was revised to 50 ft/d (western half) and 425 ft/d (eastern half) so that a much higher Kh value is assigned inland as compared to the coast. The Kv was increased more than an order of magnitude above the Geoscience model values. HydroFocus did not post/identify the specific K values used to support this set of values, so it is not possible to make a conclusion about its accuracy.

HydroFocus incorporated more water level data along the southern boundary than Geoscience, which allowed for better calibration in this area of the model. However, calibration must also reflect reasonable aquifer properties, while also minimizing the residuals between observed and calculated water levels. Some of the significant parameter changes made in the HydroFocus model may have been to compensate for anomalous boundary and initial water levels prior to the evident conclusion that the water levels were erroneous and disregarded in subsequent superposition modeling.

3.2.2 Storage Values

Only a cursory review of the model storage properties has been accomplished. I did not identify any source data values in the reports to which I can compare the model values. HydroFocus referred primarily to SVIGSM, but the LSCE model report did not include S estimates. HydroFocus had not included estimates from the CEMEX aquifer test so a comparison with model values could be made.[22]

---

[21] Because Geoscience and HydroFocus do not show the Salinas River on its respective parameter zone maps, I can only estimate based on a comparison across multiple figures.

[22] It is unknown whether the CEMEX testing yielded an estimate of specific yield and storage coefficient because the CEMEX report was not reviewed, and HydroFocus did not identify the values in its model report.

Accurate representation of the specific yield (effective porosity) and the storage coefficient is required for accurate predictions of the drawdown distribution and seawater intrusion. The HydroFocus values of specific storage (representing the storage coefficient divided by the aquifer thickness) as presented in Figure 3.3c appear to indicate an average model value of 0.001/ft, which seems high for a confined aquifer where that exists.[23] Without any independent estimates made available by the consultants, it is not possible to conclude that the model storage values are reasonable. The model reports did not present interpreted or calculated potentiometric surface maps so areas where aquifers are confined or unconfined could not be distinguished and weighed against the storage estimates. The potentiometric surface is an imaginary surface passing through all points to which water will rise in wells penetrating a confined aquifer, and the surface is described by a series of contour lines along which the potential head is equal. The ground water flow direction is perpendicular to the contours. For an unconfined aquifer, the potentiometric surface is referred to as the water table, which defines the surface upon which the water pressure is equal to atmospheric pressure[24]. Definition of the potentiometric surface/water table is integral to understanding the hydrogeologic system.

3.2.3 Model Budget

The NMGSM hydrographs show that the initial model heads and heads at the boundaries were inaccurate for a significant portion of the simulation period.[25] The HydroFocus model flow budget presented in Figure 4.5 is inaccurate because it appears to use an average based on the inaccurate heads, as well as the erroneous pumping and recharge components. The model flow budget represents the model balance of each flow component simulated explicitly in the model, with some of the components positive (water into model area), precipitation recharge for example, and the others negative (water out of model area), including pumping as an example. Modflow numerically balances the positive and negative components with a balanced model showing a near zero difference between the two. Unbalanced or excessive flow budget error would be an indication that the flow components are not balanced, and the model is not concluded to be numerically precise. A model flow budget for the Geoscience model calibration is not included in the report. It is standard modeling practice to compare the model budget with that estimated independently depending on available

[23] Without review of source data, it is indeterminate whether 0.001/ft is an accurate value for the aquifer specific storage.

[24] McWhorter, DB and DK Sunada 1977. Ground-Water Hydrology and Hydraulics. Water Resources Publications, LLC.

[25] See HydroFocus Figure 4.1A layer 2 hydrographs.

historic data. LSCE had provided a detailed basis for some components, but the consultants did not incorporate this as part of the model calibration evaluation.

3.3 Sensitivity Analysis

HydroFocus stated the objective of its sensitivity analysis (pg. 42):

> The objective of the sensitivity analysis is to address the question: "If the assumptions adopted in developing the model were changed, would the model predictions change so as to change the conclusions regarding proposed slant well operation?"

For its sensitivity analysis, the HydroFocus report included an evaluation of the changes in drawdown in the predictive scenarios with alteration of five of nearly 50 conductivity model parameter zones.[26,27] Evaluation of the predictive uncertainty is valuable but not without an evaluation of the uncertainty in the parameter values estimated in calibration, upon which predictive uncertainty also depends. Standard reporting includes reporting the parameter sensitivity for all parameters, not only 10 percent, and from the calibration, not only from the predictive scenarios. While it was not made clear in either report whether inverse modeling was used for parameter estimation, Modflow 2000 allows for calculation of the sensitivities, as do other freely-available, coupled softwares to Modflow. Corroboration of the methodology and software is not possible without more information.

3.4 Analysis of the Residual Error

Geoscience and HydroFocus presented various report figures describing the residual error between the observed and model-calculated water level (head) values. The following observations are made based on my review of the report figures.

Dune Sand/A Aquifer unit

---

[26] HydroFocus report Figure 6.1.

[27] Sensitivity is defined as the change in the model calculated response variable (for NMGWM, the water level, or derived drawdown) associated with the change in the parameter value (i.e. K; Anderson, MP, WW Woessner and RJ Hunt 2015. Applied Groundwater Modeling Simulation of Flow and Advective Transport. Elsevier/Academic Press.), although typically in inverse modeling perturbation of the parameter value over a small range more accurately reflects the parameter sensitivity because the parameter sensitivity is not always linear (Hill, MC and CR Tiedeman 2007. Effective Groundwater Model Calibration. John Wiley & Sons, Inc.). HydroFocus changes to the parameter values were large, assuming linearity, and done to demonstrate only the change in extent of drawdown away from the slant pumping.

Of the eight wells, seven show that the model underestimates the observed water levels in the Dune Sand/A Aquifer unit. The model shows a biased low water level distribution. Four of the wells[28] show that the starting head in the model was as great as 70 to 80 ft in error, as compared to the observed values. While there is convergence of the observed and simulated water levels late in the simulation period at three of the wells, it is not evident that error magnitude is not increasing with time,[29] or that application of an extremely low and likely unreasonable Kv is justified and has not been applied to specifically to reduce the residuals.

At monitoring wells MW-OU2-29-A and MW-BW-01-A, the erroneous starting head as applied at or near the boundaries is shown to rise more than 70 ft during the simulation period at the (latter) well farther in from the boundary, and 35 ft at the (former) well more proximal to the boundary, possibly distinguishing error contributions.[30] Despite the significant rise in model water levels, concluded in the report to be erroneous, the observed water levels range similarly between the wells over a 10-15-ft interval. Rather than a localized perched condition, as HydroFocus concludes without presentation of adequate data[31], the four wells collectively support instead a laterally extensive (of a few miles at least) saturated unit possibly above the Dune Sand/A Aquifer unit. It is possible that an additional aquifer above or within the Dune Sand/A Aquifer unit is present south of the Salinas River and is not the seemingly insignificant localized perched zone HydroFocus concludes. Additional data should have been collected to determine if this apparent upper aquifer unit is in hydrologic connection to the Dune Sand/A Aquifer unit. If it is, the evident vertical gradient warranted better vertical resolution (increased layering). This, among other expanses of model layer 2 where the absence of water level data could not allow for similar revelation may be an indication that the layering is too coarse for accurate representation of the uppermost aquifer units, including the Dune Sand/A Aquifer unit, thereby preventing evaluation of the full impacts from slant well pumping. Because the consultants provided no interpretation of the potentiometric surface or the model-simulated potentiometric surface for any aquifer in their reports, contrary to model reporting standards, the extent to which this

[28] MW-OU2-07-A, MW-BW-31-A, MW-OU2-29-A and MW-BW-01-A

[29] MW-OU2-07-A hydrograph Figure 4.1a shows an approximate 90% increase in the error between the beginning and end of the correlated portion of the record. MW-BW-31-A observed values show an anomalous step in the record which prevents a determination of the change in errors before the simulation period ends in Sept 2011.

[30] Errors in starting head and errors in the boundary conditions represent different error impacts in the model.

[31] Review of lithologic logs and interpretation of the potentiometric surface would have helped to distinguish whether the area may be in hydrologic communication with the aquifer or is perched, but Geoscience excluded the water level data, and HydroFocus concluded, in my opinion without adequate analysis completed, that the area was likely perched and that Modflow limitations prevented accurate representation of the water levels. Both consultants failed to adequately characterize this area, among others in NMGWM, as a consequence of not collecting additional data in the uppermost unit.

area may be in hydrologic communication with the Dune Sand unit at CEMEX has not been investigated or described by the consultants. The model does not allow for this communication as evidenced in the calibration results.

The extremely low Kv applied to the Dune Sand/A Aquifer unit, and particularly in the underlying layer 3[32] appears to have resulted in eventually reducing the residual at three of the wells. The extremely low Kv was applied to reduce the residuals at the wells, but because the value seems unreasonable, its use as a mechanism (prop up the head in layer 2) to improve the appearance of the calibration instead reduces the confidence in the calibration.

Geoscience included no data for calibration of this unit. Because of the errors revealed in the HydroFocus calibration and report, the Geoscience calibration is expectedly also poo, as likely would have been concluded had the data been included.

For the CEMEX modeling as presented in Figure 4.2, the comparison between the observed and model-calculated values indicates low error in the water level residuals. However, the basis provided by HydroFocus on its improvement to well MS-5S[33] consists of the changes made to the SVA Kv. The Kv changes are described above and are considered unreasonable but applied as a mechanism to prop up the head in the model. An acceptable calibration achieves low magnitude, spatially and temporally random error, using reasonable parameter values. Because a sensitivity analysis of the calibrated parameter values was not presented in the report, the influence of the low Kv on the CEMEX area model-calculated water levels is unknown. The extent to which the model water level distribution in the Dune Sand/A-Aquifer unit in the CEMEX area depends on the seemingly unreasonable low Kv value of the nearby underlying SVA has not been assessed due to the consultants' not including a sensitivity analysis of the calibrated parameter values.

The calibration is poor for the Dune Sand/A Aquifer unit and is affected to an unquantified extent by erroneous boundary conditions, erroneous starting heads, unreasonable parameter values and insufficient data. Based on the reports, the interpretation is also insufficient and fails to characterize the impact of these errors on the accuracy of the calibrated parameter values. Model predictions relying on a model with these errors are unreliable.

180-ft Aquifer

[32] as described in Section 3.2.1

[33] The CEMEX test was simulated in the Geoscience and HydroFocus NMGWM, but MW-5S available for monitoring and calibration during the slant well testing was excluded from Figure 4.6 without explanation.

The HydroFocus calibration included 10 wells with time-series data. The match between the observed and calibrated water levels at six of the wells is excellent in both timing and magnitude. However, five of the six wells are proximal to rivers (streams slough, etc; unlabeled in the HydroFocus report). It cannot be concluded that aquifer property values are accurate because the good fit between observed and calculated values may be a consequence of the unreported streamflow infiltration values provided by SVIGSM. It is not even clear from the reports if streamflow infiltration is applied in layer 3. Furthermore, because a sensitivity analysis was not presented for the calibrated parameter values, the sensitivity of these observations to recharge is unknown.

Two of the model-calculated water level hydrographs exhibit too much variability in the model response as compared to the observed response, and the remaining two show too little variability in the magnitude as compared to the observed values. But the extent to which this is significant depends on the problematic LSCE treatment of pumping in its calibration as described in Section 2.2 of this report. The LSCE calibration included allocation of pumping rates vertically across the aquifers based on observed water level data; water level data also used in the subsequent Geoscience and HydroFocus calibrations.[34] The LSCE practice resulted in what may be considered a contamination of the independence of the water level dataset because of the explicit correlation made between water levels and pumping in SVIGSM. If the pumping is inaccurate (as concluded by HydroFocus and this review), but a reasonable fit between observed and calculated water levels has been achieved due to parameter (K,S) adjustment, as is shown to be the case to an extent in the consultants' respective calibrations, then the aquifer properties are likely inaccurate also. Use of the observed water levels to allocate pumping results in lower confidence in the aquifer parameter values.

The calibration results indicating low error are not an indication that the underlying parameter values are reasonable, only that they have compensated for unquantified error in pumping, recharge, boundary conditions and initial heads. The extremely low Kv values are a demonstration of exactly this. The confidence in the calibrated model is low, and reliable predictions of drawdown cannot be calculated.

Geoscience presented only four hydrographs for the 180-ft aquifer, and nine for the 400-ft aquifer, even though the 180-ft aquifer is of prime interest, and more data was available. LSCE presented seven hydrographs for the 180-ft aquifer. HydroFocus presented 10 hydrographs. Why the available data was excluded was not addressed in

[34] Approximately the same datasets, as Geoscience only presented four of the wells in its report with its appended LSCE report showing only seven as compared to HydroFocus' presenting 10 hydrographs.

the Geoscience report. The Geoscience 180-ft aquifer residuals range from low magnitude to as high as approximately 18 ft. The two three? remaining wells show an acceptable match to observations, but this statement is qualified in the preceding paragraphs. Even where low residuals have been calculated, there is low confidence in the calibrated aquifer parameters.

The CEMEX modeling based on the Geoscience and HydroFocus calibrated models shows low magnitude error but a bias in the model-calculated water levels indicating that the model cannot reproduce the variability exhibited in the observed values. HydroFocus did not provide an explanation for this effect.[35]

Another anomaly in the HydroFocus and Geoscience calibrations was the ambiguous placement of observation well 14S/2E-14L01 which according to the Monterey County Water Resources Agency is a 180-ft aquifer monitoring well. But because of seemingly similar water levels, it was instead placed in the 400-ft aquifer layer. Sufficient information was not presented to discern that the consultants assigned the well to the correct aquifer. The well construction details were apparently not reviewed although that review may have resolved the ambiguous placement with more confidence. HydroFocus did not identify that Geoscience undertook this effort either.[36]

400-ft Aquifer

The HydroFocus model generally underestimates the observed response in this aquifer, and generally simulates too high a head compared to the observations. The Geoscience model achieved a poor calibration over most of the 400-ft aquifer with the largest residuals calculated along the eastern and northern boundaries. Residuals of greater than 50 ft are prevalent in proximity to the eastern boundary. This result shows that the eastern boundary water levels were significantly erroneous and influenced the water level distribution inside the model, including, expectedly, the predictions of drawdown made by Geoscience from slant well pumping. No observations near the southern boundary were included so the extent to which the southern boundary water levels were erroneous cannot be determined.

For the CEMEX modeling as presented in Figure 4.2, evident bias is shown for the 400-ft aquifer with all simulated water levels higher than the corresponding observed values. This indicates that the model underestimated the impact to the 400-ft aquifer during

[35] Although the report does identify that pumping and recharge changed after September 2011, but also identified that hydrologic conditions have not likely changed substantially between the model timeframe and the water level data period.

[36] Geoscience prepared a communication for HydroFocus on the matter, but I have not reviewed that document.

CEMEX pumping from the overlying aquifers. It is not evident from the report if the calibration sought to resolve this. If not, the predicted impact to this aquifer will be underestimated for the MPWSP.

900-ft Aquifer

During half of the simulated period, the observed water level response at all of the monitoring wells varies over a narrow range of approximately two feet. The model simulates a 10-ft range.

3.5 Analysis of the Model Error

Insufficient data was used for model calibration as described. The error evaluated by the consultants only reflects as much error as the calibration dataset allows, which is limited most notably in the Dune Sand/A Aquifer unit, a primary aquifer targeted for slant well pumping, as well as by the absence of stream gain-loss data. Error along model boundaries is largely unquantified owing to limited data in those areas. The impact of this error on calculated water levels across the model is unquantified. Because sensitivity analysis of the calibrated values and estimation of parameter uncertainty were not performed, the model error has not been thoroughly evaluated for calibration or prediction.

The structural error due to elements including layering and zonation has not been evaluated. It is possible that an additional aquifer above or within the Dune Sand/A Aquifer unit is present south of the Salinas River and is not the (insignificant) localized perched zone HydroFocus concludes. This, among other expanses of model layer 2 where the absence of water level data could not allow for similar revelation, may be an indication that the layering is too coarse for accurate representation of the upper aquifer unit, thereby preventing evaluation of the full impacts from slant well pumping.

But model error in the form of bias is evident in the calibration results. Model error is reflected in the non-randomness of the residuals as demonstrated by the correlation between residual error and calculated water levels, by non-randomness in space and, to the extent it could be determined, unreasonable parameter values.[37] Sensitivity analysis of calibrated parameter values and of the SVIGSM-adopted errors in pumping and recharge was not accomplished. Without this, the uncertainty in the parameter values is unknown.

[37] Because specific values of K and S from aquifer testing were not reported, the extent to which the model values adhered to reasonable values as determined independently of the model cannot be determined. In some cases however, the calibrated values do not appear to be reasonable based on other indicators.

Rather than rectify the model bias error, HydroFocus employed superposition to predict the drawdown associated with proposed slant well pumping. But the model error, the revelation of which was limited by the dataset, was inherent in the calibration, and superposition relied on the calibrated parameter values. So the error was transferred and potentially compounded for the superposition modeling.

Geoscience and HydroFocus present other error measures in their respective reports including the relative error, concluded by HydroFocus to be acceptable based on the following excerpt (pg. E-1):

> The relative error calculated from the standard deviation of the model errors and range of measured water levels in the model meets calibration criteria and ensures that model errors are only a small part of the overall model response.
>
> The results provide confidence that the model calculations are reliable estimates of the groundwater response to pumping, which was confirmed by simulating measured drawdown during test slant well pumping.

The statements are ambiguous, but, importantly, HydroFocus correctly concludes that other model measures, including the identified bias, renders the calibrated head model unacceptable for use in predictions of drawdown from slant well pumping. This set of conclusions, that the residual error is low, but the model bias is significant and the calibrated model cannot accomplish what it was designed for, is a good demonstration that an acceptable calibration must consider bias as an integral measure of model utility. Geoscience did not include sufficient data or analysis to make the correct conclusion that HydroFocus was able to make. The model was not calibrated to an acceptable standard, but instead of improving the calibration, admittedly not a simple undertaking in this case, HydroFocus employed superposition for predictive modeling.

4.0 Predictive Modeling

4.1 Uncertainty in Calibrated Parameter Values

HydroFocus and Geoscience did not evaluate the uncertainty in the calibrated parameter estimates, and its impact to the calculated water levels. HydroFocus evaluated only the sensitivity of a few parameters near CEMEX and Potrero Road sites during predictive modeling. From its limited sensitivity analysis for predictions, HydroFocus concluded (pg. 42):

> Increasing the anisotropy (increasing horizontal conductivity and decreasing vertical conductivity) minimizes the area of the cone of depression. Conversely, decreasing the anisotropy (decreasing horizontal conductivity and increasing vertical conductivity) maximizes the area of the cone of depression.".[38]

Hydraulic conductivity often exhibits characteristic anisotropy, meaning that it is directionally dependent[39] and in the NMGWM, anisotropy is used to reflect that Kh is not equal to Kv.[40] The HydroFocus conclusion stated above regarding the effect of anisotropy on the drawdown cone extent is counterintuitive to the expected result. For clarification, higher anisotropy indicates that the Kh is *much* larger than the Kv. For such a situation, among other variables[41], one would expect a laterally extensive drawdown in the horizontal direction (high Kh) and limited drawdown vertically (low Kv). The conclusion HydroFocus derived based on its modeling does not make sense.[42] Reducing the anisotropy (making Kh and Kv less dissimilar, or more equivalent in magnitude) and allowing for increased vertical flow should result in a cone of depression that is less laterally extensive. The HydroFocus model calibration included apparent unreasonable values of Kh and Kv east and south of the CEMEX site, and the remainder of the model includes parameter values of unquantified uncertainty because of inadequate sensitivity analysis.

HydroFocus presented three scenarios varying the pumping allocation between the Dune Sand/A Aquifer unit and the 180-ft aquifer. However, HydroFocus elects to present results for the scenario which is apparently not based on the most likely allocation between the two aquifers. Based on the CEMEX model calibration, more of the pumping is derived from the Dune Sand as opposed to the 180-ft aquifer (worse-case scenario?). While it is unclear why HydroFocus presented the results of this apparently less likely scenario, it may be that increased pumping from Dune Sand would have calculated a greater drawdown extent and increased leakage from the Salinas River and other modeled surface water drainages.[43]

---

[38] Pg 42 in HydroFocus report

[39] Anisotropy is defined as a property that varies with direction (Driscoll, FG 1986. Groundwater and Wells. Johnson Filtration Systems, Inc.)

[40] Kh can also be directionally dependent along the x and y tensors. But NMGWM does not reflect this particular anisotropy.

[41] Storage characteristics, transmissivity values, well completion, initial head and head differences across layers, boundary effects, etc.

[42] Because I do not have access to the model files, I cannot confirm that this is accurate. It is possible that sufficient numerical precision was not achieved, or the flow budget was associated with excess error. Or it is possible that the statement is correct but not intuitive.

[43] However, this can only be surmised without access to the model files.

HydroFocus adapted the NMGWM superposition model to include explicit representation of a portion of the Salinas River and Tembladero Slough/Reclamation Ditch using the Modflow river package so that the stream-aquifer interaction along these drainages is represented in order to quantify the impacts from slant well pumping. A large reach of the Salinas River and several other streams are not included in the analysis. No explanation for this is provided.

Because the calibration does not incorporate evaluation of stream gain-loss data, and the conceptual model does not include adequate information or analysis of the stream-aquifer interaction, the superposition model-predicted depletion impacts to the surface water system are concluded to be unreliable. The uncertain MPSWP predicted impacts to the streams may exceed allowable limits of established minimum streamflow standards. The results did not address this possibility.

4.2 Superposition

HydroFocus abandoned use of the calibrated head model, and instead relied on superposition to quantify the drawdown impacts from slant well pumping. But superposition relied on a set of calibrated parameter values which are concluded to also range from unreasonable to exhibiting significant but unquantified uncertainty. As a consequence, the superposition modeling produced unreliable predictions of drawdown from slant well pumping.

Superposition requires that the model be linear[44], or nearly so. But the degree of potential nonlinearity was not investigated by HydroFocus. It is not concluded that the thinning and unconfined Dune Sand/A Aquifer or the reduction in transmissivity from slant well pumping or the boundary conditions did not present significant nonlinearities in the system causing the application of superposition to calculate erroneous drawdown values. This same criticism may be applicable to the Salinas Valley Aquitard where it may become unconfined during predictive simulations.

Superposition, as applied in the HydroFocus work, did not include dynamic updating of the boundaries which may have incurred drawdown, although the presentation style of reporting only drawdown greater than one foot does not show the full drawdown extent.[45] The zero/near zero drawdown contour should have been included in the Geoscience and HydroFocus analyses and figures to identify areas where the boundaries affected the model-calculated drawdown extent. The boundary inflow with and without

[44] Reilly TE, OL Franke, and GD Bennett, 1984. The Principle of Superposition and its Application in Ground-Water Hydraulics, U. S. Geological Survey Open-File Report 84-459.
[45] This was the presentation form in both the Geoscience and HydroFocus reports.

slant well pumping should have been presented to discern any changes in inflow mitigating drawdown. A prevailing gradient is simulated at the General Head Boundary (GHB). If pumping inside the model results in drawdown reaching the GHB, inflow at the boundary will continue at a biased high rate resulting in an erroneous calculation of the drawdown extent. Insufficient analysis and reporting do not demonstrate that this was not a factor.

Application of superposition to isolate the impact from only the slant well pumping may be inconsistent with the model purpose as defined by Geoscience (pg. 8):

> The purpose of this study was to evaluate the impacts of the proposed MPWSP on the Salinas Valley Groundwater Basin. Groundwater modeling was conducted to assess the impacts of MPWSP on the groundwater levels and the seawater intrusion.

The Salinas Groundwater Basin includes multiple complex variables (recharge and discharge) changing in time and space which affect the groundwater levels and rate and extent of seawater intrusion. The success of the slant well pumping to expectedly not exceed seawater intrusion thresholds, among other measures, is dependent on the effects from these other complex and dynamic stresses. In the superposition analysis, these other relevant stresses are omitted, thereby making system response predictions unreliable. It is insufficient to predict only slant well pumping impacts in a dynamic system integrally defined by many other complex impacts which, in turn, affect the slant well pumping.

The application of superposition, intended by HydroFocus to diminish the error and uncertainty in many aspects of the calibrated head model, did not alleviate the errors or quantitatively demonstrate a reduction in error, and possibly introduced new and different errors in that aspects of the superposition model were not calibrated (i.e. stream gain-loss; boundary inflow, etc.).

4.3 Slant Wells Designed to Replace Freshwater with Saltwater

Dr. Weitzman indicated that, according to his understanding of the project objective, that the slant wells would not cause additional seawater intrusion and requested that, if available, I include information from the consultants' reports which did not support this understanding.

Review of the consultants reports identifies that seawater intrusion would increase. The increase in inland extent due to creation of a cone of depression from pumping was not reliably determined in the consultants' model. But the slant well pumping is designed to replace freshwater in the Dune Sand/A Aquifer unit and 180-ft aquifer with seawater

over some unreliably quantified aquifer volume and timeframe based on the HydroFocus report excerpt presented below (pg. 36):

> A capture zone refers to the three-dimensional volume of aquifer that contributes the water extracted by the wells. When the pumps are turned on, the wells initially extract the existing ambient mix of native groundwater in storage, but as pumping continues the wells extract increasing proportions of infiltrating recharge from the ocean. The ocean recharge gradually replaces the ambient water within the capture zone, and moves within the capture zone toward the well but does not spread beyond the capture zone. In map view, the capture zone is a 2-dimensional surface that delineates the underlying aquifer volume where ocean water replaces ambient groundwater and ultimately becomes the primary water source to the wells.

Because the slant well pumping is designed to replace aquifer freshwater with seawater, the pumping necessarily results in an increase in seawater intrusion into aquifer areas still containing freshwater.

5.0 Conclusions

The MPWSP proposes slant well pumping to replace freshwater aquifers with seawater as a supply for the desalination plant. A calibrated model was needed to make accurate predictions of drawdown and seawater intrusion resulting from slant well pumping. To accomplish this, the existing SVIGSM model was updated. The model results were adopted for use in the better resolution NMGWM. Geoscience calibrated the NMGWM as described in its 2015 report. HydroFocus provided an alternate calibration starting with the Geoscience model as described in its 2016 report, and used superposition for its predictions of drawdown.

Based on my review of the reports, it is concluded that:

- Insufficient data was collected/evaluated for the model calibrations:
    - including, but not limited to, inadequate (to no) water level data in particular for the Dune Sand/A Aquifer unit, one of two primary units targeted for slant well pumping,
    - and stream gain-loss data which would have improved the model and aided in parameter optimization.

- SVIGSM produced unreliable estimates of the pumping, recharge and initial water levels for use in NMGWM.

- NMGWM calibration included adjustment of model parameters based on unreliable values from SVIGSM.
- Geoscience was aware of Dune Sand/A Aquifer unit data but excluded it from the calibration without explanation. Geoscience also excluded water level data available for the 180-ft aquifer, also without explanation.
- Inadequate information was presented in the reports contrary to standard model report documentation and included:
    - Interpretations of the potentiometric surface for each aquifer in the NMGWM area were not included in the reports.[46] Recall that the potentiometric surface is described by a series of contour lines along which the potential head is equal. The ground water flow direction is perpendicular to the contours. Standard model reporting includes representation of the interpreted and model-simulated surfaces to show that the model is consistent with the hydrogeologic understanding of head and flow directions derived from the conceptual model. No such demonstration was made in either consultant's report for the NMGWM area.
    - Simulated potentiometric surface maps from the NMGWM area were not presented in the consultants' reports.
        - It is possible that an additional aquifer above or within the Dune Sand/A Aquifer unit is present south of the Salinas River and is not the (insignificant) localized perched zone HydroFocus concluded. This, among other expanses of model layer 2 where the absence of water level data could not allow for similar revelation, may be an indication that the layering is too coarse for accurate representation of the uppermost aquifer units, including the Dune Sand/A Aquifer unit, thereby preventing evaluation of the full impacts from slant well pumping. Because the consultants provided no interpretation of the potentiometric surface or the model-simulated potentiometric surface for any aquifer in their reports, contrary to model reporting standards, the extent to which this area may be in hydrologic communication with the Dune Sand unit at CEMEX, for example, has not been adequately investigated or described by the consultants. The model does not allow for this communication as evidenced in the calibration results.

[46] although the Geoscience model report did append the LSCE interpretations and simulations from SVIGSM of the 180-ft and 400-ft aquifers

- Inadequate specific information was reported for the source data including K and S values that were relied upon for parameter adjustment.
- Inadequate explanation for the recharge distribution including the characteristics associated with streamflow infiltration rates along unnamed rivers in NMGWM.
- HydroFocus did not report the K and S values estimated from the CEMEX testing, and without explanation, did not rely on those for calibration of NMGWM (Figure 3.3d).
- The Geoscience model report did not include an interpreted model water budget or a simulated water budget. HydroFocus presented a simulated budget but it is concluded to be incorrect for many reasons described in this report.
- A comparison between the SVIGSM aquifer properties and model calculated heads upon which NMGWM relied was not presented in the Geoscience model report. Evaluation of evident model bias was not included in the report, and therefore could not be used to improve the model. Because of this, erroneous initial heads and erroneous heads along the boundaries were not revealed until the HydroFocus report, which included data for the Dune Sand/A Aquifer unit and additional data in the 180-ft aquifer. The Geoscience model was considered a poorly calibrated model despite the calibration results presented which showed a low error in the residuals.
- The HydroFocus report revealed the existence of unacceptable error from model pumping, model recharge, initial model heads, and model boundary heads, but failed to provide detailed information to support its conclusions. Instead of correcting these errors (probably a major undertaking), HydroFocus subsequently relied on superposition for prediction of drawdown impacts from slant well pumping so that some of the identified error was eliminated to achieve accuracy in the predictions.
- HydroFocus simulated stream-aquifer interaction with the Modflow river package but did not provide an explanation why some NMGWM area streams/rivers were excluded from the predictive analysis.
- HydroFocus did not present a comparison of model-calculated gain-loss estimates against estimated values and therefore did not demonstrate that their assumptions and assigned properties were accurate.

- It was indeterminate whether the model calibration was accomplished using inverse methods, considered an industry standard at this time[47], or was accomplished deterministically. At a minimum, an explanation for not using inverse techniques should have been included in the report.
- HydroFocus and Geoscience did not include the NMGWM calibrated parameter sensitivity and parameter uncertainty. Sensitivity analysis is considered an industry standard. If inverse modeling was done, enormous information generated by that process was excluded from the reports, including among other output:
  - Sensitivity of parameters
  - Sensitivity of water level observations
  - Sensitivity of boundaries
  - Parameter correlation
  - Parameter confidence intervals
  - Degree of nonlinearity

- Because of inadequate data, analysis, reporting and the use of parameter values ranging from unreasonable to unquantified uncertainty, and known and unknown error, the NMGWM is concluded to be poorly calibrated and not representative of the aquifer system.
- HydroFocus, in recognition of some of these elements, rejected use of the NMGWM head model and instead used superposition based on NMGWM calibrated parameter values to predict drawdown from slant well pumping.
- Because superposition relies on parameters from a poorly calibrated model with known and unknown/unquantified errors, the error in the parameter estimates contributes unquantified error to the predictions.
- Superposition did not produce reliable estimates of drawdown from slant well pumping, and is not concluded to have been the appropriate methodology to employ to meet the project goals.

[47] My opinion stating that inverse modeling is the industry standard for approximately 15 years now is based on the techniques in model calibration presented at the Colorado School of Mines Integrated Ground Water Modeling Center's biannual conference (over the past 20 years) with inverse modeling being the most common approach among modelers presenting at the conference. Also at least three public domain codes are available for use. All models are not necessarily amenable to inverse modeling if dry cells are calculated but because NMGWM did not incur this effect according to the absence of information in the reports, it seems it would have been calibrated using this standard technique.

Subject: Geoscience TDS measurements questioned
Attachments: TSW DSA measurement.doc; img20191123_09100591.pdf

I believe that thousands of Test Slant Well Intake Water Conductivity/TDS measurements are incorrect. Please see my attached document and graph.

Chuck Cech
Monterey
831-594-6117

The attached graph comes from the November 2019 Monterey Peninsula Water Supply Project Test Slant Well (TSW) Long Term Pumping Monitoring Report No. 166. The Illustration is a plot of the Specific Conductivity measurements of the water being drawn by the TSW from 4/22/15 to October 18, 2019. Specific conductivity is a measurement taken by a sensor (transducer) placed in the TSW intake water. The intake water electrical conductivity is proportional to the amount of Total Dissolved Solids (TDS) in the water being measured.

The TSW conductivity data when multiplied by 0.66 provides an accurate TDS equivalent. According to Google ocean water is typically 35,000 milligrams per liter (mg/l) TDS. During the period from February 2015 to March 2017 the TSW ran 24/7 drawing 2100 gallons per minute with an average drawn water TDS of 30,000 mg/l or about 86% of average seawater. This TDS level could require Cal Am to return approximately 14% of the desalinated product water to the city of Castroville due to the return water proposal. However the TDS sensor making these measurements was placed 305 feet from the top of the slant well and is not exposed to the mix of Dune Sand Aquifer (DSA) fresh water and 180 foot aquifer brackish water. The data recoded during the 2 year test period are primarily 180 foot aquifer brackish water measurements.

In March 2017 the TSW 24/7 test was terminated, but the TSW was not deconstructed as required by prior agreement. TSW operations continue one day a week for six hour on that day. Tests are run and measurements are plotted and documented in the Monterey Peninsula Water Supply Project Test Slant Well Long Term Pumping Monitoring Reports. The weekly 6 hour plots start in March 2017 and continue to date.

Starting on March 7, 2018 the green plot indicates that because of the reduction in TSW pumping time, fresh DSA water is percolating down to the TSW sensor and is now influencing the TDS readings. This plot indicates 22,000 mg/l which is a 37% reduction of the 3.5% average TDS on October 28, 2019. Fresh DSA water is obviously moderating the brackish water drawn by the TSW. This is important because Cal Am has no rights to fresh DSA water and the return water proposal becomes unworkable. This graph is also an indication that DSA water plays a significant part in reducing seawater intrusion in the Salinas River Basin. As long as Cal Am draws DSA fresh water, the slant well intake water will never be 100% seawater as originally speculated!

THE BIG QUESTIONS ARE:

Was the conductivity sensor intentionally placed in a location that minimized the effects of DSA fresh water on conductivity/TDS measurements?

Will Cal Am Monterey District customers be billed $20 million for erroneous TSW conductivity/TDS sensor measurements?

Specific Conductivity in MPWSP Test Slant Well During and After Long-Term Pumping Test

Subject: PLEASE HEAD THE RECOMMENDATION OF YOUR STAFF

Dear Commissioners,

I have been following the plight of water shortages in Monterey County for the past 14 years. Cal Am has again sent out large postcards to every member of our community with false information - this should be illegal.

We need water, but we don't need this desal plant. There is a far better alternative. Expanding the Pure Water Monterey project is the most cost-effective and environmentally sound solution. This alternative is one of the main reasons the Coastal Commission staff recommends against Cal Am's desal.

Thank you,

Louise C Berry

Subject: California American Water Co. Project Application #9-19-0198

Dear Commissioners:

I am writing to urge you not to approve the above Project as recommended by the Coastal Commission's Staff Report. I am a resident of Seaside living on a fixed income. As a Seaside resident, I have gone to great lengths to conserve water, however, my water bills continue to rise. Cal-Am has been able to increase its rates regardless of poor management, failed projects, and even reimbursed for water not used by ratepayers. This is in addition to being paid a 10% profit. A large population of Seaside residents live in low income households. Many of these households are living below the 200% poverty level. For many of these ratepayers, increased costs of housing, job insecurity, and **rising water rates**, may make it impossible for them to continue living in Seaside. Affordable housing is not possible without affordable water. If people cannot afford to live in Seaside, the local economy will suffer. Needing to decide whether to pay rent, buy groceries, medicines, or water is an **economic injustice**.

The Cal-Am Project is not necessary. The expansion of Pure Water Monterey provides a long-term sustainable water source. Cal-Am's desalination water project would cost $6,000-$8,000 per acre foot. The alternative Pure Water

Monterey Project purified recycled water will be less than half that cost. Pure Water Monterey is now operational. In addition, ratepayers would be subsidizing desalination water for Castrollvile. Castroville would be charged $110 per acre foot. Consequently, we would pay a subsidy of $5 million a year. Seaside ratepayers cannot afford this.

In making a decision to approve or disapprove this project, I urge you to look at the economic injustice as well as the environmental injustice of this project.

Again, I urge you to look out for the greater good of our local communities and **disapprove** this project.

Sincerely,
Sheila Clark

Dear Coastal Commissioners,

The much better solution for the water we need in the Monterey area is to expand Pure Water Monterey. It is feasible, less costly and less environmentally damaging. I don't want my money going to a huge, non-local corporation that uses deception to make big profits. I heard yesterday, from a friend who lives in Seaside, that CalAm has just sent out very misleading Information to Seaside residents, in an attempt to get support for the desal project in Marina.
We need to be fair to all local communities, and treat water as the precious, vital life-sustaining resource it is!
Thank you for your attention,

Lynn Hamilton
Monterey, CA

Subject: desalination plant

CalAm is a German company and all its proceeds are returned to Germany.

I don't agree that a foreign investor should have control or say over our national resources.

If Monterey, Seaside or other cities on the Peninsula want a desalination plant then build one on your ocean site because the last time I looked I saw that the they have the same ocean shores as Marina.

Dear California Coastal Commissioners, Executive Director John Ainsworth and staff,

Please deny the harmful CDP for this project.

I've spend the last several years using my available free time trying to educate myself, neighbors and community leaders about the real harm this project will create for the disadvantaged community of Marina. As if our community wasn't struggling enough, this potential knockout blow comes at a time we are least prepared to defend against it. The scars of having to defend against this threat will be long lasting, however I believe our strong community will be up for the challenge each and every time.

Thank you for all the work you do defending the California Shoreline and the people who appreciate it.

Please deny the CAL-AM project.

Respectfully,

Brian McCarthy

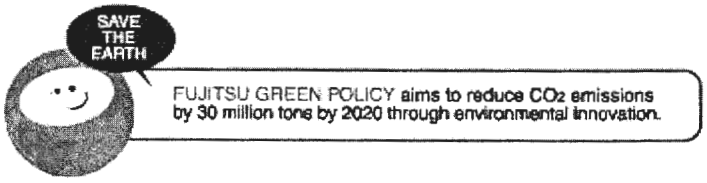
Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:-

My name is Mark Simmons.
I have lived in the lovely beachside location of Marina for over four years now and have seen little to spoil the area.
I now work 100% from home due to COVID-19 restrictions and get out onto the beach as often as I can with my wolf dog Chewie.

The beach is his happy place (& mine) & we go almost daily.



After visiting Israel & seeing a de-salination plant in action (Sorek – Red Sea coast) with its noise, dust, 24x7, the thought of a large de-salination plant on the beach right here just really really annoys me.
Compounding this is that the water from it isn't even intended for Marina's use as I understand things.... Where is the irony in that? Where is the social justice?

Please make the right decision for Chewie, myself & the other great inhabitants of this quaint small town – please deny the CalAm de-salination project!

Many thanks for your attention & consideration.

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

COMMUNITY
ROOM

My name is Liesbeth Visscher. I grew up in the Netherlands and 25 years ago moved to California, together with my husband. Three years ago, soon after moving to Marina, we attended a "Water Forum" hosted by Citizens for Just Water. When we learned about the threat to the aquifers and coast we became involved.

I would like to give you **one example** of the unfair challenges that we have had to endure while fighting a private deep-pocketed company. To attend a CPUC meeting in September 2018 a car with five volunteers left Marina at 5 AM in order to arrive on time in San Francisco. We each had prepared our 3-minutes public comments. When we filled out the speaker slips we found out that we had to limit our comments to ONE minute. Just when the meeting was about to start two buses showed up at the entrance, filled with mostly men in suits. At the end of the public comments period anybody who hadn't filled out a speaker slip was allowed to line up and give a one-minute comment. All those business people spoke in favor of CalAm's MPWSP. The CPUC approved the permit, the CalAm supporters were picked up by the buses and we heard that they celebrated with champagne on the way home. Meanwhile, we walked a few blocks to pick up our car, paid a small fortune for parking, and on the way home stopped for lunch – which we of course paid for ourselves.

I fortunately can afford to take days off from work and pay for gas to travel to meetings. Please know that many people in Marina cannot afford to do this. We feel simply overrun by CalAm. Since we now can't attend meetings in person we have taken many photos of residents trying to show you how diverse Marina's population is and that all those people are asking you to protect our water source and beach, and to **please deny the Slant Well project!**

Signed,
Liesbeth Visscher,
Resident of Marina, CA.

To: CalAmMonterey@coastal
Subject: Please deny Cal Am's Desal Project

I am against Cal Am's project because Pure Water Monterey – Phase 1, now in operation, will give us the additional water we need to stop illegal diversions from the Carmel River by the December 2021 deadline. Expanding Pure Water Monterey would give us the water we need for growth. And it would lift the moratorium much sooner than Cal Am's desal.

After December 2021, only 3,376 acre-feet (AF) of water can be legally taken from the river. But because of the 3,500 AF of new water available from Pure Water Monterey, we can meet that deadline with a surplus. This will stop the illegal withdrawals and protect the River. The decades long environmental problem on the Carmel River will be solved. But to meet the requirements of the Cease and Desist Order (CDO) and the CPUC imposed moratorium, we would need an additional water supply like the expansion of Pure Water Monterey.

If the Pure Water Monterey Expansion of 2,250 AF were added to the current 3,500 AF from Pure Water Monterey – Phase 1, along with our legal River withdrawal of 3,376 AF and other available sources, the total available would be 11,700 AF. We only use 9,825 AF annually. That would lift the CDO and give us 1,875 AF of surplus water for growth. If history is any indicator this will give us enough water for a minimum of 20 to 30 years.

To: CalAmMonterey@coastal
Subject: Public Comment on September 2020 Agenda Item undefined 3a - Appeal No. A-3-MRA-19-0034 (California American Water Company, et. al., Monterey Co.)

The proposed Cal-Am desalinization project is unnecessary and is an incredibly expensive ruse to increase their return on investment. The Pure Water Monterey project is a much preferable alternative to building a billion dollar desalinization facility that will cause irreversible harm the surrounding environment. Additionally, but the pipeline needed for transporting the water along with its installation will harm wildlife that is already under considerable pressure.

The proposal to offer water to the community of Castroville at reduced rates is offensive to those of us who are water users in other communities. If this is allowed to proceed, once again we will see another huge increase to our water bills on top of all the other rate increases and fees we currently are forced to pay. We already pay one of the highest, if not the highest, water rates in the entire country.

If the proposed facility is allowed to continue, complicated and expensive litigation over water rights will ensue and will last for many years. One effect of this Litigation is that it will postpone the reduction of water taken from the Carmel River.

I was once a supporter of Cal-Am and understand they are in the business of creating return on their shareholders' investments. However, I have changed my opinion of Cal-Am and now see them as tyrant that will do anything to increase return including building an expensive desalinization plant so they will be guaranteed nearly a ten percent return on their billion dollar investment. This begs the question, why is Cal-Am guaranteed such an obscenely high rate of return? As an individual, I feel fortunate if I can get a two percent return on my investments.

Please follow your staff's recommendations and deny all of Cal-Am's appeals and permit applications.

Thank you,

Ray Bennett
Seaside, CA

Dear Commissioners of the California Coastal Commission,

My family lives in Marina in Monterey county. We are very afraid of the environmental impact the desal plant will have on our water and environment. We ask that you deny the proposed Desal Project.

We need water in the Monterey Peninsula area, but we don't need to have this desal plant. There is a far better alternative. Expanding the Pure Water Monterey project is the most cost-effective and environmentally sound solution. This alternative is one of the main reasons your Coastal Commission staff recommends against Cal Am's desal.

This project is not in the public interest and there is an environmentally superior alternative in the expansion of Pure Water Monterey.

Sincerely yours,
Mário Flores

Subject: Deny Cal Am's Desal Project

Dear Commissioners:

It's time for Monterey Peninsula water ratepayers to get rid of California American Water. Cal Am has spent 25 years — without success but consistently increasing our water bills nevertheless — supposedly trying to solve our water supply problem. We know that Cal Am cannot be trusted, and passing Measure J was our declaration of independence from corporate greed at our expense.

Thanks to our Monterey Peninsula public agencies, all the water we need for decades is now available through Pure Water Monterey and the Pure Water Monterey Expansion — but Cal Am is blocking it in favor of its own over-sized, over-priced desal project.

Cal Am's desal project is not in the public interest: It would double our water bills, leading to a decrease in the supply of affordable housing. It would damage the environment by harming our coastal habitat and Marina's beautiful dunes. It has no legal source water and would draw NOT ocean water but groundwater from an already over-drafted groundwater basin.

The argument that desal is needed to solve a Carmel River crisis has no basis in fact. Our current water supply from Pure Water Monterey (Phase 1: 3,500 acre-feet) will allow us to stop illegal withdrawals from the Carmel River by December 2021. Our current water supply will restore the Carmel River and protect the steelhead. The environmental issues facing the Carmel River have been resolved by Pure Water Monterey without the need for Cal Am's desal.

The Pure Water Monterey Expansion is the feasible and environmentally preferable alternative to desal. It will give us a new water supply much sooner than Cal Am's project. It will provide a long-term sustainable water supply for decades of growth while supporting affordable housing and economic recovery.

The Pure Water Monterey Expansion's source water is primarily the 8,000 acre-feet of excess wastewater that is now discharged into Monterey Bay. It is contractually secure and drought proof. It avoids environmental damage to our wondrous coastline and avoids environmental injustice to our citizens.

Cal Am is the only obstacle to the Pure Water Monterey Expansion. We have been Cal Am ratepayers since 1987, and we respectfully ask you to deny CalAm's desal project.

Sincerely,

Martin & Karen Wiskoff

Subject: Subject – Deny Cal Am's Desal Project

Please deny CalAm's Desal Plant. It is not in our best interest and will only raise our already too high water prices (we are still the #1 most expensive water in the USA by far) with a project that is not necessary, as we can meet our needs via expanding Pure Water Monterey's project. Not only is the desal overkill and burdensome to water users in the Peninsula, but it just doesn't make sense when we can get all the water we need via PWM for years to come.

I did not purchase a home in this area thinking that I'd need to go to a laundromat to wash my clothes since it's unaffordable to do so anymore in my home. I conserve as much as I possibly can but still can't afford my monthly bill!

I'm pleading with you- please don't allow CalAm to build the Desal Plant!

Subject: Deny California American Water's Desal Project

Dear Costal Commission Members,

I am writing to urge you to deny California American's application for a water desalination plant in the Monterey area. I am a resident of Seaside, California. I making this request for two reasons.

First there is a much better option available that is not only environmentally sound, but much less costly. Expanding the Pure Water Monterey Project simply makes sense and is a far more efficient solution to the water needs for our area.

Second, California American Water Company has a terrible record of management. They are inefficient, and costly. They seem to have no motivation to run things in an efficient manner, as they simply keep applying for any and all possible way to increase costs to the consumer in this area. The information that they send out is misleading and often outright inaccurate, and they spend no expense to doing so, as your commission has no doubt been lobbied by them very heavily to approve the desalination proposal.

To hand an already incredibly costly project over to such a company will do no good for our community, we are already paying some of the highest cost for water in the country thanks in great part to California American's management. It simply makes no sense at all when there is a perfectly good, environmentally sound, less costly alternative available.

I cannot afford a team of attorney's and administrators to lobby for my best interests as California American Water has, I am relaying on you. Please deny this request. It is not the best solution, and it would be managed by one of the worst companies I have ever had to be a customer of. I need water, and I cannot drill my own well, so I have to business with them.

Respectfully,

Berj Amir
Resident, Seaside California 93955

Subject: Deny Cal Am!

Coaster Commissioners!

I urge you to deny Cal Am's desal permit. This project is not in the public interest and there is an environmentally superior alternative in the expansion of Pure Water Monterey.

I've read much on the topic – representing both sides – and cannot support Cal Am's proposal over that of Pure Water Monterey.

Thank you!

Subject: Please deny Cal Am's Desal Plant

Dear California Coastal Commissioners,

I am a 30 year Seaside resident who ran for Mayor of our city in 2016. I am very concerned about the number of low and moderate income local residents who will be greatly impacted financially by the costs of an unnecessary desal plant.

Due to creativity and hard work, our region has Pure Water Monterey (PWM) ready to provide enough water to suffice for 30 years at a much lower cost than desal. This is the solution favored by many residents, Monterey Peninsula Water Management District and Marina Coast Water District.

Please, stand for social justice and practicality. Follow your staff's recommendation and deny Cal Am's desal.

Respectfully,

Kay Cline

Subject: Cal Am desal plant

As a resident in Cal Am's jurisdiction, I am asking you to please deny Cal-AM's proposed desal plant. My request is based upon the finding of the Coastal Commission's Staff Report along with the following facts.

1. Cal Am water is already some of the most expensive water in the country, and this project would significantly raise the water cost of not just the low income. It also purposes hardships for those of but those of us that are considered middle income (the ones who already bear most of the burden for taxes and subsidized programs) and that are trying to be responsible citizens and budget and save for emergency funds and retirement. This project will raise water cost significantly over what the alternative program offers. This is already difficult considering my billed has already doubled since we started paying the fee for saving water during the drought.
This increase would also be inaction to another increase Cal Am is requesting to allow them to purchase and subsidize another failing water company.

2.The know negative impacts to the environment, along with the likely potential for other significant negative impacts to the environment.

3. The irresponsibility Cal Am has already demonstrated with it's lack of action, or even planning for solutions to address the over-drafting of water from the Carmel River, until just before the deadlines. Cal Am's lack of planning has resulted in poorly conceived and though out solutions, inadequate planning and studies, inaccurate budget proposals which then spurred multiple lawsuits only adding to the cost of its project. Increased costs that Cal Am wants to pass on to it consumers.

4. There is a lot of opposition to this project in the community, in fact it has spurred efforts in the community for buying CalAm out and making the water a public utility. Why then approve and start a project that is so costly and has so much opposition, when it has a high potential to end up a waste of tax payer money as Cal Am gets caught up in lawsuits and can't afford to finish the project without raising costs even more- especially when there is an alternative that has already demonstrated success. This project also has the likelihood of only being a short term solution (20-25 year) given the projected life of the wells and lack of feasible new sites. -So what happens then? Another costly project?
What will also happen if Cal Am is bought out- will it get scrapped and all that money wasted given there is so much opposition to the project.

5 Cal Am solution appears to be an extremely expensive temporary solution and not a tru solution to the problem given the expected lifespan of its wells and it apparent ability to demonstrate reasonably attainable alternative well sites when the proposed well are no longer accessible/useable.

Subject: Deny Cal Am's permit

Dear Commissioners,

I have been a Del Rey Oaks resident for over 13 years and unfortunately have been a Cal-Am ratepayer. My rates have sky rocketed, and I have been using less water..... as requested...

It's clear that with Pure Water Monterey, Cal-Am now has the water it needs to meet the cease and desist order, restoring the water needed for the protection of the Carmel River Steelhead. It is my opinion that with the recycled water project, we are moving in the right direction by reusing our wastewater, which there is plenty of, and protecting our natural resources.

There is still an issue with needing water for sustainable growth and that's where the rub comes in. Cal-Am and the local politicians and business interests who see water as their limiting factor for unrestrained growth, are pushing this project. In doing so, they have adversely affected votes for the expansion of Pure Water Monterey, just so they can continue to have a water source that satisfies their needs, even though it's environmentally damaging and far more expensive for the ratepayers. They have been moved to lies and unethical behaviors such as withholding environmental documents that the residents paid for so that it looked like the expansion was not feasible.

PLEASE, DO NOT be swayed by their politics. PLEASE DENY Cal-Am's permit for their desal project. It is not necessary and carries too many ramifications. The facts are out and clearly we have a project that is feasible, not environmentally damaging, provides water at a cheaper price, has no legal barriers ahead, and can be accomplished within a reasonable time frame. The Pure Water Monterey expansion project is the way to go!!!!

Thank you for your time,
Frederica Jones

Subject: Appeal

Dear California Coastal Commissioners and Coastal Commission Staff:

Hello Everyone:

My name is Epiphany Thompson, I'm 19 years old , I attended Marina high and now go to Monterey Peninsula College. I work unpredictable hours driving DoorDash while I"m going to school, so I can't attend meetings. I appreciate the opportunity to speak up here.

By proceeding to do the following building these pipes under the dunes just to re-sell the water back to the peninsula is first off, not a positive change to society ,and secondly it only supports the drawback of-this country which is being so money hungry that you constantly put money over human well being.

Not to mention all the extra industrialization and the stress it puts on the environment. If you permit these pipes, you show that you care about money over the environment's health and well being of others.

For example a college student like myself will spend 40+ years of their lives working a career they were rushed into or that they don't enjoy all because this society taught us to care about money more than ourselves and our lives essentially. We sell our happiness and mental health slaving at work day after day just to stay afloat already - so why add this financial burden to the already hard working citizens of the community and decrease the environment?.

The working class already works hard to just live here , not to mention taking into account those with kids and single parents, Plus young adults on their own that simultaneously do work and school while paying rent trying to stay afloat on top of all the other things life throws at you.

So my only question is - if this isn't going to be a positive change or beneficial for the vast majority of the community why do it? And how do you feel morally about the decisions you're making knowing it can affect and pollute our water?

We should give the Pure Water Recycling Project a chance before making a negative impact on Marinas water system . **Please deny the de-sal project per**mit.

Thank you.

Epiphany Thompson/ Marina

Dear CA Coastal Commissioners, Executive Director John Ainsworth, and Staff:

We are writing to ask you to deny the CalAm Slant Well project. We moved to Marina so we could be near this beautiful coastline. Please heed your duty to preserve it.

The CalAM desalination plant would damage our water and our dunes, with an industrial site on our pristine coast. And the result? CalAm would take Marina's water, without water rights, and provide it to other cities on the peninsula, not Marina.

Marina is a diverse low income community, where a majority of the population is non-white. We oppose this discriminatory land use policy. The wealthier communities should not take our town's water!

Pure Water expansion is the least environmentally damaging choice. Please save the snowy plover. We love walking on Marina's beach line and seeing this amazing bird and all the other wildlife and beauty. Save our town, save our water, and save our coastline.

Please deny the CalAm Slant Well project!

Thank you,

Cheryl & Joe de Gier

Dear Commissioners,
I am writing to you again to request a Deny of Cal Am's Desal Project.
Aside from all the reasons presented by your staff report, I found CAL AM tricking the rate payers into supporting its Desal Project. Herald has published my letter to the editor.
It is inline here to show one more reason to deny Cal Am's desal project.

Monterey Herald • September 8, 2020

Suspicious of postcard ask

A black and white large postcard came to me and my neighbors in Seaside asking us to write to the California Coastal Commission (CCC) to support the Monterey Peninsula Water Supply Project. The postcard made me feel suspicious. Upon checking, I realized it is asking me to write to CCC to support the desalination project of California American Water.

The cost of water of the proposed desalination project is more than three times the cost of water produced by recycling. The postcard is attempting to mislead its readers to write to CCC to support desalination.

I wonder how many unknowing readers have been misled. I also wonder why Cal Am would not come out openly to tout its desalination project which it has been pushing hard everywhere.

What do we owe Cal Am - who have given us only the highest water rates in the country??

First of all, Cal Am's Desal project is certainly not in the public interest.

Secondly, there is an alternative!
One that is not only feasible, environmentally preferable and more than adequate for the Penninsula's water needs. Also, it is much more affordable:

It's Pure Water Monterey Expansion plan:

Our new water supply from Pure Water Monterey – Phase 1 (3,500 acre-feet) will allow us to restore the Carmel River and stop illegal withdrawals by December 2021.

The environmental issues facing the Carmel River are resolved without Cal Am's desal.

This is MUCH more in our interest and to our benefit than Cal Am could ever be.

Respectfully,
Kristin Ramsden

Subject: No Desalination Plant

Living on the Monterey Peninsula for 26 years, I am aware of the water supply needing care and conservation. There is no room for waste. Yet a combination of factors leads to mismanagement and waste: it is a paradise of arid beauty, cool weather and welcoming social groups, although some are elitist and exclusive. The combination has severe maladaptive behaviors. The natural beauty entices tourists to a lucrative hospitality indeed which neither educates nor rations water. The Departament of Defense had two facilities that bring personnel from areas that don't have droughts and don't educate their personnel on water usage. And there's a huge surplus of golf courses.

On top of that, residents have been saddled by an unscrupulous private company that wants to profit by addressing the so-called "shortage" by building a facility that will contaminate Monterey Bay, the regional environment and agricultural lands. This company's marketing efforts are deceitful, and add to the expenses that they pass on to already abused customers.

Please vote against the desal plant.

Thank you,
Mark Poehner

I was an engineering member of a 12,000,000/day desal plant. What a disaster besides consuming 100,000 horsepower (aren't we supposed to be a green state???), the maintenance costs are astronomical, the membranes have a short life and the equipment is huge the pumps we used were 10' tall, prone to fail and have enormous costs to repair.

There are much more environmentally sounds sound ways to supply our water needs.

The only reason Cal Am wants a desal plant **is GREED,.** Per law a contractor is allowed to charge 10% overhead and **10% profit** so the more expensive the project the more they make.

What a ripoff to the consumers who would see are costs for water sky rocket.

Subject: Lies by Cal AM

We are really tired of hearing all the lies coming from Cal Am. When we citizens first tried to purchase the company, we were bombarded with very clever, but misleading, statements on this "important wonderful company". Enough people believed them. For the next election, those same lies were not believed as rates again were raised so that Cal Am customers pay the highest rates in the nation. The company spends money each day with radio ads telling us how wonderful they are. Unfortunately, repairs to an aging infrastructure are ignored. We did learn that 19 million dollars were paid to their stockholders and we have no clue how much goes to the executives.

Our second vote authorized us to purchase the company. Of course this "cash cow" is gold to Cal Am and they will fight with their attorneys to keep this lucrative company.

We now have recycled water to last for decades. We do not need or want the expensive desal treatment plant with the expense added to our already high bills. Affordable water should be a right. Not all local citizens will be able to afford water at the rates Cal Am will charge.

Please deny Cal Am's request for the desal plant. Thank you.

Sincerely,

Carole Ehrhardt

Subject: Deny Cal Am's Desal Project
Attachments: image001.png; image002.jpg

Dear Commissioners,

I have been a resident of the Monterey Peninsula area for 30 years, as well as a business owner for the past 26 years, employing over 550 people in more than 20 locations in Monterey County.

I strongly oppose Cal-Am desal project for financial and environmental reasons. Pure Water Monterey is a much better alternative.

It's absurd that Cal-Am over the years has raised rates, driving down demand/usage as intended, and then files for rate increases to cover the lost revenue. What a great business model – sell less of your product that customers can get nowhere else, resulting in reduced operating expenses, and then increase rates to cover the revenue shortfall. Too bad my business can use the same model.

I am in a 2-person household with all the latest water-saving fixtures and appliances, and I don't have a blade of grass on my quarter acre lot with drought resistant plants only watered by drip irrigation. Yet my monthly water bill is >$300 in the Winter and >$650 in the Summer.

PLEASE DENY CAL-AM's DESAL PROJECT!

From: Dianne Driessen <diannedriessen@yahoo.com>
Sent: Tuesday, September 08, 2020 12:29 PM
To: CalAmMonterey@coastal
Subject: Deny Cal Am's Desal Project

Cal Am's Desal Project is inconsistent with relevant Coastal Act and LCP policies and there is a a feasible, less damaging alternative from Pure Water Expansion that will adequately provide water and protect the public welfare. Please vote in accordance with the staff report to deny Cal Am's Desal Project. They have taken the time and done the work to evaluate the project. This was their job to do and they recommend that the project be denied.

Staff believes, after weighing the evidence in the record at this time, that the Pure Water Expansion is a feasible alternative to Cal-Am's Project, will allow Cal-Am to cease its illegal water withdrawals from the Carmel River and meet the region's water needs, and is the preferable, least environmentally damaging alternative. The Pure Water Expansion would also result in fewer environmental and economic burdens to the communities of concern within Cal-Am's service area, would avoid environmental burdens to the City of Marina, and appears to have fewer significant hurdles to clear before it could be implemented. It is important to note that the Commission does not have the authority to actually approve, or require approval of, the Pure Water Expansion project. Rather, the Commission's role is to determine whether Cal-Am's Project is Application 9-19-0918 / Appeal A-3-MRA-19-0034 (California American Water Co.) 4 consistent with relevant Coastal Act and LCP policies, whether there is a feasible alternative to the Project, and whether denial of the Project would harm the public welfare. Staff recommends finding that the Project is inconsistent with relevant Coastal Act and LCP policies and that the Commission may not approve the Project despite those inconsistencies because the PWM Expansion is a feasible, less damaging alternative that will adequately provide water and protect the public welfare.

Gabriella Ulloa
gulloa@csumb.edu

4th September 2020

California Coastal Commission
455 Market Street
Suite 300
San Francisco, CA 94105

Dear California Coastal Commission,

My name is Gabriella Ulloa and I am writing to express my thoughts regarding the Cal-Am desalination project. This project has sparked much controversy which is why I feel it is necessary for the public to voice their opinion. I am not a proponent of the Cal-Am desalination project and my arguments against the desalination plant are below. I am in support of the Pure Water Monterey Expansion Project.

First off, the desalination project presents economic concerns. The desalination plant would cost $2 billion dollars in total, at a rate of $6,000 per acre foot. The desalination plant costs around 2 to 3 times as much as the recycled water from the Pure Water Expansion Project. The desalination plant is also an expansion of an additional 2,250 ft and this expansion would cost $90 million. Cal-Am's Project unnecessarily provides excess water at a much higher cost so it is more reasonable to approve the project which will provide lower rates for customers, this being the Pure Water Monterey Expansion Project. It is important to consider the large majority of low-income ratepayers in this decision since the price of water has always been of concern in this area. Water is a basic necessity and should not be priced at such a high rate when there is an feasible, sufficient, and less expensive option provided by the Pure Water Expansion Project. It's a shame that nearby communities working in the local area can't afford to live here because of

poor water policy for decades and for this reason the Pure Water Expansion Project should be approved.

Secondly, Cal-Am's Project would emit an excessive amount of greenhouse gases in comparison to the Pure Water Expansion Project. The Desalination Project is expected to emit 4,990 metric tons of carbon dioxide per year; meanwhile, the Pure Water Expansion project is projected to emit a much smaller amount of carbon dioxide at a rate of 2 metric tons per year. This proves that the Pure Water Project is much less carbon intensive. The Pure Water Project is a much more environmentally sound choice because the recycling water plant purchases electricity from the Monterey Regional Waste Management District. The MRWMD utilizes biogas produced by the decomposition of waste material in the landfill to produce electrical energy, making this a more sustainable source of energy.

Finally, Cal-Am's Project would pose an environmental injustice by disproportionately impacting the community of Marina with the construction of the desalination plant in this city. Meanwhile, Marina would not be able to enjoy the benefits of the desalination plant since they are not a part of the service area. Marina is already an underserved community and was hoping to use the property at the CEMEX site for recreation and enjoyment instead of it being utilized by Cal-Am's Desalination Project. Equality for all people should be of great influence in this decision in order to create a more just society by lessening the strain in underserved communities.

I hope this letter impacts your decision in denying the construction of the plant. We need a water supply immediately and the Pure Water Expansion Project proves itself to be a feasible and less environmentally damaging option.

Sincerely,

Gabriella M. Ulloa

Subject: 9/17/2020 Coastal Commission Hearing concerning CalAm's Desal Project

To the Members of the Coastal Commission Hearing,

My name is Shirley Svetich, and I have been a Marina manufactured home owner since July 2000. I am very concerned about CalAm's Desal Project in Marina, especially because of the study results. And, so should you if you really care about Marina and it's residents.

The following is mainly quoted from the City of Marina's report: Our water comes from Marina's groundwater basin, which is over-drafted, and CalAm's project wants to take up to 15 million gallons per day to supply Monterey Peninsula customers (of which we are not even included). The Stanford University study and other studies indicate that CalAm's desal project may deplete and/or contaminate our groundwater. If it is contaminated, the city of Marina may be forced to purchase water from CalAm, which is the highest price in the nation. Their project would threaten our coastal dunes, the wildlife habitat, and our beachfront recreation area.

These actions would be an unconscionable, over-reach, showing their desire and plan to have a monopoly control of water in this area (in spite of the evidence of being detrimental), and then be so money hungry as to charge their customers for their own water. Any just person could see that this is totally wrong.

I suggest they pursue an alternate solution: such as The Expansion of the Pure Water Monterey Project, which is capable of replacing CalAm's desal at a fraction of the cost and with no coastal impacts. It would use Monterey One Water's existing advanced water recycling facility to produce highly purified water, which is then stored in the Seaside Groundwater Basin for CalAm customers. This would not harm Marina's water supply, and it preserves use and enjoyment of our beautiful California coast.

I respectfully request that justice prevail by rejecting this CalAm Desal Project proposal.

Sincerely,

Shirley A. Svetich
Marina, CA 93933

Subject: Marina Slant Wells: A Dishonest Project

To whom may have authority:

The fact that a privately owned company owns and has mismanaged a water utility, willfully violating the law for decades and overdrawing natural sources it was required to protect, now intends to annex a neighboring community's water supply to continue over-charging its customers is hard to accept. It is even harder to accept that it has gained this much support from politicians and big business, and it is taking community outrage to point out how wrong this is, both legally and ethically.

I am writing to point out something which should be obvious to even the most casual observer:

The proposed intention of this project is outright dishonest. If the goal is desalination of seawater, it is unnecessary to pervert an already overburdened overdrawn aquifer which is owned by another community. Cal Am has no right to the proposed location or the water which it is intending to use. The location already has been designated for other purposes by the local governing body. This manipulation is exploiting the desperation of one community and pitting it against another for a hostile land grab and takeover of another municipal water system.

This project is being marketed as if it is good for the community and the future. Nothing could be further from the truth. Overzealous development of this fragile coastal ecosystem has resulted in water shortage which threatens the future of this area. Further destroying of a floundering watershed next door is par for the course with CAL AM.

The desal initiative is clearly motivated by greed. Allowing the lack of accountability, competence, planning, and consideration for local ecology (let alone the LAW) by CAL AM which has resulted in this situation to be rewarded with such allowance would be a failure of local government and conscience.

There are other ways to solve the water issues faced by the peninsula communities without compromising adjacent watersheds.

Please stand against this hostile takeover of public resources by a private corrupt institution, and on the right side of history.

September 5, 2020

Dear Chairman Padilla and Commissioners of the CCC,

...and so, we come to the culmination of a long six-year process that I have been involved in every step of the way. I'm going to treat this letter as if I had 5 minutes to speak, to keep it under 1,000 words...

My name is Michael Baer. I was a resident of the Monterey Peninsula from August of 1982 until May of 2019... over 36 years. I moved to San Jose, the town I grew up in, in May of 2019 to help my ailing parents. I have remained active in the Monterey Peninsula Water Supply Project (MPWSP) despite the move. This is too important to me, and I have invested too much time and energy to stop merely by changing my address 70 miles north.

I first became involved in the local water issues in November of 2013, so I had already been at it a year, when I came to that fateful meeting in Half Moon Bay in November of 2014, where the Commission considered the decision of the test slant well permit, which was approved. Thus began an odyssey, and those Commissioners who have been around these last six years, probably recall me chasing you all over the state on this issue.

So here we are again... and likely for the last time.

Staff got it right, please deny the local coastal permit for the desal plant. Do your substantial part to bring this nightmare to a close.

There is so much wrong with this project which is amply and cogently covered in the staff report. You will no doubt be hearing the numerous arguments from many dozens of advocates commenting against the plant, as well as the handful of tired and misleading arguments from the proponents for the desal.

With so much to cover, the question is where to point the laser. I always try to add a novel perspective, or at least present in a novel way, to actually add value to your deliberations. What can I say now that we have reached this point?

I want to talk about the other side, the business and political allies that Cal Am has cobbled together for support.

On the political side, you "old timers" will recall, that a JPA was formed called the Monterey Peninsula Regional Water Authority (MPRWA) comprised of the six Peninsula mayors from the six Peninsula cities (Monterey, Seaside, Carmel, Pacific Grove, Del Rey Oaks, and Sand City). The fact that a community of less than 100,000 people is divided into six city jurisdictions (not to mention an additional nearly ten thousand county residents within Cal Am's borders) is one of the main reasons Cal Am can create so much mischief. There are so many different stress points they can exploit politically and financially.

The MPRWA was often referred to as "the mayors authority" and it was the brainchild and chaired by Jason Burnett, who was the mayor of Carmel; a young aspiring politician; grandson to David Packard of Hewlett/Packard, nephew to Julie Packard, the director of the world renowned Monterey Bay Aquarium. He developed a unanimous coalition of all the mayors, with the mission to unify the Peninsula to meet their long-standing problems of sufficient, sustainable water supply and resolve the CDO from the SWRCB to reduce the draw from the Carmel River.

Jason Burnett admitted more than once publicly that the "mayor's authority" had no actual authority. They were not beholden to their respective city councils nor the constituents who voted them to office. They simply worked as self-appointed lobbyists to help resolve the water supply problem in their self -perceived interests, which coincidently aligned with Cal Am wholeheartedly.

As previously mentioned, there was no representation for the county residents in unincorporated Carmel Valley, Carmel Highlands, or Pebble Beach, nor any other unincorporated areas in Cal Am's district.

Do you want to know who else wasn't at the table? Every single person who has been clambering before you to kill the project for the last six years.

I think it's instructive to note that not a single one of the six mayors on the MPRWA who came to you in 2014 was an elected official after the 2018 election. Some retired, and some were defeated. The first to leave was Jason Burnett himself, who retired in 2016 and took his family to Washington D.C.

That is the political side of the story, but there's also the commercial interests. Hospitality, Real Estate, and the local Chambers of Commerce make up the lion's share, but there are other smaller, sometimes non-profit interests, who support Cal Am. Salinas Valley Agriculture is the largest business sector in the County; they support Cal Am too, even though they are entirely outside the boundaries of Cal Am's customer base. Why do they care so much, and flex their muscles? I'm not entirely sure.

But I submit to you that every single proponent for the project, from those listed above, to Paul Bruno of MPE which has a multi-million dollar contract to trench the pipelines, to Castroville Services District, which would receive water at about 2 cents on the dollar to produce it, to low wage employees of the hospitality industry who will tell you they need that water so they can have a job...

All of them, every one, if you dig deep enough you will find they receive some financial benefit, while very few of them will see the cost on their water bill as residents, because few are residents within the Cal Am district.

This is the debate before you. Staff has laid out beautifully all the reasons why this project is fatally flawed. We've been saying it for the last several years.

Thank you for your service, your time, and your consideration.

Sincerely,

Michael Baer

Subject: Deny Monterey Desal Project

Commissioners,
As a resident of Del Rey Oaks, and part of the service area of California American Water Co. water in the Monterey Bay area, I would like to urge you to deny Cal Am's request for the local desalination project.

Cal Am's strong lobbying aside, the data clearly shows that the expanded Pure Water wastewater treatment options should be completely built out before any desal is attempted in our area. There are many economic arguments for this choice but as a marine biologist, I would like to highlight the huge environmental toll that the desal project would pose from the massive power requirements and complex brine dilutions. If (when?) the brackish intake water fails to provide the needed flow to fully dilute the brine to ocean salinities, what will happen to the outflow going into the Monterey Bay National Marine Sanctuary? Either the desal will significantly be restricted, or the hypersaline brine will be released into the bay.

We have better, cheaper, more sustainable, and lower-hanging fruit to try before any desalination should be attempted in Monterey. We need to allow for a few years of data collection with full wastewater reclamation before following this path. All current estimates show that we will have the water needed to abide by the Carmel River restrictions and meet the region's needs without desalination. Shouldn't we all try this first?

Thank you for your time,
Kevin Raskoff

Subject: Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit.

Dear California Coastal Commissioners, Executive Director John Ainsworth and staff,

My husband and I own a home in Marina. I am a retired faculty member having taught at CSUMB for 15 years. I am still a practicing archaeological consultant and have a background in the history of Monterey County and I understand the environmental challenges to the region. My husband, Jonathan Nasaw, and I oppose the slant wells that are under consideration by the Commission.

As citizens of Marina, we ask that you please deny this harmful project. Thank you!

Please read the following scientific evidence from Citizens for Just Water. We do not want this project. We are adamantly opposed.

CalAm has no groundwater rights and the experimental Slant Well extraction of groundwater will cause further harm to an aquifer in overdraft. Cal Am's desal project relies on using Marina's groundwater to feed their experimental desalination project for the Monterey Peninsula Water Supply Project. Cal Am does not have water rights to this water. A Stanford groundwater study shows that this project will cause harm to the aquifer which is already identified as "critically over drafted". The project will impact our beaches and federally recognized threatened wildlife but serve no water to Marina. Our community was not asked if we

wanted this project. It is being forced on our less wealthy community to serve the peninsula hospitality and real estate interests.

Please stop this injustice!

Respectfully,
Susan Morley, MA., RPA

Suspicious of postcard ask

A black and white large postcard came to me and my neighbors in Seaside asking us to write to the California Coastal Commission (CCC) to support the Monterey Peninsula Water Supply Project. The postcard made me feel suspicious. Upon checking, I realized it is asking me to write to CCC to support the desalination project of California American Water.

The cost of water of the proposed desalination project is more than three times the cost of water produced by recycling. The postcard is attempting to mislead its readers to write to CCC to support desalination.

I wonder how many unknowing readers have been misled. I also wonder why Cal Am would not come out openly to tout its desalination project which it has been pushing hard everywhere.

Subject: Deny Cal Am's Desal Project.

Commissioners,

I can not urge you strongly enough to deny Cal Am's desal permit.This project is not in the public interest and there is an environmentally superior alternative in the expansion of Pure Water Monterey.

Pure Water Monterey is the superior choice as it is already in operaton with Phase 1. It will give us the additional water we need to stop illegal diversions from the Carmel River by the December 2021 deadline. By expanding Pure Water Monterey would give us the water we need for growth. And it would lift the moratorium much sooner than Cal Am's desal.

FACTS:
After December 2021, only 3,376 acre-feet (AF) of water can be legally taken from the river. But because of the 3,500 AF of new water available from Pure Water Monterey, we can meet that deadline with a surplus. This will stop the illegal withdrawals and protect the River.

The decades long environmental problem on the Carmel River will be solved not by the disastoris Cal Am desal plan but with an enviromentally sound Pure Water Now plan.

FACTS:
If the Pure Water Monterey Expansion of 2,250 AF were added to the current 3,500 AF from Pure Water Monterey – Phase 1, along with our legal River withdrawal of 3,376 AF and other available sources, the total available would be 11,700 AF. We only use 9,825 AF annually. That would lift the CDO and give us 1,875 AF of surplus water for growth. If history is any indicator this will give us enough water for a minimum of 20 to 30 years.

Please deny Cal Am's Desal Project on Sept 17.

Thank you,

Kathryn O Maurer

Subject: Cal Am Desal Permit

Commissioners,
I urge you to deny Cal Am's permit for a desal plant as it provides the burden of cost onto existing customers. Right now economically is not a time to a to put more of a financial burden onto customers. As is, the customers pay already some of the highest rates in the nation and these customers also happen to be some of the most water conservative customers in the nation as well. Why punish these customers? Represent what is right by the customers and your constituents.

Sincerely,
Robert Latino

Subject: Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

This letter is in support of the Pure Water Monterey Expansion project as the superior alternative to Cal-Am's slant well desalination project. The PWM Expansion project cost far less than desal, is less harmful to our precious environment and will supply water faster.

Continuing forward, I will emphasize a few rebuttals to the Carmel Steelhead Association (CSA) argument for the desal plant against PWM Expansion.

The CSA made many false claims beginning with the amount of water the various water sources will produce. CSA claims if there is no desal plant, the Monterey Cal-Am district will be 2,000 afy short of water,however this is false because we will be 500 afy in surplus.

CSA claims the Monterey One Water board voted twice not to approve the EIR for the PWM Expansion Phase II. This is false because the vote to certify failed and the vote not to certify also failed, both with an 11 to 10 weighted vote.

CSA claims the desal plant is expandable while the PWM Expansion is not expandable.and that the volume is not guaranteed. This is false because the PWM Expansion amounts to 2,250 afy of expansion and the water is guaranteed! In Phase 1 of the PWN project, the Carmel River will be restored by taking less water mandated by the California Water Resources Control Board and by taking less water it helps to restore the steelhead.

As a resident of the Monterey Peninsula for over fifty years and a retired attorney, I find the CSA's claims misleading, discrediting and an attempt to obscure the facts.

Sincerely,

Nancy W Green,
Attorney at Law, ret'd

Subject: Denial of California American Water's Application for a Coastal Development Permit

To: California Coastal Commission Chair, Commissioners and Staff

I hereby urge the California Coastal Commission (Commission) to NOT approve California American Water Company's request to proceed with their planned desalination plant. Not only do I feel a great lack of trust in the manner in which this company has executed the planning and testing aimed at securing approval for this plant, but I also believe that a viable alternative to this plant exists that better serves the interests of all of the citizens of the entire Monterey peninsula community.

Having worked for over 45 years for a large engineering and construction company, I have extensive experience in the specification, design and construction of complex mechanical equipment and systems. I have learned (often the hard way) that it is not sufficient to merely trust that suppliers of equipment or services can satisfy the requirements established for a project based on the typically brief statements made in their proposals. Verification of the credentials of a supplier, both technical and commercial, are paramount. All work being tendered must be fully specified and the performance of the equipment and attendant systems must be clearly stated and backed up by a written warranty. Above all, the supplier must provide references for past work performed that will fully corroborate successful performance on past projects similar to the one being proposed.

In my review of literature available to the general public regarding the design and specification of the proposed CalAm desal plant, I find that little specific information has been presented both for the drilling of the extraction wells and for the design and operation of the desal plant itself. The company selected to drill the extraction wells for the CalAm desal project has limited experience in drilling slant wells in the environment and for the overall capacity associated with this project. Again, as I have learned in my work experience, bigger is different. The test wells that were drilled for the purpose of confirming the viability of the drilling technology did not correctly follow the planned methodology nor did the results address all of the required performance criteria. I do not find the proposal for the planned desal plant to be worthy of acceptance without additional testing and verification of the full specifications defining the design, engineering and "warranted" performance of the entire plant.

Fortunately, there is a viable alternative to the proposed CalAm desal plant. The alternative is the Expansion of the Pure Water Monterey (PWM) water reclamation plant. The base PWM plant, capable of producing 3500 acre-feet of highly purified reclaimed water, has been built and is in commercial operation. The PWM Expansion would produce an additional 2250 acre-feet of water which, along with approved draws from other sources, should more than satisfy the current and future water consumption requirements for the areas served by CalAm, based on accepted water consumption forecasts. The PWM Expansion project provides a host of advantages when compared to the CalAm desal plant. Both initial construction costs and ongoing operation costs would be substantially less for the PWM Expansion project than for the CalAm desalination plant project. This will equate to much lower costs for the ratepayers (of which I am one). Finally, the negative impact on the environment will be much less for the PWM Expansion as compared to the CalAm desal plant; much less air and water pollution; less visual pollution at the coastline, and less seawater intrusion into the aquifers presently supplying groundwater to the surrounding communities.

Thank you for your consideration.

Subject:	Evaluation of the Ground Water Modeling for the Cal Am Monterey Peninsula Water Supply Project
Attachments:	GeoHydroScienceWRAMPrptAugust14 .pdf

Coastal Commission:

For your consideration in making your decision on granting or denying approval of Cal Am's application for a coastal development permit, I am submitting the attached **Evaluation of the Ground Water Modeling for the Cal Am Monterey Peninsula Water Supply Project** by hydrogeologist Barbara Ford, who specializes in modeling. I originally consulted with Ms. Ford to help me find out how data used in modeling might have been altered to produce the negative correlation (-0..45) between estimates and errors I discovered in the Geoscience data on the 180-foot aquifer. I learned that the alteration occurred in the "adjustment" of what hydrogeologists call "parameters" – which are the values of what statisticians call independent variables used in modeling to make estimates of dependent variables, in this case water levels. It is that adjustment, made to reduce error variation, that created the negative correlation I observed. An error, by definition, is the portion of a measurement that a model cannot estimate and so errors should have no correlation with estimates. Ms. Ford was so helpful and had devoted so much time to her study of the MPWSP modeling that I asked her to write a report for Water Plus evaluating that modeling. The attached evaluation is her report (14 August 2019).

Most respectfully,

Ron Weitzman

President, Water Ratepayers Association of the Monterey Peninsula (aka Water Plus).

Evaluation of the Ground Water Modeling for the Cal Am Monterey Peninsula Water Supply Project

Prepared for Dr. Ron Weitzman, President
of the
Water Ratepayers Association of the Monterey Peninsula

Prepared by Barbara Ford, PE*, GeoHydroScience llc

August 10, 2019

*CO

1.0 Introduction

1.1 GeoHydroScience Objective

Modeling is essential for accurate prediction of the environmental impact of proposed slant well pumping in the California-American Water Company (Cal Am) Monterey Peninsula Water Supply Project (MPWSP). That project underwent two draft environmental impact reports (EIRs), one in 2015 and one in 2017.[1] Each report contained an appendix on modeling identified as Appendix E2. The first was prepared by Geoscience Support Services, Inc. (Geoscience) and the second by HydroFocus Inc. (HydroFocus), collectively referred to as the consultants. I have been informed by Dr. Weitzman of the following:[2]

> The second (H-E2) was created at least partly in response to critical comments on the first (G-E2) by Dr. Ron Weitzman, president of Water Plus, a party to the proceeding on MPWSP. The final project EIR contained H-E2 and a chapter (Chapter 6) consisting of responses to critical comments on the second draft, including comments by Dr. Weitzman on H-E2. According to Dr. Weitzman, the California Public Utilities Commission has not held any evidentiary hearings on the second draft or the Chapter 6 responses in the final EIR. Because Dr. Weitzman considers the EIR modeling to be seriously inadequate, as well as professionally uncontested, he has filed a lawsuit challenging the usefulness of the EIR to determine the environmental impact of MPWSP.

Under these circumstances, for assistance in that suit, Dr. Ron Weitzman has hired Barbara Ford, PE[3] of GeoHydroScience llc, as an expert in hydrogeology and modeling to review both G-E2 and H-E2, and write a report.

1.2 Information Reviewed

Because of the short timeframe as a consequence of Dr. Weitzman's communicated difficulty in acquiring assistance in California as a consequence of conflicts of interest, my review was necessarily limited to only the documents identified below:

- Water Ratepayers Association of the Monterey Peninsula and the State of California Amended Complaint for Damages and Civil Penalty and Demand for Jury Trial, Case No.:16CV001561, Draft April 12, 2019.

[1] Communication with Dr. Weitzman on August 8, 2019.
[2] Ibid.
[3] Barbara Ford, author of this report is a licensed Professional Engineer in Colorado and Arizona.

- Geoscience Support Services, Inc. April 17, 2015. Appendix E2 Monterey Peninsula Water Supply Project Groundwater Modeling and Analysis. Prepared for California American Water and Environmental Science Associates. It includes Appendix A - Luhdorff and Scalmanini, Consulting Engineers, March 2015. Monterey Peninsula Water Supply Project Using the Salinas Valley Integrated Ground and Surface Water Model. Prepared for Geoscience.
- HydroFocus, Inc., August 31, 2017. Appendix E2 North Marina Groundwater Model Review,Revision, and Implementation for Slant Well Pumping Scenarios. Prepared for Cal Am Monterey Peninsula Water Supply Project.

1.3 Information Not Reviewed

Of significance to this review, there is additional information that has not been reviewed for the reason stated. The following is a partial list of items not reviewed.

- Data and data analysis reports
- Source data
- Model files
- CEMEX model report and files
- Responses to Comments to the Final Environmental Impact Report

Accordingly, my report can only assess the model based on the information reviewed, and weighing that information across the reports and against standard modeling practice as appropriate.

The last item in the list, Responses to Comments was made available to me on July 26, late in my review and only just prior to report preparation. While time did not allow for sufficient review of that document, I was able to identify that some concerns by other reviewers similar to my own were addressed to an unknown extent by the consultants (because of my limited time not allowing for a comprehensive review). To the extent that the consultants comments have not adequately addressed, mitigated or corrected each of the items described in this report, my opinions on that particular item remain relevant.

2.0 Model

2.1 Reliance on Salinas Valley Integrated Ground and Surface Water model (SVIGSM)

The Geoscience modeling relied on an updated calibration of the SVIGSM model by its subcontractor, Luhdorff and Scalmanani, Consulting Engineers (LSCE). Geoscience extracted a portion of the area of the SVIGSM model to construct the North Marina Ground Water Model (NMGWM) and adapted it to estimate the drawdown impacts to the aquifer system resulting from proposed slant well pumping along the coast at the CEMEX site and the Potrero Road site. HydroFocus adopted the Geoscience model, adjusted parameter values among other revisions to produce a calibrated model, concluded that the NMGWM boundary conditions, pumping and recharge were in error and instead relied on superposition to predict drawdown from proposed slant well pumping.

The LSCE focus was as follows (excerpt from LSCE, p.1):

> This report focuses on documenting the extension and recalibration of the SVIGSM along with the predictive scenario results of the MPWSP generated by the SVIGSM with a focus on the influence the MPWSP has on Salinas River streamflow and interaction with underlying groundwater aquifers in the Pressure and East Side subareas of the Salinas Valley.

2.2 Limitations in SVIGSM Calibration

LSCE identified the methodology employed to update the SVIGSM calibration. Of significance, primarily because of the subsequent reliance on SVIGSM water levels for assignment of boundary conditions in NMGWM, the LSCE calibration was necessarily limited to only revising and updating system stresses including aquifer recharge and discharge, but excluded updating of the aquifer properties[4] because elements of the existing SVIGSM were inaccessible (see excerpt below, LSCE pg.2):

> The intent of the recalibration effort was to retain the existing model framework and aquifer properties as originally conceptualized by Water Resource and Information Management Engineering, Inc. (WRIME) and MCWRA due to the inability to obtain the SVIGSM source modeling code.

Also from LSCE (pg. 11; underline added for emphasis):

[4] such as hydraulic conductivity (K)/transmissivity(T), and specific storage(Ss)/storage coefficient (S); T and S reflect the K and Ss across the aquifer thickness.

> The intent of the model extension and recalibration effort was to retain the existing modeling framework and aquifer properties and any adjustments that were necessary to recalibrate the model focused on recharge and discharge input values.

Presumably LSCE would have chosen to update aquifer properties to capitalize on the new data available since the last SVIGSM calibration. LSCE provided the following SVIGSM output for the NMGWM model (excerpt, pg. 13):

> SVIGSM calibration outputs were provided to Geosciences for incorporation into the NMGWM. These outputs included monthly output of groundwater levels at SVIGSM nodes located along the edge of the NMGWM domain, groundwater pumping by element, deep percolation by element, and streambed infiltration by stream node. These data were incorporated into the NMGWM for use in model calibration.

LSCE modified the pumping in each model layer based on observed water level data, as described in the following excerpt (LSCE pg. 11):

> During the model calibration, the vertical distribution of groundwater pumping was adjusted to more closely simulate the observed conditions within all three (3) model layers based on water levels at calibration wells. Groundwater levels in each calibration well individually reflect conditions in distinct depth intervals corresponding with different model layers. Accordingly, the hydrographs of simulated and observed water levels for calibration wells were used as guidance in making adjustments to the vertical distribution of pumping for different time periods during the updated model calibration period.

While much of the LSCE data preparation for the model update was reasonable, this re-allocation of pumping during the calibration is problematic. It is not clear that this practice was done model-wide or only for select wells as the report did not provide sufficient information. If the justification for this application was for only wells which spanned multiple aquifers (multi-completion wells), a more defensible approach would have been to employ an equivalent method as that available in the Modflow multimode package which dynamically allocates pumping depending on the layer water level (head), the transmissivity and the storage characteristics (if a transient model). Reallocation by using only the observed water level, presumes the aquifer properties are known and correct in the model. If not, the pumping reallocation based on the observed water level as the guidance, is incorrect. Because the NMGWM calibration would subsequently revise aquifer properties, while retaining the SVIGSM pumping allocation, but also in accordance with the observed water levels, the pumping allocation would be erroneous. Not only that, the calibrated aquifer properties would also be potentially erroneous, because of their dependence on the erroneous stress.

LSCE presented no stream gain-loss data in its report to support its estimation of the streambed infiltration used in the calibrated model, but like the pumping, it was a calibration parameter. But because stream gain-loss data was not presented, it is indeterminate if the calibrated recharge distribution was accurate. Sensitivity analysis of calibrated values was not presented, so the uncertainty is unquantified.

2.3 SVIGSM and NMGWM Inconsistencies

NMGWM is reliant on the recharge and discharge distributions from the updated SVIGSM calibration. Geoscience explicitly states adoption of those stresses, consistent with the LSCE report as follows (excerpt from Geoscience report pg. 27):

> Monthly data for deep percolation from precipitation, stream recharge and groundwater pumping in the NMGWM area as well as the water levels assigned for the general head boundaries during the calibration period were obtained from the SVIGSM.

Geoscience describes the following calibration process (excerpt pg. 28):

> The calibration process involved adjusting model parameters until the model provided a reasonable match between the simulated and measured parameters. These aquifer parameters included horizontal hydraulic conductivity, vertical hydraulic conductivity, effective porosity, and the storage coefficient.

A side-by-side comparison of the aquifer properties in the two models (SVIGSM and NMGWM) is not presented by Geoscience or HydroFocus and because LSCE did not present the aquifer properties in SVIGSM, I am unable to identify and evaluate the differences.

The properties are presumably different between SVIGSM and NMGWM as a consequence of subsequent parameter revisions during calibration by Geoscience and HydroFocus. Because of inadequate documentation in the Geoscience report however, the extent to which a feedback loop between Geoscience and LSCE existed is not evident. It is possible that such feedback was used and the water levels assigned at the NMGWM boundaries were consistent with the SVIGSM output, but if employed, that process may have led to other errors, potentially of great relevance to the reliability of the model results. Only because HydroFocus included water level data in the southern area of the model (south of the Salinas River), was a major discrepancy revealed between the SVIGSM calculated water level elevations and those assigned by Geoscience along the boundary condition. HydroFocus identified the error but did not correct it, and chose instead to abandon use of the calibrated head model for predictions of drawdown from slant well pumping, and employ superposition in its place.

2.3.1 Boundary Conditions

The consultants relied on the updated SVIGSM model-calculated water level distributions associated with an unknown set[5] of SVIGSM aquifer property values in order to assign the water level elevations along the general head boundaries (GHB) in the NMGWM model.

The GHB includes assignment of water levels and conductance terms to perimeter boundary cells and its function is simulation of a head distribution and prevailing gradient at the NMGWM model boundary. Accurate representation of the GHB ensures that the water level elevations in the aquifer layers are equivalent between the parent SVIGSM and NMGWM models at the boundaries. But the consultants do not report the water level elevations at the GHB. LSCE included figures of the simulated potentiometric surface showing contours of the model-calculated spatial water level elevation in the 180-ft aquifer and the 400-ft aquifer, but did not include the Dune Sand/A Aquifer/Salinas Valley aquitard potentiometric surface (SVIGSM model layer 1a). Geoscience and HydroFocus included no figures of the interpreted or simulated potentiometric surfaces for any aquifer in NMGWM so the head assigned along the boundaries could not be determined. The failure to include these interpretations is contrary to standard model (conceptual and numerical) reporting.[6] Also contrary to standard model reporting was the absence of a conceptual water budget, how well the model adhered to that budget, and definition of the method used to calculate the GHB conductance terms.

Subsequent to boundary assignment using the SVIGSM results, Geoscience and HydroFocus[7] revised the aquifer properties inside of the model area, including along the boundaries. This likely resulted in a disparity between the water level elevation assigned at the boundary per SVIGSM, and that inside of the NMGWM. But the disparity at the boundary would result in erroneous flow rates at the boundaries and to an unquantified extent, erroneous water levels inside the boundary. HydroFocus concluded the error was significant, and rather than correct the erroneous boundaries, abandoned the NMGWM physically-based head model in favor of a superposition

[5] not included in the LSCE report appended to the Geoscience report

[6] Anderson, MP, WW Woessner and RJ Hunt 2015. Applied Groundwater Modeling Simulation of Flow and Advective Transport. Elsevier/Academic Press.

[7] It is assumed Geoscience altered the parameter values after importing the SVIGSM boundary water levels because the report does not distinguish otherwise. HydroFocus did alter the Geoscience NMGWM parameter values.

model, where only the change to the water level (not the water level elevation or head) is calculated. The predictive modeling is described in Section 4.0 of this report.

Pumping

The errors in pumping introduced during SVIGSM calibration described in the previous section, were compounded in the Geoscience and HydroFocus calibrations.

Recharge

In order to accurately quantify the impacts during predictive modeling, there must first be an understanding of the stream-aquifer interaction for the conceptual model based on gain-loss data, followed by estimation of the stream-aquifer parameter values during calibration using that data, and finally, quantification of the uncertainty in the calibrated parameter values based on sensitivity analysis. But the consultants do not present this data and analysis.

Stream gain-loss estimates were not presented in the Geoscience or HydroFocus reports. The reports do not present adequate information for the conceptual model pertaining to the stream aquifer interaction, nor where or how SVIGSM stream infiltration is assigned in the NMGWM model, and how well the NMGWM represents that relationship.

It appears[8] that historic gaged flow data along the Salinas River within the SVIGSM and NMGWM areas is available, but an explanation as why gain-loss estimates have not been estimated and utilized in calibration of the respective ground water models was not provided. If such data are available, it is of high value because it reduces uncertainty in the estimated parameter values and reduces the non-uniqueness commonly confounding optimization. Nonuniqueness occurs when different combinations of parameter values match the observations equally well.[9] Furthermore, the predictions of drawdown from slant well pumping and the impact to the stream gain-loss is of critical interest as identified in both the Geoscience and HydroFocus reports. The Geoscience and HydroFocus reports did not include a demonstration that the models accurately simulate the stream-aquifer interaction.

2.3.2 Model Layering

[8] on only a cursory review of USGS online data

[9] Hill, MC and CR Tiedeman 2007. Effective Groundwater Model Calibration. John Wiley & Sons, Inc.

NMGWM includes a layer for the Dune Sand/Aquifer A aquifer[10] (layer 2), and a layer (layer 3) representing the Salinas Valley aquitard, where present. In contrast, SVIGSM combines the typically highly transmissive Dune Sand/Aquifer A unit and the very low permeability aquitard into only one layer (1a), even where both occur vertically in the project area. Because LSCE did not present the aquifer properties of this lumped layer, the disparity in the SVIGSM and NMGWM cannot be evaluated.[11] Accurate representation of this uppermost aquifer layer including the Dune Sand/A Aquifer unit is critical to the calibration and predictions made using the model, including subsequent superposition modeling. The uppermost layer has expectedly the most (if not all) interaction with the recharge stresses, including stream gains and losses, precipitation recharge and other deep percolation.[12] Because SVIGSM revised the recharge distribution in its calibration, it is not evident that the inconsistent representation of the uppermost aquifer unit did not result in inaccurate representation of the recharge distribution. This may be another reason HydroFocus concluded the recharge distribution was erroneous, but this was not specified in its conclusion.

Geoscience and LSCE presented no calibration data for the Dune Sand/A Aquifer unit, although Geoscience was apparently aware of the existence of this data as shown in its Figure 96. Because Geoscience and LSCE did not include any calibration data in the Dune Sand/A Aquifer unit, the level of error remains unquantified.

3.0 Model Calibration

The description of the methodology employed for model calibration in the Geoscience and HydroFocus reports is incomplete. It is not possible to determine if Modflow 2000 was used for parameter estimation using inverse techniques, or was instead used deterministically. Parameter estimation using inverse techniques includes minimization of the objective function, representing the sum of the squared residual values in order to optimize the independent variables, the parameters. The residual is the difference between the observed and calculated value.

[10] Layer 2 also houses Perched Aquifer, the Perched "A" Aquifer, the 35-ft Aquifer and the -2 ft Aquifer (HydroFocus report pg. 9) but in this report I will refer to the "Dune Sand/A Aquifer unit" for simplicity.
[11] LSCE presented no information on the aquifer property values in the SVIGSM model so that a comparison could be made with that presented in the Geoscience and HydroFocus reports.
[12] Based on HydroFocus figures, however, there may be stream infiltration to the 180-ft aquifer, although there was inadequate information in the report to make a conclusion.

Modflow 2000 can be used for either approach. Parameter estimation is the calibration process which adjusts aquifer and stress variables (typically including the aquifer hydraulic conductivity, transmissivity, storage properties and recharge, among others) within reasonable ranges, to minimize the residuals in the observed and calculated response variables (i.e. the water level, also referred to as the head, and flux/flow). Industry standard calibration was historically done deterministically but, for approximately the past 15 years, inverse techniques have become more commonly employed because of the benefits of the inverse methodology, including quantification of the parameter uncertainty and sensitivities (coefficients calculated during parameter estimation to reduce the difference between the observed and calculated values[13]) , as well as quantification of the uncertainty in predictions, among other documented benefits.[14]

Neither consultant states which of the two, or whether a combination of the two was used to calibrate the models, critical to my review. It would have been assumed that the models were calibrated using inverse techniques in that the model is expectedly amenable to inversion.[15] The absence of enormous amounts of information generated by inverse modeling from the reports suggests that perhaps only deterministic methods were employed, sacrificing a valuable opportunity to better define the system through parameter optimization and uncertainty analysis. At a minimum, the identification of which calibration method was employed, and if not employed, a legitimate reason for not using inverse methods should have been included in the report.

The objective of the NMGWM model stated in the Geoscience report (pg.8) was to "evaluate the impacts of the proposed MPWSP on the Salinas Valley Groundwater Basin. Groundwater modeling was conducted to assess the impacts of MPWSP on the groundwater levels and the seawater intrusion".

Geoscience identified the following tasks to be completed in its scope of work (pg. 8):

- Collecting and analyzing historical geohydrologic data,
- Updating and recalibrating the North Marina Groundwater Model (NMGWM), including data gathered during the exploratory borehole work (GEOSCIENCE, 2014),
- Updating and recalibrating the Salinas Valley Integrated Ground and Surface Water Model (SVIGSM; see Appendix A)
- Developing a focused CEMEX Model for the CEMEX Site,
- Developing and running various MPWSP scenarios, and

[13] Doherty, J. 2015. PEST Calibration and Uncertainty Analysis for Complex Environmental Models, pg. 62.
[14] Hill, MC and CR Tiedeman 2007. Effective Groundwater Model Calibration. John Wiley & Sons, Inc.
[15] Dry cells in modeling can present difficulties for inverse modeling, but this model expectedly did not incur this difficulty to the extent that inverse methods would have been rejected *a priori*.

- Preparing the modeling report.

3.1 Data Deficiencies and Exclusion

While additional data collection was part of the task, Geoscience included no water level data for the Dune Sand/A Aquifer unit across the entire model area. But the Dune Sand/A Aquifer unit is one of the two primary units intended for pumping in the MPWSP. Geoscience did identify the existence of well data at Fort Ord (Figure 96), but excluded it from the calibration results in the model report. Because the expanse of this unit as represented in model layer 2 excluded water level data, the Geoscience NMGWM calibration for the Dune Sand/A Aquifer unit is associated with significant uncertainty, and predictions relying on the Geoscience calibrated model are concluded to be unreliable. Model bias is also evident in the 180-ft aquifer. Only when HydroFocus included the water level data (but only in the Fort Ord area south of the Salinas River), a poor calibration was revealed. But the calibration may be poor across other areas of the model where no water level data was available to inform the calibration. HydroFocus is correct in its assertion that the model in its current condition was unacceptable for its intended objective.

Geoscience described the CEMEX modeling in its report (April 17, 2015) but monitoring and testing of the CEMEX wells was initiated at nearly the same time as the report in early to mid-April 2015. It is unfortunate that the Geoscience CEMEX modeling was not delayed until after the testing which presumably would provide significantly better data for the model.[16] Because this data was not yet available, Geoscience relied on lower quality information from sediment texture curves, which included significant and untested assumptions, to derive the aquifer parameter starting values for calibration. But equipped with no water level data and no stream gain-loss data for calibration, the model representation of the Dune Sand/A Aquifer unit remained uncalibrated, so the presumably highly uncertain values used as initial values reasonably remained equivalent or nearly so to the final values.

HydroFocus presented calibration results using the CEMEX testing in which observed and calculated drawdown were presented for its model, the Geoscience model and the CEMEX model. But HydroFocus did not report the CEMEX test estimates of hydraulic conductivity (K); horizontal (Kh) or vertical (Kv)) or the estimated specific yield/storage estimate (sy/S), or that the model used those values.[17] The model K and S values for

[16] I am unfamiliar with potential constraints on the project schedule but the nearly contemporaneous report submittal and data acquisition is noted.

[17] See Figure 3.3d

either the HydroFocus model or the Geoscience model are not compared with the valuable test-derived estimates. Of the three models, the CEMEX model most accurately simulated the test drawdown, which HydroFocus attributed to the better resolution in the CEMEX model.

The source data was not included in the reports. Neither consultant posted actual K or storage values from testing in their parameter zone maps. While HydroFocus did prepare a list of sources for its basis in the model parameter zone values, those sources are most often other modeling efforts. It is not known if the source K values are model-estimated or estimates from testing. Model-derived estimates of K through calibration, for instance, are of less reliability than a hydraulic conductivity (K) value derived from pumping tests. The consultants require that the reviewer must gather and review all source documents to extract the information that should be reported in the model report. Standard model reporting includes a description of the method used to estimate each aquifer parameter[18], which is absent in the reports.

3.2 Parameter Adjustment During Calibration

HydroFocus and Geoscience adjusted parameter values to minimize the difference between the observed and model-calculated water levels during calibration. This minimization of the objective function (water level or head residuals (errors)) is but one measure of many in determination of the calibration quality and whether the model is a sufficiently accurate representation of the aquifer system. Calibration quality assessing only the error in the water level residuals, considers only a portion of the error information, and in this case likely a small portion of the error information. The NMGWM objective function is dependent on the water level data available, and as described in previous sections, insufficient data was acquired, utilized and presented for the NMGWM model calibrations. Furthermore, the calibration process must only adjust parameters within reasonable ranges based on available data, and quantify the uncertainty in those parameter estimates during the sensitivity analysis.

But the NMGWM calibration is concluded to have significant errors besides those already presented, and they include unreasonable parameter values, insufficient data, and inadequate sensitivity analysis.

[18] Anderson, MP, WW Woessner and RJ Hunt 2015. Applied Groundwater Modeling Simulation of Flow and Advective Transport. Elsevier/Academic Press.

Because of these errors, the model is not concluded to be representative of the aquifer system. The model will be unreliable for predictions of impacts from slant well pumping, regardless of its ability to minimize the objective function.

3.2.1 Hydraulic Conductivity

Sensitivity analysis and confidence intervals for the calibrated parameter values are not reported in the consultants reports. The uncertainty in the calibrated parameter estimates is not quantified.

Geoscience updated the CEMEX model subsequently in 2016, prior to the HydroFocus NMGWM calibration (2017), and presumably reflective of the high quality data from the pumping test performed in April 2015.[19] But HydroFocus did not identify the CEMEX aquifer test estimates of the horizontal (Kh) and vertical hydraulic conductivity (Kv) values in the report, and instead relied on other (often older) reports which appear to include predominantly modeling estimates of Kh and Kv.[20] The CEMEX monitoring well network for the test appears to have been particularly well suited for determination of Kh and Kv values.

In the CEMEX and Potrero Road sites, the Geoscience initial estimates of Kh and Kv were based on an assumed relationship between sediment texture and horizontal and vertical hydraulic conductivity. The method assumptions were not subsequently validated with the CEMEX aquifer test parameter estimates. Had the assumptions been subsequently validated, an opportunity would have existed to extend that demonstrated correlative relationship to other areas of the model. HydroFocus did not provide a post-audit of the validity of the approach and assumptions, or appear to rely on that method.

In the model area primarily east, south and southeast of CEMEX, the Kh and Kv values in the Geoscience and HydroFocus models are substantially different for the Dune Sand/A Aquifer unit, the Salinas Valley aquitard (SVA), and the 180-ft aquifer. The Kv changes include up to seven orders of magnitude reduction in the newly-interpreted low conductivity material in the HydroFocus model in layer 3.

The mapped SVA (Salinas Valley aquitard) north of the Salinas River has a Kv value five orders of magnitude larger than this anomalous low Kv zone south of the river. Because this change was not associated with a defined lithologic reinterpretation in the HydroFocus report, the value appears to be unreasonable. The Kh and Kv of the Dune Sand/A Aquifer unit are also generally lower in this anomalous zone, although the Kh

[19] The pumping test at CEMEX is concluded to have been performed in April 2015 based on the hydrographs presented in the HydroFocus report.
[20] See Figure 3.3d

value is identical between the Dune Sand unit and the low conductivity zone, also potentially reflecting an unreasonable Kh value if it is permeable material.

This area is partially traversed and bordered by the Salinas River.[21] The low Kh and Kv will limit the hydrologic connection between the river and the aquifer. Because the stream-aquifer interaction along the Salinas River may be affected by the erroneous model values, and because stream gain-loss data were not presented for the calibration, the predicted impact to the River from slant well pumping is unreliable. HydroFocus excluded explicit representation of a portion of the Salinas River in this area of the model in its predictive modeling as will be described in Section 4.0.

The Kh and Kv values in the 180-ft aquifer were also revised between the Geoscience and HydroFocus models significantly south of the Salinas River and near the southern boundary. The Geoscience Kh of 160 feet per day (ft/d) was revised to 50 ft/d (western half) and 425 ft/d (eastern half) so that a much higher Kh value is assigned inland as compared to the coast. The Kv was increased more than an order of magnitude above the Geoscience model values. HydroFocus did not post/identify the specific K values used to support this set of values, so it is not possible to make a conclusion about its accuracy.

HydroFocus incorporated more water level data along the southern boundary than Geoscience which allowed for better calibration in this area of the model. However, calibration must also reflect reasonable aquifer properties, while also minimizing the residuals between observed and calculated water levels. Some of the significant parameter changes made in the HydroFocus model may have been to compensate for anomalous boundary and initial water levels prior to the evident conclusion that the water levels were erroneous and disregarded in subsequent superposition modeling.

3.2.2 Storage Values

Only a cursory review of the model storage properties has been accomplished. I did not identify any source data values in the reports to which I can compare the model values. HydroFocus referred primarily to SVIGSM, but the LSCE model report did not include S estimates. HydroFocus had not included estimates from the CEMEX aquifer test so a comparison with model values could be made.[22]

---

[21] Because Geoscience and HydroFocus do not show the Salinas River on its respective parameter zone maps, I can only estimate based on a comparison across multiple figures.

[22] It is unknown whether the CEMEX testing yielded an estimate of specific yield and storage coefficient because the CEMEX report was not reviewed, and HydroFocus did not identify the values in its model report.

Accurate representation of the specific yield (effective porosity) and the storage coefficient is required for accurate predictions of the drawdown distribution and seawater intrusion. The HydroFocus values of specific storage (representing the storage coefficient divided by the aquifer thickness) as presented in Figure 3.3c appear to indicate an average model value of 0.001/ft which seems high for a confined aquifer where that exists.[23] Without any independent estimates made available by the consultants, it is not possible to conclude that the model storage values are reasonable. The model reports did not present interpreted or calculated potentiometric surface maps so areas where aquifers are confined or unconfined could not be distinguished and weighed against the storage estimates. The potentiometric surface is an imaginary surface passing through all points to which water will rise in wells penetrating a confined aquifer, and the surface is described by a series of contour lines along which the potential head is equal. The ground water flow direction is perpendicular to the contours. For an unconfined aquifer, the potentiometric surface is referred to as the water table, which defines the surface upon which the water pressure is equal to atmospheric pressure[24]. Definition of the potentiometric surface/water table is integral to understanding the hydrogeologic system.

3.2.3 Model Budget

The NMGSM hydrographs show that the initial model heads and heads at the boundaries were inaccurate for a significant portion of the simulation period.[25] The HydroFocus model flow budget presented in Figure 4.5 is inaccurate because it appears to use an average based on the inaccurate heads, as well as the erroneous pumping and recharge components. The model flow budget represents the model balance of each flow component simulated explicitly in the model, with some of the components positive (water into model area), precipitation recharge for example, and the others negative (water out of model area), including pumping as an example. Modflow numerically balances the positive and negative components with a balanced model showing a near zero difference between the two. Unbalanced or excessive flow budget error would be an indication that the flow components are not balanced, and the model is not concluded to be numerically precise. A model flow budget for the Geoscience model calibration is not included in the report. It is standard modeling practice to compare the model budget with that estimated independently depending on available

[23] Without review of source data, it is indeterminate whether 0.001/ft is an accurate value for the aquifer specific storage.

[24] McWhorter, DB and DK Sunada 1977. Ground-Water Hydrology and Hydraulics. Water Resources Publications, LLC.

[25] See HydroFocus Figure 4.1A layer 2 hydrographs.

historic data. LSCE had provided a detailed basis for some components, but the consultants did not incorporate this as part of the model calibration evaluation.

3.3 Sensitivity Analysis

HydroFocus stated the objective of its sensitivity analysis (pg. 42):

> The objective of the sensitivity analysis is to address the question: "If the assumptions adopted in developing the model were changed, would the model predictions change so as to change the conclusions regarding proposed slant well operation?"

For its sensitivity analysis, the HydroFocus report included an evaluation of the changes in drawdown in the predictive scenarios with alteration of five of nearly 50 conductivity model parameter zones.[26,27] Evaluation of the predictive uncertainty is valuable but not without an evaluation of the uncertainty in the parameter values estimated in calibration, upon which predictive uncertainty also depends. Standard reporting includes reporting the parameter sensitivity for all parameters, not only 10 percent, and from the calibration, not only from the predictive scenarios. While it was not made clear in either report whether inverse modeling was used for parameter estimation, Modflow 2000 allows for calculation of the sensitivities, as do other freely-available, coupled softwares to Modflow. Corroboration of the methodology and software is not possible without more information.

3.4 Analysis of the Residual Error

Geoscience and HydroFocus presented various report figures describing the residual error between the observed and model-calculated water level (head) values. The following observations are made based on my review of the report figures.

Dune Sand/A Aquifer unit

Of the eight wells, seven show that the model underestimates the observed water levels in the Dune Sand/A Aquifer unit. The model shows a biased low water level distribution.

---

[26] HydroFocus report Figure 6.1.

[27] Sensitivity is defined as the change in the model calculated response variable (for NMGWM, the water level, or derived drawdown) associated with the change in the parameter value (i.e. K; Anderson, MP, WW Woessner and RJ Hunt 2015. Applied Groundwater Modeling Simulation of Flow and Advective Transport. Elsevier/Academic Press.). Although typically in inverse modeling, perturbation of the parameter value over a small range more accurately reflects the parameter sensitivity because the parameter sensitivity is not always linear (Hill, MC and CR Tiedeman 2007. Effective Groundwater Model Calibration. John Wiley & Sons, Inc.). HydroFocus changes to the parameter values were large, assuming linearity, and done to demonstrate only the change in extent of drawdown away from the slant pumping.

Four of the wells[28] show that the starting head in the model was as great as 70 to 80 ft in error, as compared to the observed values. While there is convergence of the observed and simulated water levels late in the simulation period at three of the wells, it is not evident that error magnitude is not increasing with time,[29] or that application of an extremely low and likely unreasonable Kv is justified and has not been applied to specifically to reduce the residuals.

At monitoring wells MW-OU2-29-A and MW-BW-01-A, the erroneous starting head is shown to rise more than 70 ft during the simulation period at the (latter) well farther in from the boundary, and 35 ft at the (former) well more proximal to the boundary, possibly distinguishing error contributions.[30] Despite the significant rise in model water levels, concluded in the report to be erroneous, the observed water levels range similarly between the wells over a 10-15-ft interval. Rather than a localized perched condition as HydroFocus concludes without presentation of adequate data[31], the four wells collectively support instead a laterally extensive (of a few miles at least) saturated unit possibly above the Dune Sand/A Aquifer unit. It is possible that an additional aquifer above or within the Dune Sand/A Aquifer unit is present south of the Salinas River and is not the seemingly insignificant localized perched zone HydroFocus concludes. Additional data should have been collected to determine if this apparent upper aquifer unit is in hydrologic connection to the Dune Sand/A Aquifer unit. If it is, the evident vertical gradient warranted better vertical resolution (increased layering). This, among other expanses of model layer2 where the absence of water level data could not allow for similar revelation, may be an indication that the layering is too coarse for accurate representation of the uppermost aquifer units, including the Dune Sand/A Aquifer unit, thereby preventing evaluation of the full impacts from slant well pumping. Because the consultants provided no interpretation of the potentiometric surface, or the model-simulated potentiometric surface for any aquifer in their reports, contrary to model reporting standards, the extent to which this area may be in hydrologic communication with the Dune Sand unit at CEMEX has not been investigated

[28] MW-OU2-07-A, MW-BW-31-A, MW-OU2-29-A and MW-BW-01-A

[29] MW-OU2-07-A hydrograph Figure 4.1a shows an approximate 90% increase in the error between the beginning and end of the correlated portion of the record. MW-BW-31-A observed values show an anomalous step in the record which prevents a determination of the change in errors before the simulation period ends in Sept 2011.

[30] Errors in starting head and errors in the boundary conditions represent different error impacts in the model.

[31] Review of lithologic logs and interpretation of the potentiometric surface would have helped to distinguish whether the area may be in hydrologic communication with the aquifer or is perched, but Geoscience excluded the water level data, and HydroFocus concluded, in my opinion without adequate analysis completed, that the area was likely perched and that Modflow limitations prevented accurate representation of the water levels. Both consultants failed to adequately characterize this area, among others in NMGWM as a consequence of not collecting additional data in the uppermost unit.

or described by the consultants. The model does not allow for this communication as evidenced in the calibration results.

The extremely low Kv applied to the Dune Sand/A Aquifer unit, and particularly in the underlying layer 3[32] appears to have resulted in eventually reducing the residual at three of the wells. The extremely low Kv was applied to reduce the residuals at the wells, but because the value seems unreasonable, its use as a mechanism (prop up the head in layer 2) to improve the appearance of the calibration, instead reduces the confidence in the calibration.

Geoscience included no data for calibration of this unit. Because of the errors revealed in the HydroFocus calibration and report, the Geoscience calibration is expectedly also poor, as likely would have been concluded had the data been included.

For the CEMEX modeling as presented in Figure 4.2, the comparison between the observed and model-calculated values indicates low error in the water level residuals. However, the basis provided by HydroFocus on its improvement to well MS-5S[33] consists of the changes made to the SVA Kv. The Kv changes are described above and are considered unreasonable but applied as a mechanism to prop up the head in the model. An acceptable calibration achieves low magnitude, spatially and temporally random error, using reasonable parameter values. Because a sensitivity analysis of the calibrated parameter values was not presented in the report, the influence of the low Kv on the CEMEX area model-calculated water levels is unknown. The extent to which the model water level distribution in the Dune Sand/A-Aquifer unit in the CEMEX area depends on the seemingly unreasonable low Kv value of the nearby underlying SVA has not been assessed due to the consultants not including a sensitivity analysis of the calibrated parameter values.

The calibration is poor for the Dune Sand/A Aquifer unit and is affected to an unquantified extent by erroneous boundary conditions, erroneous starting heads, unreasonable parameter values and insufficient data. Based on the reports, the interpretation is also insufficient and fails to characterize the impact of these errors on the accuracy of the calibrated parameter values. Model predictions relying on a model with these errors are unreliable.

180-ft Aquifer

[32] as described in Section 3.2.1

[33] The CEMEX test was simulated in the Geoscience and HydroFocus NMGWM, but MW-5S available for monitoring and calibration during the slant well testing was excluded from Figure 4.6 without explanation.

The HydroFocus calibration included 10 wells with time-series data. The match between the observed and calibrated water levels at six of the wells is excellent in both timing and magnitude. However, five of the six wells are proximal to rivers (streams slough, etc; unlabeled in the HydroFocus report). It cannot be concluded that aquifer property values are accurate because the good fit between observed and calculated values may be a consequence of the unreported streamflow infiltration values provided by SVIGSM. It is not even clear from the reports if streamflow infiltration is applied in layer 3. Furthermore, because a sensitivity analysis was not presented for the calibrated parameter values, the sensitivity of these observations to recharge is unknown.

Two of the model-calculated water level hydrographs exhibit too much variability in the model response as compared to the observed response, and the remaining two show too little variability in the magnitude as compared to the observed values. But the extent to which this is significant depends on the problematic LSCE treatment of pumping in its calibration as described in Section 2.2 of this report. The LSCE calibration included allocation of pumping rates vertically across the aquifers based on observed water level data; water level data also used in the subsequent Geoscience and HydroFocus calibrations.[34] The LSCE practice resulted in what may be considered a contamination of the independence of the water level dataset because of the explicit correlation made between water levels and pumping in SVIGSM. If the pumping is inaccurate (as concluded by HydroFocus and this review), but a reasonable fit between observed and calculated water levels has been achieved due to parameter (K,S) adjustment, as is shown to be the case to an extent in the consultants respective calibrations, then the aquifer properties are likely inaccurate also. Use of the observed water levels to allocate pumping results in lower confidence in the aquifer parameter values.

The calibration results indicating low error are not an indication that the underlying parameter values are reasonable, only that they have compensated for unquantified error in pumping, recharge, boundary conditions and initial heads. The extremely low Kv values are a demonstration of exactly this. The confidence in the calibrated model is low, and reliable predictions of drawdown cannot be calculated.

Geoscience presented only four hydrographs for the 180-ft aquifer, and nine for the 400-ft aquifer, even though the 180-ft aquifer is of prime interest, and more data was available. LSCE presented seven hydrographs for the 180-ft aquifer. HydroFocus presented 10 hydrographs. Why the available data was excluded was not addressed in

[34] Approximately the same datasets, as Geoscience only presented four of the wells in its report with its appended LSCE report showing only seven as compared to HydroFocus presenting 10 hydrographs.

the Geoscience report. The Geoscience 180-ft aquifer residuals range from low magnitude to as high as approximately 18 ft. The two remaining wells show an acceptable match to observations, but this statement is qualified in the preceding paragraphs. Even where low residuals have been calculated, there is low confidence in the calibrated aquifer parameters.

The CEMEX modeling based on the Geoscience and HydroFocus calibrated models, shows low magnitude error but a bias in the model-calculated water levels indicating that the model cannot reproduce the variability exhibited in the observed values. HydroFocus did not provide an explanation for this effect.[35]

Another anomaly in the HydroFocus and Geoscience calibrations was the ambiguous placement of observation well 14S/2E-14L01 which according to the Monterey County Water Resources Agency is a 180-ft aquifer monitoring well. But because of seemingly similar water levels, was instead placed in the 400-ft aquifer layer. Sufficient information was not presented to discern that the consultants assigned the well to the correct aquifer. The well construction details were apparently not reviewed although that review may have resolved the ambiguous placement with more confidence. HydroFocus did not identify that Geoscience undertook this effort either.[36]

400-ft Aquifer

The HydroFocus model generally underestimates the observed response in this aquifer, and generally simulates too high a head compared to the observations. The Geoscience model achieved a poor calibration over most of the 400-ft aquifer with the largest residuals calculated along the eastern and northern boundaries. Residuals of greater than 50 ft are prevalent in proximity to the eastern boundary. This result shows that the eastern boundary water levels were significantly erroneous and influenced the water level distribution inside the model, including expectedly, the predictions of drawdown made by Geoscience from slant well pumping. No observations near the southern boundary were included so the extent to which the southern boundary water levels were erroneous cannot be determined.

For the CEMEX modeling as presented in Figure 4.2, evident bias is shown for the 400-ft aquifer with all simulated water levels higher than the corresponding observed values. This indicates that the model underestimated the impact to the 400-ft aquifer during

[35] Although the report does identify that pumping and recharge changed after September 2011, but also identified that hydrologic conditions have not likely changed substantially between the model timeframe and the water level data period.

[36] Geoscience prepared a communication for HydroFocus on the matter but I have not reviewed that document.

CEMEX pumping from the overlying aquifers. It is not evident from the report, if the calibration sought to resolve this. If not, the predicted impact to this aquifer will be underestimated for the MPWSP.

900-ft Aquifer

During half of the simulated period, the observed water level response at all of the monitoring wells varies over a narrow range of approximately two feet. The model simulates a 10-ft range.

3.5 Analysis of the Model Error

Insufficient data was used for model calibration as described. The error evaluated by the consultants only reflects as much error as the calibration dataset allows, which is limited most notably in the Dune Sand/A Aquifer unit, a primary aquifer targeted for slant well pumping, as well as by the absence of stream gain-loss data. Error along model boundaries is largely unquantified owing to limited data in those areas. The impact of this error on calculated water levels across the model is unquantified. Because sensitivity analysis of the calibrated values and parameter uncertainty analysis were not performed, the model error has not been thoroughly evaluated for calibration or prediction.

The structural error due to elements including layering and zonation has not been evaluated. It is possible that an additional aquifer above or within the Dune Sand/A Aquifer unit is present south of the Salinas River and is not the (insignificant) localized perched zone HydroFocus concludes. This, among other expanses of model layer2 where the absence of water level data could not allow for similar revelation, may be an indication that the layering is too coarse for accurate representation of the upper aquifer unit, thereby preventing evaluation of the full impacts from slant well pumping.

But model error in the form of bias is evident in the calibration results. Model error is reflected in the non-randomness of the residuals as demonstrated by the correlation between residual error and calculated water levels, and non-randomness in space, and to the extent it could be determined, unreasonable parameter values.[37] Sensitivity analysis of calibrated parameter values, and of the SVIGSM-adopted errors in pumping and recharge was not accomplished. Without this, the uncertainty in the parameter values is unknown.

[37] Because specific values of K and S from aquifer testing were not reported, the extent to which the model values adhered to reasonable values as determined independently of the model cannot be determined. In some cases however, the calibrated values do not appear to be reasonable based on other indicators.

Rather than rectify the model bias error, HydroFocus employed superposition to predict the drawdown associated with proposed slant well pumping. But the model error, the revelation of which was limited by the dataset, was inherent in the calibration, and superposition relied on the calibrated parameter values. So the error was transferred and potentially compounded for the superposition modeling.

Geoscience and HydroFocus present other error measures in their respective reports including the relative error, concluded by HydroFocus to be acceptable based on the following excerpt (pg. E-1):

> The relative error calculated from the standard deviation of the model errors and range of measured water levels in the model meets calibration criteria and ensures that model errors are only a small part of the overall model response.
>
> The results provide confidence that the model calculations are reliable estimates of the groundwater response to pumping, which was confirmed by simulating measured drawdown during test slant well pumping.

The statements are ambiguous, but importantly, HydroFocus correctly concludes that other model measures, including the identified bias, renders the calibrated head model unacceptable for use in predictions of drawdown from slant well pumping. This set of conclusions, that the residual error is low, but the model bias is significant and the calibrated model cannot accomplish what it was designed for, is a good demonstration that an acceptable calibration must consider bias as an integral measure of model utility. Geoscience did not include sufficient data or analysis to make the correct conclusion that HydroFocus was able to make. The model was not calibrated to an acceptable standard, but instead of improving the calibration, admittedly not a simple undertaking in this case, HydroFocus employed superposition for predictive modeling.

4.0 Predictive Modeling

4.1 Uncertainty in Calibrated Parameter Values

HydroFocus and Geoscience did not evaluate the uncertainty in the calibrated parameter estimates, and its impact on the calculated water levels. HydroFocus evaluated only the sensitivity of a few parameters near CEMEX and Potrero Road sites during predictive modeling. From its limited sensitivity analysis for predictions, HydroFocus concluded (pg. 42):

> Increasing the anisotropy (increasing horizontal conductivity and decreasing vertical conductivity) minimizes the area of the cone of depression. Conversely, decreasing the anisotropy (decreasing horizontal conductivity and increasing vertical conductivity) maximizes the area of the cone of depression.".[38]

Hydraulic conductivity often exhibits characteristic anisotropy, meaning that it is directionally dependent[39] and in the NMGWM, anisotropy is used to reflect that Kh is not equal to Kv.[40] The HydroFocus conclusion stated above regarding the effect of anisotropy on the drawdown cone extent is counterintuitive to the expected result. For clarification, higher anisotropy indicates that the Kh is *much* larger than the Kv. For such a situation, among other variables[41], one would expect a laterally extensive drawdown in the horizontal direction (high Kh) and limited drawdown vertically (low Kv). The conclusion HydroFocus derived based on its modeling does not make sense.[42] Reducing the anisotropy (making Kh and Kv less dissimilar, or more equivalent in magnitude), and allowing for increased vertical flow should result in a cone of depression that is less laterally extensive. The HydroFocus model calibration included apparently unreasonable values of Kh and Kv east and south of the CEMEX site, and the remainder of the model includes parameter values of unquantified uncertainty because of inadequate sensitivity analysis.

HydroFocus presented three scenarios varying the pumping allocation between the Dune Sand/A Aquifer unit and the 180-ft aquifer. However, HydroFocus elects to present results for the scenario which is apparently not based on the most likely allocation between the two aquifers. Based on the CEMEX model calibration, more of the pumping is derived from the Dune Sand as opposed to the 180-ft aquifer (worse-case scenario?). While it is unclear why HydroFocus presented the results of this apparently less likely scenario, it may be that increased pumping from Dune Sand would have calculated a greater drawdown extent and increased leakage from the Salinas River and other modeled surface water drainages.[43]

---

[38] Pg 42 in HydroFocus report

[39] Anisotropy is defined as a property that varies with direction (Driscoll, FG 1986. Groundwater and Wells. Johnson Filtration Systems, Inc.)

[40] Kh can also be directionally dependent along the x and y tensors. But NMGWM does not reflect this particular anisotropy.

[41] Storage characteristics, transmissivity values, well completion, initial head and head differences across layers, boundary effects, etc.

[42] Because I do not have access to the model files, I cannot confirm that this is accurate. It is possible that sufficient numerical precision was not achieved, or the flow budget was associated with excess error. Or it is possible that the statement is correct but not intuitive.

[43] However, this can only be surmised without access to the model files.

HydroFocus adapted the NMGWM superposition model to include explicit representation of a portion of the Salinas River and Tembladero Slough/Reclamation Ditch using the Modflow river package so that the stream-aquifer interaction along these drainages is represented in order to quantify the impacts from slant well pumping. A large reach of the Salinas River and several other streams are not included in the analysis. No explanation for this is provided.

Because the calibration does not incorporate evaluation of stream gain-loss data, and the conceptual model does not include adequate information or analysis of the stream-aquifer interaction, the superposition model-predicted depletion impacts to the surface water system are concluded to be unreliable. The uncertain MPSWP predicted impacts to the streams may exceed allowable limits of established minimum streamflow standards. The results did not address this possibility.

4.2 Superposition

HydroFocus abandoned use of the calibrated head model, and instead relied on superposition to quantify the drawdown impacts from slant well pumping. But superposition relied on a set of calibrated parameter values which are concluded to also range from unreasonable to exhibiting significant but unquantified uncertainty. As a consequence, the superposition modeling produced unreliable predictions of drawdown from slant well pumping.

Superposition requires that the model be linear[44], or nearly so. But the degree of potential nonlinearity was not investigated by HydroFocus. It is not concluded that the thinning and unconfined Dune Sand/A Aquifer, or the reduction in transmissivity from slant well pumping or the boundary conditions did not present significant nonlinearities in the system causing the application of superposition to calculate erroneous drawdown values. This same criticism may be applicable to the Salinas Valley Aquitard where it may become unconfined during predictive simulations.

Superposition, as applied in the HydroFocus work, did not include dynamic updating of the boundaries which may have incurred drawdown, although the presentation style of reporting only drawdown greater than one foot does not show the full drawdown extent.[45] The zero/near zero drawdown contour should have been included in the Geoscience and HydroFocus analyses and figures to identify areas where the boundaries affected the model-calculated drawdown extent. The boundary inflow with and without

[44] Reilly TE, OL Franke, and GD Bennett, 1984. The Principle of Superposition and its Application in Ground-Water Hydraulics, U. S. Geological Survey Open-File Report 84-459.

[45] This was the presentation form in both the Geoscience and HydroFocus reports.

slant well pumping should have been presented to discern any changes in inflow mitigating drawdown. A prevailing gradient is simulated at the General Head Boundary (GHB). If pumping inside the model results in drawdown reaching the GHB, inflow at the boundary will continue at a biased high rate resulting in an erroneous calculation of the drawdown extent. Insufficient analysis and reporting does not demonstrate that this was not a factor.

Application of superposition to isolate the impact from only the slant well pumping may be inconsistent with the model purpose as defined by Geoscience (pg. 8):

> The purpose of this study was to evaluate the impacts of the proposed MPWSP on the Salinas Valley Groundwater Basin. Groundwater modeling was conducted to assess the impacts of MPWSP on the groundwater levels and the seawater intrusion.

The Salinas Groundwater Basin includes multiple complex variables (recharge and discharge) changing in time and space which affect the groundwater levels and rate and extent of seawater intrusion. The success of the slant well pumping to expectedly not exceed seawater intrusion thresholds, among other measures, is dependent on the effects from these other complex and dynamic stresses. In the superposition analysis, these other relevant stresses are omitted, thereby making system response predictions unreliable. It is insufficient to predict only slant well pumping impacts in a dynamic system integrally defined by many other complex impacts which in turn, affect the slant well pumping.

The application of superposition, intended by HydroFocus to diminish the error and uncertainty in many aspects of the calibrated head model, did not alleviate the errors or quantitatively demonstrate a reduction in error, and possibly introduced new and different errors in that aspects of the superposition model were not calibrated (i.e. stream gain-loss; boundary inflow, etc.).

4.3 Slant Wells Designed to Replace Freshwater with Saltwater

Dr. Weitzman indicated that according to his understanding of the project objective, that the slant wells would not cause additional seawater intrusion and requested that if available, I include information from the consultants reports which did not support this understanding.

Review of the consultants reports identifies that seawater intrusion would increase. The increase in inland extent due to creation of a cone of depression from pumping was not reliably determined in the consultants model. But the slant well pumping is designed to replace freshwater in the Dune Sand/A Aquifer unit and 180-ft aquifer with seawater

over some unreliably quantified aquifer volume and timeframe based on the HydroFocus report excerpt presented below (pg. 36):

> A capture zone refers to the three-dimensional volume of aquifer that contributes the water extracted by the wells. When the pumps are turned on, the wells initially extract the existing ambient mix of native groundwater in storage, but as pumping continues the wells extract increasing proportions of infiltrating recharge from the ocean. The ocean recharge gradually replaces the ambient water within the capture zone, and moves within the capture zone toward the well but does not spread beyond the capture zone. In map view, the capture zone is a 2-dimensional surface that delineates the underlying aquifer volume where ocean water replaces ambient groundwater and ultimately becomes the primary water source to the wells.

Because the slant well pumping is designed to replace aquifer freshwater with seawater, the pumping necessarily results in an increase in seawater intrusion into aquifer areas still containing freshwater.

5.0 Conclusions

The MPWSP proposes slant well pumping to replace freshwater aquifers with seawater as a supply for the desalination plant. A calibrated model was needed to make accurate predictions of drawdown and seawater intrusion resulting from slant well pumping. To accomplish this, the existing SVIGSM model was updated. The model results were adapted for use in the better resolution NMGWM. Geoscience calibrated the NMGWM as described in its 2015 report. HydroFocus provided an alternate calibration starting with the Geoscience model as described in its 2016 report, and used superposition for its predictions of drawdown.

Based on my review of the reports, it is concluded that:

- Insufficient data was collected/evaluated for the model calibrations:
    - including, but not limited to, inadequate (to no) water level data in particular for the Dune Sand/A Aquifer unit, one of two primary units targeted for slant well pumping,
    - and stream gain-loss data which would have improved the model and aided in parameter optimization.

- SVIGSM produced unreliable estimates of the pumping, recharge and initial water levels for use in NMGWM.

- NMGWM calibration included adjustment of model parameters based on unreliable values from SVIGSM.
- Geoscience was aware of Dune Sand/A Aquifer unit data but excluded it from the calibration without explanation. Geoscience also excluded water level data available for the 180-ft aquifer, also without explanation.
- Inadequate information was presented in the reports contrary to standard model report documentation and included:
    - Interpretations of the potentiometric surface for each aquifer in the NMGWM area were not included in the reports.[46] Recall that the potentiometric surface is described by a series of contour lines along which the potential head is equal. The ground water flow direction is perpendicular to the contours. Standard model reporting includes representation of the interpreted and model-simulated surfaces to show that the model is consistent with the hydrogeologic understanding of head and flow directions derived from the conceptual model. No such demonstration was made in either consultant's report for the NMGWM area.
    - Simulated potentiometric surface maps from the NMGWM area were not presented in the consultants' reports.
        - It is possible that an additional aquifer above or within the Dune Sand/A Aquifer unit is present south of the Salinas River and is not the (insignificant) localized perched zone HydroFocus concluded. This, among other expanses of model layer2 where the absence of water level data could not allow for similar revelation, may be an indication that the layering is too coarse for accurate representation of the uppermost aquifer units, including the Dune Sand/A Aquifer unit, thereby preventing evaluation of the full impacts from slant well pumping. Because the consultants provided no interpretation of the potentiometric surface, or the model-simulated potentiometric surface for any aquifer in their reports, contrary to model reporting standards, the extent to which this area may be in hydrologic communication with the Dune Sand unit at CEMEX, for example, has not been adequately investigated or described by the consultants. The model does not allow for this communication as evidenced in the calibration results.

[46] although the Geoscience model report did append the LSCE interpretations and simulations from SVIGSM of the 180-ft and 400-ft aquifers

- Inadequate specific information was reported for the source data including K and S values that were relied upon for parameter adjustment.
- Inadequate explanation was provided for the recharge distribution, including the characteristics associated with streamflow infiltration rates along unnamed rivers in NMGWM.
- HydroFocus did not report the K and S values estimated from the CEMEX testing and, without explanation, did not rely on those for calibration of NMGWM (Figure 3.3d).
- The Geoscience model report did not include an interpreted model water budget or a simulated water budget. HydroFocus presented a simulated budget but it is concluded to be incorrect for many reasons described in this report.
- A comparison between the SVIGSM aquifer properties and model calculated heads upon which NMGWM relied was not presented in the Geoscience model report. Evaluation of evident model bias was not included in the report, and therefore could not be used to improve the model. Because of this, erroneous initial heads and erroneous heads along the boundaries were not revealed until the HydroFocus report, which included data for the Dune Sand/A Aquifer unit and additional data in the 180-ft aquifer. The Geoscience model was considered a poorly calibrated model despite the calibration results presented which showed a low error in the residuals.
- The HydroFocus report revealed the existence of unacceptable error from model pumping, model recharge, initial model heads, and model boundary heads, but failed to provide detailed information to support its conclusions. Instead of correcting these errors (probably a major undertaking), HydroFocus subsequently relied on superposition for prediction of drawdown impacts from slant well pumping so that some of the identified error was eliminated to improve accuracy in the predictions.
- HydroFocus simulated stream-aquifer interaction with the Modflow river package but did not provide an explanation why some NMGWM area streams/rivers were excluded from the predictive analysis.
- HydroFocus did not present a comparison of model-calculated gain-loss estimates against estimated values and therefore did not demonstrate that their assumptions and assigned properties were accurate.

- It was indeterminate whether the model calibration was accomplished using inverse methods, considered an industry standard at this time[47], or was accomplished deterministically. At a minimum, an explanation for not using inverse techniques should have been included in the report.
- HydroFocus and Geoscience did not include the NMGWM calibrated parameter sensitivity and parameter uncertainty. Sensitivity analysis is considered an industry standard. If inverse modeling was done, enormous information generated by that process was excluded from the reports, including among other output:
  - Sensitivity of parameters
  - Sensitivity of water level observations
  - Sensitivity of boundaries
  - Parameter correlation
  - Parameter confidence intervals
  - Degree of nonlinearity

- Because of inadequate data, analysis, reporting and the use of parameter values ranging from unreasonable to unquantified uncertainty, and known and unknown error, the NMGWM is concluded to be poorly calibrated and not representative of the aquifer system.
- HydroFocus, in recognition of some of these elements, rejected use of the NMGWM head model and instead used superposition based on NMGWM calibrated parameter values to predict drawdown from slant well pumping.
- Because superposition relies on parameters from a poorly calibrated model with known and unknown/unquantified errors, the error in the parameter estimates contributes unquantified error to the predictions.
- Superposition did not produce reliable estimates of drawdown from slant well pumping, and is not concluded to have been the appropriate methodology to employ to meet the Project goals.

[47] My opinion stating that inverse modeling is the industry standard for approximately 15 years now is based on the techniques in model calibration presented at the Colorado School of Mines Integrated Ground Water Modeling Center's biannual conference (over the past 20 years) with inverse modeling being the most common approach among modelers presenting at the conference. Also at least three public domain codes are available for use. All models are not necessarily amenable to inverse modeling if dry cells are calculated but because NMGWM did not incur this effect according to the absence of information in the reports, it should have been calibrated using this standard technique.

Subject: Opposition to CalAm Desal Project in Marina

Hello,
As a long-time resident of the city of Marina, I am opposed to CalAm's proposed Desal Project in Marina. I am concerned about the potential environmental impacts to our coastline, and the potential environmental and health impacts to Marina's existing water supply. Other more environmentally and economically sound options exist, like the Pure Water Monterey Project. Smarter solutions exist. Please do not approve the permit by CalAm.

Thank you,
Ethan Meyer

Subject: Cal Am's Desal Project

Dear Commissioners,

My wife wrote a letter signing both of our names but I wanted to write my own letter

I am writing in support of your staff's recommendations OPPOSING California American Water Company's (Cal-Am) proposed Monterey Peninsula Water Supply Project. Some of the reasons important to me are the project's extremely high costs and its environmental impacts. In addition, there is a project available, the expansion of the Pure Water Monterey project, that would satisfy Cal-Am's need for additional water supply.

Cal Am has failed to produce a good solution in a long time and have used deceptive practices in their mailing. Please help protect our dunes and marine life with a more environmentally

sustainable program with the Pure Water Monterey project.

Thank you,

Nicholas Kukulan

Subject: Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff.

WELCOME
HOUSE

My name is Debi Nobriga and I have lived in Marina for 4 yrs. I have raised a family of 6 boys (now men) and am now retired. I chose Marina for the proximity to its beautiful dunes and its wonderful community. This community faces many challenges, the most important being the safety of its aquifers, which is its sole source of water supply. CalAm's proposed desalination plant is a blatant **exploitation of a disadvantaged community**.
Marina will NOT benefit from this plant, as we are not CalAm customers, but .....
It will adversely impact Marina's water source, AND adversely impact the habitat (dunes) of the Snowy Plover.

The Pure Water Monterey expansion project is completely doable with no environmental impact. It will produce the water needed without the slant wells and it's adverse impacts.

Please deny CalAm's application for this permit for the Slant Well project!

Respectfully,

Debi Nobriga

Subject: Deny CalAm Desalination Project Permit

Dear CA Coastal Commissioners, Executive Director John Ainsworth and Staff:

2020 began with great promise as a year of "clear vision". Bill and I were looking forward to soaking up the sounds, smells and visual pleasures of living near the beaches in Marina. Although we still enjoy the pleasure of this relaxing environment, this year has dealt our community a heavy blow as we deal with the many Corona virus concerns. Our community certainly needs a relief from additional stress. Damaging our environment and destroying our wildlife is unthinkable.

Please support our committee's well being by denying the CalAm Slant Well project.

Sincerely,
Judy Strojny

Subject: Cal Am's Desal Project

Thank you very much for all the work done

I'm writing to strongly urge you to vote AGAINST CalAms Desal Project

Pure Water Monterey Expansion is the feasible and environmentally preferable alternative There is no water supply crisis. Pure Water Monterey will give us a new water supply much sooner than desal

Our new water supply from Pure Water Monterey – Phase 1 (3,500 acre-feet) will allow us to restore the Carmel River and stop illegal withdrawals by December 2021. The environmental issues facing the Carmel River have been resolved without Cal Am's desal.

Expansion of Pure Water Monterey provides a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and protecting the Carmel River and the Seaside basin.

Cal Am's Desal project is not in the public interest Cal Am's desal would double our water bills. We don't need Cal Am's oversized, over priced desal project to provide our future water supply Cal Am is the only obstacle to the expansion of Pure Water Monterey. Also Cal Ams recent mailer is deceptive and and seems to want to confuse the voters by trying to get users to sign up for pure water by clicking on their link. Cal Am cannot be trusted. Passing Measure J was the community's statement

I believe that Desal damages the environment, costs too much and creates environmental injustice. It (Desal) harms the coastal habitat and Marina's beautiful dunes
Desal would draw from an overdrafted groundwater basin NOT under the ocean

PWMon the other hand Would source water from primarily the 8,000 acre-feet of excess wastewater that is now discharged into the Bay. It is contractually secure and drought proof
Pure Water It is the same system thatOrange County has used for decades

Cal Am has had 25 years to solve or water supply problem with too much delay and litigations.

Thank you
Nick and A Kukulan

Sent: Monday, September 07, 2020 5:51 PM
To: CalAmMonterey@coastal
Subject: Please DENY CAL AM's Desalination Project

Members of the California Coastal Commission,

I know you have all heard this before. I am a member of the citizen's group that has been advocating for public ownership of the Monterey water system for years. Forgive me if I become repetitive but this is very important to me and my children. Please deny CAL AM's arguments against public ownership because:

Cal Am's desalination project is not in the public interest. They have had 25 years to solve or water supply problem.
Currently, Cal Am is the only obstacle to the expansion of Pure Water Monterey (PWM).
Pure Water Monterey Expansion is the feasible and environmentally preferable alternative. It will give us a new water supply much sooner than any desalination effort. The current water supply from PWM – Phase 1 (3,500 acre-feet), will allow Cal Am to stop illegal withdrawals from the Carmel River by December 2021.

The environmental issues facing the Carmel River have been resolved by PWM without the need for Cal Am's desalination or the PWM Expansion. Our current water supply will restore the Carmel River and protect the Steelhead. Cal Am desalination project is a solution to a problem that does not exist!

Affordable housing cannot be planned without affordable water yet the Cal Am desalination project would substantially increase our current water bills. The Expansion of PWM will provide a long-term sustainable water supply for decades of growth. It will support affordable housing and economic recovery and avoid environmental damage and environmental injustice to Marina.

The passage of Measure J affirmed the community's statement to the feasibility study to purchase the Cal Am assets. Moving forward to meet that vote is the PUC's responsibility. Please help us out.

Subject: Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Andrew Zendejas; I am a resident of Gonzales, California. In my family I have two sisters, one brother, and two wonderful parents. We enjoy our quiet life in our small hometown with our dog, Cookie, who I received as a gift for my tenth birthday. I am a current high school senior at Palma High School meanwhile my younger sister attends our sister school, Notre Dame. My older siblings have attended or are currently attending the University of California Santa Cruz in preparation for medical school. My parents are hardworking individuals who work in the agriculture and custodial business to pay for our schooling. We may not live in the area but we are worried that the CalAm project will negatively affect the city of Marina therefore negatively impacting the people who live there. The city of Marina is a highly populated BIPOC area, which makes the project not only an economic issue, but a social issue. The project under review is similar to the stories of gentrification in which white owned businesses attempt to obtain property owned by BIPOC to accommodate to the needs of middle to upper class people who also happen to be majority white. Please do not let CalAm capitalize off of what belongs to the citizens of Marina, which again is a majority BIPOC area. Additionally, I am enrolled in an AP Environmental Science class that has highlighted this topic as a prominent local issue concerning our Earth's most precious resource. We have already discussed how limited access to uncontaminated freshwater will become if we, as human beings, continue to take easy cash grabs that neglect what is best for the environment only to fill people's pockets. I believe that the CalAm initiative is one of these cash grabs that will push California and the world as a whole into an unhealthy position in the future. Please ask yourself if a greedy short-sighted plan is worth negatively impacting the environment and community of Marina. Please deny this harmful project! Thank you.
Sincerely,
Andrew Zendejas

Subject: Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff,

My name is Mitch Johnson. I have been a resident of the Marina for about 50 years. My wife, Trish was born in Monterey and has lived and worked here all her life. When we decided to buy a home, Marina was the obvious choice. It is a beautiful place, and we love it.

I'm writing today to ask you to please deny CalAm's permit for their proposed desal project. Better technology already exists that is more ecologically sound, much (much) less expensive, and will provide all the needed water – and more - where it is needed. This technology will continue to advance and will only get better, supplying all the water that the Peninsula needs, eventually in quantities that will allow us to replenish sources that have been overdrawn.

The proposed desal plant will be an environmental disaster. Please deny this harmful project.

Thank you,

Mitch Johnson

To: CalAmMonterey@coastal
Subject: Deny CalAm Desal Project

Salt and water are ionic substances and separating them is energy expensive; proportional to the salinity of the water. Sea water is 3.5 percent salt while domestic and agricultural waste waters are less than 1.0 percent salt. Thus desalting waste waters is much less expensive than desalting sea water. Pure Water Monterey will recycle low salinity waste and brackish waters, thus saving energy costs.

The proposed CalAm desalination system would use electricity generated by the gas-fueled generator at Moss Landing. We should reduce our burning of fossil fuels wherever possible to moderate climate effects.

Desalination of sea water discharges high salinity brine into the ocean which may harm marine life.

For these reasons, I urge you to deny CalAm's proposed seawater desalination program.

Subject: Subject: Cal Am's Desalination Project/Staff Report on De Novo Appeal and Consolidated Coastal Development Permit
Attachments: Commission Letter.docx

California Coastal Commission

With respect to Coastal Commission Staff Report on De Novo Appeal and Consolidated Coastal Development Permit,

I submit this attached letter for your consideration.

I have read the California Coastal Commission staff's Summary of Staff Recommendation. I agree with your staff's findings that the Cal Am proposed Monterey Peninsula Water Supply Project (MPWSP) is inconsistent with relevant Coastal Act and LPC policies and that the Commission may not approve the Project despite those inconsistencies because the PWM Expansion is a feasible, less damaging alternative that will adequately provide water and protect the public welfare.

I strongly urge the Coastal Commission to follow your staff's Summary of Staff Recommendation for the Denial of De Novo Permit and the Denial of Regular Permit.

My letter is attached with the reasons for recommendation.

Sincerely,

Joe Lucido (831-372-7537)

California Coastal Commission

September 7, 2020

455 market Street, Suite 228

San Francisco CA 94105

Subject: Staff Report on De Novo Appeal and Consolidated Coastal Development Permit

I have read the California Coastal Commission staff's Summary of Staff Recommendation. I agree with your staff's findings that the Cal Am proposed Monterey Peninsula Water Supply Project (MPWSP) is inconsistent with relevant Coastal Act and LPC policies and that the Commission may not approve the Project despite those inconsistencies because the PWM Expansion is a feasible, less damaging alternative that will adequately provide water and protect the public welfare.

Cal Am and their supporters believe that the MPWSP is the ONLY viable option for the Monterey District, but this believe is not consistent with both the Monterey Peninsula Water Management District's and your staff's findings and recommendations. Cal Am and their supporters desire the MPWSP for their own special interests and they are not always in the best interests of the public welfare, considering all factors.

History gives us an indication of Cal Am's interests. In 1990's Cal Am illegally over drafted the Carmel River for their special interests. Then, in 2006, Cal Am adjudicated the Seaside Basin resulting in the expected overdraft of that local water resource and with the legal requirement to restore this local water resource over a 30-year period (This 30 year period was to start in 2015, but the overdraft of the Seaside Basin continues at this time). For over 25 years Cal Am has promised the development a of safe and secure a water source to remedy their illegal activities. The MPWSP is their latest attempt, but the Project has many outstanding legal and environmental challenges that are extensively addressed in your staff's findings (pages 4 through 11) and many other reliable studies.

Your staff and/or the Monterey Peninsula Water Management District findings support the PWN Expansion over the MPWMD desalination plant.

The only proven project to date is the Pure Water Monterey Projects (PWM) sponsored by the Monterey Peninsula Water Management District and many other Monterey organizations over the last seven years. Cal Am and their supporters have tried every possible legal and technical tactic to deny implementation of the PWM Projects to enhance their own special interests. Cal Am has been a constant obstacle to the expansion of Pure Water Monterey Projects and Cal Am even refused to purchase water from PWM, because they desired to defeat the PWM Projects and pursue their own special interests.

Pure Water Monterey Factors are as follows: PWN Expansion is in the public interest and is a significantly lower cost water supply alternative; PWN Expansion is the feasible and is environmentally preferable alternative; PWN Expansion will give us a new water supply much sooner than the proposed but unproven MPWSP; With the Pure Water Monterey Projects the MPWMD analysis shows that the Pure Water Monterey project now in operation will stop illegal diversions on the Carmel River by December 2021; PWM Expansion provides a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and protecting the Carmel River and the Seaside Basin; and PWM Expansion source water is primarily the 8,000 acre-feet of excess wastewater that is now discharged into the Bay.

MPWSP Factors are as follows: The MPWSP will result in a major impact to the cost of water and the affordability of water to all to all customers in the Monterey District; The MPWSP will be over-sized and over-priced and will dramatically exceed our projected water supply needs; The MPWSP does not have the legal rights to groundwater water that the proposed extraction wells would produce, since these extraction wells (located only onshore that will draw water from onshore resources prior to gaining access to draw offshore seawater) would draw groundwater from an already over drafted groundwater basin (not under the ocean) and would draw water that will impact the legal groundwater supply to the City of Marina; The MPWSP will most likely result in the increased intrusion of seawater within an expanded local coastal onshore area/depth, which has been the major concern of the Seaside Basin Adjudicated Decision of 2006; and The MPWSP will most likely harm the coastal habitat, including the Marina's environmentally sensitive dunes.

My Opinion of Cal Am Accountability

Cal Am has had 25 years to solve or water supply problem, caused by their improper if not illegal actions to over-draft water resources in the Carmel River and Seaside Basin. Without Cal Am's support our local public agencies have developed a solution over the last 6 years that is in the best interests of the Monterey District customers. Cal Am activities have been counter productive to the successful development of the PWN Projects. Cal Am's special interests have not always been in the best interests of the customers of the Monterey District. Cal Am past activities have proved financially harmful and environmentally harmful without any accountability to Cal Am. The full burden for Cal Am's harmful activities has been imposed on the Monterey Community customers. We solve the problems and we pay the financial burden. I believe that we should not give Cal Am and their supports a third opportunity to financially and environmentally harm our Monterey Community by thinking that Cal Am's activities always represent the Monterey District's best interests or by thinking that the cost and technical documentation presented by Cal Am are accurate and provable. The past history shows a proven record of Cal Am deficiencies without any Cal Am accountability.

With the proven and substantiated information provided by Coastal Commission staff, the Monterey Peninsula Water Management staff and the many letters from concern agencies and customers, I strongly urge the Coastal Commission to follow your staff's Summary of Staff Recommendation for the Denial of De Novo Permit and the Denial of Regular Permit.

Sincerely,

Joseph Lucido

To: CalAmMonterey@coastal
Subject: DENY Cal Am's Desal Plant

Dear Staff,
I am writing regarding the upcoming vote on Cal Am's proposed desal plant.
I just want to encourage you to deny this request. It is both extremely costly and unnecessary given the new source of Pure Water Monterey that is now at hand and ready to deliver. The people of Monterey County clearly demonstrated via vote that they want to move forward with a publicly directed and owned water system. Our public organizations should now help us move in that direction.
If Cal Am is allowed to proceed with this highly questionable approach we know that our water bills will only continue to rise. The cost of building the desal operation will itself be extravagantly high and that too will be passed on to consumers. This has become untenable—-we already have the highest water cost in the entire nation.
Please stand with the people with your votes.
Sincere thanks for your time and attention, Sheila Sheppard

Subject: Appeal No. A-3-MRA-19-0034; Deny Cal-Am Desalination Project Permit.

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Steve Hunt and I have lived in Marina since 1992 where my wife Julie and I have raised three children, all of whom are now adults. I serve the City of Marina as a Public Works Commissioner, Past President of Marina Rotary and co-founder of a 501c(3) nonprofit organization. Not to mention many roles as a volunteer. My wife is a past PTA President and also involved in the community. We will be celebrating our 30th wedding anniversary and cannot attend the Sept 17 meeting which the reason for my letter today.

I am somewhat amazed that this issue is still pressing. Cal-Am attorneys must really have a hold on you and the commission since we are still talking and writing you about this. The only reason Cal-Am chose Marina in the first place is because it was the most simple and profitable solution for Cal-Am and its investors. The proverbial path of least resistance. We all know that if Marina were Pebble Beach these debates would not be taking place. Cal-Am would never challenge the "white" money that is Pebble Beach, Pacific Grove and Monterey for that matter. There are multiple locations south of Marina that Cal-Am could use to desalinate their water without stealing from Marina and you know it. But they chose Marina because they thought we lacked the resources (money & intelligence) to put up a fight.

Also, in addition to water and the quality of water, if you allow Ca-Am to prevail it will mean they will be digging up the streets of Marina in order to install pipelines that deliver Marina water to their treatment facility. Another major disruption. It would also suggest the CCC is either corrupt or incompetent.

Do what is right and Please deny the CalAm Slant Well project!

CA Coastal Commissi
September

My name is Anthony Santa Ana. I have lived in Salinas all my life. Drinkable water in my area has seen prices steadily rising for years, an unfortunate occurrence when we all depend on it, especially during the current times. Even though a desalination plant would make the situation more economically beneficial for our wallets, we, not just as citizens of Monterey County, but as global citizens of the Earth, have a moral obligation to care for our planet. A desalination plant is a greedy, short-term solution to an expansive and burgeoning long-term issue- one that my high school environmental class has covered extensively. The decision to deny the permit may not be the most glaring financial choice, but, with the health of our lush local area and the situation of the posterity in consideration, the choice is clear. I will be unable to speak at the meeting, but, through this letter, I hope that my concerns have been voiced and that my voice has been heard.

Please deny the CalAm Slant Well project!

Signed,
Anthony Santa Ana

Subject: Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit.

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

Hello my name is Blake Iverson and I am a resident of King City. I am in the AP environmental science class at Palma and this cause was recently brought to my attention. Although I do not live in Marina, I feel that it is important that I help the residents get their voices heard in their fight against the Cal Am project. I understand the need for a desalination plant, however it seems unfair that the residents of Marina are being asked to bear the risk and danger involved, especially since the project isn't going to benefit them. I am also concerned, along with the residents of Marina, that the slant wells could cause salt water intrusion and be damaging to the environment and to the safety of the endangered species that call Marina home.

Please deny this harmful project

Thank you for your time,
Blake Iverson

Subject: Subject: Cal Am's Desal Project

Dear Commissioners:

Cal Am's continuing misleading and false assertions, for which it has become notable, now are being organized by Cal Am into a letter-writing campaign intended to promote those unsupportable assertions as if arising from public enthusiasm. **The case against the Cal Am claims, however, is overwhelming**, independent of any attempt to disguise them as arising from popular knowledge and concern.

It is simply **false** to claim that Cal Am's proposed desalination plant (labeled misleadingly the "Monterey Water Supply Project") is "the **only** viable option to supply our community" that meets fundamental needs of the Monterey Peninsula. Your Commission is, of course, very much aware of an *existing alternative water source,* the Pure Water Monterey system with its expansion project.

The[TS1] **Pure Water Monterey Expansion** is **in** fact an **available, feasible** and indeed **superior alternative** water source that meets Cal Am's own stated criteria of being

- **Sustainable** for foreseeable decades
- Capable of **supporting affordable housing**
- Capable of **supporting economic recovery**
- (Most important!) Capable of **restoring the Carmel River and Seaside Basin.**

The Pure Water Monterey Expansion is

- Far **less expensive** both to build and to operate than the proposed desalination plant
- Environmentally much **cleaner**,
  - Using **far less energy**, and correspondingly, until and unless totally renewable energy sources are utilized, generating **far lower greenhouse gas** emissions and air pollution
  - Being **free from seawater and ocean impacts.**

The **additional economic costs of the desalination** alternative to water-recycling **are huge**. The recycling alternative can utilize population and business growth to increase the base resource of recycled water. And the lower price of recycled water compared with desalinated water **reduces the relative costs of living** on the Peninsula and thus supports more-affordable housing.

The **Cal Am proposal** is **substantially oversized**, and since the cost of desalination increases with the degree of underutilization, the excessive size of the Cal Am proposal produces **unnecessary and unwanted inefficiencies**.

All available evidence indicates that the Pure Water Monterey Expansion will be able to deliver water reliably **before** the Monterey Water Supply Project, and therefore will satisfy Cal Am's "as quickly as possible" criterion, **again favoring the water-recycling solution**.

The Monterey Peninsula water resource problem is ***not*** **a crisis**, and the delays and resistance to solution that have exacerbated the problem are principally of Cal-Am's own making.

Through its ***control*** of a *vital human resource*, Cal Am consistently has chosen to grow its **profits in preference to fulfilling** its fundamental obligation to efficiently and faithfully serve the **public's needs and interests**. The Coastal Commission on the other hand is fundamentally committed to the public interest. **By every relevant measure, the Pure Water Monterey Expansion is significantly superior to the Cal Am desal proposal** in pursuit and execution of that commitment, and should be selected as the source for future Monterey Peninsula water requirements.

I **urge you** and your Commission Colleagues therefore to vote to **deny the Cal Am desal proposal** and thereby remove that threat of oversized, over-expensive and environmentally greatly inferior system from the Peninsula's water-dependent future. The **Coastal Commission's thorough Staff report demonstrates clearly and unambiguously that this is the appropriate decision,**

Thank you for your considered attention.

Respectfully,

Timothy D. Sanders

SUBJECT: Comments on Items TH3a and TH4a
September 17, 2020 Special Meeting Re: California American Water Company's Monterey Peninsula Water Supply Project

Dear Commissioners:

I urge you to deny California American Water Company's (Cal-Am) Appeal No. A-3-MRA-19-0034 and Application No. 9-19-0198.

The Coastal Commission Staff Report dated August 25, 2020 recommends both of these actions. The Staff Report provides detailed background and reasoning for the staff recommendations. Primary in importance to me are the project costs and the environmental impacts of its construction and operation. An alternative project, expansion of the Pure Water Monterey water recycling and aquifer storage project, is available to allow Cal-Am to cease its illegal water withdrawals from the Carmel River and meet the region's water supply needs, and according to your staff's analysis is the preferable, least environmentally damaging alternative. The cost of water from an expanded Pure Water Monterey project is a fraction of that from Cal-Am's proposed desalination project. In addition, this project could be implemented much more quickly than Cal-Am's desal proposal.

Sincerely,

Andrew M. Bell

Subject: Appeal No.MRA-19-0034: Deny CalAm Desalination Project Permit

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff

My name is Royce Foster and I am a resident of Marina. My husband Jim and I are retired, and moved here from Carmel and Los Angeles, originally, because of the beautiful, fresh ocean environment and the friendly family-oriented neighborhoods. We are very disappointed that a huge, for-profit company, CalAm, has illegally attempted to take our water, to which they are not entitled,
in order to sell it into other areas at a profit. This will destroy our pristine and fragile coastline and it's natural inhabitants.

Please deny this harmful project. Thank you, Royce Foster

Subject: Cal Am's Desal Proposal

Subject: Cal Am Desalination Project

I am writing to support your staff's recommendation to deny Cal Am's proposed desalination project. There are numerous reasons why this project should be denied, and perhaps the most salient is that Pure Water Monterey will be able to provide the water Cal Am needs to meet the state's order to stop pumping from the Carmel River quickly, at a significantly lower price, with less environmental damage, and for a longer period of time. Cal Am has stated that the slant wells will have to be re-located in twenty to twenty-five years to an undetermined location that will have new and additional environmental problems.

I have been a Cal Am customer for more than forty years and have watched in dismay as our water bills have increased annually by substantial amounts. As you know, we were charged many millions of dollars by Cal Am for being conscientious and conserving water. Cal Am does not have it's customers' interest at heart, as a privately held company, it is more concerned with increasing profits for shareholders.

Cal Am has been aware of water shortage issues on the Monterey Peninsula for decades and has landed on desal as a water source, not because it is the best or most affordable, but the one that provides them with more revenue. Fortunately, Pure Water Monterey has created a solution that will provide the water we need at a reasonable price.

Other issues surrounding a desalination plant include reduced affordable housing due to increased water costs, increasing water fees for lower income communities, environmental damage, which still has not been fully calculated, a questionable water source for the water the slant wells will use, the unproven technology of slant wells, etc.

Thank you for your thoughtful consideration of our water source for the coming decades, I hope you will concur with staff recommendations and deny Cal Am's permit.

Sincerely,

Doug Steakley

Subject: Pure Water Monterey Reduces Carmel River Withdrawals

Cedar Street Times • August 30, 2020

Withdrawals from the Carmel River to be Reduced as the Pure Water Monterey Supply Becomes Available

By Mike McCullough, MPA
Director of External Affairs for Monterey One Water

Coming to a tap near you in February, 2021

Monterey, Calif., August 26, 2020 >> A new water supply for the Monterey Peninsula is here. Over the weekend, injection of purified water from the Pure Water Monterey Project into the Seaside Groundwater Basin – a key drinking water source for the Monterey Peninsula – reached 1,000 acre feet. This mile- stone marks completion of the Project's operational reserve and the start of its 1-for-1 replacement water supply to support species and habitats in the Carmel River.

"On behalf of our Board and staff, Monterey One Water is pleased to help in providing cooperative water solutions for the area. It has been a long journey but one where collaboration and innovation have made a difference in developing a sustainable water solution for many years to come," stated Paul Sciuto, General Manager for Monterey One Water (M1W), the Agency responsible for operating and managing Pure Water Monterey.

How does a 1-for-1 replacement water supply work?

The primary goal of Pure Water Monterey is to reduce extractions from the Carmel River. To do this, Pure Water Monterey treats then purifies a variety of wastewaters to stringent drinking water standards. The purified water is injected into the Seaside Groundwater Basin where it mixes with existing groundwater and enhances the water supply for California American (Cal Am) Water's Monterey District. For every acre foot of purified water added to the Basin, Cal Am can increase its dependency on the Seaside Basin by one acre foot and reduce its dependency on the Carmel River by one acre foot.

What is an operational reserve?

The original 1,000 acre feet of purified water injected into the Seaside Groundwater Basin represent an operation reserve for M1W. It gives the Agency flexibility in the future to temporarily decrease production for routine maintenance or capital improvements and can be thought of as a savings account to be used only when needed.

The Monterey Peninsula Water Management District (MPWMD), who manages and allocates available water supplies, was critical in developing and commissioning this new supply. "Together, M1W and District staff performed outstandingly to get us to our 1,000-acre-foot goal ahead of expectations," said Dave Stoldt, MPWMD General Manager. This important milestone introduces a new water supply for residents and businesses.

When will advanced purified water be part of the supply coming out of taps?

Pure Water Monterey is a groundwater replenishment project. Purified water is not pumped directly to homes, rather it is injected into the Seaside Groundwater Basin to assist in sustaining this existing water source. Once purified water is injected into the Basin, it travels through the aquifer for approximately one year before it reaches Cal Am's extraction wells which deliver water to its Monterey District customers. Injection of purified water began in February 2020 and customers can anticipate purified water reaching their taps in late winter/spring of 2021. Extensive monitoring of water quality and travel time confirms the integrity, safety, and progress of the purified water for the life of the project.

Subject: CalAm trickery

Dear Commissioners:

This mailer shown below is the latest effort by Cal Am to get their unnecessary desal plant built (at an exorbitant price for Monterey Peninsula ratepayers:

California American Water is attempting to dupe their customers into appealing to directly you to approve the permit for the desal project in order to maintain their strangle-hold on our water. Please recognize the fallacy or their message, claiming desal is needed to keep rents low.

The desal plant will double water costs for the Peninsula... higher rents will be inevitable. Wealthy ratepayers can absorb the costs, but average and struggling ratepayers will be deeply affected.

Our best, least-expensive, fastest, and environmentally-safest solution for sustainable water for our area is available through the Pure Water Monterey recycled water project.

Please follow the findings of your own staff and deny the permit.

Subject: Sept 17 meeting regarding desal

Dear ladies and gentlemen of the Coastal Commission, and for Greta

If you simply peruse peninsula neighborhoods to see a growing blight brought about by among the most expensive water in the country, we residents can't live with the CalAm knee pressed upon our surroundings and pocket backs...

Your staff findings to recommend against the slant wells are absolutely correct..Desal slant wells are for water as fracking is for oil; an ecologic and economic CalAmity, CalAM seeks to press upon us.

CalAm has engaged in every conniving, lying maneuver imaginable to retain their control over the public's resource- their cash cow.

As to their veracity, in an earlier round, parading a person before the media to proclaim what a bad deal it was for Felton residents to buy CalAM. Being an old Felton resident, one afternoon I interviewed residents in shops, religious centers, the police and fire departments, grocery store, and every person expressed how pleased they were with their accomplishment. and shook their heads incredulous at to what could motivate the person to be a spokesperson for CalAm.

If you ever visited the San Clemente Dam site it was obvious there was no sign of ANY upkeep of the dam or reservoir. A Carmel Valley resident told me about the non-disclosure agreement a property owner entered to have the material removed from the silted-in reservoir and deposited in his nearby canyon. It became easier, politically correct, and at no expense to CalAm to have their private maintenance problem become a $55,000,00 public liability. (With weather extremes a well designed, modern dam will ultimately prove to be a crucial structure for all living creatures and to protect the many millions of dollars of property downstream; see Los Vaqueros reservoir.)

Among the litany, how about the "misplaced" sensor that gave erroneous salinity readings in the test well. See also the Stanford ground penetrating radar study.

For thirty years, we three Leos often met from San Luis Obispo to Santa Barbara (dinner at Ostini's Hitching Post II in Casmalia) where we encountered Hollister Ranch with its remote, pristine ocean-front, restricted from the public. Makes Martin's Beach a postage stamp. How could that possibly be? A local told us. It's creation occurred prior to the Ca Coastal Comm! Please do not allow the desal CalAmity to be set upon us all, with its deleterious energy effects.

Very truly yours, Mark Magruder Eckles Pacific Grove Ca 831-241-8940 1040 Olmsted Ave

Subject: CalAm Desal Plant

As a long time resident of Marina, I strenuously object to CalAm"s desal plant project to take water from Marina,
and ship the water to the Monterey Peninsula, especially since there is a viable alternative.(Pure Water Expansion).
This project is nothing more than a rob Peter (Marina water) to pay Paul (mitigate CalAm's overpumping of the Carmel River).
To add insult to injury, not one drop of water from the desal project will go to Marina...Bummer.

Question: Will CalAm be held responsible for making Marina's water undrinkable in the future due to salt contamination?
Could happen!...PG&E shelled out over 300 million to settle legal claims involving contamination in Hinkley CA (Erin Brockovich).
Perhaps, the Coastal Commission should consider having CalAm post a 300 million dollar bond to pay for any future litigation.

Question: Will the state of California be held responsible for making Marina's water undrinkable in the future if the
Coastal Commission approves CalAm's desal plant project?...Could happen!...Recently the state of Michigan has agreed to pay the
city of Flint Michigan 600 million for its part in contaminating Flint,s water with lead.

Sent: Saturday, September 05, 2020 7:14 PM
To: CalAmMonterey@coastal
Subject: Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Dear California Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Tina Walsh; I am a resident of Marina, California and lifelong resident of Monterey County. As a fixed income older person and widow of a Vietnam veteran, I live a simple life and appreciate the small, free pleasures living near the coast can bring as I observe the birds and dune plants that exist in my community. Especially exciting to me is the possibility of spotting a Smith's Blue Butterfly!

I urge you to vote for denial of the Cal Am project which came to us uninvited and brings to us harm instead of benefits. The intended recipients of the desalinated output water don't even want it because of its high cost. Expansion of the Pure Water Monterey project has been identified as a feasible alternative with less damaging impacts to our ESHA, public enjoyment, and local groundwater issues.

Please say no to this harmful project. Thank you for your consideration.

Sincerely,

Justina Walsh

To: CalAmMonterey@coastal
Subject: Public Comment on September 2020 Agenda Item undefined 3a - Appeal No. A-3-MRA-19-0034 (California American Water Company, et. al., Monterey Co.)

Commissioners,

I write to you as a resident of Pacific Grove. I was an attorney at the CPUC for 15 years; for four of those years, Chief Counsel for the CPUC's Office of Ratepayer Advocates. I retired in 2014 and moved to Pacific Grove in 2018.

Commissioners, I urge you to adopt the staff recommendation to deny a coastal permit for Cal Am's desalination plant in Marina. The staff report presents overwhelming evidence in support of its recommendation. Pure Water Monterey Expansion is a feasible and environmentally preferable alternative. It would make it possible to stop illegal withdrawals from the Carmel River by December 2021. The environmental issues facing the Carmel River can be resolved without Cal Am's desal plant.

Furthermore, Pure Water Monterey Expansion can meet the supply needs of the Monterey Peninsula at a far lower cost. The cost issue is important. Cal Am's customers on the Monterey Peninsula already pay the highest costs in the country. The proposed desal plant would drive rates even higher. This is in a region with a high cost of living and a largely low-paid workforce.

Cal Am has argued that the desal plant is necessary to build affordable housing. This argument is disingenuous. You can't have affordable housing without affordable water. Pure Water Expansion can meet the region's needs at a much lower cost.

Is Cal Am's proposed desal plant even feasible? Probably not! Even if the Commission were to issue a permit, it seems unlikely that the plant could be built in this location. Cal Am doesn't have the necessary groundwater rights, and cannot acquire them. The staff report also identified unresolved environmental impact issues that at the very least, require further study before a permit can be issued. The project's unproven slant well technology is another source of uncertainty. And what about the impact of rising sea level? How long before the wells would need to be moved inland? Cal Am doesn't own land inland.

None of these hurdles apply to Pure Water Monterey Expansion. It is much more likely to succeed in bringing a new supply of water to the region.

I hope you will also give serious consideration to the environmental justice issue. The City of Marina should not be required to sacrifice its precious coastal resources to a project that would bring no benefit whatsoever to its residents, only burdens.

For all of these reasons, you should adopt the staff's recommendation and deny the permit.

Respectfully,

Karen Paull
Pacific Grove

Cal Am's Desal Project

Application No.: 9-19-0198

Dear Commissioners,

I am writing to you today to address the application from Cal Am for their Desal Project on the Monterey Peninsula. You will be voting on this on September 17 – just over a week away. I urge the Commission in the strongest terms to deny that application, based upon all the reasons that your staff recommended denial.

- Cal Am's Desal project is not in the public interest.
- Pure Water Monterey Expansion is the feasible and environmentally preferable alternative. It will give us a new water supply much sooner than desal.
- Our new water supply from Pure Water Monterey – Phase 1 (3,500 acre-feet) will allow us to restore the Carmel River and stop illegal withdrawals by December 2021. The environmental issues facing the Carmel River have been resolved without Cal Am's desal.
- The Peninsula will not be able to build workforce housing until we get a new water supply. We have it in our sights to provide this much needed housing so people who work on the Peninsula can afford to live here and not have to drive an hour or more each way to work.
- Also, the Pure Water Monterey expansion will be a much more affordable way to ensure a sustainable water supply that the Peninsula's lower income earners could actually afford.
- Cal Am is the only obstacle to the expansion of Pure Water Monterey.
- Desal damages the environment – it would harm the dunes which provide a habitat for threatened and rare species.
- Cal Am's project is a major offense to environmental injustice, which was clearly pointed out by the CCC Staff report on this proposal.

Thank you for your years of attention to this issue. It has been a real struggle. I urge you to deny this application so that the Peninsula can move forward.

Respectfully,

Amy Anderson

Subject: I am against desalination plant

Dear Commissioner,

Owing to the fact that EVERYTHING CalAm has done for decades and continues to do to manipulate and promote their interests first—how on Earth could anyone support giving them stewardship of any desal facilities??

They have proven themselves the worst of stewards for decades. Their profit margins are sinful and made on the backs of hard working citizens. How many companies have the HUGE GUARANTEED profit margins Cal Am is ensured?? They are an abusive and one sided entity and they have been blowing in the ear of the Coastal Commission for way too long.

I have been heartened that as of late the Coastal Commission has finally found their 'sea legs' pardon the pun—and have said no to them once or twice. Good on you.

Please quit believing the 'spun sugar' of Cal Am's Catherine Stedman with her 'sing-song' voice, deceptive presentations and half truths. That dog and pony show has been trotted out far too many years.

It would be important on this upcoming decision—more than any other—to REFUSE Cal Am's ridiculous request. The cogent points below more than ratify this position:

Key points to draw from:

– Cal Am's Desal project is not in the public interest
– Pure Water Monterey Expansion is the feasible and environmentally preferable alternative
– It will give us a new water supply much sooner than desal
– Our new water supply from Pure Water Monterey – Phase 1 (3,500 acre-feet) will allow us to restore the Carmel River and stop illegal withdrawals by December 2021. The environmental issues facing the Carmel River have been resolved without Cal Am's desal.
– There is no water supply crisis
– No Affordable housing without affordable water. Cal Am's desal would double our water bills.
– We don't need Cal Am's oversized, over priced desal project to provide our future water supply
– Expansion of Pure Water Monterey provides a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and protecting the Carmel River and the Seaside basin.
– Cal Am is the only obstacle to the expansion of Pure Water Monterey.
– Cal Am cannot be trusted. Passing Measure J was the community's statement
– Desal damages the environment, costs too much and creates environmental

injustice
– Desal harms the coastal habitat and Marina's beautiful dunes
– Desal has no legal source water, it would draw groundwater from an overdrafted groundwater basin NOT under the ocean
– PWM Expansion source water is primarily the 8,000 acre-feet of excess wastewater that is now discharged into the Bay. It is contractually secure and drought proof
– Orange County has used this same system for decades
– Cal Am has had 25 years to solve or water supply problem
– Our public agencies have solved it in the last 6 years. Now all the water we need for decades is available, but Cal Am is blocking it.

Thank you for considering my letter.

Sincerely,
Lisa St Mary

September 5, 2020

Dear Chairman Padilla and Commissioners of the CCC,

...and so, we come to the culmination of a long six-year process that I have been involved in every step of the way. I'm going to treat this letter as if I had 5 minutes to speak, to keep it under 1,000 words...

My name is Michael Baer. I was a resident of the Monterey Peninsula from August of 1982 until May of 2019... over 36 years. I moved to San Jose, the town I grew up in, in May of 2019 to help my ailing parents. I have remained active in the Monterey Peninsula Water Supply Project (MPWSP) despite the move. This is too important to me, and I have invested too much time and energy to stop merely by changing my address 70 miles north.

I first became involved in the local water issues in November of 2013, so I had already been at it a year, when I came to that fateful meeting in Half Moon Bay in November of 2014, where the Commission considered the decision of the test slant well permit, which was approved. Thus began an odyssey, and those Commissioners who have been around these last six years, probably recall me chasing you all over the state on this issue.

So here we are again... and likely for the last time.

Staff got it right, please deny the local coastal permit for the desal plant. Do your substantial part to bring this nightmare to a close.

There is so much wrong with this project which is amply and cogently covered in the staff report. You will no doubt be hearing the numerous arguments from many dozens of advocates commenting against the plant, as well as the handful of tired and misleading arguments from the proponents for the desal.

With so much to cover, the question is where to point the laser. I always try to add a novel perspective, or at least present in a novel way, to actually add value to your deliberations. What can I say now that we have reached this point?

I want to talk about the other side, the business and political allies that Cal Am has cobbled together for support.

On the political side, you "old timers" will recall, that a JPA was formed called the Monterey Peninsula Regional Water Authority (MPWRA) comprised of the six Peninsula mayors from the six Peninsula cities (Monterey, Seaside, Carmel, Pacific Grove, Del Rey Oaks, and Sand City). The fact that a community of less than 100,000 people is divided into six city jurisdictions (not to mention an additional nearly ten thousand county residents within Cal Am's borders) is

one of the main reasons Cal Am can create so much mischief. There are so many different stress points they can leverage politically and financially.

The MPWRA was often referred to as "the mayors authority" and it was the brainchild and chaired by Jason Burnett, who was the mayor of Carmel, a young aspiring politician, and grandson of David Packard, nephew to Julie Packard, the director of the world renowned Monterey Bay Aquarium. He developed a unanimous coalition of all the mayors, with the mission to unify the Peninsula to meet their long-standing problems of sufficient, sustainable water supply and resolve the CDO from the SWRCB to reduce the draw from the Carmel River.

Jason Burnett admitted more than once publicly that the "mayor's authority" had no actual authority. They were not beholden to their respective city councils nor the constituents who voted them to office. They simply worked as self-appointed lobbyists to help resolve the water supply problem in their self - perceived interests, which coincidently aligned with Cal Am wholeheartedly.

As previously mentioned, there was no representation for the county residents in unincorporated Carmel Valley, Carmel Highlands, or Pebble Beach, nor any other unincorporated areas in Cal Am's district.

Do you want to know who else wasn't at the table? Every single person who has been clambering before you to kill the project for the last six years.

I think it's instructive to note that not a single one of the six mayors on the MPWRA who came to you in 2014 was an elected official after the 2018 election. Some retired, and some were defeated. The first to leave was Jason Burnett himself, who retired in 2016 and took his family to Washington D.C.

That is the political side of the story, but there is also the commercial interests, Hospitality, Real Estate, and the local Chambers of Commerce make up the lions share, but there are other smaller, sometimes non-profit interests, who support Cal Am. Salinas Valley Agriculture is the largest business in the County; they support Cal Am too, even though they are entirely outside the boundaries of Cal Am's customer base. Why do they care so much, and flex their muscles? I'm not entirely sure.

But I submit to you that every single proponent for the project, from those listed above, to Paul Bruno of MPE which has a million dollar contract to trench the pipelines, to Castroville Services Committee, which would receive water at about 2 cents on the dollar to produce it, to low wage employees of the hospitality industry who will tell you they need that water so they can have a job...

All of them, every one, if you dig deep enough you will find they receive some financial benefit, while very few of them will see the cost on their water bill as residents, because few are residents within the Cal Am district.

This is the debate before you. Staff has laid out beautifully all the reasons why this project is fatally flawed. We've been saying it for the last several years.

Thank you for your service, your time, and your consideration.

Sincerely,

Michael Baer

Subject: Cal Am's Desalination Project Proposal at the current controversial CeMex sand mining site Near Marina, CA

I attended the coastal commission meeting held in Half Moon Bay last year regarding this subject. As you may know there was incredible community outrage and opposition to this proposal. The expert on desalination for the state of CA spoke also summarizing why this site is a very poor choice. Some extremely well educated and articulate members of our community spoke along with scholars on all aspects concerning this matter. No one that does not stand to be personally enriched by this boondoggle is advocating for approval of this desalination project.
Why Cal Am continues to push for this desal project at this very unsuitable location instead of finding an acceptable location shows how reckless this extremely profitable corporation is to everyone other than those shareholders and speculators.
PLEASE END THIS MADNESS! Cal Am has shown our community that it's profit motive is a major obstacle to our water resource. Eventually our community will rise up and take control of this vital public resource. Help us begin to untangle the stranglehold Cal Am has on the communities of the Monterey Bay!
Stand up to this extremely profitable New Jersey Corporation !
Thank you.

Subject: desal project

Commissioners: I have lived in Monterey Co for over 40 years. 30+ years ago we bought a home that was in the Bishop water co. area of service. Our home has a pool. The water was / is awful but plentiful and affordable.
Cal am bought Bishop water several years ago. This past summer my bills have been high $400, $500, (water in the pool $800), $400. We have two families, (8 people) in the house and Cal Am's tiered billing is a killer. The costs will be unmanageable if the desal plant is allowed. It is not needed. **I urge you to follow the advice of your staff report** and deny the desal project for so many reasons. Thank you, Tamara Harris 10175 Sunstar Rd. Monterey CA.

Subject: Cal Am's Desal Project, Vote NO. We support CA Coastal Commission Staff Report Recommendations against Desalination Project.

Dear California Coastal Commission,

Thank you for all that you do to protect California's precious coast. With regard to our issue here on the Monterey Peninsula, I urge you to uphold the thorough CCC Staff report in support of the City of Marina Planning Department decision against the California American Water desalination project and CCC Staff's recommendation for denial of Cal-Am's application for that project. Among the many reasons I oppose the desalination project is a new one. This community, which already has expensive water, is grappling with the effects of the Covid 19 epidemic. It has been damaging to hotels, restaurants, government services, small and large business and so many individuals and families. We cannot afford this experimental plant with unresolved issues that would impact acres of coastal dunes. AND there is a reasonable, less costly, and ready to implement alternative in the Pure Water Monterey project.

Please note that California American Water Company has sent out a flyer recently, quite deceptive and misguided in tying water to affordable housing. They ask that the addressee click on a form that will generate support for their desalination plant. I fear that many people will be confused by the label, "Monterey Water Supply Project," the description of which includes other projects besides the desalination project.

With much gratitude,

Jane R. Bell, MPH

SUBJECT: Comments on Items TH3a and TH4a
September 17, 2020 Special Meeting Re: California American Water Company's Monterey Peninsula Water Supply Project

Dear Commissioners:

I urge you to deny California American Water Company's (Cal-Am) Appeal No. A-3-MRA-19-0034 and Application No. 9-19-0198.

The Coastal Commission Staff Report dated August 25, 2020 recommends both of these actions. The Staff Report provides detailed background and reasoning for the staff recommendations. Primary in importance to me are the project costs and the environmental impacts of its construction and operation. An alternative project, expansion of the Pure Water Monterey water recycling and aquifer storage project, is available to allow Cal-Am to cease its illegal water withdrawals from the Carmel River and meet the region's water supply needs, and according to your staff's analysis is the preferable, least environmentally damaging alternative. The cost of water from an expanded Pure Water Monterey project is a fraction of that from Cal-Am's proposed desalination project. In addition, this project could be implemented much more quickly than Cal-Am's desal proposal.

Sincerely,

Andrew M. Bell

Subject: Commission Staff recomendations - support

September 3, 2020

To: Chair Steve Padilla and California Coastal Commissioners and Staff
From: Robert Melton MD, MPH
Re: Coastal Development Proposal from California American Water

I urge the Commissioners to support the recommendations of Commission Staff and deny the Coastal Development Permit for the desalination plant proposed by California American Water.

The need for the proposed plant has been obviated by the local community's Pure Water project that is now increasing the supply of potable water to the service area. At the same time, our consistent efforts at water conservation have significantly lowered the demand for water. The data on which the need for the original desal plant was based are now obsolete. We can meet current and future demand for water, including future growth and development, with Pure Water Monterey and the Pure Water Expansion.

During my twenty years as Public Health Officer and Director of the Monterey County Health Department I was responsible for the oversight of drinking water systems for small communities throughout Monterey County, and thus became aware of need to promote access to and quality of drinking water for all residents and visitors. Protection of ground water aquifers from contamination and runoff was an essential part of our staff's work. From this I learned of the long-term consequences of seemingly low-risk events and the costs of rebuilding systems that have been damaged. The risks from the proposed desal plant may be difficult to quantify, but the consequences of contamination of Marina's water supply would be long-lasting and irreversible.

I also recognize safe drinking water as an essential public good that must be available to all without regard for income or residency status.
An important aspect of access to water is cost. Monterey County's population is largely made up of moderate and low-income workers in the agricultural, hospitality and tourism sectors. These and other low income people may not be present to testify today, but their wellbeing matters very much. The desal plant proposed by California American water has become an expensive and environmentally risky project that would impose a very significant financial burden on ratepayers from these working families, without providing real benefits to them that justify its high additional economic and environmental costs.

Sincerely,

Robert J. Melton, MD, MPH

Subject: Cal Am's Desal Project

September 4, 2020

To: Chairman Steve Padilla and the California Coastal Commissioners and Staff:

Please support your staff's exhaustively researched and carefully reasoned recommendation to deny a Coastal Development permit for Cal Am's proposed desal project.

I believe that communities are capable of solving difficult problems in ways that benefit diverse interests and can create unexpected win-wins for all their residents and the environment, too.

Pure Water Monterey (PWM) and its Expansion are strong examples of this. After 20 years of Cal Am's failures, a coalition of local public agencies developed Pure Water Monterey in just six years. Expansion of Pure Water Monterey will provide a long-term sustainable water source that is capable of supporting affordable housing with affordable water. It will help us create a strong economic recovery and protect the Carmel River and the Seaside basin.

The PWM Expansion has an assured, drought-proof water supply. Its capital costs are roughly a quarter to a third of the cost Cal-Am's desal—and an even smaller fraction when the full cost, including interest over the life of the desal project is included. The water from Pure Water Monterey and the Pure Water Expansion projects is expected to cost between $2,245 and $3,000 per acre-foot (AF). Cal Am's desal would be more than two to three times as costly ($7,000 to $8000 per acre-foot).

Both Pure Water Monterey and its Expansion are well engineered. The Pure Water project description anticipated that its first-year production would be about 1,000 AF per year, not 3,500 AF. Based on current progress, Pure Water Monterey will be up and running in time to supply the full 3500 AFso we can comply with the State Water Resources Control Board's pumping limitations for the Carmel River by December 31, 2021. It seems odd that Cal Am claims an 18 month delay during a pandemic is a major PWM flaw, given its own 25 years of failures that were (and are) costly for ratepayers but profitable for Cal Am. The most recent example is that somehow, its engineers forgot that water doesn't run uphill and that it wouldn't be able to deliver the PWM water unless it added unexpected charges for more equipment to our bills.

Thank you for contacting low income residents in all the affected communities. While Monterey Peninsula residents are sympathetic to low income Castroville residents who need water, we believe the agricultural firms who caused the depletion and saltwater intrusion need to help them. There are more than 21,000 low income residents on the Monterey Peninsula, more than 5 times as many as there are in Castroville. They did not cause Castroville's depletion and saltwater intrusion, cannot afford to correct it, and already struggle to pay for some of the most expensive water in the nation.

Cal Am often cites the California Public Utility Commission's (CPUC) approval of its project and the large projected demand for its desal as if it were law. Please do not rely on these outdated figures or

the CPUC's supply and demand numbers or its environmental impact conclusions. Today's CPUC Commissioners have recently shown they are strongly committed to using current data and are willing to update and discard past findings that are no longer correct and discard policies that can no longer be justified.
If, in the future, global warming worsens dramatically, the PWM Expansion will allow us to build a better sited, technologically advanced, efficient, environmentally sustainable, nonprofit regional desal facility that meets our needs.

Today, Pure Water Monterey will allow us to lift the CDO more quickly than the proposed desal. PWM plus the Expansion will have the source water, location, and reliable functionality to assure a better future for salmon while also protecting the snowy plover, vernal pools and important coastal habitats. Equally important, the PWM Expansion will allow more affordable futures, greater fairness and better coastal access for many local people, including the disadvantaged. Unlike Cal Am's desal, the Pure Water Expansion will not create hazards, suffer from erosion or cause it in trying to protect its pipes, or pose any risk to the residents of Marina.

Thank you again for the Commission staff's very careful review, based on current evidence. Please support its findings that denial of the proposed Project will not harm the public welfare and that the Pure Water Expansion is a feasible and better alternative.

In closing, I would also like to appreciate and thank Chairman Padilla for his valiant fight to survive and recover from Covid-19 and for his very moving account of his experiences and those of his daughter.

Sincerely,

Marli Melton

Subject: Slant Well Ground Water? Attachment
Attachments: # # Slant Well Ground Water.docx

How much Desalinated Water Will Need to Be Returned?

The following information was found in Cal Am's Test Slant Well Long Term Pumping Monitoring Report Number 168 dated 1/21/2020

Instead of drawing seawater from Monterey Bay for desalination, Cal Am's test slant well draws water from two aquifers. The upper intake is drawing fresh water from the shallow Dune Sand Aquifer (DSA) and the lower intake is drawing brackish water from the 180-foot aquifer. The total water drawn is around 46% DSA fresh water and 54% brackish water from the 180-foot aquifer. These are estimated slant well intake screen volumes. Note that the quality of the DSA water has been confirmed to be fresh water by Stanford University, using a proven high tech airborne electromagnetic measurement system.

The test slant well uses an electrical conductivity sensor to determine the total dissolved solids (mostly salt) in the drawn water. This sensor is located near the top of the 180-foot aquifer intake; but it is below the DSA (fresh water) intake. With the sensor in this location it primarily measures the electrical conductivity of the brackish 180-foot aquifer water; it does not measure the mixture of brackish and fresh DSA fresh water. The sensor should have been placed at the top of the test slant well to accurately measure the actual fresh water content of the mixed intake water.

A prominent California water law attorney has pointed out that the Monterey County Water Resources Agency Act prohibits exporting groundwater from the Salinas Valley Groundwater Basin. Cal Am is suggesting that the water being drawn from the 180-foot Aquifer is 93% seawater and only 7% fresh water. These measurements are made by the misplaced conductivity sensor. Cal Am proposes to pump 17,300 acre-feet from the Basin and return 7% fresh water by selling the 7% as desalinated water to the town of Castroville at a deeply discounted price. There is no provision in the Agency Act for taking and returning water to the Basin. This expert water law attorney believes that Cal Am's return water concept is rational for illegally pumping fresh water out of the Salinas Valley Groundwater Basin without water rights.

When DSA fresh water is mixed with the 180-foot aquifer intake the fresh water content might be as high as 52%. Consequently, the amount of desalinated water that will be produced and would need to be returned to Salinas Valley Groundwater Basin in Castroville is unknown but will unquestionably much higher than 7%.

Confirmation of the incorrect placement of the conductivity sensor in the test slant well can be viewed on page 32 of the Cal Am Test Slant Well Report 168 (See Reverse Side). The graph on this page indicates a decrease in the electrical conductivity in the water drawn by the test slant well starting in March of 2018. The decrease is due to the test slant well operating times being reduced from 24 hours per day to 6 hours per week. This dramatically reduced the amount of DSA fresh water drawn by the test slant well shallow intake. This allows the DSA fresh water to percolate down to the 180-foot aquifer sensor during the quiescent periods. This additional DSA fresh water reduced the volume of total dissolved solids in the water measured by the sensor by approximately 30%. The water measurement sensor indicated a fresh water increased from approximately 3% to about 23% in19 months. This fresh water also helps slow seawater intrusion.

Did Cal Am intend to misrepresent the total dissolved solids measurements of the blended brackish and fresh water by placing the sensor half way down the Test Slant Well? When there are 6 slant wells simultaneously drawing DSA fresh water how much water will need to be returned to the Basin? Is Cal Am's ultimate goal to create100% seawater intrusion in the Salinas Valley Groundwater Basin?

Subject: Appeal No. A-3 MRA-19-0034; Deny CalAm Desalination Project Permit
Attachments: Birding 2.jpg; Birding 1.jpg

I am a resident of Marina California.I am highly opposed to the Cal AM Desal Project.
I feel very fortunate to live in a very beautiful and diverse area. I live a short distance to the dunes, beach and ocean which I frequent on a daily basis. Being a nature lover, it is important to me that our coast and its inhabitants, humans and all other creatures are treated with fairness and respect. I enjoy walking the beach and birdwatching. I enjoy the calmness I get while strolling along with the vast ocean on one side and the stunning dunes on the other. I also enjoy seeing many families playing with their children along the beach. Getting to experience these things on a regular basis makes my heart happy.
The Dunes are very important to me. I participate in a state parks program that is helping to restore dunes by removing invasive non native plants.The Marina community is also very important to me. I volunteer with organizations that feed the homeless and protect the ocean and educate school children.
Marina has borne the brunt of a landfill and sewage plant. The residents of this wonderful community are now being forced to have one more unsightly and a most environmentally unfriendly project and industrial buildings on their beautiful dunes. This is just not fair
1. This project is too expensive
2. The technology is unproven
3. The plant most likely will endanger our groundwater
4. There already is a much more environmentally friendly and affordable alternative, Monterey One Water.

I urge you to side with the residents of Marina and the Staff at the California Coastal Commision and Deny the Permit for the Cal AM Project.
Robin Rosinski Resident of Marina California

Subject: September 17 Hearing

I oppose granting any permit for Cal Am to build a desalination plant. It is unnecessary at this time, as the Pure Water Now project provides sufficient water, thanks to local support for water conservation. Eventually, a desal plant may be needed, but let's wait for improved technology and reduced costs. Monterey Peninsula does not need to be the first to test, and finance, a new system.

Also, this proposed plant would probably damage the city of Marina's water supply. Marina (where I do not live) has long been the neglected stepchild of the Monterey Peninsula, with its sand mining, county dump, etc. It does not seem fair that more infrastructure should be built there, which would not even benefit Marina residents.

Thank you for your consideration.

Subject: No Desal: Yes Pure Water

For the following reasons I support the Coastal Commission recommendations:

– Cal Am's Desal project is not in the public interest
– Pure Water Monterey Expansion is the feasible and environmentally preferable alternative
– It will give us a new water supply much sooner than desal
– Our new water supply from Pure Water Monterey – Phase 1 (3,500 acre-feet) will allow us to restore the Carmel River and stop illegal withdrawals by December 2021. The environmental issues facing the Carmel River have been resolved without Cal Am's desal.
– There is no water supply crisis
– There will not be Truly Affordable Housing without affordable water. Cal Am's desal would double our water bills.

– We don't need Cal Am's oversized, over priced desal project to provide our future water supply.
– Expansion of Pure Water Monterey provides a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and protecting the Carmel River and the Seaside basin.
– Cal Am is the only obstacle to the expansion of Pure Water Monterey.
– Cal Am cannot be trusted. Passing Measure J was the community's statement

– Desal damages the environment, costs too much and creates environmental injustice.
– Desal harms the coastal habitat and Marina's beautiful dunes and their endangered species.

– Desal has no legal source water, it would draw groundwater from an overdrafted groundwater basin -- NOT under the ocean
– PWM Expansion source water is primarily the 8,000 acre-feet of excess wastewater that is now discharged into the Bay. It is contractually secure and drought proof
– Orange County has used this same system for decades
– Cal Am has had 25 years to solve or water supply problem and not done so
– Our public agencies have solved it in the last 6 years. Now all the water we need for decades is available, but Cal Am is blocking it.

Thank you,

Subject: Vote Against Cal Am's desal project!

Dear Commissioners,

Your staff did its homework! There is no water crisis on the Monterey Peninsula. Pure Water Monterey's recycled water is the sustainable source of water we need to supply the Monterey Peninsula for decades to come. Phase 1 water has already been injected into the Seaside aquifer. That will be enough to meet the December 2021 deadline for illegal withdrawals of water from the Carmel River.

The truth is that Cal Am's desalination project is the only option on which they can make a huge profit. It is not in the best interests of our water customers, as it would double the price of our water which is already the most expensive in the country (according to Food and Water Watch). Pure Water Monterey has the capability to expand and meet the water needs of those of us being served by the Monterey Peninsula Water Management District. An expansion of the project would provide a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and restoration of the Carmel River and the Seaside basin. Cal Am is the only thing standing in the way of this expansion.

Please vote against the Cal Am desal project.

Sincerely,

Jeanne Turner

Subject: Special Meeting September 17, 2020 **Th3a & 4a**
Appeal No. A-3-MRA-19-0034 (California American Water) and Appl. No. 9-19-0198

Chair Padilla, Commissioners and Staff,

I strongly **support your staff's recommendation** for denial of California American Water's (Cal-Am) appeal of the City of Marina's decision and your staff's recommendation for denial of Cal-Am's Application to build more pipelines we do not need. Your staff's and expert consultants very thorough evaluation of the environmental and economic damage and environmental justice issues that the Cal-Am proposed desalination plant in Marina will cause is so appreciated by every Cal-Am ratepayer I know.

Why Cal-Am could not find or create an affordable water source in the last 25 years since the CDO was issued, I can only assume is because they are incompetent and/or only driven by how they can maximize their profit. Cal-Am chooses to waste our money on glossy brochures filled with lies and scare tactics rather than provide water we can afford. It's no wonder we do not trust them. We are tired of paying for their mismanagement and mistakes.

Over 35,000 Monterey Peninsula ratepayers voted successfully to pursue a public takeover of Cal-Am in 2018. The Monterey Peninsula Water Management District's (MPWMD) feasibility study then showed that publically owned water (as over 85% of our country has already) with the recycled water project MPWMD developed (not Cal-Am), Pure Water Monterey, will save us huge amounts of money without the environmental damage that would be caused by the proposed Cal-Am Desal project. Pure Water Monterey will provide water for growth and affordable housing. Cal-Am's desal water will be too expensive for the affordable housing projects they are now sending us large postcards claiming only their desal project can provide. They can only lie and send out misleading propaganda because the facts do not support their claims.

Castroville is an under-privileged community that also needs water, but Cal-Am's desal project is not answer. I thank your staff for recognizing that I am one of the many poverty level senior citizens of the Monterey Peninsula, still working to pay bills. I think we all deserve the economic benefits of publically owned water. Cal-Am's expensive water is just not sustainable for anyone.

We, who live on the Monterey Peninsula, who have been the very best at water conservation in the state, **do not want to steal water from Marina**. We **do not want to cause environmental damage** to our coastal habitats. We do not want to cause salt intrusion into aquifers and potentially destroy the Salinas Valley agriculture. And we have learned from experience to have **no faith or trust in Cal-Am's management**. The less water we used, the more Cal-Am charged us to protect their profits. The CPUC has finally recognized that Cal-Am's WRAM has not been fair to ratepayers (8/27/2020 vote to discontinue).

The **Pure Water Monterey project will supply all the water we need** and provide for growth for more than 40 years. This new water supply Phase 1 (3,500 acre-feet) will allow us to restore the Carmel River and stop illegal withdrawals by December 2021, much earlier than the Cal-Am desal ever would, if it can be built at all with its pending lawsuits. We will still conserve water as it has become our lifestyle. In the future, if we

need to develop a desal plant we can choose a better location and technology that will not cause damage to the environment or bankrupt us all.

The Cal-Am Desal Plant proposed would produce more water than the Monterey Peninsula will need for decades. With our **current water being the most expensive in the country,** we can't afford to pay for water we aren't using. And we certainly **can't afford to pay the expected 2-3 times** what we are paying now for the Cal-Am Desal project nor Cal-Am legal bills to fight the City of Marina. Cal-Am's desal project and history of mismanagement is just too expensive for us in every way: economically, environmentally, ethically...

I thank your staff for their thorough report and urge you to **stop the wasting of our money and deny** the Cal-Am Appeal and Application for building pipeline for a desal plant we do not need or want.

Thank you,

Nancy Runyon

Cal-Am ratepayer since 1998

California Coastal Commission
Chair Dana Bochco, Commissioners and staff

Re: Denial of California American Water's Application for a Coastal Development Permit

Please deny California American Water's application for a Coastal Development Permit as not being in the public interest for at least the following reasons: a) the water production projections for California American's desalination plant ("the desalination plant") are outdated and far exceed the projected water demand over the life of the desalination plant; b) there is an environmentally superior alternative available; and c) there is a lower cost alternative available. The Coastal Commission staff correctly analyzes these issues in their latest report, and I urge you to adopt its findings.

Since the staff's original report, nothing has changed except California American Water's (Cal Am's) attempts to scare the populace into supporting the misguided, expensive, and unneeded desalination plant. The Pure Water Monterey Expansion Project ("PWME Project") meets the projected water demands for the Monterey Peninsula, while mitigating the effects on the environment and costing less than the desalination plant.

In addition, the Pure Water Monterey – Phase 1 (3,500 acre-feet) allows restoration of the Carmel River and allows stopping illegal withdrawals by December 2021. The environmental issues facing the Carmel River are resolved without Cal Am's desalination plant.

There is no water supply crisis. Cal Am's arguments to the contrary demonstrates that Cal Am cannot be trusted.

Unfortunately, Cal Am's interest appears to be directed more to providing profits for it shareholders than to providing the most environment friendly, lowest cost water to its customers. Cal Am appears to be the only obstacle to expansion of Pure Water Monterey, which, compared to the desalination plant, will provide the most environment friendly, lowest cost water to customers.

The PWME Project is projected to produce less greenhouse gases than the desalination plant. The desalination plant would produce 250 times more greenhouse gas than the PWME Project, and so the desalination plant is not in the public interest.

The desalination plant is estimated to cost Monterey Peninsula ratepayers $1.2 billion compared to $190 million for the environmentally superior alternative, the PWME Project. The excessive costs for unneeded water generation capacity will saddle the Monterey Peninsula with yet another handicap in maintaining and further developing an economically diverse population. Cal Am argues that affordable housing and economic recovery is not feasible without the desal plant. This totally ignores that costs associated with the desal plant and its costly water will take money away from everyone that could be used for other purposes such as sustaining the economy and affordable housing. The negative effects of unnecessarily costly water can be mitigated by denying California American Water's application for a Coastal Development Permit so that the lower cost alternative can be pursued.

Clearly, the desalination plant is not in our community's interest. It benefits Cal Am shareholders, while creating environmental damage and unnecessary financial burden for the Monterey Peninsula. I ask you to deny this permit.

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff,

My name is Julius VanderSpek, resident of Marina.

Like many other inhabitants of my town I am protesting against the proposed CalAm desalination project.
As detailed in your staff report, this project is in effect raiding the Marina aquifer, and it amazes me to no end that the working class population of Marina had to spend their time, energy and money for over four years now to rally against this harmful project. That is, defending Marina's critical resources to which CalAm has no rights whatsoever.
The water purification project is a better solution to the region's water supply.

Please deny this water theft,

Thank you,

Julius VanderSpek

Subject: Cal Am's Desal Project

Dear Commissioners,

I am writing to say that I wholeheartedly support the California Coastal Commission Staff recommendation to deny the Cal Am Water proposed desalination project.

I have lived on the Monterey Peninsula since 1969 and have lived through all on going water challenges. Pure Water Monterey is giving us the solution that has been needed since 1995. It is feasible, a less damaging alternative that will adequately provide water; protect public welfare, the environment and the best economic solutions for the ratepayers.

Other key issues that are important to this community is, affordability and environment. Affordability is key to our economically diverse community that is badly in need of affordable housing, which cannot happen without affordable water. The Pure Water Monterey allows that to happen.

Desal damages the environment, is costly and harms the coastal habitat and the City of Marina's beautiful dunes.

I am grateful to our public agencies that have developed a solution to our water needs in just six years.

Sincerely,

Vicki Williams

Subject: Cal-Am Desal Project

Dear commission member,

As a resident of Carmel Valley on the Monterey Peninsula where Cal-Am is seeking to saddle us with yet another unaffordable, yet for them highly profitable project, I am writing you to urge a no vote on Cal-Am's proposals.

First off, we as a community, have done what was required of us to not only save water, but to develop sources of water that have clearly obviated the need for deal water.

Secondly, we already have some of the highest rates in the nation for water, and they will only get higher as we are burdened with Cal-Am's profit oriented approach to a public resource. How this has anything to do with making anything more affordable is beyond me.

Our newly developed source from Pure Water Monterey allows us to meet state requirements for environmental protection of the precious Carmel River aquifer with no need for over-pumping, as Cal-Am has done for years, passing the problems along to us. We have met that challenge, and deserve to chose our own destiny when it comes to supply and demand issues in our community. Anything less is anti-democratic and flies in the face of the people's will as evidenced in the Prop J outcome.

For years Cal-Am has overdrawn not only our water but our reserves of trust in them as a reputable utility that has our best interests at heart. Its time to put an end to their profiteering. As they currently oppose a proven solution, one that the community as a whole supports, is measure enough of their intention and willingness to disregard what is right in favor of what brings them cash and us needed financial burden.

Please see that the Deal Project is rejected. Do the right thing for the people you serve, not the corporations who come before you seeking to further gouge, lie, and deny.

Thank you.

Subject:	September 17, 2020 Coastal Commission Meeting/hearing re CalAm Coastal Development Permit Application and Appeal
Attachments:	Coppernoll Final Response #2 to CCC Staff Report Recommendation to Deny CalAm Permit, 29 August 2020.docx

Dear Commissioners, Commissioner Alternates, John Ainsworth, Tom Luster and Staff,

Please accept the attached letter for your consideration and public comment input pertaining to the staff recommendation to deny the CalAm Coastal Development Permit Application and Appeal. It is my firm, and confirmed, conviction that the staff did a magnificent and absolutely thorough job in researching and presenting its findings and Conclusions. They "Got it Right" again, and have conscientiously put forward the only valid recommendation based on the scientific research and evidence: permit denial. I submitted the attached letter earlier, but want to ensure all proper procedural guidelines are followed, thus I am re-sending for that purpose - it is too important to risk your not seeing my communication.

Even if this permit were to be approved, which I strongly hope does not happen, the CalAm desalination project would be doomed to future failure because ultimately this project will run up against the State of California Sustainable Groundwater Management Act (SGMA) of 2014. The Salinas Valley Groundwater Basin, which is already on the state's critically over drafted groundwater list, will be under SGMA management stipulations that CalAm is currently violating, and will even increase violations if six more slant wells are allowed to be installed in the City of Marina's Dune Sand Aquifers and the 180/400 Foot Aquifers, the sole source of potable water for Marina and the Ord Communities. SGMA is working to mitigate the existing seawater intrusion in these aquifers. CalAm's desalination project would seriously increase seawater intrusion, per an independent hydrogeologist's scientific analysis and evaluation of the HydroFocus report in the CalAm EIR, Appendix E-2, a report that Water Plus provided to you under separate communication.

If you should approve the permit, it would, in my opinion, necessarily be overturned because this desalination project would further damage the Salinas River and its aquifers. This decision would ultimately bring an abrupt end to the desalination project, thereby leaving the Monterey Peninsula stranded without a potable water supply, and a huge unaffordable cost. **There is NO ENVIRONMENTAL JUSTICE achieved by approving the CalAm desalination permit.** Only future disaster is assured for all our communities. Marina ends up with no water at all, its potable water supply being destroyed, and the CalAm desalination plant forced to close due to its destruction of the Salinas River aquifers, leaving the Monterey Peninsula without sufficient potable

water. CalAm has already demonstrated it willfully endangered the Carmel River to the point of being issued a Cease and Desist Order from the State Water Resources Control Board that oversees surface water, but has no jurisdiction over groundwater. CalAm also over pumped the Seaside Basin, bringing on litigation and the adjudication of the Seaside Basin, which left CalAm owing the Seaside Basin a water debt yet to be repaid.

Please, please, Commissioners, understand the significance of a vote to deny this CalAm permit. As stated above, your staff got it right again. Permit denial is the only right answer. You will be praised for looking beyond the CalAm campaign to obfuscate, confuse, manipulate, and deceive you in order to obtain what it wants - more and more profits for its shareholders. Please do not let this greed happen at the expense of good citizens who have conscientiously conserved water and struggled for years against CalAm's nefarious and injurious actions in order to obtain environmental justice. What CalAm failed to accomplish in 25 years, Monterey Peninsula public agencies have accomplished in 6 years! Give credit where credit is due.

The Pure Water Monterey Expansion is the right answer to provide all the potable water the Monterey Peninsula will need for decades to come. In the meantime, there will be new technologies to explore and more resources to procure and preserve that are just now being considered as possible water sources. Furthermore, the State of California has mandated that all possible water sources be used and recycled as a way to protect and preserve our precious reservoirs and aquifers as well as the Monterey Bay National Marine Sanctuary.

This fact makes the Pure Water Monterey Expansion even more supportable and of paramount importance to implement.

Thank you so very much for doing the right thing. I salute John Ainsworth, Tom Luster, and staff for their truly outstanding, admirable report. They deserve special commendation for their solid research and well presented scientific arguments and evidence. I am very proud of them and their achievements. When doing what is in the public interest as opposed to doing what is in the interest of corporate greed, there is reason to celebrate the good action. Please deny the permit.

Very respectfully,

Margaret-Anne Coppernoll, Ph.D.

August 29, 2020

California Coastal Commission
Commissioners, Tom Luster and Staff

SUBJECT: September 17, 2020 California Coastal Commission Hearing for California American Water Company's Monterey Peninsula Water Supply Project (MPWSP) Consolidated Coastal Development Permit Application, No.9-19-0918 and Appeal No. A-3-MRA-19-0034

Dear Commissioners and Staff,

In my past two letters supporting a MPWSP California American Water Company (CalAm) consolidated coastal development permit application denial, and supporting the November 2019 Staff Report Recommendation to deny the project permit, I am writing a third time to re-emphasize the vital importance of endorsing the August 24, 2020 Staff Report that for a second time recommends permit denial. This report is so professionally presented, so thorough and well researched with substantive scientific evidence reinforcing every documented finding, that it should be impossible to espouse any decision other than permit and appeal denial.

The obvious negative impact this desalination project would have in our communities is undeniable, and confirmed by legal, environmental justice dictates, scientific data, and local coastal plans as well as the California Coastal Plan, that even the most uninformed person can understand these well thought out, well developed and logically presented, clearly sequenced arguments in favor of permit and appeal denial, that this letter may be rendered superfluous, so perfect and professionally accomplished is this staff report. It is an awesome, impeccable, exceptionally well researched document. Still I write again as a way to remind you just how seriously significant your decision is to the future of our communities and to our peace, financial well-being, and survival.

Please deny this permit and appeal. The staff expended an enormous amount of time and energy in its meticulous report preparation and execution. Tom Luster, a consummate environmental scientist, examined every point of analysis and provided every possible detailed explanation authenticating the reasons the permit and appeal must be denied. This project is infeasible and unsustainable. It will necessarily entail a future Cease and Desist Order from the State Water Resources Control Board to stop CalAm from over pumping and depleting, via seawater intrusion, the Salinas River Freshwater Dune Sands Aquifers from which the project fully and explicitly intends to extract its source water for its desalination plant. This intended action is in direct violation of the State of California Sustainable Groundwater Management Act of 2014 that mandates groundwater sustainability plans be developed and implemented to protect, restore, and preserve groundwater in the Salinas Valley Groundwater Basin, a basin that is already on the California critically over drafted groundwater basin list.

The Salinas River and its aquifers service Monterey county, having seven sub-basins that extend as far south as San Luis Obispo county. This water system interconnectedness makes permit denial even more crucial and consequential due to the dangerous seawater intrusion challenge and sea level rise projections resulting from climate change. It is noteworthy that the MPWSP slant wells have been proven, and designed, to cause seawater intrusion. Please refer to hydrogeologist Barbara Ford's independent analysis, paid for and distributed by Water Plus. The Ford report elucidates the true purpose behind CalAm's slant well design as described in the HydroFocus EIR report in Appendix E-2.

It is unconscionable that any agency is still even considering this project or contemplating whether or not it should be allowed to move forward. How can any agency even suggest that it might approve a project that is already pre-identified as being an illegal, infeasible, unsustainable project that will destroy the viability of the Salinas River and its essential-for-life aquifers that so many communities and endangered species and ESHA depend on for survival? We are dealing with a blatantly disingenuous and surreptitious company whose project disregards environmental justice, legal water rights, and the legitimate concerns of conscientious tax-paying citizens, their well-being, and their wishes!

There should be no discussion other than a motion to deny the permit and appeal. Any other decision is an aberration of decency and sound judgment. Please do the right thing and vote in the public's interest and against callous corporate greed.

Our citizens are exhausted from having to fight so strenuously, and for such an extended period of years, to obtain environmental justice, and to realize our human right to affordable potable water. Please deny the permit and support the Pure Water Monterey Expansion as the only sensible and acceptable alternative project.

Thank you so much for your efforts to complete a fair and thorough analysis of our water crisis. I urge you to vote in favor of the only viable, feasible, environmentally safe, water alternative solution, Pure Water Monterey Expansion, by upholding Staff's Findings, Conclusions, and Recommendation to deny the MPWSP consolidated coastal development permit application and appeal.

You will be blessed for doing what is best for our communities. We salute you for your wisdom and for being good stewards of the public trust.

Very respectfully,

s//Margaret-Anne Coppernoll//

Subject: Cal Am's Desal Project

Dear Commissioners and Staff

As your staff has so meticulously shown, there are key issues with Cal Am's desal including: 1. Cost of desal water is 2x-3x more than Pure Water Monterey Expansion recycled water (PWMX). The cost for ratepayers would be over $1 billion over 30 years. 2. Environmental issues including: a. destruction of 7 acres of coastal dunes on ESHA; b. hundreds of times more energy consumption; c. thousands of times more CO2 release; d. saltwater intrusion; f. does not provide drought reserve as does PWMX. g.discharges huge amounts of brine; h. PWMX has no legal issues and can meet the State Water Resources Control Board's Carmel River CDO in less time than desalination. One often overlooked issue though is our mistrust of Cal Am. They have consistently distorted facts so they can make ever more increasing profits; have consistently criticized and distorted scientifically based facts as in PWMX SEIR and mocked the November 2018 Measure J Campaign that was brought to voters by resident activists and was passed overwhelmingly by voters in November 2018 in the interest of the residents here; and now in the desal proposal before you are giving water to Castroville for $100 afy where we the Monterey Peninsula residents pay $6000-$8000 afy when CCC Staff shows Marina and Cal Am service area has 7x more residents that would be burdened than those in Castroville that would benefit. Also, not specifically mentioned in the CCC Staff report is that Marina and Cal Am's service area has more low income residents than Castroville.

PWMX came as the result of a cooperative creative problem solving effort from many government entities including Monterey One Water, Monterey Peninsula Water Management District, Federal Agencies, State Agencies, and local leaders to give the Monterey Peninsula a long-term sustainable solution to our water issues. Since Cal Am has been water purveyor in 1966 through the present, Cal Am has never adequately brought in all the local stakeholders for cooperative solutions because it is so focused on shareholder return. Cal Am never even bothered considering the harm it was doing to the Carmel River all those years and had to be issued a state mandate to quit overdrawing water. They only looked at the cheapest source for the most profit and greatest shareholder return. Cal Am has spent more on lobbying, distorting facts, and misrepresenting ratepayers than on any significant wise stewardship of our water resources. My ultimate wish for all of us negatively impacted here is that PWM and PWMX can restore the trust that Cal Am has broken and that we residents do everything we can to stop Cal Am from another failed and expensive project that we will pay dearly for. Please deny Cal Am's coastal permit.

Thank You for Your Consideration

These materials have been provided to Coastal Commission staff

Marina Coastal Water District's Preliminary Response to Cal-Am's Presentation Materials dated 9/2/20

Cal-Am's Presentation Materials are full of inaccurate and misleading statements. MCWD provides this slide-by-slide response to Cal-Am's presentation summarizing why the Staff Report's conclusions regarding the Project's impacts on coastal resources and recommendation of denial is supported by more than the required substantial evidence. MCWD also provides references to the evidence in the record showing Cal-Am's attack on the Staff Report is not supported by the evidence and is, in fact, based largely on false or misleading statements.

(Submitted to Coastal Commission Staff on September 11, 2020)

Cal-Am Presentation Materials (Page 2)

MCWD Response:

PURE WATER MONTEREY EXPANSION IS FEASIBLE

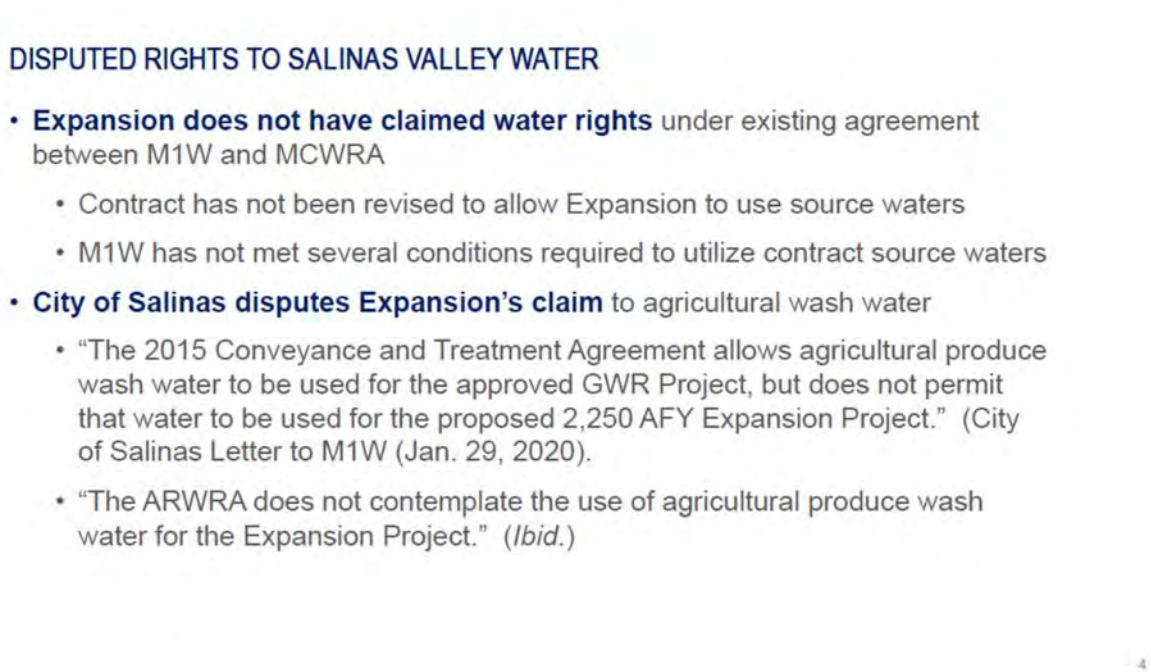
Staff Report addresses each of the points raised by Cal-Am and explains why Cal-Am's arguments regarding the feasibility of PWM expansion are not supported by facts.[1] As explained by the Monterey Peninsula Water Management District (MPWMD)—the public agency created by the Legislature to address the Monterey Peninsula's water supplies—and further below :

- Expansion SEIR would be certified overnight if Cal-Am withdrew its opposition.
- Source water availability for Expansion has been confirmed by third-party experts. [2]
- Existing source water contracts do not differentiate between Phase 1 or Expansion. [3] The contracts are available for review and confirm supply is ample for Phase 1 and Expansion.
- No agricultural runoff is expected or needed for Expansion. [4]
- Startup problems with PWM Phase 1 have been resolved and will meet all targets next fiscal year. [5]

While the Staff Report acknowledges some uncertainty, the Expansion does have the ability to timely meet the Monterey Peninsula's demand[6]—the evidence shows that Cal-Am's expert's speculation is based on inaccurate assumptions and outdated data. As discussed below:

- During the last 4 water years, ASR has met supply targets despite Cal-Am's infrastructure constraints. [7] Cal Am deceptively uses ASR data from a ten-year span that largely predates installation of all four ASR wells and completion of the Monterey Pipeline and Hilby Pump Station.[8] The current ASR system with all the wells, pipelines, and pump stations has only been in service since January 2019,[9] skewing their average. Given additional ASR wells, Monterey Pipeline and Hilby Pump Station are now in place, it is likely Cal-Am will get more—not less—ASR supplies in the future.
- Sufficient wastewater in region verified by third-party experts. [10]
- Source water projections analyzed under two drought scenarios by third-party experts. [11]

Cal-Am Presentation Materials (Page 3)



MCWD Response:

M1W BOARD DID NOT DENY CERTIFICATION OF THE EXPANSION SEIR OR VOTE TO STOP WORK AS CAL-AM FALSELY CLAIMS

Cal-Am ***misleadingly*** states the M1W Board voted to deny certification of the SEIR. As the Staff Report explains: "The vote to certify it failed by a vote of 10 to 11. **There was then a motion to deny certification of the FSEIR and terminate any further action on the Expansion project, which also failed on a vote of 10 to 11**."[12] Because both votes failed, no findings of any kind were made by the M1W Board regarding the SEIR

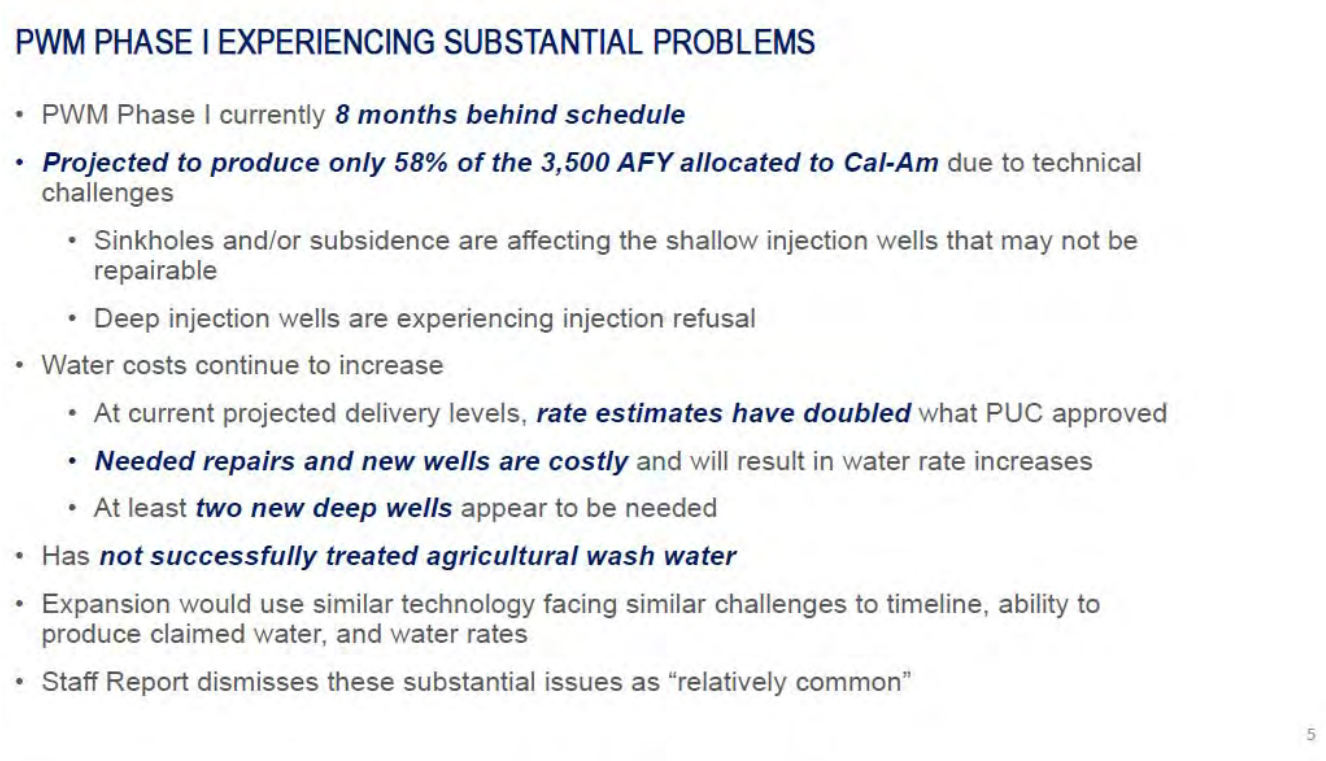
- While the M1W Board has not certified the EIR, they could do so without further environmental review with a one vote switch. Unless and until the Commission denies Cal-Am's CDP application, Cal-Am and its M1W Board allies are unlikely to relent in their unfounded opposition.
- The M1W Board did not adopt findings relating to any particular concern as Cal-Am misleadingly suggests. Moreover, the MPWMD explains in its assessment of Cal-Am's claims and the record shows:
    - M1W never asked its CEQA consultant to remedy any of Cal-Am's alleged "deficiencies" in SEIR or purportedly "unknown" scope of impacts. [13]
    - M1W never stated funding was an issue. [14]
    - MPWMD pays 75% and was never asked for funding remedies. [15]
    - Non-certification is a political gambit by proponents of the desalination project.
    - Carmel River ecosystem is not in peril based on last five years of data.[16] As explained further below, Cal-Am must—and can—eliminate all illegal Carmel River diversions with the supplies available at the end of 2021 and there is no need to modify the CDO.

Cal-Am Presentation Materials (Page 4)

MCWD Response:

M1W HAS CONTRACTIAL RIGHTS TO SUFFICIENT WATER FOR EXPANSION

- Cal-Am ***falsely*** states that M1W does not have contractual rights to source waters identified for Expansion. As the Staff Report explains: MIW "has contracts and agreements in place for more than enough water actually needed to provide the Pure Water project's expected production volumes , which would allow it to operate even if some sources are not available or are available in lesser amounts, and the[FSEIR] concludes that there is adequate water for the facility."[17]
- As the MPWMD explains in its recent assessment of Cal-Am's presentation:
    - Existing source water contracts do not differentiate between Phase 1 or Expansion. [18]
    - The "conditions precedent" if not met, have been factored into Phase 1 and Expansion sizing. [19]
    - No agricultural produce wash water is expected or needed for Expansion.[20] As explained further below, Cal-Am can must—and can—eliminate all illegal Carmel River diversions with the supplies available at the end of 20210.
- Through the 2015 City of Salinas agreement M1W[21] was given the right to use the industrial wastewater, also known as Ag Wash Water, that is beneficial to the Pure Water Monterey project. There are no limitations on the amount of Ag Wash Water to be provided to Pure Water Monterey nor any restrictions on us of the water for initial or future phases of the Pure Water Monterey project. The key language in the Agreement is as follows:
    - Term 1b states, "For the Term of this Agreement, City will provide MRWPCA [now M1W] access and RIGHTS to the industrial waste water in order for the MRWPCA to use industrial waste water in a manner that is beneficial and consistent with the uses described in Recital B, above, and consistent with the recitals and the terms and conditions listed in this section."[22]



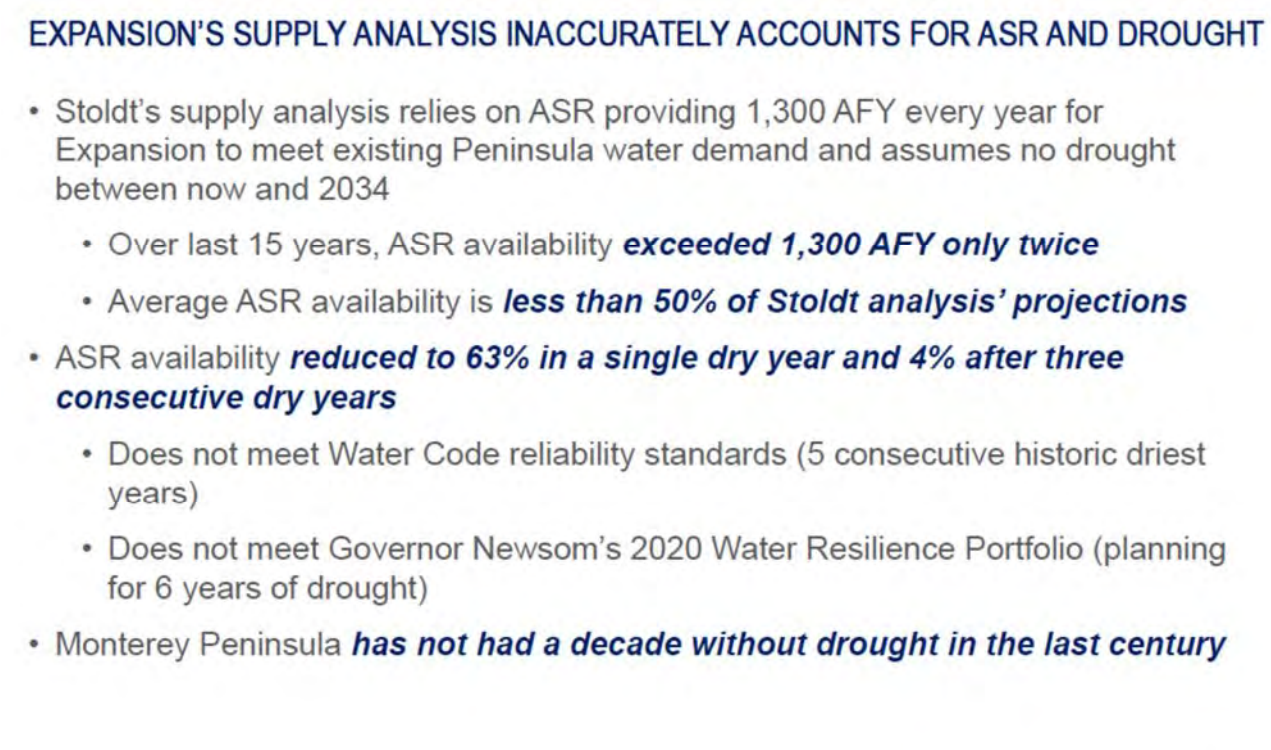
MCWD Response to Cal-Am Presentation Materials Page 4 (Continued):

- Recital B states "The MRWPCA [now M1W] has an existing need for source water for 1) to serve its Pure Water Monterey Replenishment Project (the "GWR Project") and 2) to augment the existing Castroville Seawater Intrusion Project ("CSIP") crop irrigation supply.[23]

- Further, through the 2015 Amended and Restated Water Recycling Agreement[24] between M1W and the MCWRA, section 4.02, the "New Source Water" derived from the Ag Wash, Rec Drain, and Blanco drain, totaling 8,701 AFY, was allocated to M1W and MCWRA such that M1W had first priority of 4,320 AFY of these "New Source Water" flows and MCWRA had the remaining allocation of 4,381 of "New Source Waters". This amount to M1W is sufficient on its own for PMW without use of any wastewater flows.

- Under Section 4.01 of the Agreement, M1W was allocated its share of wastewater flows that would be added to the "New Source Water" flows. Those rights include access to wastewater that is not claimed or utilized by MCWD or needed by MCWRA's authorized demand pursuant to the Agreement, plus 650 AFY to M1W from MCWRA. MCWRA's authorized demand in the Agreement, as shown in Exhibit C of the Agreement, has a total of 16,692 AFY of "New Source Water and SVRP" (wastewater flows) going to MCWRA. Subtracting the 4,381 of New Source Flows allocated to MCWRA from this amount (the amount described above in Section 4.02) determines MCWRA's demand for wastewater per the agreement at 12,311 AFY out of a total of 21,689. That leaves 9,378 AFY of wastewater flows that are for MCWD and M1W to use according to their rights. MCWD sends about 2100 AFY to the plant, leaving 7,378 AFY that M1W has rights to use currently**. The expansion project needs only 2,778 AFY.**

Cal-Am Presentation Materials (Page 5)



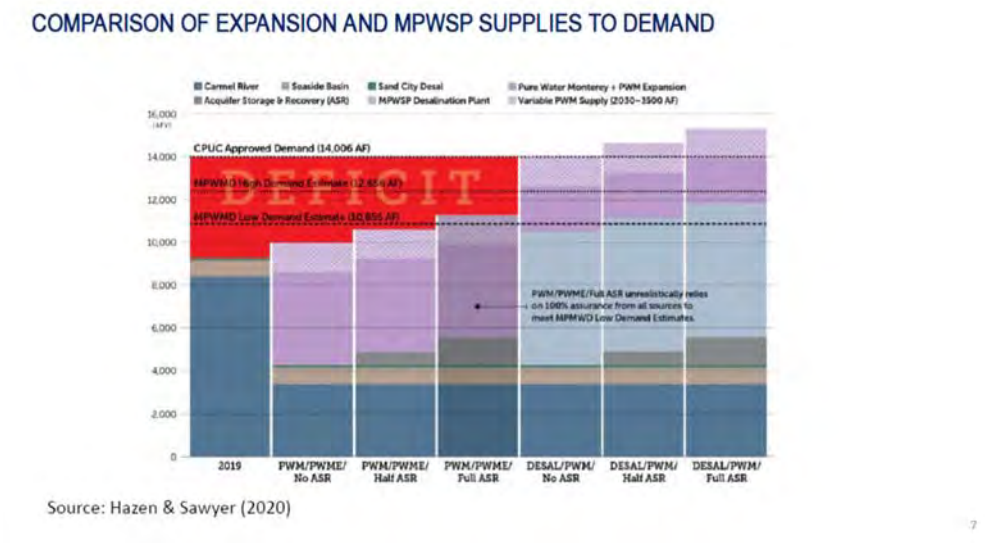
MCWD Response:

PWM PHASE I STARTUP GLITCHES HAVE BEEN ADDRESSED; PHASE I HAS MET ITS FIRST OBLIGATION TO DELIVER 1,000 AF RESERVE

Cal-Am ***misleadingly*** suggests the Staff Report improperly dismissed PWM Phase I start-up problems and falsely claims the project's initial delays and increased costs make its delivery of water unreliable. As the Staff Report explains: "the start-up problems are of a type that can readily be resolved, and in fact, Monterey One Water has developed the methods and schedule for adding a new well and improving conditions at the existing wells to allow for the full expected production."[25]

- As the MPWMD further confirms and explains in its recent assessment of Cal-Am's presentation:
  - Problems with PWM Phase 1 have been resolved and next fiscal year will meet all targets. [26]
  - Operating Reserve requirement was met August 21st, properly within 6 months of first injection. [27]
  - Deliveries began September 1, 2020.[28]
  - Rates have not doubled as Cal-Am implies. While the costs are higher than the projected 2016 estimates, Desal costs remain 3-times higher. [29]
  - M1W successfully treated agricultural wash water during the drought. It has not been needed recently. [30]
  - The PWM Phase I start-up issues are not "substantial." Rather, they are common start-up setbacks for which there are obvious and simple fixes. [31]
  - Originally PWM had 4 wells to be installed as part of the project. In an effort to save costs, only two wells were constructed. M1W is now installing a third well with approval of a fourth. All 4 wells could be online by the end of 2021 with sufficient capacity for both PMW and expansion, and M1W has already injected a 1,000 AF reserve in the Basin for Cal Am's later use.

Cal-Am Presentation Materials (Page 6)



MCWD Response:

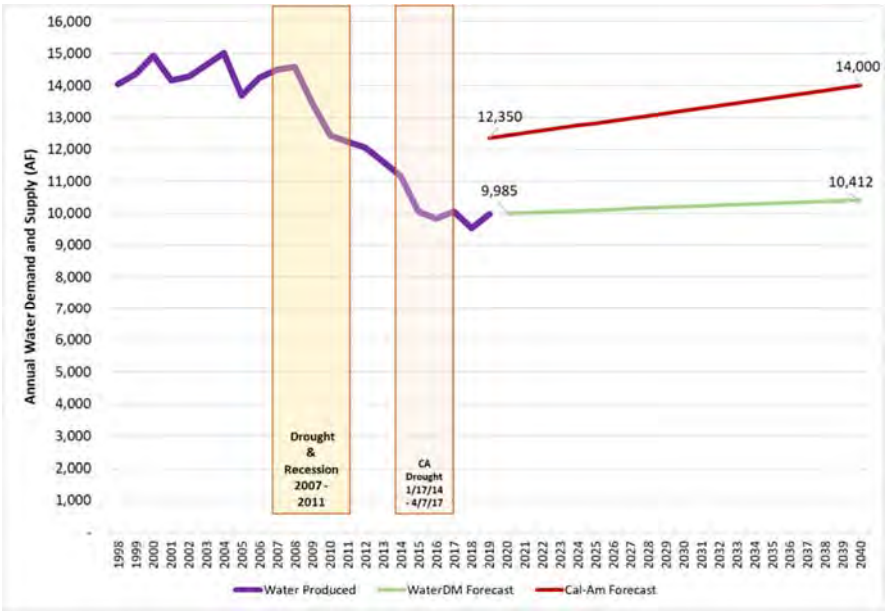
EXPANSION SUPPLY INCLUDES DROUGHT YEARS; CAL-AM's ATTEMPTS TO DIMINISH ASR SUPPLIES ARE CONTRADICTED BY THE RECORD

Cal-Am ***incorrectly*** states ASR supplies are not reliable and attacks the PWM Project SEIR's and Staff Report's reliance of ASR in evaluating future water supplies. As the Staff Report explains, improvements now permitting recovery of 1,300 AFY on average of ASR supplies have consistently been accounted for in the CPUC's analysis of Cal-Am's supply portfolio.[32]

- As the MPWMD further confirms and explains in its recent assessment of Cal-Am's presentation:
    - ASR has averaged 1,282 AF of injection the past 4 years despite Cal-Am infrastructure constraints, which is on the 1,300 AF target. Later, when operated post-CDO it will build up a "bank" of water that can persistently produce an average yield of 1,300 AF per year. [33]
    - Cal-Am "experts" use pre-CDO operating assumptions, rather than post-CDO analysis, in an attempt to justify the need for Cal-Am's desal project.[34]
    - ASR drought resilience has been confirmed by third-party experts.[35]
- In 2019, Cal-Am used the reliability and water supply value of ASR to justify including in its rate base the $50 million cost of the new Monterey Pipeline and Hilby Pump Station as essential to convey ASR water to the Seaside Basin for storage.[36] Now Cal-Am appears to imply that investment was wasted because ASR is purportedly unreliable.
- Cal Am deceptively uses ASR data from before all four ASR wells were installed and before the Monterey Pipeline and Hilby Pump Station were completed. The full ASR system was not in service until January 2019 resulting in an incorrect average.

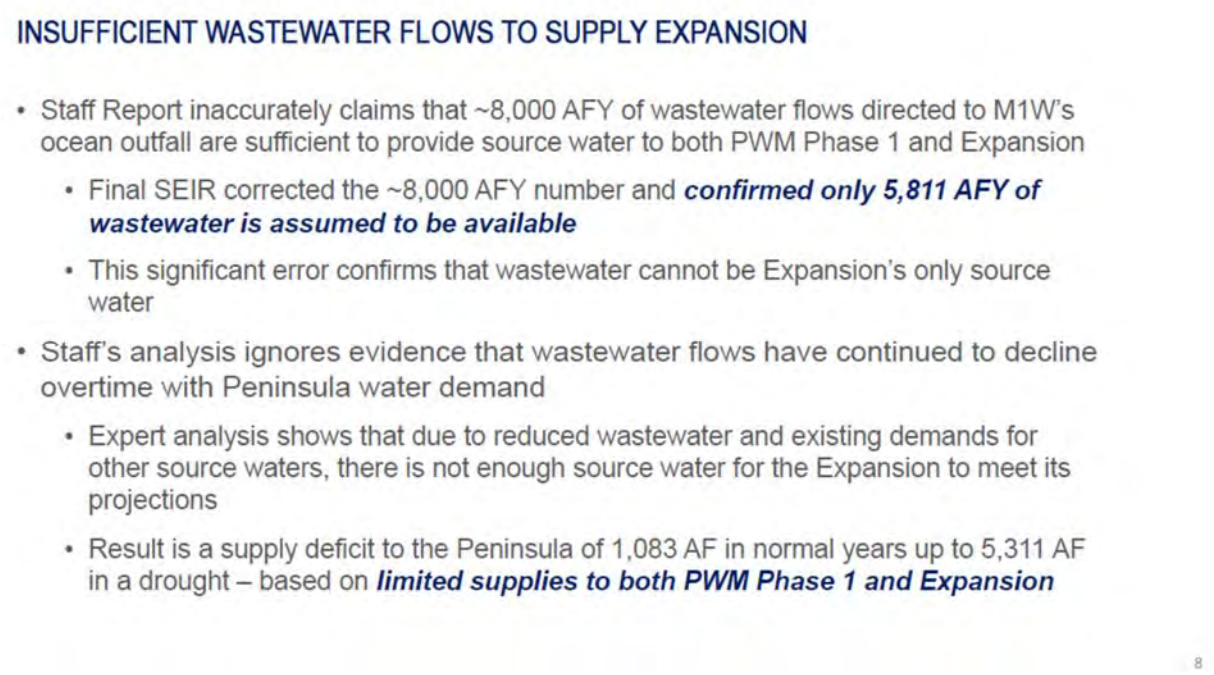
Cal-Am Presentation Materials (Page 7)

Source: Hazen & Sawyer (2020)



MCWD Response:

CAL-AM'S EXPERTS FAIL TO ADDRESS NEW INFORMATION RELATING TO DEMAND INCORECTLY ASSUMING NOTHING HAS CHANGED.

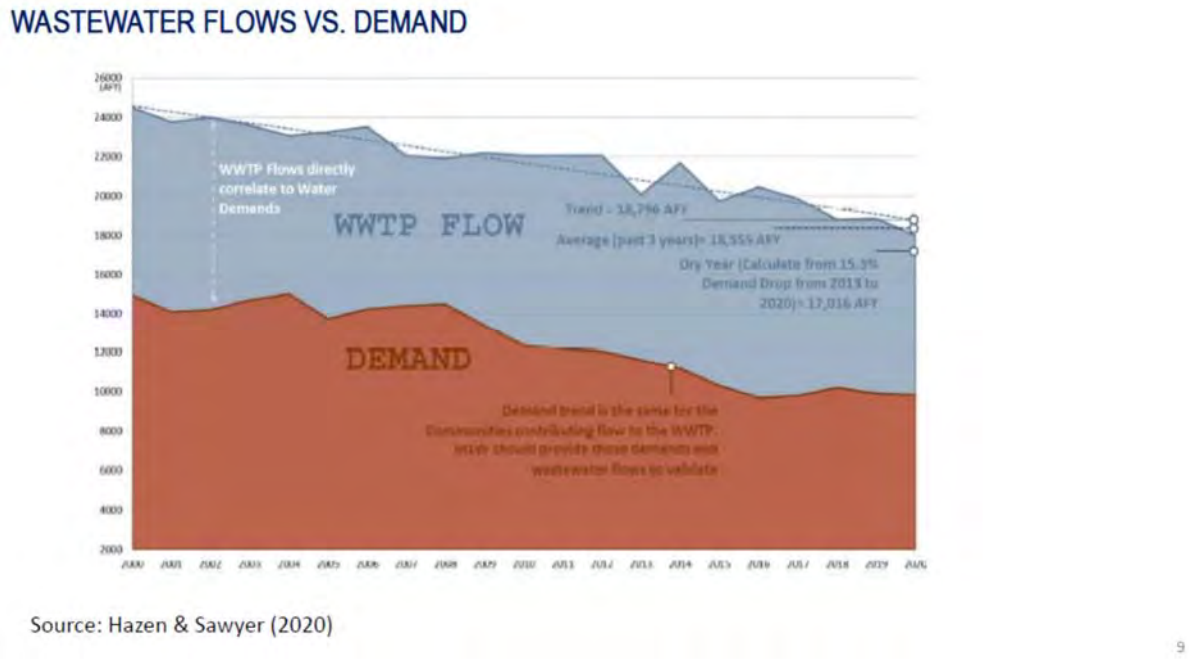


Cal-Am's reliance on the above Hazen and Sawyer Report chart is misplaced because Hazen and Sawyer ignored significant new information that shows significantly lower water demand in Cal-Am's service area—instead relying on the CPUC's demonstrably outdated prior projections. As the Staff Report explains: "Cal-Am's recent testimony to the CPUC shows that it expects demand in 2020 through 2022 to remain at the low end of use – about 9,789 acre-feet per year – which results in the high demand during 2008 and 2009 of around 14,000 acre-feet being replaced by upcoming years of about **4,000 acre-feet less demand**."[37]

- As MPWMD noted the "This chart makes no sense to any of us or our third-party experts."[38]
- As shown in Figure 1 of WaterDM's Second Supplemental Expert Report, 14,000 AFY is not a reasonable or accurate estimation of demand:[39]

Figure 1: WaterDM and Cal-Am forecasts of future average annual production

Cal-Am Presentation Materials (Page 8)



MCWD Response:

EXPANSION WASTEWATER FLOWS ARE ALONE SUFFICIENT

Cal-Am ***incorrectly*** states wastewater flows are insufficient to supply Expansion and that Staff Report's reliance of these flows is not supported by the evidence. As the Staff Report explains: M1W "has contracts and agreements in place for more than enough water actually needed to provide the Pure Water project's expected production volumes , which would allow it to operate even if some sources are not available or are available in lesser amounts, and the[FSEIR] concludes that there is adequate water for the facility."[40]

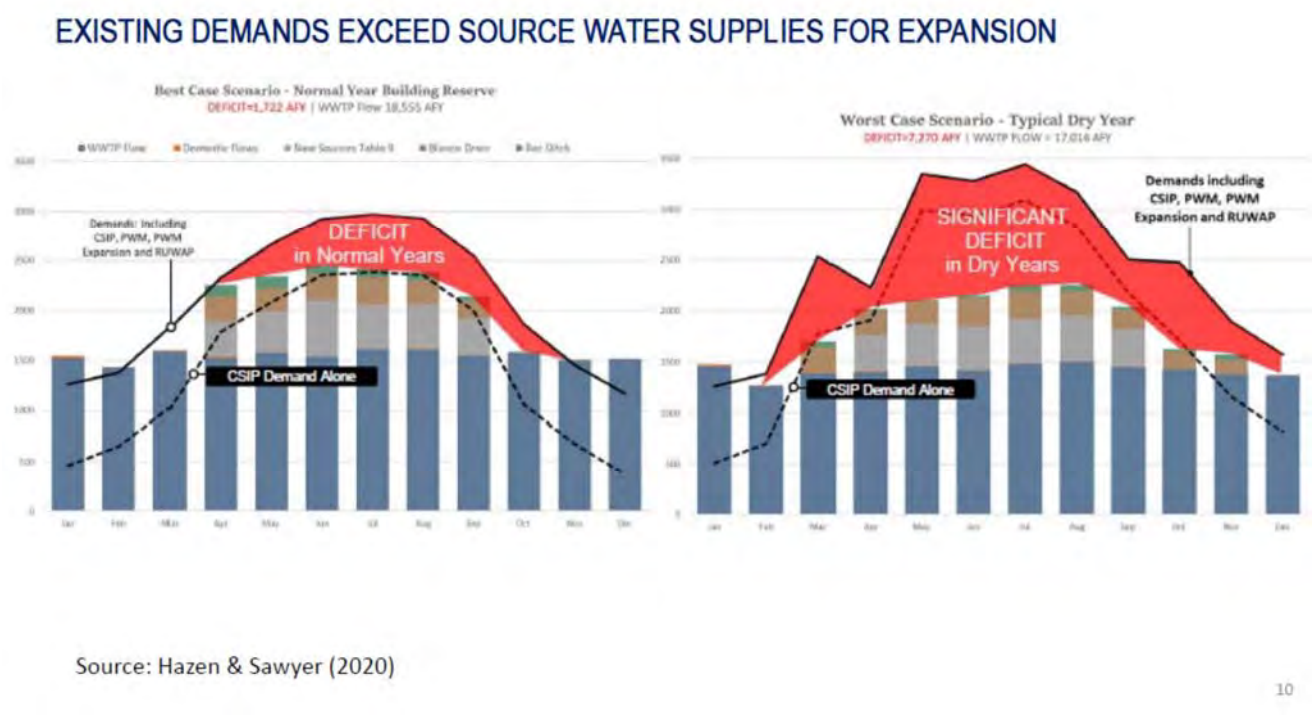
- As the MPWMD further confirms and explains in its recent assessment of Cal-Am's presentation:
    - Third-party experts on PWM Expansion did their analysis based on 5,811 AFY and confirmed more than enough source water. [41]
    - All four normal year/drought year scenarios analyzed indicate 1,400 to 2,100 AFY of excess source waters AFTER PWM Expansion, a buffer for declining flows. [42]
    - There is no supply deficit.[43]
    - M1W's analysis of the PWM wastewater sources under various conditions, including drought, concluded that the project can reliably perform.[44]

Cal-Am Presentation Materials (Page 9)

MCWD Response:

WASTEWATER FLOWS WILL INCREASE IF PROJECTED GROWTH OCCURS

As the Staff Report explains: "An August 20, 2020 letter from Monterey One Water addresses Cal-Am's contentions and clarifies that ***Cal-Am's concern about inadequate wastewater was based on incorrect analyses***."[45]



- Cal-Am's reliance on the above Hazen and Sawyer Report chart is ironic, because, although Hazen and Sawyer show a decrease in wastewater flows, the same chart confirms the long-term and permanent decrease in demand within Cal-Am's system that both Hazen and Sawyer and Cal-Am refuse to acknowledge throughout their materials.

- Moreover, even the decreased wastewater flows are more than ample for the various dedicated uses, and at any rate, to the extent there are population increases in the communities contributing wastewater flows to M1W's treatment facilities, that will balance out or exceed any additional reductions in wastewater flows due to ongoing conservation.

- As the MPWMD noted the "This chart summarizes why Cal-Am's proposed desal plant is too large – Customer demand has dropped since the plant was sized and shows no sign of needing 6,252 AFY within a reasonable planning horizon."[46]

- WaterDM's forecast is based on AMBAG's forecast of future population growth for the Cal-Am service area, and it includes all forecasts for future development across all sectors.[47]

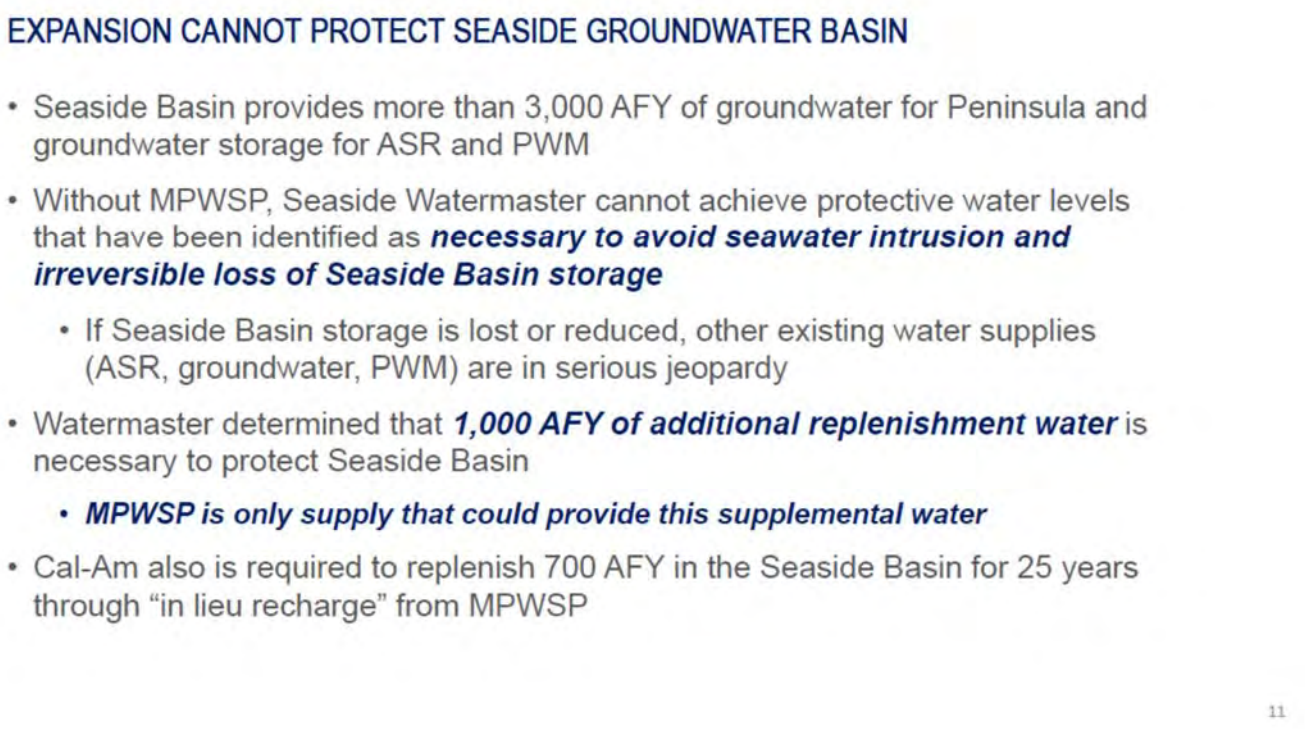
Cal-Am Presentation Materials (Page 10)

MCWD Response:

THERE IS MORE THAN ENOUGH SOURCE WATER FOR EXPANSION

As the Staff Report explains: "the Pure Water Expansion's Final SEIR, which includes a detailed technical memorandum that uses a number of relatively conservative assumptions to evaluate several different scenarios – e.g., dry year versus wet year supplies, variable seasonal or annual amounts from different sources, etc. – and determined in each case that there would be sufficient water to produce the 2,250 acre-feet expected from the Pure Water Expansion" [48]

- Again, Cal-Am's reliance on the above Hazen and Sawyer Report chart is misplaced because Hazen and Sawyer incorrectly assume that recycled water must be available as-needed throughout the year by all users, when in fact it is only CSIP that requires recycled water for immediate use in the high irrigation summer months.



- PWM, PWM Expansion and RUWAP (MCWD's recycled water project, to be implemented in the future) will all have the flexibility to take treated water in variable amounts through the course of the year because that water must repose in the groundwater aquifers for at least six months before withdrawal.

- Cal-Am is suggesting, incorrectly, that banked storage must work on the same "use it or lose it" seasonal supply basis as surface flow.

- Moreover, Hazen's chart appears to incorporate amounts of recycled water which CSIP *could* claim, but which it is not currently using.

- As the MPWMD noted the chart fails to account for significant new information as outlined in its comments."[49]

Cal-Am Presentation Materials (Page 11)

MCWD Response:

EXPANSION PROVIDES FAR MORE WATER THAN REQUIRED FOR PAYBACK OF CAL-AM'S SEASIDE GROUNDWATER BASIN REPLENISHMENT OBLIGATIONS

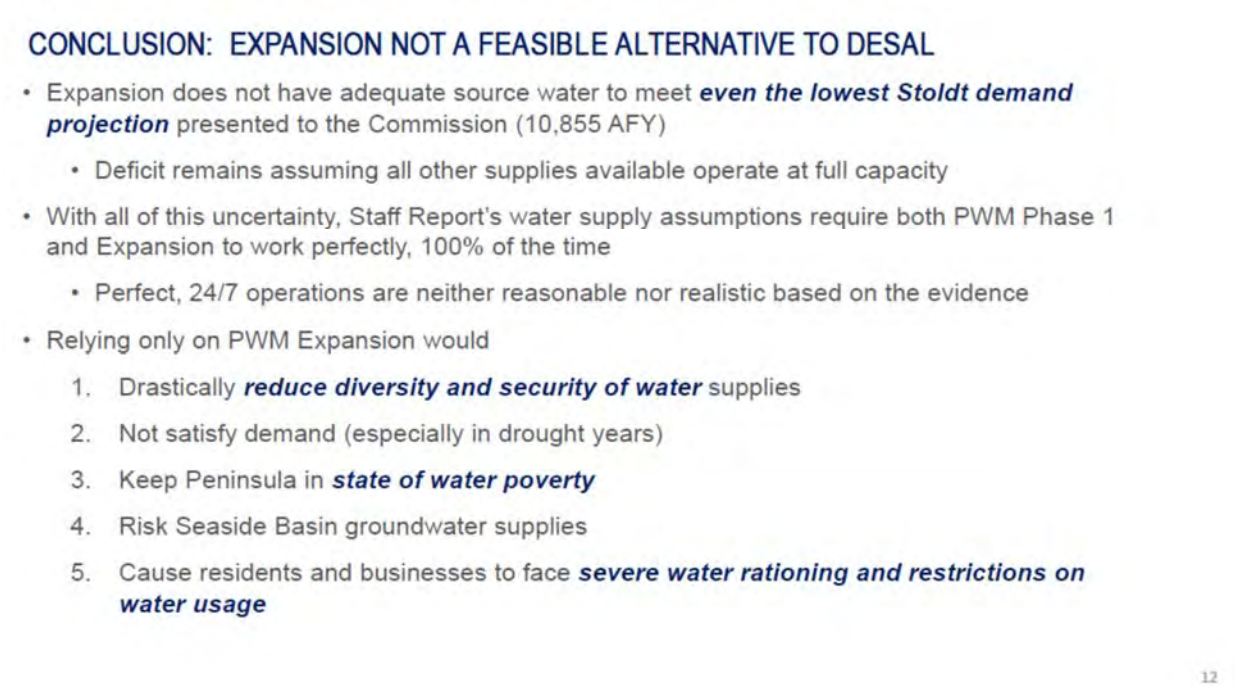
Cal-Am ***misleadingly*** suggests that without its desalination project the Seaside Groundwater Basin will be vulnerable to increased seawater intrusion. But, as the Staff Report correctly observed, both the desalination project and PWM Expansion will meet the project's 2nd and 3rd primary objectives, which are to:

- 2. Develop water supplies to enable Cal-Am to reduce pumping from the Seaside Groundwater Basin from approximately 4,000 to 1,474 AFY, consistent with the adjudication of the groundwater basin, with natural yield, and with the improvement of groundwater quality; and

- 3. Provide water supplies to allow Cal-Am to meet its obligation to pay back the Seaside Groundwater Basin by approximately 700 AFY over 25 years as established by the Seaside Groundwater Basin Watermaster.[50]

Furthermore, the Staff Report prudently discounted the significance of the Watermaster's new assertion, made on August 12, 2020, that 1,000 AFY of additional recharge would be required "to provide protective groundwater elevations in the Basin," because this measure was considered in 2009 and 2013 but the Watermaster "took no action to implement the associated infrastructure that would be needed or to fund the approximately $6,000,000 per year needed to purchase that amount of desalinated water," concluding that "any such new demand for water appears to be speculative."[51]

- The MPWMD reached the conclusion that this is merely an alarm tactic, based in part on past technical analysis by HydroMetrics WRI.[52]



MCWD Response to Cal-Am Presentation Materials Page 11 (Continued):

- Moreover, MPWMD noted that at a 2013 Watermaster Technical Advisory Committee meeting where a presentation was made on the topic of protective water levels, the Cal-Am representative stated that replenishment to meet protective water levels is not the company's responsibility. [53]
- MPWMD further concluded that PWM Expansion at 2,250 AFY could also provide more than enough than the water needed for such a purpose, even allowing for the acknowledged need to repay 700 AFY, and at the same time as unprecedented annual growth in population. [54]
- MPWMD's comments also indicated that the Watermaster's letter oversimplified the issue of sufficient protective water levels, because the levels – and therefore the optimal additional annual replenishment amounts, if any – would be different for inland wells and coastal wells. [55]

Cal-Am's newfound concern for protecting Seaside Basin groundwater is ironic, given its historic overpumping from that resource, which is similar to its chronic, illegal overdrafting of the Carmel River. The further irony is that Cal-Am proposes to protect the Carmel River and the Seaside Basin by illegally exploiting the Salinas Valley Groundwater Basin.

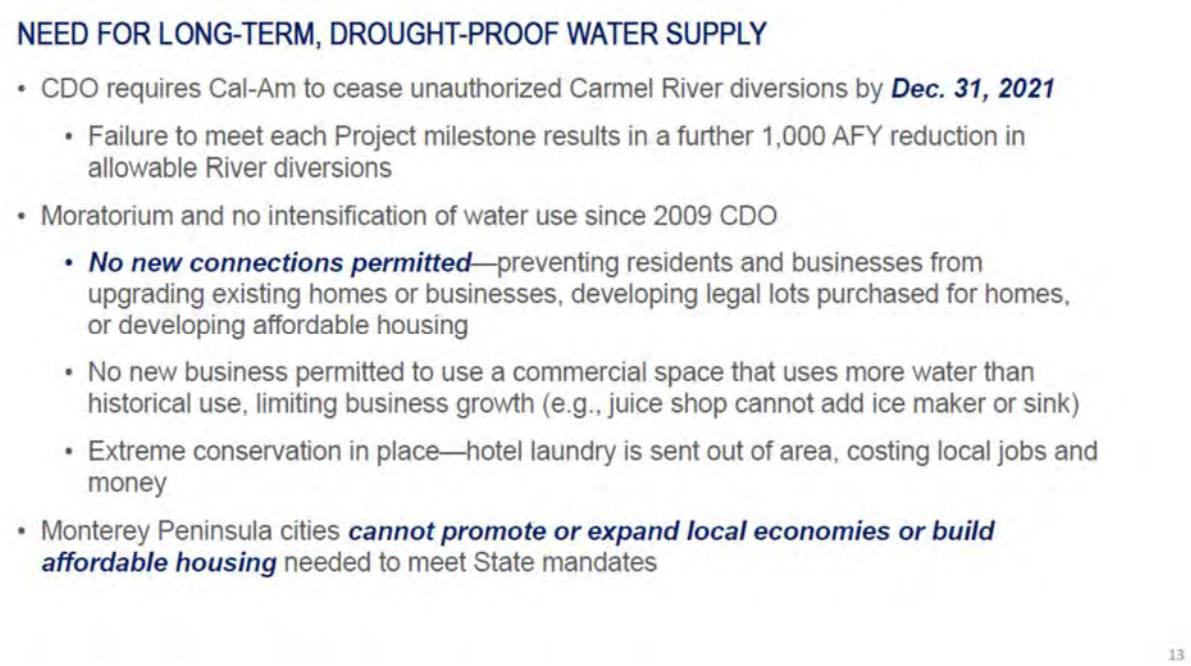
- As WaterDM observed "With the addition of the Pure Water Expansion, Cal-Am will have additional opportunity to inject and store water in the Seaside Groundwater Basin" in addition to ASR injection, which will contribute to operational reliability and help ensure a long-term reliable supply. [56]
- Available excess water for injection from ***the Pure Water Monterey Expansion will enable Cal-Am to store additional water in the Seaside Basin***. The proper management of this storage potential and the water supply from the expansion could provide drought-resilience to the Monterey Peninsula for years to come.[57]
- In addition, increased ASR capacity will contribute to protective water levels in the Seaside Basin. As WaterDM stated, "Based on long-term historical precipitation and streamflow data, which includes drought hydrology, the ASR system is designed to allow an average of 1,920 AF per year to be recovered."[58] Increased ASR storage will also contribute to increasing protective water levels in the Seaside Basin.

Cal-Am Presentation Materials (Page 12)

MCWD Response:

EXPANSION IS FEASIBLE AND WOULD ALLOW CAL-AM TO MEET MONTEREY PENINSULA'S WATER DEMAND UNTIL AT LEAST 2040

- Again, Cal-Am fails to evaluate significant new information relating to water demand in Cal-Am's service area. As the Staff Report explains: "With the currently lower baseline demand described below, the Pure Water Expansion can be expected to provide the necessary amount of water for at least 20 to 25 years without the desalination facility in place."[59]
- As the MPWMD explained, there is no deficit:



> "With PWM Expansion there is a sufficient supply for 30 years AND that does not factor in other available intermittent supplies available to Cal-Am: 700 AFY becomes available from the Seaside Basin after year 25 of their proposed in-lieu recharge program, every year the 'alternate producers' on the Seaside Basin give up their unpumped water to 'standard producers' such as Cal-Am (approx.. 200-400 AF per year), Cal-Am holds Table 13 water rights from the Carmel River in addition to the water rights in question under the CDO (another 200-400 AF per year in normal to wet years)." [60]

- As WaterDM's initial expert report concluded:

> "With the addition of the Pure Water Monterey Expansion project providing an additional 2,250 acre-feet per year of supply to Cal-Am, the combination of Cal-Am's available and projected water resources total 11,650 acre-feet of reliable supply." This is sufficient supply to meet annual demand in 2040 by more than 1,200 acre-feet.[61]

- Cal-Am will have sufficient water supplies to eliminate its illegal diversion of Carmel River water by January 1, 2022. PWM Expansion is the right sized addition to eliminate the moratorium and for Cal-Am to start paying back the Seaside Basin for its many years of overpumping native groundwater.[62]

Cal-Am Presentation Materials (Page 13)

MCWD Response:

EXPANSION PROVIDES SUFFICIENT RESERVES/BUFFER DURING DROUGHT YEARS AND CAN BE ONLINE YEARS BEFORE DESAL

- As the Staff Report concludes, taking into account growth rates during the past 20 years, including periods of drought and conservation measures: "the total portfolio with the Pure Water Expansion would supply several decades of growth."[63]

- As the Staff Report also explained, "the Cal-Am project appears to have as great or a greater risk of delay than does the Pure Water Expansion."[64]

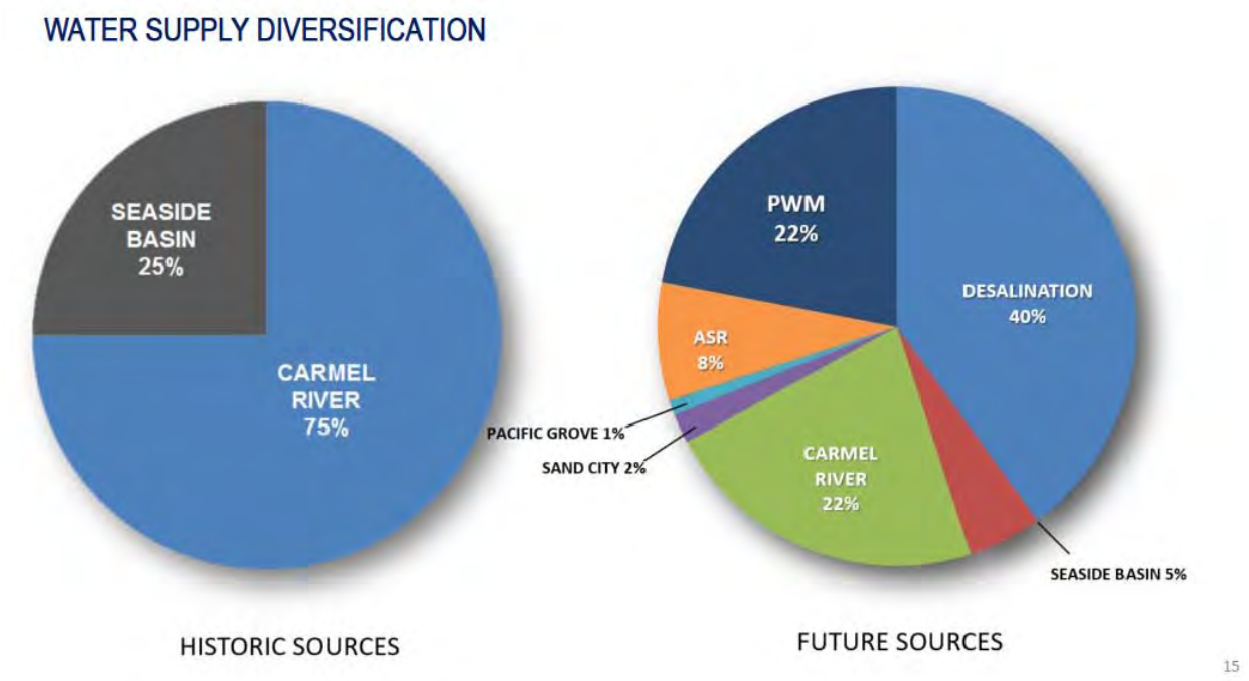
- As the MPWMD explained, "MPWMD and all community leaders are united in the pursuit of a new, permanent replacement water supply." [65]
    - PWM Expansion has been sized to meet job growth and housing needs, per Association of Monterey Bay Area Governments (AMBAG) growth projections and Regional Housing Needs Allocations (RHNA), for next three decades. [66]
    - Examples cited are misleading – e.g. hotel laundry left because it is too expensive under current water rates. It will not return under rates that are 40-55% higher as a result of the MPWSP. [67]

- WaterDM also concluded that, even without desalination or PWM Expansion, banked storage in the Seaside Basin "provides a valuable and necessary buffer for Cal-Am to use if drought or higher demand than forecasted should occur."[68]

Cal-Am Presentation Materials (Page 14)

MCWD Response:

NEW INFORMATION DEMONSTRATES THE MPWSP IS UNECESSARY AND WOULD RESULT IN SIGNIFICANT AND UNAVOIDABE IMPACTS TO COASTAL RESOURCES; EXPANSION IS THE ENVIRONMENTALLY SUPERIOR ALTERNATIVE



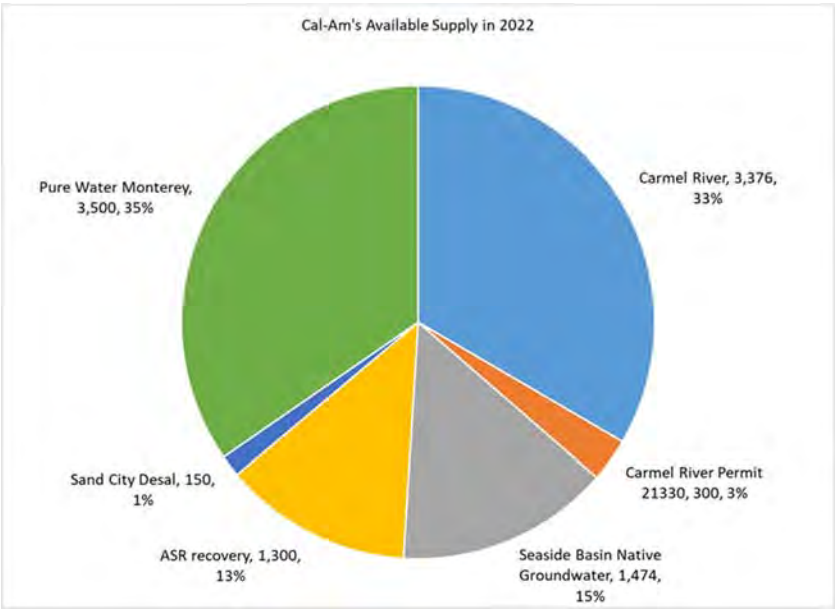
- As the Staff Report explains: PWM Expansion would "result in fewer environmental and economic burdens to the communities of concern within Cal-Am's service area, would avoid environmental burdens to the City of Marina, and appears to have fewer significant hurdles to clear before it could be implemented."[69]

- As the MPWMD explained, "PWM Expansion is the best transitional project for the future. In 30-40 years when new water supply would be needed under PWM Expansion, desalination technology will be so much better, and less expensive, that it could be considered for the next increment of supply needs." [70]

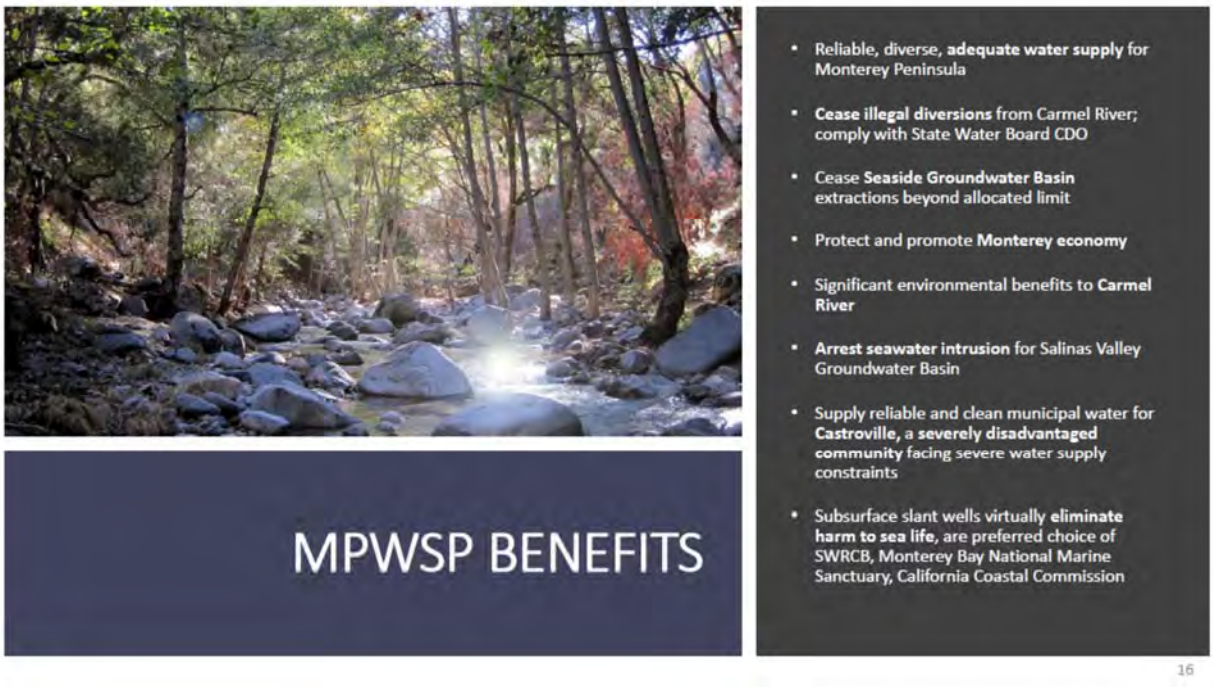
- And as the MPWMD also noted: "If there is a feasible alternative that is less environmentally degrading AND outside the Coastal Zone, why not consider it? PWM Expansion is that alternative." [71]

- The Staff Report correctly observed that the Commission "is not legally required to accept or use the CPUC's water supply and demand numbers or its environmental impact conclusions when conducting its own Coastal Act review. Rather, the Commission has the independent authority and duty to review these issues, based on current evidence, when determining whether denial of the proposed Project will harm the public welfare, whether there is a feasible alternative, and in making other Coastal Act findings."[72]

Cal-Am Presentation Materials (Page 15)



MCWD Response:

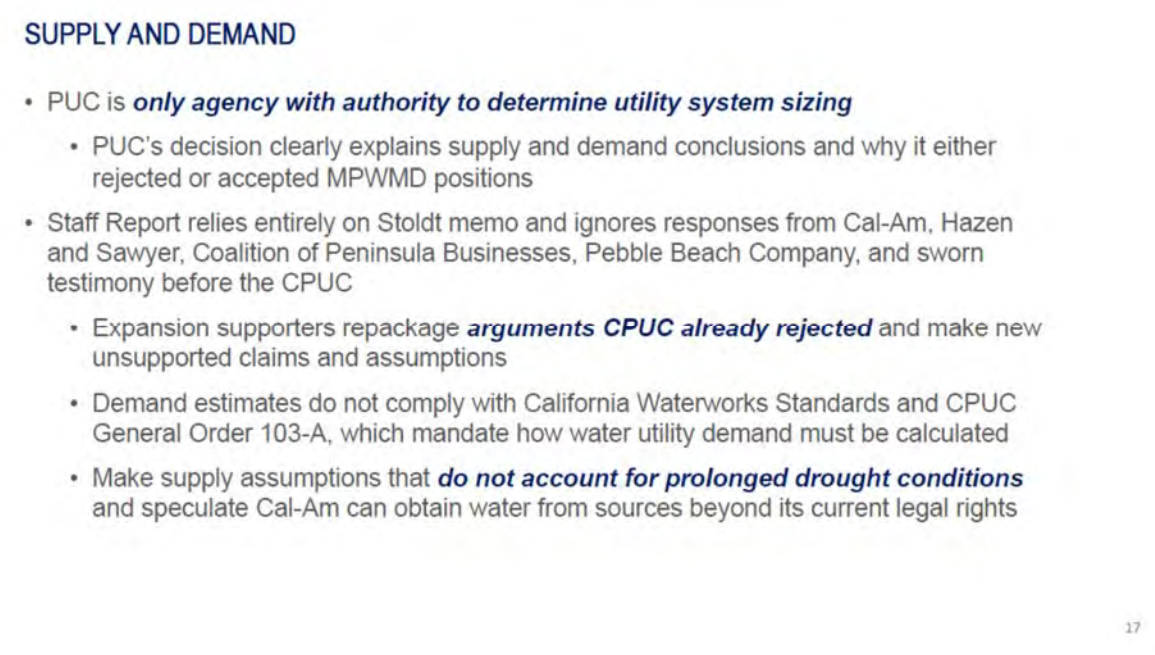


CAL-AM PRESENTLY HAS A DIVERSE, RESILIANT WATER SUPPLY PORTFOLIO

As the Staff Report recognized: "Although Cal-Am's desalination facility would provide more water than would the Pure Water Expansion, either project, when combined with Cal-Am's other available water sources, would provide more than adequate water supplies for current and expected future demands and would allow the water system to conform to the state's design and capacity requirements."[73]

- As WaterDM concluded in analyzing Cal-Am's supply portfolio as of January 2022, "Cal-Am's supply sources are already diverse – without desalination."[74]

Cal-Am Presentation Materials (Page 16)



MCWD Response:

As the Staff Report explains: "The Pure Water Expansion would [] result in fewer environmental and economic burdens to the communities of concern within Cal-Am's service area, would avoid environmental burdens to the City of Marina, and appears to have fewer significant hurdles to clear before it could be implemented."[75]

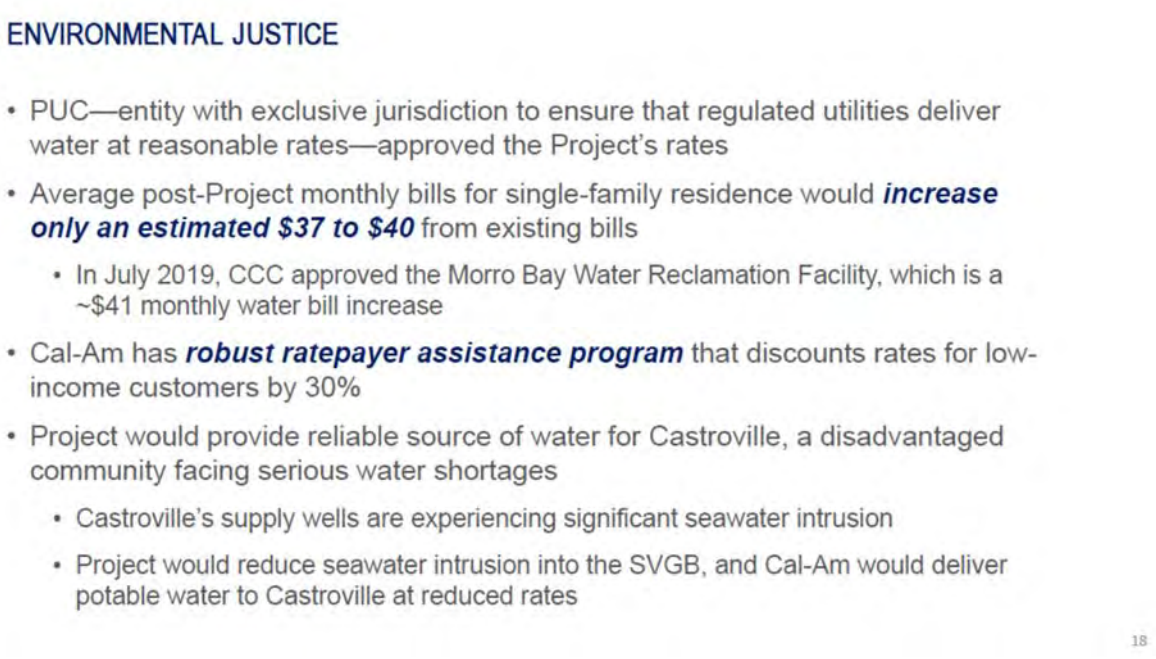
- As the MPWMD explained, "The first six of eight "benefits" are also met by PWM Expansion." [76]
- With respect to item seven on this page, the Monterey Peninsula has 3-times the number of disadvantaged community members than Castroville, per State of California
- Seaside and City of Marina, communities of color and highly disadvantaged have 7.99 times the number of residents as Castroville They are not in Cal Am's service district, they are in MCWD's and will receive NO benefits from the project
- Department of Water Resources data, shows Cal-Am is expecting to significantly subsidize water delivered to Castroville to reward them for their support. [77]
- With respect to item eight on this page, PWM Expansion obviates the need for slant wells or desalination, in general. [78]
- Castroville has 3 wells fully functioning with sufficient supply to meet all their demand. One of the three wells is approaching 400 parts per million, still well within drinking water standards, and has received approval and grant funds to drill a new deep will when needed. The Castroville area is not facing serious water shortages. There is time to deal with their issues and they are most properly mitigated and addressed via the SVBGSA GSP as the participants in that group are the ones directly responsible for any seawater intrusion issues experienced by Castroville.

Cal-Am Presentation Materials (Page 17)

MCWD Response:

COMMISION IS REQUIRED TO EVALUATE SIGNIFICANT NEW INFORMATION RELATING TO SUPPLY AND DEMAND UNDER CEQA AND THE COASTAL ACT

As the Staff Report correctly observed, the Commission "is not legally required to accept or use the CPUC's water supply and demand numbers or its environmental impact conclusions when conducting its own Coastal Act review. Rather, the Commission has the independent authority and duty to review these issues, based on current evidence, when determining whether denial of the proposed Project will harm the public welfare, whether there is a feasible alternative, and in making other Coastal Act findings."[79]



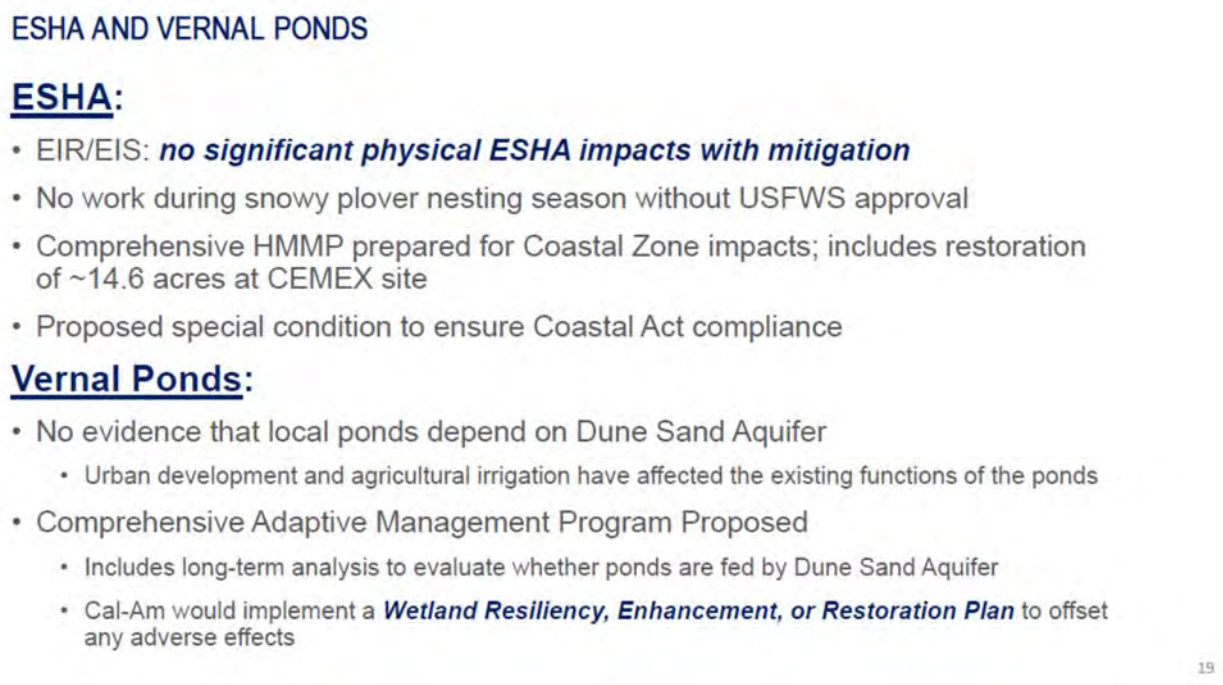
Further, as the Staff Report explains: "Cal-Am's recent testimony to the CPUC shows that it expects demand in 2020 through 2022 to remain at the low end of use – about 9,789 acre-feet per year – which results in the high demand during 2008 and 2009 of around 14,000 acre-feet being replaced by upcoming years of about 4,000 acre-feet less demand."[80]

- As the MPWMD explained, "all MPWMD planning analyses are 100% consistent with national and California waterworks standards and CPUC Orders."[81]

- WaterDM also concluded that "With or without desalination or the Expansion, Cal-Am is currently complying and can continue to comply with California Waterworks Standards and CPUC General Order 103-A."[82]

    - Further, "Cal-Am's faulty premises and errors are addressed in detail in WaterDM's April expert report (pp. 37 – 41). WaterDM's analysis adhered to all applicable codes and industry standards and practices."[83]

Cal-Am Presentation Materials (Page 18)



MCWD Response:

APPROVAL OF THE PROJECT IS NOT IN THE PUBLIC INTEREST AND WOULD CONTINUE DISCRIMINATORY LAND USE PRACTICES

- Cal-Am misleading suggests the project would result in an average of $37 increase in water bills.
  - Cal-Am's revised aspirational filing, because there is no certainty the Company will receive full State Revolving Fund loan funding it anticipates, Advice Letter 1220-A on 9/10/19, indicates a $37 - $40 impact on a base bill of approximately $67, still a 55% increase.[84]
  - And because it does not include any of the surcharges that are imposed on the rate payers as a result of all of Cal-Am's illegal actions Cal-Am's own filing, Advice Letter 1220 on 12/31/18, indicates a $55-$60 impact on a base bill of approximately $71, a 77% increase.[85]
- Cal-Am's alleged robust ratepayer assistance does not reach many renters, among other flaws.[86]
- While the project provides water to the Castroville at extremely low rates, it is at the expense of the other disadvantaged communities such as Marina and Seaside.
  - Total of Marina and Seaside residents is 53,745 or 7.99 times as many as Castroville.
  - 33% of Marinas residents have income below 200% of the federal poverty level
  - The Monterey Peninsula has 3-times the number of disadvantaged community members than Castroville, per State of California Department of Water Resources data.[87]
- CPUC listed the purposes of the project—providing water to Castroville was not one of them.[88]
- Project is designed to draw seawater into the SVGB and will destroy MCWD's ability to use the current groundwater basin to provide reasonably price water to Marina and others and will make it hard to build affordable housing in the areas that will need them the most
- As the Staff Report explains: "There is a long history of government institutions allowing unwanted industrial development to be concentrated in underserved communities of color ... ***Approving yet another would perpetuate this discriminatory land use practice in Marina***."[89]
- While slant wells have expected life of 25 years, the CPUC's approval does not expire – so this Commission's decision will have a legacy decision will affect Marina for 60 plus years, if not perpetuate discriminatory land use practices in Marina for generations to come.

Cal-Am Presentation Materials (Page 19)

MCWD Response regarding ESHA:

PROJECT DOES NOT MEET 30260 REQUIREMENTS FOR MITIGATION OF ESHA IMPACTS TO THE GREATEST EXTENT POSSIBLE

- The Project will result in significant and unavoidable impacts to ESHA. As Staff Report explains: "The Final EIR/EIS includes a number of mitigation measures meant to avoid or reduce some of these known or potential impacts to ESHA ... However, they would not result in mitigation 'to the greatest extent possible,' as required by the LCP."[90]
- Therefore, the Commission cannot make the required Section 30260 that the project is mitigated to the greatest extent feasible.
- Requiring USFWS approval to conduct work during snowy plover nesting season is not mitigation and will not result is less than significant impacts, or mitigation to the fullest extent feasible. Cal-Am's test well was constructed during snowy plover nesting season with USFWS approval.

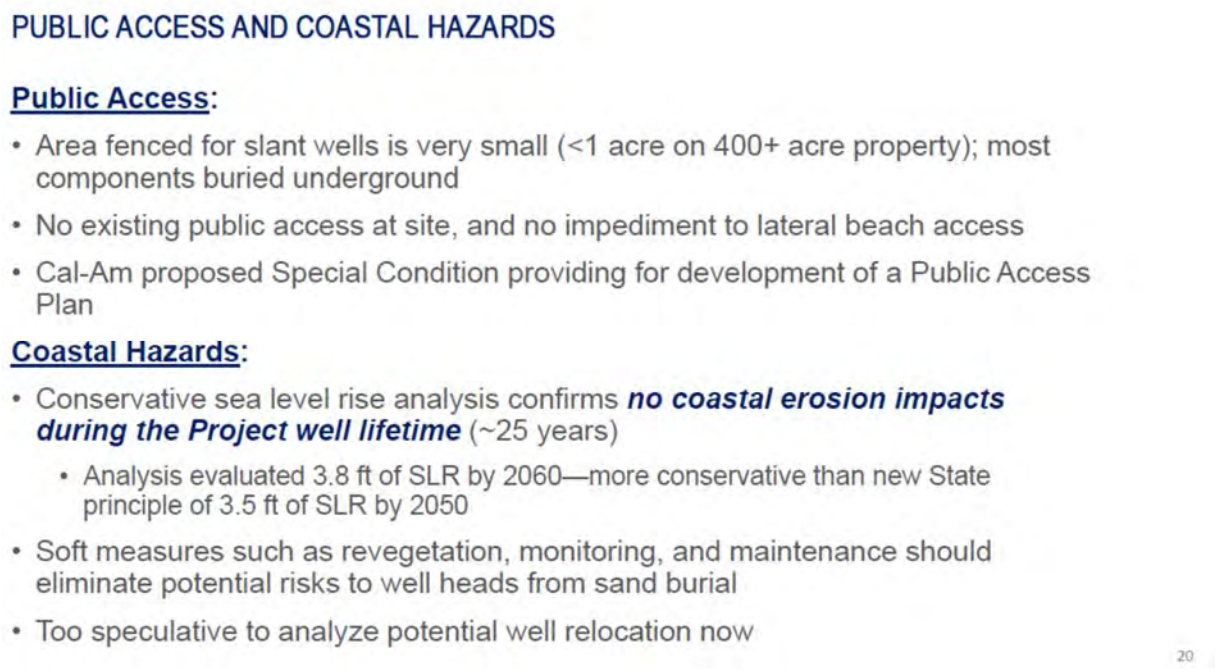
- Cal-Am proposed HMMP is not consistent with Coastal Act standards, as it:
  - Does not explain why they claim only 2.18 acres of impact when staff has stated all along it is over 35 acres[91]
  - Did not use the proper standard for what is a temporary impact.[92]
  - Did not consider the need for buffers.[93]
  - Uses land for the mitigation that is already scheduled for restoration under the CEMEX agreement- double dipping. [94]
  - Proposes to use ag run off water that has silt in it that creates the wrong type of soil and is loaded with invasive seeds and pesticides - so restoration will fail in long run. [95]
  - Does not address work on liner requires work in critical habitat during the breeding and nesting time for Western Snowy Plover. [96]

MCWD Response to Coastal Wetlands and Vernal Pools - Page 19 (Continued):

PROJECTS IMPACTS TO COASTAL WETLANDS AND VERNAL POOLS HAVE NOT BEEN ADEQUATELY EVALUATED AND CANNOT BE MITIGATED

- The best available evidence shows the existing wetland and vernal pond areas in the project area are hydrologically connected to the Dune Sand Aquifer. As the Staff Report notes:

  The GDE review described data collected … during Cal-Am's approximately two-year pump test … ***identified a relatively immediate groundwater drawdown/response of about one foot. The review also notes that the groundwater underlying these areas has variable salinity levels …, suggesting it has sources other than … precipitation. It also notes that the overlying habitat includes vegetative species that have adapted to this range of salinity variation.*** [97]



- The Commission Staff and expert hydrologists have concluded that wetland and vernal pond areas in the Project area will likely experience significant water levels declines and that brackish wetlands and vernal pools are not the result of rain or ag runoff. [98]

- Proposed adaptive management cannot work because there is no way to "manage" impacts to vernal ponds if the groundwater is removed. **Nor is there a baseline to evaluate or enforce potential mitigation as required by Coastal Act and CEQA**. As Staff Report explains:

  "… importantly, it would be difficult to monitor the actual effects the expected drawdown would have on these wetland and vernal pond areas, in part due to the complex interactions among changing groundwater elevations, different amounts of precipitation and other water sources, the presence of different species with different *responses to those changes,* ***as well as the lack of adequate reference sites or baseline data for many of these areas****. It would likewise be difficult to provide adequate mitigation for any adverse effects, in part due to the potential extent of the effects – which could cover up to several dozen acres of wetlands and vernal ponds – and also due to the difficulty in identifying sites where creating or restoring wetland or vernal ponds could be successful and would not result in the conversion of other sensitive habitats*."[99]

- Cal-Am's refusal to provide or fund the acquisition of the required information and modeling is an independent ground for denial under Coastal Commission.

Cal-Am Presentation Materials (Page 20)

PUBLIC ACCESS AND COASTAL HAZARDS

Public Access:

- Area fenced for slant wells is very small (<1 acre on 400+ acre property); most components buried underground
- No existing public access at site, and no impediment to lateral beach access
- Cal-Am proposed Special Condition providing for development of a Public Access Plan

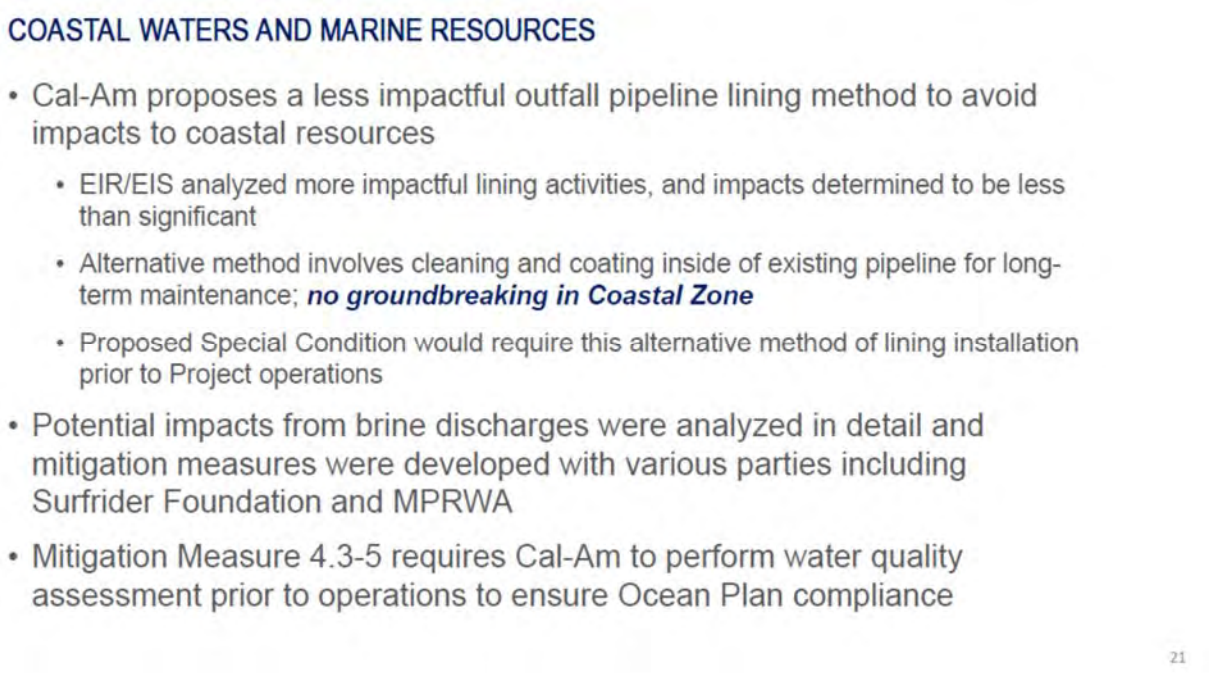
Coastal Hazards:

- Conservative sea level rise analysis confirms ***no coastal erosion impacts during the Project well lifetime*** (~25 years)
  - Analysis evaluated 3.8 ft of SLR by 2060—more conservative than new State principle of 3.5 ft of SLR by 2050
- Soft measures such as revegetation, monitoring, and maintenance should eliminate potential risks to well heads from sand burial
- Too speculative to analyze potential well relocation now

20

MCWD Response:

PROJECT'S IMPACTS TO PUBLIC ACCESS ARE NOT MITIGATED; CAL-AM'S PROPOSED MITIGATION FOR COASTAL HAZARDS RESULTS IN ADDITIONAL IMPACTS TO ESHA THAT HAVE NOT BEEN EVALUATED OR MITIGATED



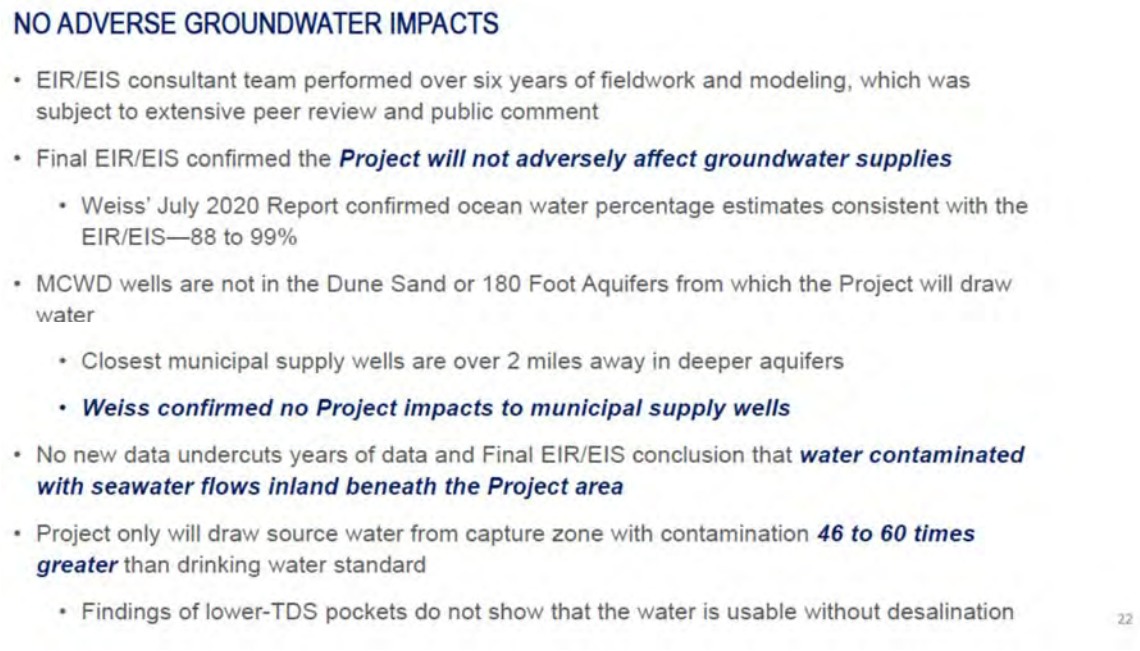
Public Access

- Cal-Am's attempts to minimize the project's public access impacts fail. As the Staff Report explains, the project "would result in temporary adverse impacts to public access and recreation during construction. It would also result in relatively modest, but by no means insignificant, ***long-term loss of public access and recreation opportunities.***"[100]
- Access in project area currently does not exist because of sand mining operations. But CEMEX settlement specifically intended for public access, which will not now take place in fenced areas.
- Wells and fencing destroy the beauty of the site for the public walking along the shoreline

Coastal Hazards

- Cal-Am's impermissibly attempts to defer analysis of relocating slant wells due to sea-level rise as will be required during the indefinite life of the project. As the Staff Report accurately explains: "the currently proposed locations are near the most inland extent of Cal-Am's easement and could not be moved out of the hazard zone unless Cal-Am was able to obtain additional legal interest for areas further inland. The terms of the above-referenced CEMEX Settlement may prevent Cal-Am from obtaining additional legal interest on the CEMEX lands… "[101]
- Cal-Am's proposed "soft measure" are entirely unrealistic. Revegetating and contouring the dunes cannot avoid the long-term effects of sea-level rise and dune recession.
- In reality, it is much more likely Cal-Am will have to use "hard measures" to avoid impacts related to coastal hazards, which will indisputably cause additional ESHA impacts that must be addressed before the project is approved under the Coastal Act.

Cal-Am Presentation Materials (Page 21)



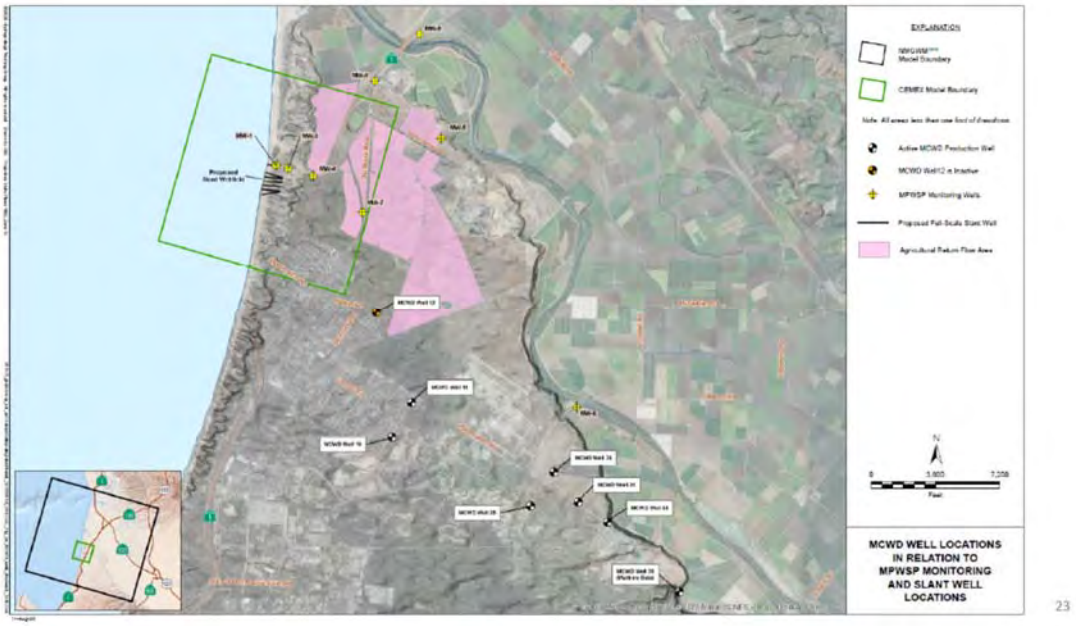
MCWD Response:

WITHOUT THIS INFORMATION REGARDING OUTFALL IMPROVEMENTS MANDATED BY CPUC –IT IS IMPOSSIBLE TO MAKE REQUIRED 30233 FINDINGS

- Cal-Am failed to provide the required information to evaluate. As Staff Report explains:

  One necessary Project component that Cal-Am did not include in its CDP application and that it has not yet fully described is an approximately two-mile long liner that must be installed within the existing ocean outfall pipeline to prevent the desalination facility discharge from corroding the outfall line ***… installation work would likely require heavy equipment on the beach and foredune area, excavation of some amount of beach and dune habitat,*** *installation of temporary fencing … and other activities* ***that would result in noise, disturbance, and occupancy of this critical habitat area during a critical time period for the species.*** *Such activities would not conform to Coastal Act Section 30240 (if the work is done in the Commission's retained jurisdiction) or LCP provisions that mirror that Section (for any work in the City's permitting jurisdiction) because they would be non-resource- dependent activity that would occur in ESHA.*[102]
- To avoid this fatal flaw, Cal-Am now suggests it has a possible new method of installation that no one has enough information about to be able to analyze or comment on. [103]
  - Cal-Am has not applied for a CDP, which is required even if this proposal works.
  - In addition, Placement of moorings requires attachment to ocean floor and is considered "fill" under section 30233. [104]
- No complete analysis of the impacts or potential mitigation has been done because there has never been a full description of the project. This is a classic case of piecemealing to avoid full project review of impacts and alternatives.
- Settlement with Surfrider Foundation addresses discharge water quality standards - not impacts outfall improvements. No analysis of impacts to marine life was ever conducted.

Cal-Am Presentation Materials (Page 22)



MCWD Response:

STAFF REPORT CORRECTLY CONCLUDES PROJECT'S IMPACTS TO GROUNDWATER HAVE NOT BEEN ADEQUATELY MODELED OR MITIGATED

- Cal-Am's claim that the project will not adversely affect groundwater ignores the Coastal Commission's independent expert's conclusions that the EIR/'s modeling was flawed and "***is not appropriate for calculating the expected effects of differences in the groundwater gradient on how the proposed project would affect the rate or volume of seawater intrusion into the aquifer or on how much fresh water the wells would extract.***" [105]
- Cal-Am falsely claims Commission's independent expert confirmed the EIR's conclusions.
  - As the Staff Report explains: "***The Commission's independent hydrogeologic review also recommended additional modeling be done to better identify how much water Cal-Am would need to return to the Basin under different conditions***."[106] Weiss expressly stated "Due to a variety of known and unknown limitations, the results should not be considered as definitive representations of past, current, or future groundwater flow." [107]
- Cal-Am's arguments that no new data shows groundwater gradients have changed is also false and in direct conflict the Commission's independent expert. [108]
- Due to lack of funding and time, Weiss did not evaluate Stanford's AEM data or water quality data collected at Fort Ord that show significant quantities of fresh water exist in the Upper 180-Foot Aquifer, which will be drawn into the slant wells as gradients decline.[109]
  - As MCWD'S experts explained, the existence of this fresh groundwater in the Upper 180-Foot Aquifer was not considered in the Weiss Report and must be evaluated to provide a meaningful understanding of the project's impacts and OWP.[110]
- The Staff Report correctly concludes that the current evidence does not support a finding that the Project is consistent with Coastal Act Section 30231's groundwater protection provision:

  "***additional modeling and analysis is needed to identify the extent of Cal-Am's likely or potential effects on possible depletion of groundwater supplies, including the effects of the expected depletion on nearby wetlands and vernal ponds***."[111]

Cal-Am Presentation Materials (Page 23)

MCWD Response:

- Cal-Am incorrectly claims that the project's capture zone is located in a coastal area of the SVGB ***already intruded with seawater*** that is not usable for human consumption or irrigation without treatment.
- As explained by MCWD's experts, the Weiss Report shows that the project's capture zone is substantially larger than what was disclosed in the FEIR.
    - Importantly, the likely capture zones identified by Weiss show that the project will impact groundwater conditions over many square miles and extract significant quantities of fresh groundwater from the basin.
    - The impact of decreasing landward gradients on the size of capture zones is illustrated on Figures on the next page sowing the difference of what the EIR predicted and what the Weiss analysis conservatively shows.

- The additional modeling and analysis necessary to allow the Commission to meaningfully consider and mitigate the project's groundwater impacts must include address the following as explained by Marina Coast's expert and others:

    (1) the importance of fresh water recharge from Dune Sand Aquifer in protecting and maintaining water quality in the Upper 180-Foot Aquifer south of the Salinas River;

    (2) the importance of this recharge to the Salinas Valley Groundwater Basin (SVGB);

    (3) water quality information from Airborne Electromagnetics (AEM) Studies and groundwater sampling at Fort Ord;

    (4) resistivity data from geophysical logs obtained at Monitoring Well MW-7;

    (5) recharge (mounding) of salt water from CEMEX operations; and,

    (6) pumping of shallow groundwater from the Dune Sand Aquifer (DSA) in the vicinity of Monitoring Well MW-4S which depresses local water levels.[112]

- In sum, additional investigation and modeling recommended in the Weiss Scope of Work and Marina Coast Water Districts' experts' comments on the Scope of Work must be completed before the public can make informed comments and before the Commission can make an informed decision on the project's impacts to groundwater and GDEs.

Cal-Am Presentation Materials (Page 24)

MCWD Response:

PROJECT IS NOT FEASIBLE AND CANNOT OBTAIN WATER RIGHTS

- This slide is a gross misrepresentation. In fact, the CPUC expressly confirmed in denying Marina Coast and the City of Marina's request for rehearing on the project that it did not adjudicate water rights and that the issue would be resolved elsewhere in the future:

> In the instant proceeding, we did not adjudicate water rights. Rather, we looked at the water rights in terms of project feasibility. We sought and received the input of the SWRCB as to whether or not it was reasonably foreseeable that Cal-Am had a path forward to perfect future water rights. [Citation.] The SWRCB confirmed attaining such water rights was possible and the issue will likely be resolved in a future body of competent jurisdiction as facts develop. [113]

- It is undisputed that Cal-Am has no existing overlying, appropriative or prescriptive groundwater right or claim of right to pump groundwater from the SVGB. It is also undisputed that the SVGB is in a state of overdraft, and therefore there is no surplus water available for or accessible to a new appropriator. These issues are now being litigated in the Monterey Superior Court.[114]
- Cal-Am also falsely claims that its project complies with SGMA stating the SVBGSA recommends installation slant wells like the MPWSP to create a seawater barrier. As MCWD's experts explain, Cal-Am mispresents the Plan's recommendations and the MPWSP slant wells are in the wrong location and aquifers to create such a barrier.
- As the Staff Report explains: "… there are also uncertainties about how Cal-Am would operate beyond the 20 to 25-year operating life of its wells, and ***whether it will be able to successfully obtain the appropriative water rights it needs to extract groundwater from the Basin. The Commission's independent hydrogeologic review also recommended additional modeling be done to better identify how much water Cal-Am would need to return to the Basin under different conditions***."[115]

ERRATA PLEASE USE THIS Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Bruce Delgado <bdelgado62@gmail.com>

Sat 9/12/2020 12:30 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CCC, The email I sent you at 457pm earlier today had an important and inaccurate error from an earlier draft. This version is the corrected version. Could you please you this instead? thank you. Bruce Delgado

Dear Chair Padilla, All Coastal Commissioners, Tom Luster, and Jack Ainsworth,

Thank you for all your hard work and accepting our comments on this complex issue which fortunately has a simple and sure solution: support the people and Monterey Bay's coastal environment and we'll all be on the right side of history with your Sept. 17 decision.

Monterey Bay Desalination Project Promotes Economic Racism

By Seaside Mayor Ian Oglesby and Marina Mayor Bruce Delgado

As two Mayors of color and whose cities would be the most adversely impacted resource-wise, economically or both, we oppose a desalination project that would impose environmental injustice and economic racism on the people of Seaside and Marina. The desalination plant being forced on the Monterey Peninsula by California American Water (Cal-Am) will be voted on Thursday, September 17 by the California Coastal Commission.

The Monterey Peninsula does not want or need this oversized, overpriced groundwater desalination plant. We have a far more cost-effective solution for our future water needs in expanding our new recycled water project – Pure Water Monterey (PWM). Initially Cal-Am's desalination plant was sold as a way to meet the State's Cease and Decease Order (CDO) to reduce our reliance on the Carmel River. But with PWM now operating and our community's heroic job of conserving water we have solved that problem. We are on track to meet the State's Cease and Desist Order by December 2021 without desalination. And expanding our Pure Water Monterey recycled project would give us all the water we need for decades of growth.

Marina and Seaside are predominantly minority and working-class communities on the Monterey Peninsula, struggling to survive in these challenging times. Many of Seaside and Marina's residents live below the poverty line. We are proud of our diversity (in Marina 52 languages/dialects spoken by our familie) and ashamed some of our state agency representatives seem to look beyond which is the environmentally just side of this history and show most deference to power and money that would trample our community values and needs.

Cal-Am's groundwater desalination plant would cause great financial and environmental harm to our communities. Its $1.2 billion price tag dwarfs the alternative $200 million cost for expanding our existing Pure Water Monterey recycled water plant. This is outrageous given Cal-Am customers already have the highest water costs in the nation.

Our concern is that aggressive political lobbying by the profit seeking Cal-Am could lead to this desal project's approval and devastation for our communities.

Environmentally the plant would be a massive energy hog and worsen climate change. It would emit 8,000 metric tons of CO2, making it the largest emitter of greenhouse gases on the Central Coast. The desalination project's extraction wells, electrical supply buildings, and access roads, would dominate over 30 acres of Marina's beautiful coastal sand dunes, which provide environmentally sensitive habitat to several species. Perimeter fences would prohibit access to our community's beaches.

CalAm's groundwater extraction wells would remove the freshwater above the 400-foot aquifer that provides drinking water for Marina. Seawater would replace the groundwater and increase the risk of seawater intrusion into the 400-foot aquifer.

We agree with the Coastal Commission Staff Recommendation that this project should be denied, in part because there is a better solution to our water supply shortage that is affordable, socially just and environmentally responsible.

But this is where money and greed come in. Cal-Am cannot profit from expanding the Pure Water Monterey recycled water project, and stands to make over $100 million in profit from the desalination plant.

Cal-Am has employed an aggressive lobbying strategy and in a playbook reminiscent of the British Empire, tried to divide and conquer our region by promising subsidized desalinated water to some at the expense of others. Meanwhile they continue to repeat the lie that the desalination plant is the only solution to our future water needs.

We urge the Newsom Administration to see through this smokescreen and stand up for environmental and economic justice. We are honored to stand with over 25 local elected officials, Assembly member Mark Stone, and Senator Bill Monning to oppose this desalination project.

Now we need the California Coastal Commission to say yes to recycled water and conservation and no to a greedy company bent on profit over people and our environ

Thank you for all you do and we look forward to your Sept. 17, 2020, decision.

Appeal No. A-3-MRA-19-0034 (California American Water Company, et. al., Monterey Co.): Deny CalAm Desalination Project Permit

Laura Hoover <laura_c_hoover@yahoo.com>

Fri 9/11/2020 11:54 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear California Coastal Commissioners, Executive Director John Ainsworth, and Staff,

I am a Marina resident, and I am so grateful for our wild and beautiful beaches which stretch for miles. The snowy plover needs open space to survive, and Marina offers one of the last bastions of protected habitat.

I understand that Cal Am desperately wants this desalination project because they would build it (as opposed to a public agency) and profit from the construction at the expense of local Marina residents and without regard for the welfare of our community. The proposed project and slant wells would cause serious harm to our environment and our community.

Please come visit and see for yourself what a special place we (and the snowy plovers) call home. Thank you for your help with protecting our beautiful beaches and community.

Please deny this harmful project. Thank you!

Sincerely,
Laura Hoover

Citizens for Just Water
13809 Sherman Blvd.
Marina, California 93933

California Coastal Commission
455 Market St Suite 300
San Francisco, CA 94105

Dear Chair Padilla and Coastal Commissioners, John Ainsworth,Tom Luster, Alison Dettmer, and Staff:

Our grassroots organization holds mostly residents of Marina and Ord Communities, members of the Marina Coast Water District (MCWD).

As we have communicated with the Commission on several occasions, and at many locations up and down the state over the last few years, we are against the placement of 6 additional slant wells at the Cemex dunes and beach, and against the construction and operation of an inland desalination facility where the water would be treated.

This project has many flaws, most addressed in the CCC Staff Report, including:

-Damage to the coastal dunes and ESHA.

-Taking of large volumes of groundwater by Cal-Am, for which it has no water rights, beyond the 500 AFY that the Cemex easement may offer it. Unknown ability of CalAm to ever get "appropriative rights" once it has been allowed to start pumping from multiple slant wells.

-Initial and ongoing upheaval to Marina, a disadvantaged community, and one which gets no benefits - not a single drop of desalinated water- only harm, from having this unwelcome project possibly forced upon it.

-Already having caused significant direct harm to Marina and MCWD due to the many resources spent fending off Cal-Am. The City of Marina has already spent at least $3.5 Million...money and focus that could have been utilized for many other civic investments, such as infrastructure maintenance, a new fire truck, the Senior Center, etc.

-IMMEASURABLE negative impacts caused by the interruption of the plan to hand over the Cemex property for recreational and conservation purposes in perpetuity, resulting from the 2017 agreement between the Coastal Commission, State Lands Commission and Cemex to wind down sandmining operations on this 400 acre site.

How could we ever know what might have been, in terms of a glorious handover of this property, to be healed from the scars of sandmining and reopened as a restored and natural beach environment, accessible to the public, if it is allowed to go straight from one industrial use to another?

The Staff Report calls out the fact that this project "involves the most significant environmental justice concerns the Commission has considered since it adopted an Environmental Justice Policy in 2019."

pages 8-9:

"Environmental Justice Staff also conducted an in-depth environmental justice analysis and identified several communities of concern that would be affected by Cal-Am's proposed Project – Marina, Seaside, Sand City and Castroville. Overall, the analysis showed that there would be greater and more serious environmental justice issues arising from Cal-Am's Project than from the alternative Pure Water Expansion. Cal-Am's proposed Project would be sited in part within the community of Marina, which is not in Cal-Am's service area but would be burdened with the adverse coastal resource impacts as discussed above and receive none of the Project benefits. Marina is already disproportionately affected by several other industrial uses, including a regional landfill, regional composting facility, regional sewage plant, a municipal airport, a contaminated site listed on the U.S. EPA's national priorities list, and the CEMEX sand mining facility, now scheduled to close. Additionally, water from Cal-Am's desalination facility is expected to cost two to three times as much as the recycled water from the Pure Water Expansion. ....

Water from CalAm's proposed Project could significantly raise water rates for low-income ratepayers in Seaside and other low-income ratepayers throughout the service area, who worry that the cost of water could eventually push them out of their moderately priced coastal communities.."

We deeply appreciate the staff's efforts to do a comprehensive Environmental Justice assessment. We agree with the conclusion that Expansion of Pure Water Monterey is a more environmentally just solution than the coastal slant well desal project.

Water needs in the Monterey region will continue to be a challenge, as is true in much of California, and the world. We believe that whatever solutions are pursued are best approached as a regional solution, as opposed to one for-profit company setting up a solution that benefits part of the region at a cost paid by another. The feasible alternative, Pure Water Monterey, is a regional solution, and we believe warrants Cal-Am's support as an additional water supply.

Thank you, as always, for your efforts to do right by the people of California and the beautiful coastline we are so fortunate to have and cherish.

Sincerely,

Therese Kollerer

Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Eessa Vanderspek <evanderspek@csumb.edu>

Fri 9/11/2020 11:52 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Eessa Vanderspek. I have been a Marina resident for the past few years after moving here to attend CSU Monterey Bay.

In my "Water Law" class we learned about the many different methods that cities in the United States do to get their water. I was proud to be a part of Marina and the sustainable methods that are being studied to reuse water as a water source. This method has seen a rise in cities across California, including Berkley and Orange County. It saddens me to hear about a CalAm desalination plant that is being considered despite our community's efforts in reaching sustainable water collection practices. A CalAm desalination plant in this area would not benefit Marina citizens since we would not receive a single drop of the water collected. It would also harm our own groundwater in the process with salt water intrusion and destroy habitat for a wide array of endemic native species, including the snowy plover, leggless lizard,and the Smith's Blue Butterfly.

According to the Orange County website: "Reused water is water used more than once or recycled. It happens daily on rivers and other bodies of water. If you live in a community downstream of another, chances are you are reusing its water, and likewise, communities downstream of you are most likely reusing your water. Scientifically-proven advances in water technology have allowed OCWD to reuse water for many different purposes, including industrial, irrigation and drinking."

Our city has already come up with a plan for sustainable water collection and usage to preserve our natural landscape and benefit our community. CalAm has had since 1995

to come up with a sustainable water source from the Carmel River. Do not let their procrastination and misuse of time cause irreversible damage to our home.

Please deny this slant well project!

Thank you,

Eessa Vanderspek
Marina resident

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

To whom it may concern:

Michele Altman

– Cal Am's Desal project is not in the public interest
– Pure Water Monterey Expansion is the feasible and environmentally preferable alternative
– It will give us a new water supply much sooner than desal
– Our current water supply from Pure Water Monterey – Phase 1 (3,500 acre-feet) will allow us to stop illegal withdrawals from the Carmel River by December 2021.
– Our current water supply will restore the Carmel River and protect the Steelhead. The environmental issues facing the Carmel River have been resolved by Pure Water Monterey without the need for Cal Am's desal or the PWM Expansion.
– There is no Carmel River crisis
– We don't need Cal Am's oversized, over priced desal project to solve our problems
– The Expansion of Pure Water Monterey will provide a long-term sustainable water supply for decades of growth. It will support affordable housing and economic recovery and avoid environmental damage and environmental injustice to Marina.
– No Affordable housing without affordable water. Cal Am's desal would double our water bills.
– Cal Am is the only obstacle to the expansion of Pure Water Monterey.
– Desal damages the environment, costs too much and creates environmental injustice
– Desal harms the coastal habitat and Marina's beautiful dunes
– Desal has no legal source water, it would draw groundwater from an overdrafted groundwater basin NOT under the ocean
– PWM Expansion source water is primarily the 8,000 acre-feet of excess wastewater that is now discharged into the Bay. It is contractually secure and drought proof
– Orange County has used this same system for decades
– Cal Am has had 25 years to solve or water supply problem
– Our public agencies have solved it in the last 6 years. Now all the water we need for decades is available, but Cal Am is blocking it

SIERRA CLUB
FOUNDED 1892

VENTANA CHAPTER
FOUNDED 1963

California Coastal Commission
455 Market Street, Suite 300
San Francisco, CA 94105

Re: Appeal No. A-3-MRA-19-0034; Deny California American Desalination Project Permit

September 9, 2020

Dear Commission Chair Steve Padilla and Commission Board,

The Sierra Club has long had a position that projects which impact the environment should be either denied or if not, then their impacts should be reduced to minimize those impacts. It has also had the position that when such projects are approved they should not be systematically placed only in communities of color and disadvantaged communities. All must share the pain associated with these projects.

For too long our society has engaged in systemic racial prejudice that manifests itself in many ways, one of which is to place these unwanted facilities in disadvantaged communities. This has the effect of sparing the financially well off, mostly white communities, from having to bear the effects of these projects. A prime example of this is the City of Marina which has had to bear the brunt of almost all of these projects that benefit the Monterey Peninsula- a landfill, a wastewater treatment facility, a regional composting facility, an anaerobic digester facility and a sand mining operation that provides sand, gravel and cement for regional development. Marina also suffers from the adverse effects of leftover munitions and toxins from Fort Ord, a long established military installation that closed in 1994. The residents, the City of Marina, the State Lands Commission and the California Coastal Commission (CCC) finally got together and worked hard to phase out closure of the Cemex sand mining plant.

The signed Cemex Settlement agreement will now return those beaches and sensitive habitats to the people for use as public access, low impact recreation and environmental protection. This was finally going to be a place where the residents of Marina and the Ord communities could go freely to relax and enjoy the open spaces and coastal vistas within walking distance. It is a historical truth that coastal communities have displaced persons of color and predominantly reflect wealthy, white populations.

Marina formally adopted the Western Snowy Plover as their City shorebird because it symbolizes the environment and the need for protected places to be able to exist. * If the Cal Am desalination project is allowed to be built, this pristine and rare ecosystem will be lost. Public access will be impacted, recreational opportunity diminished and the beauty and potential views of restful open space and solitude will be lost for future generations. The six well head cement pads will not be visible from the beach, but they sit just over the first dune ridge. The size of each well pad will be between 5,250-6,025 sq feet with fencing installed around each, running parallel to the beach. Walking from the main Cemex site to the beach will be met with this eyesore of industrial development, interrupting and marring the beauty of this natural place. Marina did not ask for this CalAm development nor approve any part of it, yet this is what Marina is expected to accept.

In the current climate of our country, environmental injustice has taken on a more timely and critical priority, as we have finally taken steps to recognize the racial injustices that continue to be perpetrated upon those who cannot speak for themselves. We applaud the CCC staff report for espousing a firm position on this issue of environmental justice. Sierra Club urges all Commissioners to exercise your right to support the community of Marina by your vote. Marina is 66% non-white or mixed race with 33% of the residents with income below 200% of the federal poverty level. The project can only be approved under Section 30260 which means that you must determine whether the project is in the public interest. The only beneficiaries from this project will be Cal Am's stockholders, certainly not the people of Marina or the other disadvantaged communities on the Peninsula. With the additional Covid-19 crisis, many in Marina are struggling to maintain and keep their own homes or pay their rents in the midst of job loss, reduced household incomes, health issues without insurance and more.

You now have the ability to right the wrongs of the past, or to continue to do what has always been the practice of allowing the rich and powerful to place unwanted industrial facilities in disadvantaged communities of color. We urge you to deny this ill advised project.

Thank you for consideration of our request.

Sincerely,

Joel Weinstein

Deny Cal-Am's Desal Project - Items Th3a/Th4a

Catherine Crockett <cm_crockett@sbcglobal.net>

Fri 9/11/2020 11:29 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Chair Dayna Bochco and Coastal Commissioners:

I write in support of the Coastal Commission Staff recommendation to deny California American (Cal Am) a permit to construct and operate a desalination facility. As a resident of Seaside, I am concerned about the prospect of increased water rates imposed on our lower-middle income population. A 2019 report by the Monterey Peninsula Water Management District found that costs associated with Cal Am's desalination project could nearly double the average residential ratepayer's water bill by 2023. While Cal Am seeks to supply Castroville customers with water at inexpensive rates, it would be at the expense of Marina, whose residents will bear the brunt of environmental and economic hardships under the conditions of Cal Am's water supply project. Furthermore, the impacts of increased water rates would impact significantly more ratepayers in the financially disadvantaged city of Seaside than in Castroville.

To allow Cal Am to move forward with a project laden with adverse environmental justice impacts and the potential to exact serious damage to our coastal environment seems imprudent when a viable and more cost-efficient alternative exists. According to the Coastal Commission Staff's analysis, the Pure Water Expansion water recycling and aquifer storage/recovery project provides adequate water supplies, with fewer environmental and economic burdens on our disadvantaged communities.

Please vote to deny Cal Am's permit on September 17th at the Coastal Commission Special Meeting.

Sincerely,

Catherine Crockett
Seaside, CA 93955

September 11, 2020

CA Coastal Commissioners,

CAL EPA needs to update their information on our local situation with the Carmel River.
No new water supply is needed to stop illegal withdrawals from the Carmel River. The Peninsula's current water supply, now expanded by Pure Water Monterey – Phase 1, will restore the River and protect Steelhead and other species. Neither Cal Am's desal, nor the PWM Expansion are needed to accomplish this.

The numbers below from Cal Am and the Monterey Peninsula Water District (MPWMD) show that the water from the Pure Water Monterey project now in operation is sufficient to stop illegal withdrawals from the Carmel River by December 2021. I'm sure Cal Am will not be pointing this out.

Due to the community's conservation efforts, Cal Am's Carmel River withdrawals have dropped to a five year average of 6,314 AF. Its legal river draw of 3,376 AF plus the 3,500 AF from Pure Water Monterey, now in operation, will put Cal Am well within its legal draw from the River by December 2021 without any new water supply.

3,376 AF	Cal Am's Legal Carmel River Entitlement
+3,500 AF	Pure Water Monterey – Phase 1 now in operation
6,876 AF	
-6,314 AF	Cal Am's Average Diversion from Carmel River last 5 years
562 AF	Surplus as of December 2021

We are approaching balance with our current demand of 9,825 acre-feet and our available supply. But a new water supply is needed for growth and to legally lift the SWRCB CDO and the CPUC moratorium, NOT to restore the River and its ecosystem. Pure Water Monterey – Phase 1 will do that.

It should be pointed out that Cal Am played no part in solving this decades long problem on the Carmel River. It contributed nothing and will not profit from this solution. The problem has been solved by our public agencies, Monterey One Water and the Monterey Peninsula Water Management District and the Marina

Coast Water District, along with the amazing conservation efforts of our community.

Please deny the Cal-Am Desal Project permit

Kyle W-M <25kylworc@gmail.com>

Fri 9/11/2020 11:13 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear commissioners,

As a monterey resident I'm urging you to NOT approve California American Water's permit to install a de-sal water plant near mariana.

While de-sal sounds good, it has both short term and long term downsides that significantly outweigh the benefits compared to alternatives like the Pure Water Monterey Expansion. The biggest issue with de-sal is the cost, both in construction and energy consumption, which will get passed down to all customers like myself as well as low income communities & businesses. Alternatives like Pure Water Monterey are much better because they can fulfill Monterey area water needs without the high cost & while being more environmentally friendly because they recycle the excess wastewater without using the vast amounts of energy de-sal requires. Pure Water Monterey then is much more cost effective & gets us to a stable water supply much quicker than Cal Am's proposal. Especially in this time we need to be looking at solutions that keep costs down and prioritize community & economic recovery. Pure Water Monterey does that, desal does not. Finally the Coastal Commission staff report also recommended denying the permits.

Thank you,
- Kyle Worcester-Moore

Deny Cal-Am's Desal Project - Items Th3a/Th4a

Steve Moore <geekyseabeast@gmail.com>

Fri 9/11/2020 11:10 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>; Materials <materials@coastal.ca.gov>

Dear Chair Padilla and Coastal Commissioners,

As a current resident of Monterey, CA, and a former long-time resident of Marina, CA, I am deeply concerned about Cal-Am's plans to develop a desal plant in Marina to supply additional water to the Monterey Peninsula. I have read your staff report about Cal-Am's permit application (#9-19-0198) and related appeal (#A-3-MRA-19-0034) to construct and operate a slant well field near the existing CEMEX sand plant in Marina. I appreciate the staff's thorough and objective analysis of the situation, and I strongly agree with the staff recommendation that the Cal-Am permit application be **denied**.

Cal-Am has been illegally withdrawing water from the Carmel River for many years. The State Water Resources Control Board has issued a Cease-and-Desist order (CDO) requiring an alternative water source by Dec 31, 2021, which is less than 16 months from now.

Cal-Am has proposed a new desal plant to be located in Marina, with slant wells and some associated piping located within the Coastal Zone, as a way of addressing this need for additional water. As documented in the staff report, Cal-Am's proposed desal plant is neither necessary nor realistic and is most likely inconsistent with Coastal Act and Local ESHA policies.

There is a feasible (and preferable) alternative that can meet projected water needs. As detailed in the staff report, modest expansion of the existing Pure Water Monterey wastewater recycling facility (from a capacity of 3,500 AFY to 5,750 AFY) would provide enough water for current and anticipated water needs for at least the next 30 years, and it would do so with much lower costs (both short-term and long-term), lower environmental impacts, greater security in the face of future droughts, fewer social justice issues, and fewer technical and legal hurdles than Cal-Am's proposed desal plant. Moreover, the expansion is relatively straightforward and could be implemented by the Dec 31, 2021 CDO deadline. In contrast, the Cal-Am proposal faces numerous and substantial technical, legal, and social obstacles that will undoubtedly prevent the desal plant from coming online and delivering the required water by Dec 31, 2021.

In addition, it appears that the coastal environmental impacts of the proposed desal plant, including potential adverse impacts to coastal wetlands (e.g. vernal pools), impacts to sensitive coastal dune species and habitats, and fill that would be placed in coastal ocean waters are inconsistent with Coastal Act and Local ESHA policies, particularly given the existence of a viable alternative that does not have such adverse impacts.

Therefore, I respectfully urge you to follow the carefully considered recommendation of the staff report and decline Cal-Am's appeal regarding application (No. 9-19-0918)

Sincerely,
Steven W. Moore

Deny Cal Am's Desal Project

Melissa Kelly <melissamegankelly@gmail.com>

Fri 9/11/2020 11:09 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

To Whom it May Concern:

My name is Melissa Kelly. I am a resident of Seaside, California. I run a non-profit organization in Monterey County and work/volunteer for several other non-profits in the area. I love the Monterey County community & dedicate my career to preserving our beautiful home.

It is in the public's best interest to deny Cal Am's Desal project. It is obvious Cal-Am is not looking out for the best interest of our community. If they were, they would be fully in support of the Pure Water Monterey Expansion which has already been proven to be a feasible and environmentally preferable alternative by the California Coastal Commission Staff. The fact that Cal-Am is still fighting to build the desal plant should be alarming to everyone.

Based on the California Coastal Commission Staff Report, there are numerous social and environmental issues with the desal plant. Issues range from doubling residents water bills, harming local coastal habitats & sand dunes, and no legal water source with the likelihood of lawsuits. The report concludes that the desal plant does not align with the Coastal Act and LCP policies and is not in the best interest of the public.

The Expansion of Pure Water Monterey will provide long-term sustainable water supply for decades while avoiding environmental damage and social injustices to the community. The environmental issues facing the Carmel River can be resolved and the river can be restored by the Pure Water Monterey Expansion. The only problem with the Pure Water Monterey Expansion is that Cal-Am has tried to stop them every chance possible.

Cal-Am has made a mess of our water supply including draining the Carmel River. They have had 25 years to resolve it & they are just now getting starting on a desal plant one year before the deadline. Cal-Am is irresponsible & should not be given the opportunity to make a mess out of the beautiful dunes of Marina. Cal-Am's motives are questionable and they cannot be trusted. The Passing of Measure J was the community's statement.

Thanks to our public agencies, the water shortage issue has been solved in the last 6 years. All the water we need for decades is available. What has Cal-Am solved in the last six years? Or the last 25 years?

Support the community by denying Cal-Am the desal plant. The facts are in and it is the next logical step. We don't need Cal-Am's oversized, overpriced desal project to solve our problems.

Thank you for your time.

Sincerely,

Melissa Kely

Denial of proposed CalAm Project

Demetrio Pruneda <dvptoro@yahoo.com>

Fri 9/11/2020 11:04 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>; Materials <materials@coastal.ca.gov>; Gary Karnes <gary.karnes@comcast.net>; Karen Araujo <karaujo93901@gmail.com>

To whom it may concern

Hi,

Our names are Demetrio and Sally Pruneda. We are retired teachers and community activists in Monterey County. We have been actively involved in the protection of our water and environment in Monterey County for 20 years.

We are advising you to stop your proposed water project in Monterey County.

The Coastal Commission finds your proposed development is inconsistent with various applicable policies of the certified LCP and Coastal Act, and is denied on that basis. As an additional and independent basis for denial, the Commission denies the proposed Project under CEQA in order to avoid the environment effects that Cal-Am's Project would have within the coastal zone, including the effects to environmentally sensitive habitat and the other impacts described in this report.

Sincerely,

Demetrio\Sally Pruneda

Ref: Appeal No. A-3-MRA-19-0034 (California American Water Company, et. al., Monterey Co.) and Application No. 9-19-0918 (California American Water Co., Seaside, Monterey Co.)

Alastair Rodd <arodd_ht@yahoo.com>

Fri 9/11/2020 10:48 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear California Coastal Commission Members:

I am a 20-year Marina resident and I write requesting that you collectively **reject** the Appeal and Application to construct and operate a slant well field, associated water transmission pipelines and related infrastructure within the coastal zone to support a proposed desalination facility located inland of the coastal zone.

In support of my request, I cite the following reasons:

1. Marina residents fought hard to end the industrial exploitation of coastal resources by the CEMEX sand-mining facility. We do not want to see one industrial development replaced by another. That land can be better used as a coastal habitat and for public access (which is one area the Coastal Commission is expected to protect).

2. Linked to the above, the City of Marina residents, representing the 8th most racially diverse town of its size in the United States, are tired of being treated as the dumping ground for our wealthier, whiter neighboring towns on the Peninsula. We are treated as a dormitory community that supplies the cheap labor for Monterey's tourist industry; we were selected as the site to receive the Monterey Peninsula's waste; we receive the Peninsula's sewage waste; we will *not* accept to be the industrial site for the Peninsula's water needs. If CalAm wants to defile the coast, there are plenty of locations between the Carmel River, Pebble Beach coastline, and through to Seaside that could host an industrial complex of this size - why try and force this on Marina. In this era of social justice, we I would expect the Coastal Commission to put on their "anti-racist" glasses and protect the rights of the less privileged and minorities of Marina.

3. The water to be supplied by the desalination plant will supply the Monterey Peninsula, not the residents of Marina. Why? Because we already have our own water supply. If the Commission approves this application, research by experts at Stanford University shows that it would tap into Marina groundwater aquifers and as the water is pumped from the targeted aquifers it will lead to increased seawater intrusion and further contaminate the groundwater supply. Is that environmental justice? Directly linked to this, in 1996, the City of Marina sought to protect the groundwater aquifer and entered into a legally binding agreement with CEMEX that prohibited exporting any of the extracted groundwater to users outside the Basin. Cal Am's planned use of the CEMEX property directly violates both the limitations of groundwater extraction, and the absolute prohibition on exported extracting groundwater to users outside the Basin. As tenants, Cal Am has deliberately broken this agreement and forced the City of Marina into spending over $3 million on law suits, money that could have been used to support our youth, our elderly, provide support in the time of Covid-19. Is that environmental justice?

4. CalAm, already charging one of the highest water rates in the whole of the United States, intends to actually increase the price of water charged to its customers on the Peninsula when the desalination plant becomes operational. CalAm has offered lower prices to the community of Castroville, but not to the community of Seaside, another community of color. Castroville aquifers are no longer usable because years of over-pumping the Salinas valley Groundwater Basin to benefit the agricultural industry has led to saltwater intrusion - the very factor Marina has fought to avoid. Pitting one poor community against another poor community while the wealthy profit. Is that environmental justice?

4. Finally, there is a viable alternative to the proposed application cited above in the form of Pure Water Monterey Expansion. I cite the **Commission staff's own report (P3)**: " Pure Water Expansion would result in fewer environmental and economic burdens to the communities of concern within Cal-Am's service area, would avoid environmental burdens to the City of Marina, and appears to have fewer significant hurdles to clear before it could be implemented."

Based on these reasons, I ask once again that you, the Coastal Commission, reject the appeal and the new application based on the fact that it violates a plethora of environmental justice factors and there is a viable alternative with significantly less environmental or social justice impact.

Yours Sincerely

Alastair Rodd

Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit.

M. SO <sonomacountycool@gmail.com>

Fri 9/11/2020 10:45 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

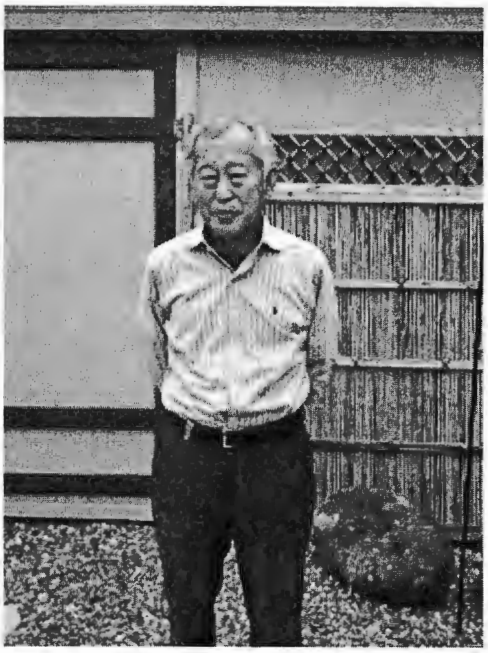
Greetings! My name is Maggie Stader; I am a brand new resident of Marina. I relocated here just two weeks ago; following a whim that brewed from the depths of my soul - a calling to be near the ocean and to be a steward to this land. I am a young student, artist, and yogi who wants to speak for Mother Earth in order to protect our life here in the habitable zone. I am completing my transfer degree requirements from Santa Rosa Junior College and am hoping to become a CSUMB student in Fall 2021. I am looking forward to making Marina and Monterey County my home and becoming part of the community here.

Upon learning about the proposed CalAm slant well project from the Citizens for Just Water at the Marina Farmer's Market - I was truly shocked that this harmful project was being considered. We are so lucky to be living in a habitable zone, on a life giving planet - at the shores of the Monterey Bay National Marine Sanctuary - how can we not be tasked with the honor and responsibility to protect it all? Now is an important time to slow down - consider our impact and role on this coast and on this planet. Hastiness can only spell further destruction and future problems to our survival. I urge you to make a choice to defend the oceans and the shores; to stand and protect the animals who cannot speak but to peep their songs in the dune; hoping to survive another generation.

The value this land holds as a refuge, a natural wonder, and a place to keep safe for citizens and visitors simply cannot be numbered. Please let's stand together and think of a new path forward in love and stewardship.

Please deny this harmful project. Thank you.

Namaste,



Maggie A. Stader
Marina, CA 93933

Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit.

Katherine Biala <kybiala@icloud.com>

Fri 9/11/2020 10:06 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Kyung Ho Min. I know many Koreans who live in Marina because I am a small business owner here. I speak Korean and my English is not my first language, but I want you to know that I do not want CalAm to come to Marina. They will steal our water and make our water bad so that they can take over Marina later. Right now our water rates are low but we cannot pay for expensive water in the future.

We want our beautiful beaches to not be harmed by CalAm. Marina wants what everyone else wants but CalAm will destroy our happy future!

Do not approve this CalAm project, please.

Sincerely,
Mr. Kyung Ho Min

Dear Commissioners:

The Monterey Bay Chapter of the California Native Plant Society supports the Coastal Commission Staff Report recommending the denial of California American Water's Coastal Development Permit for its desalination project. Protection and restoration of the dune ecosystem and its special status plants that would be impacted by construction and operation of this project have long been a focus of the Chapter. We concur with the Staff Report that the mitigations fall short of what is needed to adequately compensate for the project's disturbance.

An additional concern is new evidence of possible impact to area vernal pools and native plants associated with them. We concur with the Staff Report that further analysis of this potential groundwater impact is needed before approval of the permit can be considered.

Sincerely,
Donna Burych, Conservation Chair

Attn: Tom Luster

Re: Application No. 9-19-0918, Appeal No. A-3-MRA-19-0034 (California American Water Co., Marina)

Dear Chair Padilla and Commissioners:

In the face of the raging fires and the devasating impact of COVID-19, your focus on the other critical issue facing Monterey County is so appreciated. We have many challenges in our state right now which makes the work you are doing even more important. And the outcome of your deliberations today will have as severe an impact on the residents of our county as these other incredible problems are having.

Access to safe and affordable water is the most important issue facing our community. New water supplies are needed if we want to be able to thrive. Workforce housing, economic development, business expansion and human commodity rely on a sustainable and affordable source of water.

The primary reason for this desalination project, however, is to end Cal-Am's illegal diversions on the Carmel River and to reduce pumping in the Seaside Groundwater Basin as mandated in its adjudication decision. I take the State Water Resources Control Board Cease and Desist Order very seriously, as it would have dramatic consequences for our residents and our economy. Without a replacement water supply, the health of the Carmel River and the species that depend on it will continue to be endangered, and the Seaside Groundwater Basin could be at risk of seawater intrusion.

While the desalination project has been planned mostly for Cal-Am's service area, it would impact the neighboring Marina community. Implementation of a desalination project should not be done to their detriment. I appreciate the Coastal Commission's environmental justice analysis and the consideration for communities of concern in Marina, Seaside and Castroville.

As the District 5 Monterey County Supervisor, residents in my district will carry most of the costly burden of this project, so I am especially vested in the outcome of your decision. The CCC staff's reasoning in recommending denial of the appeal and application reflects the concerns I have expressed about the project for quite some time.

The environmental justice analysis addresses one of my primary concerns about the project – the cost and its impact to Cal-Am's ratepayers. In addition to the communities of concern included in the staff report, within my supervisorial district, I am concerned about the cost to seniors and the many people on fixed incomes who would be greatly burdened by the increased cost of water as a result of the proposed project.

Monterey County, Marina Coast Water District and California American Water lost a true opportunity some years ago with the failed Regional Desal project. The public mistrust about this current project is an ongoing reminder of those unfortunate decisions. I firmly believe that desalination will be needed in our future, even with Pure Water Monterey expansion. A thoughtful regional approach, towards a project serving a larger area that includes the Monterey Peninsula and Seaside Basin, along with the City of Marina and other urbanized areas in the Salinas Valley Basin that face loss of their water supplies due to seawater intrusion, is needed for a prudent long range solution in Monterey County. Such a regional approach, led by public agencies, would also reduce the significant costs that Cal-Am's project would impose on the ratepayers in my district and throughout our county.

As recommended, the Pure Water Monterey Expansion can serve as a bridge to meet the near term requirements of the CDO until a regional desalination project can be developed, as opposed to this unbearably expensive Cal-Am project.

Thank you for your consideration of these comments and for the incredible amount of time, thought, and diligence you give all projects that come before you.

Sincerely,

Mary L. Adams
Board of Supervisors
Fifth District

DENY Cal Am Desal Project-Items Th3a/Th4a

Tom Ward <tomaward@yahoo.com>

Fri 9/11/2020 10:03 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>; Materials <materials@coastal.ca.gov>

Dear CA Coastal Commissioners and staff:

My name is Thomas Ward and my wife, Leslie Ward and I are retired residents of Pebble Beach and long suffering Cal Am customers.
Please support the Coastal Commission staff's recommendation to DENY Cal-Am's permit for the very costly desal plant and instead decide that expansion of Pure Water Monterey is a feasible, cost effective and environmentally superior solution to our water needs for the next 20-30 years.
We can't afford Cal Am's desal plant!

Thomas Ward
Pebble Beach, CA 93953

Dear CA Coastal Commissioners, Executive Director John Ainsworth and Staff:

Last fall we collected over 1200 signed short but powerful statements of why we oppose the proposed CalAm desal plant. Since then, we have gathered even more. Citizens for Just Water started collecting signatures at the Women's March Monterey Bay in January. After the COVID19 induced Shelter In Place orders were eased, we donned our facemasks and collected 150 more signed statements at, "Everyone's Harvest, Farmers' Market, Marina."

Our 1400+ gathered petitions, from Marina and nearby communities

Here is the statement:

I AM AGAINST THE CAL AM DESALINATION PROJECT PROPOSED IN MARINA BECAUSE:

1) CalAm's project steals groundwater from Marina's aquifers and sends it to the Peninsula!
2) CalAm's project creates salt water contamination and damages our sole source of drinking water in a critically overdrafted basin!
3) CalAm's project damages rare & endangered species on Marina's sensitive dune habitats.
4) CalAms project plans to build pipes and structures on the same Cemex site already designated by the CA Coastal Commission for beach access, conservation and low-cost recreation when the sandmining stops in 2020.
5) CalAm's project ignores a feasible recycled water project, the Pure Water Monterey Expansion, that can provide the Peninsula with all the water they need without adverse effects to the Marina community.
6) Marina is a small, working class city with high diversity who would receive zero benefits but suffer all the harm and risks in order to benefit another district!
7) CalAm's project is unfair, unnecessary and uninvited! Please deny the permit to CalAm!

Following are a sample set of signatures from those who signed since the November 14, 2019 Costal Commission hearing in Half Moon Bay:

I am against the CalAm desalination project proposed in Marina because:

1) CalAm's project steals groundwater from Marina's aquifers and sends it to the Peninsula!
2) CalAm's project creates salt water contamination and damages our sole source of drinking water in a critically overdrafted basin!
3) CalAm's project damages rare & endangered species on Marina's sensitive dune habitats.
4) CalAm's project plans to build pipes and structures on the same Cemex site already designated by the CA Coastal Commission for beach access, conservation and low-cost recreation when the sandmining stops in 2020.
5) CalAm's project ignores a feasible recycled water project, the Pure Water Monterey Expansion, that can provide the Peninsula with all the water they need without adverse effects to the Marina community!
6) Marina is a small, working class city with high diversity who would receive zero benefits but suffer all the harm and risks in order to benefit another district!
7) CalAm's project is unfair, unnecessary and uninvited! **Please deny the permit to CalAm!**

Estoy en contra del proyecto de desalinización de CalAm propuesto en Marina porque:

1) El proyecto de CalAm roba agua subterránea de los acuíferos de Marina y lo envía a la península.
2) El proyecto de CalAm cree contaminación de agua salada y daña nuestra única fuente de agua potable en una cuenca con sobregiro crítico.
3) El proyecto de CalAm daña especies raros y en peligro de extinción en los hábitats sensibles de dunas de Marina.
4) El proyecto de CalAm planea construir pipas y estructuras en el mismo sitio de Cemex ya designado para acceso a la playa, conservación, y recreación de bajo costo por la Comisión Costal CA cuando se detiene la extracción de arena en 2020.
5) El proyecto CalAm ignora un proyecto factible de agua reciclada, la Expansión Agua Pura Monterey, que pueda proporcionar toda el agua necesaria sin efectos adversos para la comunidad de Marina.
6) Marina es una pequeña ciudad de clase trabajadora con alta diversidad que no recibiría ningún beneficio, pero sufriría todo el daño para beneficiar a otro condado.
7) El proyecto de CalAm es injusto, innecesario, y sin invitación. **¡Por favor, niegue el permiso a CalAm!**

Citizens for Just Water
13809 Sherman Blvd.
Marina, California 93933

California Coastal Commission
455 Market St Suite 300
San Francisco, CA 94105

Dear Chair Padilla and Coastal Commissioners, John Ainsworth,Tom Luster, Alison Dettmer, and Staff:

Our grassroots organization holds mostly residents of Marina and Ord Communities, members of the Marina Coast Water District (MCWD).

As we have communicated with the Commission on several occasions, and at many locations up and down the state over the last few years, we are against the placement of 6 additional slant wells at the Cemex dunes and beach, and against the construction and operation of an inland desalination facility where the water would be treated.

This project has many flaws, most addressed in the CCC Staff Report, including:

-Damage to the coastal dunes and ESHA.

-Taking of large volumes of groundwater by Cal-Am, for which it has no water rights, beyond the 500 AFY that the Cemex easement may offer it. Unknown ability of CalAm to ever get "appropriative rights" once it has been allowed to start pumping from multiple slant wells.

-Initial and ongoing upheaval to Marina, a disadvantaged community, and one which gets no benefits - not a single drop of desalinated water- only harm, from having this unwelcome project possibly forced upon it.

-Already having caused significant direct harm to Marina and MCWD due to the many resources spent fending off Cal-Am. The City of Marina has already spent at least $3.5 Million...money and focus that could have been utilized for many other civic investments, such as infrastructure maintenance, a new fire truck, the Senior Center, etc.

-IMMEASURABLE negative impacts caused by the interruption of the plan to hand over the Cemex property for recreational and conservation purposes in perpetuity, resulting from the 2017 agreement between the Coastal Commission, State Lands Commission and Cemex to wind down sandmining operations on this 400 acre site.

30x20 Collage people with Snowy Plover Signs - 200811 96 dpi.jpg; 30x20 Collage Marina Businesses 200831 96 dpi.jpg;

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

Since we cannot attend meetings in person, we have taken many photos of residents and business owners in Marina to try to show you that they are all asking to deny CalAm's harmful project.

I am sending you two photo collages that might not be shown correctly in the PDFs of the email messages that have been sent by Marina residents. This is only a small collection of the photos that we have taken of people with the Snowy Plover "Stop CalAm" poster. This poster is being displayed in many windows of businesses and homes in Marina and the Fort Ord Communities.

Thank you for your time,
Liesbeth Visscher,
Citizens for Just Water volunteer,
Resident of Marina, CA

Re: Monterey Peninsula Water Supply Project
Appeal No. A-3-MRA-19-0034 and Application No. 9-19-0918
Commission Sept. 17, 2020 Meeting, Agenda Nos. Th3a and Th4a

Dear Chair Padilla and Honorable Commissioners:

On behalf of the City of Marina ("City" or "Marina"), we submit this comment letter regarding the two Coastal Development Permits ("CDPs") -- one appealed to the Commission from a CDP denial by the City of Marina and one constituting an original consolidated CDP application -- being sought by California-American Water Company ("CalAm") for the Monterey Peninsula Water Supply Project ("Project" or "MPWSP"). As explained in further detail below, the City urges the Coastal Commission to deny both Coastal Development Permits.[1]

I. Introduction

The City strongly supports the recommendation of Coastal Commission Staff, in its August 25, 2020 Staff Report ("Staff Report"), that the Commission deny both the "appealed"

[1] The City of Marina bases this comment letter not only on the specific materials cited herein, but also on all of its comment letters, reports and other materials it has submitted to the Coastal Commission during the pendency of these CDP appeal and original proceedings, as well as on the complete administrative record developed in the underlying City of Marina proceedings relating to CalAm's application for a CDP for the Project from the City.

and "consolidated" CDPs sought by CalAm for the Project. The Staff has continued to recommend denial consistent with its original October 28, 2019 Staff Report ("2019 Staff Report"). Although ten months have passed since the original staff report was issued and further information has been submitted to and developed by Staff, the CDP analyses and conclusions of Staff remain completely appropriate and are fully supported by the comprehensive administrative record that has been developed over the last 18 months.

As you know, the MPWSP is a large industrial desalination project that would be constructed in, through and around the City. Although CalAm characterizes the Project as an ocean desalination plant that would "draw seawater from beneath the ocean floor," it is actually a "groundwater basin" desalination project that would extract approximately 17,300 acre feet per year ("afy") of groundwater from the Salinas Valley Groundwater Basin ("Basin") and export almost all of it after treatment to the affluent Monterey Peninsula communities to the south. The City is completely dependent on the Basin's clean, local and affordable water source, which provides 100% of its drinking water.

On March 7, 2019, the City of Marina Planning Commission denied a Coastal Development Permit for the Project for most of the same reasons articulated for permit denial in the Staff Report. The Project is remarkable for the range of very serious environmental, economic and social problems it will cause. Moreover, it is fatally inconsistent with a wide range of Marina Local Coastal Program ("LCP") and Coastal Act policies and cannot be approved. Although CalAm continues to vigorously promote the Project, it has become clear that this Project is the wrong project at the wrong time in the wrong place. Not only is the Project based on inflated water demand projections, an outdated groundwater model and an unsustainable economic foundation, but it would cause irreparable adverse impacts to coastal ecosystems, disadvantaged communities and precious groundwater resources.

The Commission, as recommended by its Staff, should deny the appealed and consolidated CDPs for the Project for the following reasons, among others:

- **Critically Incomplete Project Application:** CalAm has failed to apply for a CDP for one major component of the Project within the coastal zone -- the installation of a new protective liner within the Project outfall -- which prevents the Commission from evaluating all of the Project's coastal impacts and makes the Project application incomplete. The Final EIR adopted by the CPUC directed CalAm to "include the land segment outfall lining and associated activities in [its] CDP application." However, CalAm has refused to do so, claiming that this should be the responsibility of Monterey One Water. The result is that the Commission's evaluation of the Project's impacts in the coastal zone has been segmented, in violation of legal requirements and the directives in the Final EIR. The CDP applications must be denied for this reason alone. (*See* Section II herein.)

- **ESHA Impacts**: The Project's well field, pipeline and other components in the coastal zone would cause adverse impacts to at least 35 acres of valuable ESHA, including permanent impacts to potentially several dozen acres of Flandrian dune and coastal habitat ESHA on the City's coastline. CalAm contends that its new Habitat Mitigation and Monitoring

Plan ("HMMP") supposedly fully and effectively mitigates for these Project impacts, but the City's expert Dr. Mike Josselyn (WRA Environmental) has prepared an analysis reflecting that the HMMP is wholly deficient. *See* **Exhibit 1** herein. The Staff Report agrees that the HMMP does not conform with Commission requirements. CalAm asserts that it somehow has acquired the right to develop its Project on the CEMEX Property, but in fact the CEMEX Settlement Agreement on which it relies requires the Project to obtain all CDPs before any project can be built. Moreover, since the CEMEX site must be reclaimed by CEMEX after its active sand mining shuts down in four months, the attempt by CalAm to mitigate on this same site is not allowable for multiple reasons. (*See* Section III(A) herein.)

- **Coastal Hazards:** The Commission is rightly concerned about the coastal hazards threatening the Project slant well facilities. According to the Staff Report, "[t]he Bay shoreline near Cal-Am's proposed well field has exhibited the highest annual erosion rates in the state, due in part to relatively high levels of wave energy and the easily erodible sand that makes up most of the Bay shoreline." Staff Report, at 55. The erosion is exacerbated by the fact that CEMEX sand mining operations have removed more than 100,000 cubic yards of sand annually, "thereby exacerbating the ongoing natural erosive processes." *Id.* at 56. Since CalAm's slant wells apparently will need to be replaced in 20-25 years due to their limited life and in light of the new state sea level rise assumptions, it is likely that the slant wells will need to be replaced and moved in only 20-25 years, for a project with a 60-year life. However, since CalAm does not have, and is barred by the CEMEX Settlement Agreement from obtaining, any easement landward of the current well locations, it will not be able to move the wells. For all of these reasons, the Project is not feasible over the long-term, particularly in comparison to the expansion of the Pure Water Monterey project. (*See* Section III(B) herein.)

- **Wetlands And Vernal Pond Impacts:** There are seven sets of wetlands, vernal ponds and other groundwater-dependent ecosystems ("GDEs") totaling about 25 acres located in and near the City that are sustained by groundwater in the Dune Sand Aquifer, which is the uppermost Basin aquifer where the Project's slant wells would be constructed. These valuable coastal ecosystems are managed by a comprehensive management plan that was prepared (with assistance from the Commission) and adopted in 1994 by the City. Two recent reports -- one hydrological and one biological -- demonstrate that these ponds are groundwater dependent and could be dramatically affected by the Project's slant well extraction activities that cause groundwater drawdown. The Commission has a duty to protect these sensitive coastal and public trust resources. These anticipated adverse GDE impacts are yet another threat by the Project to Marina's sensitive coastal ecosystems. The reports prepared for Marina on this topic are enclosed herewith as **Exhibit 2, Exhibit 3 and Exhibit 6**. (*See* Section III(C) herein.)

- **Coastal Water/Marine Resource Impacts:** Marina's LCP and the Coastal Act require protection of marine resources, ocean water quality and biological productivity when considering issuance of a CDP. In this case, as the Staff Report finds, the Project proposes to place "fill" for structures in coastal waters (potentially including a diffuser retrofit, buoy installation and outfall clamp replacement). Such fill is allowed *only* if the three-part "override" test in Coastal Act Section 30233 is met. The City agrees with Staff that "the Project does not

conform to Section 30233 because there is a feasible and less environmentally damaging alternative project that will not require fill in coastal waters and because not all mitigation has been identified and imposed." Staff Report, at 66. (*See* Section III(D) herein.)

- **Groundwater Depletion Impacts:** One important Coastal Act policy is "preventing depletion of ground water supplies." Coastal Act § 30231. The State Water Resources Control Board, in its Resolution No. 2015-0033 approving the Ocean Plan desalination amendment, stated that a facility with subsurface wells with the potential to "exacerbate saltwater intrusion into freshwater aquifers or alter groundwater flow" to such aquifers and wells "is unlikely to be approved." Recent studies of the Basin, including those by a Stanford University research team using state-of-the-art Airborne Electromagnetic ("AEM") imaging, disclose that the Project is likely to deplete and contaminate this water supply. The July 10, 2020 Report prepared by the Coastal Commission's independent hydrogeology consultant (Weiss Associates) confirms these potential risks and demonstrates that as little as 72% of the extracted groundwater qualifies as "seawater." The City's hydrogeology consultant (Formation Environmental) has analyzed and confirmed these findings in an August 13, 2020 Technical Memorandum enclosed herewith as **Exhibit 4**. (*See* Section III(E) herein.)

- **Public Access Impacts:** One critical set of Coastal Act and Marina LCP policies protect public access and recreation. This is particularly important in this location because, only three years ago, as a result of coordinated enforcement actions by the Coastal Commission, the City of Marina and the State Lands Commission, the agencies successfully ended the CEMEX sand mining operations on a portion of this site that had caused decades of environmental depredations to this coastal habitat. This settlement requires that the property owner end its mining operations by December 2020, fully reclaim and restore the site, and then convey it to a governmental or non-profit organization with an easement in perpetuity for conservation and public recreation purposes. The huge permanent 35-acre easement area for the wellfield facilities poses major public access issues at a critical access point. (*See* Section III(F) herein.)

- **Environmental Justice Impacts**: The City of Marina is a diverse, working-class community. It qualifies as a community of color and a low-income community under various federal, state and local laws and programs. The Project would have wide-ranging and disproportionate impacts on the social, economic, cultural and environmental values of this community of concern. As the Staff Report concludes: "The proposed Project also results in adverse coastal resource effects within the community of Marina that is already disproportionately burdened by many other industrial uses and would receive none of the project benefits. There is a long history of government institutions allowing unwanted industrial development to be concentrated in underserved communities of color without their consent. Approving yet another would perpetuate this discriminatory land use practice in Marina." Staff Report, at 101.

The City of Seaside, immediately adjacent to Marina, is also a community protected by environmental justice principles, and because is it within CalAm's service area, is expected to suffer crippling water rate increases that some residents fear will force them to sell their homes.

CalAm unpersuasively argues that these impacts are addressed by CalAm's ratepayer assistance program, which does not affect Marina and is only of marginal assistance for low-income Seaside residents. (*See* Section IV herein.)

- **Water Supply and Demand:** It is undisputed that the water demand in CalAm's service area has averaged only about 9,800 afy over the last five years, yet CalAm predicates its Project on the need to obtain a total of 14,000 afy of water for its customers. Since CalAm's service area population is not expected to grow substantially in the next 20 years, CalAm has been relegated to phantom arguments about an expected "tourism rebound," a Pebble Beach buildout and a demand surge after removal of water conservation restrictions (directly contrary to new State laws which impose permanent future water use restrictions) to justify these unsupported projections. Moreover, CalAm has unfairly attacked the Monterey Peninsula Water Management District ("MPWMD") for making its own expert water demand/supply projections (which demonstrate that an expansion of the Pure Water Monterey project would meet CalAm customer water demands for decades), when in fact MPWMD is required by law to make these projections on an annual basis. Regardless, the demand numbers do not justify a large desalination project. As the City's water demand/supply expert explains, in a report dated April 2020, due to the very high fixed Project costs and the likely outcome that it will run far below capacity, the cost to CalAm's ratepayers will be astronomical. (*See* **Exhibit 5** and Section V(B) herein.)

- **Feasible Alternative Water Solution (PWM Expansion):** The Pure Water Monterey Expansion Project ("PWM Expansion") is a feasible alternative to CalAm's Project. A recent analysis by MPWMD reflects that the PWM Expansion would provide sufficient water for this service area for at least 20 years and likely considerably longer. The PWM Expansion would produce water at approximately one-third of the cost of expensive desalination water, would have virtually no environmental impacts, and can be on-line more quickly than the Project. Since any approval of CalAm's Project would require an "override" of Coastal Act and Marina LCP policies and such an override requires a finding that no other feasible project is present, the availability of the feasible PWM Expansion prevents any Section 30260 "override." (*See* Section V(B) herein.)

- **Coastal Act Override:** Coastal Act Section 30260 allows an override of Coastal Act requirements only if three major criteria are met. In this case, as the Staff Report concludes, none of the criteria can be met. In addition to the existence of the feasible alternative described above, the public welfare would not be harmed (but rather would be promoted) by denial of the Project CDPs. Further, as the Marina Planning Commission found in its denial decision and the Staff Report determines, the third criteria requiring that the adverse impacts have been "mitigated to the maximum extent feasible" has not been met. (*See* Section V herein.)

- **Public Trust Duties:** The Commission has an independent affirmative and fiduciary duty, under the public trust doctrine, to protect public trust resources for the benefit of all Californians and future generations. This duty encompasses the preservation of public trust resources in their natural state. In particular, in connection with these CDP applications, the

Commission must protect the terrestrial and special dune habitat, the vernal ponds and wetlands, and (under recent law) the groundwater that is interconnected with surface water features. By denying the CDPs, the Commission would be meeting its obligations under the public trust doctrine.

- **No Water Rights:** It is undisputed that the Project lacks any current water rights to the groundwater that it intends to extract through the slant wells in the coastal zone. The Subbasin in which it hopes to extract groundwater is one of only 21 basins in California that has been designated as "critically overdrafted." CalAm has no overlying rights, appropriative rights or prescriptive rights for its plan to pump 15.5 million gallons of groundwater per day. Rather, it hopes to use an untested and risky "salvaged water" theory that no court has ever authorized and it has no real chance of success. This is a "showstopper" issue that makes the Project infeasible and compels the denial of any CDP for it. Moreover, CalAm is prevented by the Annexation Agreement applicable to the CEMEX property from extracting more than 500 afy of groundwater (a tiny fraction of the 17,300 afy it plans to extract) and cannot export this groundwater outside of the Basin. The City of Marina has filed litigation on this subject, which is currently pending.

B. Groundwater Resources 38
C. Marina's Vernal Ponds/Wetlands 38
VIII. THE PROJECT IS FATALLY FLAWED BECAUSE IT LACKS ANY CURRENT WATER RIGHTS AND HAS NO REASONABLE OR ACCEPTED PATH FORWARD TO OBTAIN SUCH RIGHTS. 39
IX. CONCLUSION 40

II. The Project's CDP Applications Are Fatally Flawed And Incomplete Because They Do Not Include The Extensive Coastal Zone Impacts Of The Project's Outfall Liner And Other Outfall Related Work.

CalAm plans to use the existing outfall for Monterey One Water's facility to convey the brine wastewater from the desalination plant to Monterey Bay. However, the corrosive characteristics of the brine require CalAm to install a protective lining in the land segment of the outfall. In the Final EIR, Mitigation Measure 4.13-5b details the installation of this protective liner. Final EIR, at 4.13-27 to 4:13-30. The failure of CalAm to submit an application for this integral portion of the Project to Marina (the local coastal agency) or to the Commission has resulted in prohibited segmentation of the Project and, at a practical level, prevents the Commission from evaluating the entire coastal zone impacts of the Project.

The Final EIR certified by the CPUC requires that CalAm "include the land segment outfall lining and associated activities in [its] CDP application." Errata to March 2018 Final EIR/EIS at E-8 (Sept. 2018). However, CalAm has failed to do so. As a result, CalAm has not provided either the Commission or the City of Marina with the information necessary to grant a CDP. Indeed, the Staff Report notes that CalAm "did not include this aspect of the work needed for this Project in its CDP application" and "there is not a complete final description of the work at this point." Staff Report, at 18.

CalAm has tried to "finesse" its failure to comply with the Final EIR's requirement by representing that it "plans to have the work done by the agency that operates the treatment facility." 2019 Staff Report, at 4. As a result, Monterey One Water ("M1W") "will be responsible for obtaining a CDP and other relevant permits for that work." *Id.* at 4, 45. However, the Final EIR states the opposite and establishes that CalAm is responsible for lining the land segment of the outfall under an agreement with M1W. Final EIR, at 4-13-29. CalAm's failure to include the outfall liner in its CDP application is a fundamental deficiency that justifies the denial of CalAm's CDP applications.

In its June 30, 2020 Letter (page 5 of Attachment A), CalAm incorrectly asserts that "the M1W outfall work is a wholly separate project that may be separately conditioned when M1W applies for a CDP for that work." However, to the contrary and as the Final EIR makes clear, the outfall is an integral part of the Project and legally cannot be segmented from it. This is especially true because, since the Commission is considering the possibility of a Section 30260 "override," it is essential that it have all of the Project's coastal zone impacts before it.

It is evident that the outfall liner work will have very significant ESHA impacts. Mitigation Measure 4.13-5b requires "the phased installation of a protective liner system along the entire approximately 13,000-foot-long land segment of the outfall." *Id.* at 4.13-27–4.13-28. CalAm identified ten access locations where it plans to dig excavation pits directly above the outfall pipe to install the liner in segments. *Id.* at 4.13-29. These excavation pits will be up to 12 feet by 25 feet, and CalAm plans to store the excavated soil by "stockpil[ing] [it] within the existing outfall right-of-way." *Id.* at 4.13-29. Notably, some of this excavation and construction will occur in ESHA. Indeed, the Final EIR identifies Access Point 10 as located within the coastal dune ecosystem, most of which is ESHA. See Figure 4.13-1, Final EIR, at 4.13-29.

The Final EIR states that the excavation pits for the outfall liner "would be located in areas with similar types of biological resources as the Source Water Pipeline." Final EIR, at 4.13-35. Accordingly, installation work for the outfall liner, like construction of the Source Water Pipeline, would adversely impact the "threatened" western snowy plover, whose critical habitat includes the beaches from Moss Landing south to Monterey. *Id.* at 4.6-72. In particular, the Final EIR recognizes that western snowy plovers have "a high potential to nest along the beach and foredunes," and they "may use the beach and dunes within all subsurface slant well and Source Water Pipeline work areas for wintering, roosting, and foraging." *Id.* at 4.6-54.

Both the Final EIR and the Staff Report recognize that construction noise or activity would impact western snowy plover. The Final EIR notes that such activity would have significant impacts "during western snowy plover breeding season . . . by causing temporary flight of breeding birds and potentially permanent effects from nest abandonment or failure." Final EIR at 4.6-142. However, installation of the outfall liner must occur during the March through September breeding season, because CalAm can install the liner "only during the irrigation season (April through September), when flows in the outfall would be minimal." *Id.* at 4.13-29. Accordingly, as the Staff Report correctly concludes, the significant disturbances from installing the outfall liner will impact a "critical habitat area" for the western snowy plover "during a critical time period for the species." Staff Report, at 44.

In addition to western snowy plover, installation of the outfall liner would potentially impact Monterey spineflower and "a number of other special-status plants" as well as the habitats of the Smith's blue butterfly and other species. Final EIR at 4.6-142–4.6-143. The installation of the outfall liner would likewise impact environmentally sensitive coastal dunes and ESHA. Staff Report, at 44.

As outlined in the preceding paragraphs, CalAm's construction activities in ESHA would not conform to Coastal Act Section 30240 or the corresponding LCP provisions because those

activities are not resource-dependent activity. Therefore, anticipated impacts from the installation of the outfall liner require the Coastal Commission to deny CalAm's CDP applications.

Finally, in Attachment C to its June 20 Letter, CalAm proposes what it calls a "Special Condition" that "prior to commencement of Project operation," it "shall demonstrate that a Coastal Development Permit or Amendment has been obtained authorizing Project-related construction on the Monterey One Outfall." In short, CalAm proposes to obtain a CDP 3-4 years from now before it actually starts operating the Project. This is not a condition designed safeguard the affected coastal ecosystems and species, and it does not promote comprehensive protection of coastal zone resources. Rather, it impermissibly attempts to authorize CalAm to wait years before even applying for the outfall liner CDP. The Commission should reject this proposed condition.

III. The Requested Coastal Development Permits Are Not In Conformance With The Requirements And Policies of the Coastal Act Or Marina's Local Coastal Program.

The first level of analysis for a coastal development permit is to determine whether the proposed facilities and activities in the coastal zone are in conformance with the policies and requirements of the applicable Local Coastal Program ("LCP") and Coastal Act policies. The CDPs requested by CalAm implicate both the Marina LCP (for the appealed permit) and the Coastal Act (for both permits). In the sections below, we will demonstrate that the permits requested by CalAm for the Project are fatally inconsistent with the ESHA, coastal hazards, wetland protection, coastal waters/marine impacts, groundwater depletion, and public access policies and requirements contained in Marina's LCP and the Coastal Act.

A. Environmentally Sensitive Habitat Areas (ESHA) -- Terrestrial

As the City has demonstrated in prior comments and in expert reports by WRA Environmental Consultants ("WRA"), the Project's proposed facilities in the coastal zone are not in conformance with Marina's Local Coastal Program policies or applicable Coastal Act policies. As discussed herein, the Project will have widespread and permanent impacts on ESHA that are not allowed under the Coastal Act. CalAm's proposed Habitat Mitigation and Monitoring Plan is woefully inadequate to address these impacts.

1. The Project Would Have Total Impacts On At Least 35 Acres Of ESHA, Which Is Not Allowable Because the Project Is Not "Resource Dependent."

In its February 7, 2019 Report that is part of the administrative record for the City Planning Commission CDP denial, WRA summarized the extremely high biological value of the terrestrial ESHA that would be impacted by the Project:

> *The Project is proposed within a unique and very significant coastal dune habitat known as Flandrian dunes.* The Coastal Commission considers

> this habitat as ESHA and the City categorizes it as Primary Habitat with equivalent protections to ESHA. Flandrian dunes are a unique habitat bordering Monterey Bay. This habitat has developed on large sand dunes that shift over time by wind and wave action.
>
> *The presence of over 30 special status species including seven plants and four animal species listed as threatened or endangered within the Flandrian dune habitat and their complex linkages justify considering the entire coastal dune habitat as an Ecosystem ESHA.* Compensatory mitigation for individual species is largely inadequate when considering how to restore an entire ecosystem. Rather, mitigation for such ecosystem-level ESHAs must consider the foundational aspects of the habitat as well as the interactions between species.

In its Staff Report, the Commission emphasized the biological importance and unique nature of this habitat:

> *The CEMEX site consists primarily of central foredune habitat, which is one of the most important, vulnerable, and geographically constrained environmentally sensitive habitat types in California.* The California Natural Diversity Database ("CNDDB") classifies it as "critically imperiled, this [thus] qualifying it as ESHA. Dunes form only under certain conditions where adequate sand supply and appropriate wind energy and direction allow. . . The habitat values in dune areas are therefore best understood in terms of the overall complex of dunes of which they are a part, and the Commission has typically found coastal dune habitat to be ESHA even when it is disturbed, due to its rarity, its important ecosystem functions, and its support of sensitive species.

Staff Report, at 34-35 (emphasis added).

The Staff Report carefully analyzed the anticipated Project impacts on ESHA, both for the appealed permit and the consolidated permit. It concluded that the Project's anticipated impacts to terrestrial ESHA would be up to several dozen acres within the City of Marina's jurisdiction, including a minimum of 7 acres of permanent impacts within the well field area and potentially multiples of this amount of permanent impact acreage in the pipeline routes. There would be up to 24 acres of additional ESHA impacts in the consolidated permit areas, with an unknown amount consisting of permanent impacts. Staff Report, at 31.

The Staff Report also identified an additional adverse impact to ESHA resulting from "the need for Cal-Am to protect or relocate its well sites due to the effects of sea level rise and coastal erosion." Staff Report at 39. Since the slant wells apparently will need to be replaced after 20-25 years and given the latest sea level rise expectations, the wells will likely need to be replaced and moved before the Project even reaches half of its 60-year life. However, this presents a fundamental problem since CalAm does not hold easement rights further landward from the current locations, and (as discussed herein) will not be able to obtain such rights. On this point, the Staff Report states: "Those areas inland of the currently proposed well sites are

also within the area slated for restoration under the above-referenced CEMEX Settlement and are outside of Cal-Am's 30-acre easement, so relocation would require Cal-Am to obtain additional legal interest to any sites further inland -- which is something it is not clear Cal-Am will be able to do -- and would likely interfere with restoration efforts expected in those areas as part of the CEMEX Settlement." *Id.*

Both the Coastal Act and the Marina LCP provide that only uses dependent on the resources in ESHA can be sited in ESHA. The City's LCP Land Use Policy provides: "Primary habitat areas shall be protected and preserved against any significant disruption of habitat values and only uses dependent on those resources shall be allowed within those areas." Similarly, Coastal Act Section 30240(a) provides that ESHA "shall be protected against any significant disruption of habitat values, and only uses dependent on those resources shall be allowed within those areas."

It is undisputed that the Project components sited in ESHA are not "resource dependent" within the meaning of these provisions because they do not depend on or need to consume this habitat for their proper functioning. Accordingly, these twin ESHA prohibitions completely bar the siting of any Project components in this ESHA and require denial of the Project in this location. Given these legal bars, the only route for the Project to be constructed in ESHA would be if it qualified for, and was granted, an override under Section 30260. As demonstrated below, the Project fails to meet any of these override criteria and therefore cannot be built in this ESHA.

In its June 30, 2020 Letter, CalAm attempts to bat away these arguments through incorrect legal statements and misplaced arguments. First, CalAm argues that the California Public Utilities Commission already found, in its Final EIR, that the impacts to ESHA are not significant and CalAm implies that, as a result, no extensive mitigation is required. However, CalAm has made a fundamental error. Both the City (in exercising its local coastal jurisdiction) and the Coastal Commission are responsible agencies who, as part of their interpretation and application of the Coastal Act, have full and complete control over determining the amount and extent of adverse impacts to ESHA and over the appropriate avoidance, minimization or mitigation measures for these impacts. Indeed, the Final EIR recognizes this authority.

Second, CalAm apparently asserts, as it has before, that it has a right to develop its Project on the CEMEX Property because this right was supposedly enshrined in the 2017 CEMEX Settlement Agreement. However, this argument has no factual basis. The CEMEX Settlement only recognized the real property easement rights established as of the date of the settlement. The Agreement clearly stated that "[n]othing in this Agreement guarantees or conveys any Right to development on the Site" and requires that any proposed development must receive a coastal development permit under the Coastal Act and/or the City of Marina Local Coastal Development Plan. CEMEX Consent Settlement Agreement and Cease and Desist Order CCC-17-CD-02, at § 2.1. CalAm's further contention that the City of Marina somehow "waived" an argument that "Cal-Am lacks a property right to use the CEMEX site" for certain purposes (June 30, 2020 letter at 2, fn. 2) is not accurate for the same reasons. Moreover, as

explained elsewhere herein, CalAm has improperly attempted to expand the scope of the easement it claims after the date of the CEMEX settlement.

2. CalAm's New Habitat Mitigation And Monitoring Plan Is Woefully Deficient And Fails To Qualify As A Plan That The Commission Can Or Should Adopt.

For two years, CalAm refused to provide either the City of Marina (during its consideration of the coastal development permit within its jurisdiction) or the Coastal Commission (in the current proceeding) with a Habitat Mitigation and Monitoring Plan ("HMMP") that specifically details mitigation for ESHA impacts. At the City level, CalAm took the spurious position that Marina was not entitled to receive a mitigation plan. In its denial decision, the Planning Commission concluded that "[t]his refusal is unjustified and contrary to law, and leads to our determination that this Ecosystem ESHA will not be protected in conformance with the LCP and Coastal Act." Finding 4-6.

The 2019 Staff Report agreed with the City's position on mitigation:

> *Under the LCP, the City may require mitigation above and beyond what is identified in a CEQA document in order to comply with the LCP and the Coastal Act, and it may require that mitigation be identified earlier than what is required through CEQA.* Although the City could have required that Cal-Am provide its proposed mitigation and HMMP "prior to issuance" of a CDP, it chose instead to deny the application. *Because the City was within its authority to request that Cal-Am identify mitigation measures with more specificity to ensure the project would comply with the LCP, this contention raises no substantial issue.*

2019 Staff Report, at 22 (emphasis added).

A similar scenario played out at the Coastal Commission level. By letter dated August 22, 2019, the Commission notified CalAm that its application for a coastal development permit was incomplete. In the notice, the Commission requested a mitigation plan to address ESHA impacts that includes "the proposed locations, types, and size of the mitigation area(s), proposed performance standards and monitoring methods, proposed legal protections for the mitigation, and proposed contingency plans in the event of the mitigation area(s) not meeting performance standards." In response to the Commission's notice, CalAm submitted only a short memorandum that it called a "mitigation strategy overview."

The 2019 Staff Report appropriately found that "this Mitigation Strategy document is not consistent with Commission guidance and past approvals as to what is required to provide adequate mitigation." 2019 Staff Report, at 46. It observed that CalAm primarily uses an "in-lieu fee approach" inconsistent with ESHA mitigation requirements. The mitigation strategy also addresses only the CEMEX site, which does not encompass areas within the Commission's consolidated permit jurisdiction. As WRA noted in a critique, the strategy is actually habitat preservation (not restoration), which is insufficient because under the CEMEX settlement these

CEMEX areas are "already slated for preservation." Finally, contrary to the Commission analysis that impacts occur to up to 35 acres of ESHA, the mitigation strategy incorrectly identifies only 2.2 acres of permanent impacts. *Id.*

In June 2020, CalAm finally submitted a proposed Habitat Mitigation and Monitoring Plan ("HMMP") to the Commission. Unfortunately, although it provides more detail than the earlier "mitigation strategy overview," the HMMP essentially consists of the same flawed mitigation approach and it is completely inadequate to satisfy legally mandated mitigation requirements.

The City requested that Dr. Mike Josselyn of WRA evaluate the HMMP and he prepared a July 29, 2020 Report that was provided to Commission Staff and is enclosed herewith as **Exhibit 1**. Dr. Josselyn reached the following conclusions, among others:

- The amount of proposed habitat replacement is manifestly insufficient. CalAm contends that there are only 2.2 acres of permanent impacts and about 19 acres of temporary impacts. However, the so-called "temporary impacts" are in fact permanent impacts under Coastal Commission standards. Thus, for the impacts within City of Marina jurisdiction alone, the required mitigation should be at least 51 acres. And this does not take into account the additional permanent impacts identified by the Commission within its own original jurisdiction, which were substantial.

- There is no assurance that the proposed restoration in HMMP will occur or will be consistent with an overall management plan for the CEMEX property because of mitigation timing issues.

- No Long Term Management Plan ("LTMP") or endowment is proposed as required by the City's Local Coastal Program. As a result, "the costs associated with long-term management actions are unknown and cannot be determined for the endowment…[and] LTMP is needed in order to determine if the endowment is sufficient to provide for success of the mitigation area for the duration of the operation of the slant wells."

- The California Department of Fish and Wildlife ("CDFW") has not found that the Project's impacts on State protected species meet the requirements for issuance of an Incidental Take Permit ("ITP"). In its comments on the ITP application, CDFW "found that the calculation of temporary and permanent impacts were not consistent for the species" and concluded that "it is not clear if the proposed compensation for Project impacts is commensurate with the level of take for each species listed in the ITP application."

The WRA Report also repeats, as stated in earlier reports, that "mitigation for such ecosystem-level ESHAs must consider the foundational aspects of the habitat as well as the interactions between species. Due to the difficulty of restoring these types of ecosystem ESHAs,

avoidance of these sensitive habitats must be given the highest priority when evaluating projects." For this Project, no avoidance of sensitive dune ecosystems and species habitat of any type has been undertaken. Rather, CalAm has insisted that it wants the slant wells and associated facilities in this location. However, CalAm's hopes and positions cannot override the important mitigation requirements of the Coastal Act.

The Staff Report also determines that the HMMP is deficient and "proposes a number of measures that are not consistent with past Commission-approved mitigation plans." Staff Report, at 46. The deficiencies identified by Staff include, but are not limited to: (1) the failure to properly characterize many of what CalAm calls "temporary" impacts as "permanent impacts;" (2) insufficient mitigation ratios and amounts; (3) inapplicable site restoration standards; (4) failure to use full quantitative monitoring methods; and (5) the use of "relatively lenient" performance criteria. *Id.* The Staff Report adds: "Importantly, the HMMP proposes that most of the restoration activities take place within the CEMEX North Mitigation Area, which is already expected to benefit from preservation pursuant to the aforementioned [CEMEX] Settlement Agreement." *Id.*

Since the Staff Report recognizes that the Project does not meet the two other Section 30260 "override" tests, it does not undertake to identify conditions that might address these nonconformities. Rather, the Report states: "thus, there is no need to determine whether the project's ESHA impacts could, pursuant to the third test of that section, be mitigated to the maximum extent feasible." *Id.* at 47.

In short, the Project is anticipated to have wide-ranging permanent adverse impacts to dozens of acres of valuable Ecosystem ESHA within the City of Marina's coastal jurisdiction and within the Commission's independent jurisdiction for which there is no mitigation plan that meets the "fully mitigated" (Marina LCP) or "maximum mitigation" (Coastal Act Section 30260) standards required by law. Accordingly, the requested Coastal Development Permits must be denied.

B. Coastal Hazards

The City requests that the Commission deny the CDPs on the basis that the Project is not sited to prevent coastal hazards. Instead, during its 60-year life, the Project would be subjected to these hazards, which are expected to become even more severe due to sea level rise and climate change. As a result, the Project is inconsistent with the requirements in the Coastal Act and in Marina's LCP.

As the Staff Report correctly states, pursuant to Coastal Act Section 30253 and Marina's LCP, new development must be sited to avoid and minimize risks associated with coastal and geologic hazards, such as from wave erosion, wind erosion, tsunami inundation, and shaking from earthquakes, for the entire duration of the development's life. Staff Report, at 55. However, the Project is not sited in compliance with these requirements. Coastal Commission Staff explain that "*[t]he Bay shoreline near Cal-Am's proposed well field has exhibited the highest annual erosion rates in the state*, due in part to relatively high levels of wave energy and

the easily erodible sand that makes up most of the Bay shoreline. The area has experienced, and will likely continue to experience, storm-driven erosion that results in losses of as much as 100 feet of beach during a single event." *Id.* at 55-56 (emphasis added). The erosion is exacerbated by the fact that CEMEX sand mining operations have removed more than 100,000 cubic yards of sand annually. *Id.*, at 56.

Commission Staff previously requested that CalAm provide an updated assessment using current Commission guidance of expected sea level rise and erosion rates. 2019 Staff Report, at 51. In particular, the Commission was concerned about wind erosion rates that had not been fully addressed. *Id.*, at 51-53. After considering the information produced, Coastal Commission Staff determined that the Project slant wells would be subjected to wind erosion risks beginning in 2040, and that due to expected dune recession, "active burial of the well heads by dune sand could start by 2040." *Id.*, at 52. The Project is expected to be in operation until 2080. *Id.*, at 53.

Consequently, CalAm would either need to remove and relocate the wells inland, or it would need to install protective measures to prevent burial. The first option is legally infeasible because CalAm cannot obtain an additional legal interest on the CEMEX lands. *Specifically, Sections 6.2(A) and (B) and 23.2 of the CEMEX Settlement Agreement bar CalAm from acquiring any new easement or other interest in the CEMEX property after June 15, 2017.* The only property interest that CalAm recorded prior to this date is a Memorandum of Option Agreement (but not the option agreement itself). This option is limited to two identified areas of 33.58 and 2.421 acres respectively. CalAm was not granted an easement until May 2018, and this easement purported (improperly) to modify and expand the easement area to 35.935 acres and 3.53 acres respectively. Thus, this easement fails to conform to the rights of record and is partially or fully invalid.

However, even more importantly, these CEMEX Settlement terms preclude CalAm from obtaining any future easement rights on the CEMEX property to move slant well facilities expected to be impacted or destroyed by coastal erosion or sea level rise during the Project lifetime. CalAm also cannot install protective measures because they would involve new impacts to ESHA and other coastal resources, which CalAm has already demonstrated it cannot mitigate to the maximum extent feasible as required under the Coastal Act.

This issue of coastal hazards was also a top concern for the City when it was evaluating the CDP. Although it is well understood that the effects of sea level rise and coastal erosion will be greater than previously assumed, CalAm refused to provide the City with current information using the updated Coastal Commission guidance to determine the realistic impacts of sea level rise on the Project facilities. Resolution, Findings 4-24 to 4-28. Now that more information is known about the significant impacts on the Project due to erosion and sea level rise, it is obvious that the CDPs must be denied because they are inconsistent with the Coastal Act and Marina's LCP.

C. Wetlands and Vernal Pond ESHA

Wetlands, vernal ponds and other groundwater-dependent ecosystems ("GDEs") are located in and near the City of Marina that are sustained by groundwater in the Dune Sand Aquifer, which is the uppermost aquifer where the Project's slant wells would be constructed. There are seven sets of ponds totaling about 25 acres that are managed by a comprehensive management plan that was prepared (with assistance from the Commission) and then adopted by the City in 1994. These vernal pond features have been extensively studied in the last year and have been determined to constitute special coastal ecosystems that are believed to be dependent on groundwater in the Dune Sand Aquifer. We will briefly summarize two reports, enclosed with this letter, that analyze these features.

On April 13, 2020, Formation Environmental prepared a Technical Memorandum regarding the GDEs that arose from its work in preparing the Groundwater Sustainability Plan for the Marina Groundwater Sustainability Agency. This Memorandum is enclosed herewith as **Exhibit 2**. The Memorandum summarizes the potential GDEs that were identified during the GSP preparation process and then confirms that they qualify as groundwater dependent based on different lines of data. Formation then analyzed whether these GDEs could be adversely affected by groundwater withdrawals by the proposed slant wells on the CEMEX Property in the coastal zone. The Memorandum concludes that there is a correlation between groundwater levels and biomass productivity in these areas (which is a key indicator of biological health) and finds that they constitute GDEs.

On July 30, 2020, WRA prepared a report entitled "Biological Resource and Groundwater Dependency Analysis of Marina Vernal Ponds," which is enclosed as **Exhibit 3** to this letter. WRA performed an assessment of biological resources at six of the seven identified Marina ponds. WRA updated earlier findings regarding the biological resources at the ponds and evaluated water salinity and water table characteristics at each of the six pond complexes. WRA concluded that there are a variety of sensitive biological communities at the ponds and many sensitive species that occur or are expected to be present. In a critical finding, WRA concluded that "all six ponds are reliant upon groundwater and should therefore be considered groundwater-dependent ecosystems." *Id.* at 31. Moreover, given the vegetation present, "all six ponds could therefore be adversely affected by future activities that cause groundwater drawdown." *Id.*

In August 2020, two consultants submitted to the Coastal Commission written critiques of Formation Environmental's April 13, 2020 report regarding the assessment and protection of these GDEs. In a report and a letter dated August 23 and August 22, 2020 respectively, enclosed collectively herewith as **Exhibit 6**, Formation responded to these critiques. In brief, this report and letter collectively find that: (1) Formation followed an appropriate "systematic evaluation" to determine if a potential GDE should be considered groundwater dependent; (2) the Formation analysis properly relied on "the available data to assess, based on the available guidance and best available and accepted science" to make its GDE determinations; (3) a GDE is not disqualified as a GDE if it receives some surface as "most GDEs are dependent on a combination of surface and groundwater;" (4) the extrapolations made by the CalAm report

D. Protection Of Coastal Waters And Marine Resources

1. Coastal Act Section 30233 Mandates Stringent Protections

Coastal Act Section 30233 affords stringent protections to open coastal waters by only allowing "[t]he diking, filling, or dredging of open coastal waters" for specific enumerated uses. Cal. Pub. Res. Code § 30233(a). Further, Section 30233 only permits those activities if (1) "there is no feasible less environmentally damaging alternative," and (2) "feasible mitigation measures have been provided to minimize adverse environmental effects." *Id.* The Coastal Act defines "[f]easible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors." *Sierra Club v. California Coastal Com.*, 19 Cal. App. 4th 547, 555–56 (1993) (quoting Coastal Act § 30108) (internal quotation marks omitted).

Here, mitigation measures for the Project's brine effluent discharge would require "fill" activity in Monterey Bay's coastal waters. Although the Project arguably may fall under one of Section 30233's enumerated uses (a new coastal-dependent industrial facility),[2] CalAm's CDP application fails to meet Section 30233's two remaining requirements. First, the PWM Expansion provides a "feasible less environmentally damaging alternative" to the Project and its fill activity. Cal. Pub. Res. Code § 30233(a). Second, CalAm's CDP application's failure to identify the full extent of the Project's water quality impacts precludes the Coastal Commission from finding that CalAm's application provides "feasible mitigation measures . . . to minimize adverse environmental effects." *Id.*

2. Violations Of These Protections

Brine effluent is a byproduct of the Project's desalination process. CalAm plans to dispose of this brine effluent through the same outfall that Monterey One Water uses to discharge treated wastewater from its wastewater treatment facility. Staff Report, at 64. The existing outfall extends roughly 11,000 feet offshore in Monterey Bay and ends with a 1,100-foot diffuser with over 100 ports. *Id.*; Final EIR, at 4.13-23–4.13-24. Untreated, the brine effluent has the potential to impact water quality, so CalAm plans to blend it with treated wastewater from MRWPCA's wastewater treatment facility before discharging the mixture into the ocean. Staff Report, at 64. While the wastewater treatment facility discharges "about 17 mgd in the winter," that rate drops to "close to zero gallons" during the growing season when growers use the recycled water for irrigation. *Id.* In contrast, the desalination facility's output would be more consistent, generating about 9 mgd of brine effluent all year. Final EIR, at 5.5-60.

Because of the variation in discharges from the wastewater treatment facility, the Project's brine effluent would represent anywhere from not quite half to 100% of the total effluent conveyed through the outfall. Staff Report, at 64; Table 4.3-9, Final EIR, at 4.3-71.

---

[2] The City believes, for the reasons set forth in Section V(A) herein, that the Project is not a "coastal-dependent" facility.

These discharges threaten to violate the Ocean Plan's requirement "that discharges into ocean waters from seawater desalination facilities not exceed two parts per thousand over natural background salinity levels as measured no further than 100 meters from the discharge points," particularly when the brine effluent is undiluted. Staff Report, at 64; Final EIR at 4.3-68; *see also* State Water Res. Control Bd., California Ocean Plan, Chapters III.M.3 (2019) ("Ocean Plan").

The Ocean Plan outlines discharge concentration standards and monitoring and reporting requirements for desalination facilities. *See* Ocean Plan at Chapters II, III.M.3–III.M.4. To comply with these provisions, the Final EIR sets forth two mitigation measures that require CalAm "to monitor, report and reduce the water quality impact associated with potential exceedances of the Ocean Plan water quality objective to a less-than-significant level." Final EIR, at 4.13-23. These mitigation measures specifically require CalAm to construct additional monitoring infrastructure. They will also likely require CalAm to make structural changes to the diffuser. Both of these involve the placement of structures in coastal waters in violation of Coastal Act Section 30233.

First, the Ocean Plan provides monitoring and reporting requirements for new desalination facilities. *Id.* at 4.3-92 (citing Ocean Plan at Chapter III.M.4). Desalination facilities must also "submit a Monitoring and Reporting Plan to the RWQCB for approval." *Id.* CalAm's monitoring program requires installing "water quality monitoring equipment at a minimum of four locations" in Monterey Bay. *Id.* at 4.3-94. Specifically, CalAm plans to "install several monitoring buoys offshore" before it "starts discharging its effluent." Staff Report, at 65. These buoys "would include a seafloor anchor, a package of sensors, floats, and other equipment." *Id.* at 65. And CalAm would also install a telemetry buoy with additional equipment. *Id.* Accordingly, Mitigation Measure 4.3-4 requires fill activity in Monterey Bay.

Second, the Ocean Plan sets forth general water quality requirements as well as specific salinity requirements for desalination facilities. *See* Ocean Plan at Chapters II, III.M.3. Mitigation Measure 4.3-5 requires CalAm to gather data to determine whether the Project's brine effluent discharges will meet the water quality objectives "for the full range of regulated water quality constituents specified in the Ocean Plan and NPDES water quality requirements." Final EIR, at 4.3-105. If the data shows that the Project's brine effluent discharges will not meet those standards, CalAm must employ "additional design features, engineering solutions, and/or operational measures to reduce the concentration of water quality constituents." *Id.* at 4.3-105–4.3-106. The Final EIR also identifies possible additional design features and operational measures with retrofitting the existing diffuser with inclined jets being both "[t]he most effective strategy," and the "most likely to be implemented." *Id.* at 4.3-106. Retrofitting the existing outfall diffuser requires installing inclined nozzles on the diffuser's check valves and/or replacing the diffuser's end gate opening with a check valve. *Id.* at 4.3-109.

In sum, both Mitigation Measure 4.3-4 and Mitigation Measure 4.3-5 require fill activity in coastal waters. CalAm may argue that fill activity under Mitigation Measure 4.3-5 is only speculative because CalAm must conduct monitoring before determining that additional water

quality mitigation efforts are necessary. However, CalAm's failure to submit complete data regarding the Project's potential water quality impacts prevents the Coastal Commission and other agencies from conclusively determining whether modifications to the existing diffuser will be necessary to comply with water quality standards. Based on these data gaps, the Final EIR "conservatively concluded that Ocean Plan water quality objectives could potentially be exceeded during operations for some operational discharge scenarios, resulting in a significant impact." Final EIR, at 4.13-103.

The Coastal Commission should likewise assume that the Project's brine effluent discharges could exceed water quality standards and that CalAm will have to employ one or more of the designs or operational features identified in Mitigation Measure 4.3-5. Furthermore, the Final EIR found that discharges may result in cyanide and ammonia levels exceeding or coming close to exceeding water quality standards, which would also trigger Mitigation Measure 4.3-5. *Id.* at 4.3-100. Because the Final EIR notes that the most likely mitigation option is retrofitting the diffuser, the Coastal Commission should presume that the Final EIR's mitigation measures will require fill activity in coastal waters by installing monitoring buoys and retrofitting the diffuser.

The Staff Report appropriately concludes: "Any of these Project aspects -- a potential diffuser retrofit, the proposed buoy installation, or the WEKO clamp replacement -- would involve placing fill in coastal waters in the form of new of modified structures." Staff Report, at 66. However, pursuant to Section 30233, such fill is only allowable if it meets the "override" tests that (1) there is no feasible less damaging alternative, (2) feasible mitigation measures have been provided to minimize adverse environmental effects, and (3) the project qualifies as a certain type of facility. The Report concludes: "For the reasons described in those Findings [regarding the Section 30260 override], the Project does not conform to Section 30233 because there is a less feasible and less environmentally damaging alternative project that will not require fill in coastal waters and because not all mitigation has been identified and imposed." *Id.* at 66.

The City of Marina agrees with Staff that: (1) the Project does not conform to Coastal Section 30233 because the PWM Expansion is a feasible and less environmentally damaging alternative Project that will not require fill activity in coastal waters, and (2) that the mitigation test has not been met. Accordingly, the Coastal Commission must deny CalAm's CDP applications based on its failure to meet the 30233 override criteria.

E. Depletion And Contamination of Groundwater Resources

The City of Marina believes that it is critically important to preserve and protect the clean and affordable groundwater that supplies 100% of its drinking water. Since CalAm is proposing to extract groundwater underneath the City of Marina rather than seawater from underneath the ocean, and because the Subbasin within which the slant wells would extract groundwater has been designated as one of only 21 "critically overdrafted" basins in California, the Project's massive groundwater extractions are very controversial. Since state-of-the-art hydrogeologic studies demonstrate that the Project is expected to cause severe adverse impacts on the amount and quality of groundwater in the Basin, it is evident that the Project's impacts on groundwater

will be inconsistent with Marina's LCP and the Coastal Act and that the CDPs therefore should not be approved by the Commission.

Coastal Act Section 30231 states that coastal development must not deplete groundwater supplies. *See* Staff Report, at 68; *see also* Coastal Act § 30200 (protection of marine environment and water quality). These goals are incorporated into Marina's LCP. In addition, State Board Resolution 2015-0033 (¶ 29), which adopts the Desalination Amendments to the California Ocean Plan, warns of the "potentially significant impacts to hydrology and water quality" occurring from desalination plant subsurface intakes, including the potential to cause or exacerbate saltwater intrusion or alter groundwater flow to freshwater aquifers and wells. It concludes that "a proposed facility that with [sic] apparent potential to result in such impacts is unlikely to be approved." Here, the Project threatens groundwater supplies in violation of Section 30231 and is contrary to the Desalination Amendment directives. Therefore, the City agrees with Staff's conclusion that "current evidence does not support a finding that Cal-Am's proposed Project is consistent with the groundwater protection provision of Coastal Act Section 30231."

The 2019 Staff Report concluded that there was not enough evidence to support a finding that the Project is consistent with Section 30231, that the Project would likely result in greater adverse effects on groundwater resources than were previously determined; and that additional groundwater modeling is needed to identify the extent to which the Project may deplete groundwater supplies. 2019 Staff Report Addendum, at 5, 9. Critically, the Coastal Commission determined that the Project "could adversely affect more of these 'nonseawater' supplies than had been previously identified, resulting in an inability to find that the project conforms to the provision of Coastal Act Section 30231 requiring that development prevent the depletion of groundwater supplies." *Id.*, at 7.

In addition to the impacts discussed above, there are additional groundwater impact issues. As the City has previously explained in comment letters, the EIR's analysis of groundwater impacts is deficient. The Project plans to pump 15.5 million gallons of groundwater every day from the "critically overdrafted" 180/400 Foot Aquifer Subbasin. Experts predict that such pumping will have huge adverse impacts, which have not been properly assessed in the EIR, on Basin groundwater. Prior to the EIR's certification, a groundbreaking report by the Stanford University Center for Groundwater Evaluation and Management research team revealed dramatic and important new information regarding actual Basin conditions, including the presence and distribution of higher quality groundwater, gaps in the aquitards (the ground layers between aquifers), the existence of a freshwater/seawater wedge retarding seawater intrusion near the site of Project slant wells, the water volumes of the aquifers, and other current Basin conditions. The report demonstrated that the actual Basin conditions are significantly different than assumed in the simplistic and outdated model used for the Final EIR. It also revealed that Project groundwater impacts would be much more severe and widespread than previously disclosed.

In 2020, Coastal Commission Staff requested further analysis from its consultant Weiss Associates of certain specified groundwater issues. Weiss issued a report entitled "*Independent Evaluation, Modification, and Use of the North Marina Groundwater Model to Estimate Potential Aquifer Impacts Associated With The Monterey Peninsula Water Supply Project*" dated July 10, 2020 ("Weiss Report"). Based on the Commission's direction, Weiss undertook a limited review of the defined groundwater issues (time did not permit the full review that Weiss thought was necessary).

At the City's request, Formation Environmental prepared a Technical Memorandum dated August 13, 2020 which reviewed the Weiss Report ("Formation Review"). A true and correct copy of the Formation Review is enclosed herewith as **Exhibit 4**. Among other findings, Formation Environmental emphasizes that the Weiss Report indicates that the amount of fresh water captured by the Project's slant wells will be several times greater than had previously been predicted in the Final EIR for the Project. Formation Review, at 5. This finding "raises concerns about … potential impacts that were not previously evaluated," including the following:

- "Potential . . . increased and more rapid depletion of drinking water resources in the DSA [Dune Sand Aquifer] and the 180-Foot Aquifer and the potential for increased seawater intrusion into the nearshore area;"
- Potential conflicts with SGMA "caused by the increased capture and depletion of freshwater resources;"
- "Increased groundwater impacts related to operation of the Project that were not considered or evaluated in the EIR (more freshwater capture and more drawdown at GDEs);" and
- Project changes needed because of the increased replacement water volumes required to be delivered to the Castroville District. *Id.* at 5-6.

Based on the Weiss Report calculations, Formation concluded that the Project would be expected to extract about 1.5 *billion* gallons of *fresh water* each year from this "critically overdrafted" Subbasin, which is a "4-fold to 7-fold increase in the estimated volume of fresh water" compared to what was calculated in the Final EIR. *Id.* at 12. In fact, based on the limitations in the approach Weiss used, Formation believes that the actual amount of extracted fresh water may be even greater. Formation concludes: "The evaluation conducted by Weiss indicates the Project will result in potentially significant impacts to freshwater resources, water rights holders and beneficial groundwater users and uses, and could interfere with sustainable groundwater management." *Id.* at 12-13.

One very important economic issue arising from the latest Weiss Associates report is the finding that it is possible that as much as 30% of the groundwater extracted by the Project could be usable groundwater. In addition to greatly depleting this usable groundwater, this very high percentage of groundwater would require CalAm, under its Return Water Settlement Agreement, to provide Castroville with much more return water at very low rates, driving up the cost to

CalAm's ratepayers for subsidizing this water. The Staff Report (at page 72) explains this economic concern, which is of particular import to CalAm's low-income ratepayers:

> If one or two wet years result in Cal-Am's return water requirements increasing from the expected 700 acre-feet per year to a possible 2,100 acre-feet per year, this would represent a need to subsidize about a third of Cal-Am's total water production of 6,250 acre-feet per year. That subsidy, which could range from about $3,000 to $5,000 per acre-foot, would substantially increase the costs for Cal-Am to produce and distribute each unit of water it provides.

These findings in the Weiss Report, as summarized by Formation, corroborate the findings of many other experts, based on new data and analyses in the last few years, that the Project's impacts on these groundwater resources will be much greater and broader in scope than predicted in the Final EIR. The Project will cause very severe groundwater supply depletion in this critically overdrafted Subbasin in contravention of Coastal Act Section 30231 and will make the already very high cost of desalinated water substantially higher. The Project is not consistent with Section 30231 and therefore cannot be approved.

F. Public Access And Recreation

The Coastal Act and the City's LCP have numerous provisions in place to protect public access to the coast and recreation at beaches. *See* Coastal Act §§ 30210, 30211, 30212(a), 30214, 30221; LCP Policies 1, 2, and 3. These policies ensure that the public is able to access the shoreline. The Project, however, would have short and potentially long-term adverse effects that are contrary to these public access and recreation policies. Staff Report, at 81. Therefore, Marina supports the Coastal Commission Staff's recommendation to deny the CDPs.

For example, during construction, there may be temporary traffic closures or detours near the beach to allow for the installation of the slant wells and the Project's source water pipeline. Staff Report, at 80. To install the modified diffuser components for the existing wastewater outfall, boats and divers would be active in the coastal waters and this could impact fishing or other uses. *Id.* Cumulatively, these construction activities will inhibit public access and recreational opportunities and are contrary to the Coastal Act and the City LCP policies.

Furthermore, due to the installation of the required outfall liner and the proposed clamp replacement, there may also be heavy equipment on the beach, placement of barriers and protective work zones around the installation, and other measures that would prevent lateral access along the shoreline for a period during the summer. As discussed in further detail in these comments, the outfall liner was not included in CalAm's CDP application. *See* Section II herein. Therefore, the full extent of its construction impacts and possible need for mitigation measures is not yet known and constitutes an independent reason to deny the CDPs.

During operation, there may also be impacts to public access and recreation because the Project is located on the CEMEX site, which includes an active sand mining operation that does not currently provide vertical access to the shoreline. City Resolution, Finding 2-1. By

December 2020, under the completed agency enforcement actions and approved settlement agreement, the CEMEX facility will stop operating and the site will thereafter be reclaimed and dedicated to conservation and public recreational use(s).

Unfortunately, CalAm has not provided documentation to assure that public access would be preserved and what, if any, lands CalAm intends to take out from public use, based on the permanent and access easements that CalAm claims on the CEMEX site. City Resolution, Finding 2-1. With respect to these easements, their size has inexplicably enlarged over time. A 2014 Memorandum of Option Agreement provided an easement size of approximately 33.5 acres for the permanent easement and approximately 2.4 acres for the access easement. Four years later, in May 2018, CalAm entered into an Easement comprised of a permanent easement of 36 acres and an access easement of 3.5 acres. The Coastal Commission should require that CalAm account for this discrepancy and explain how it is supposedly entitled to a larger and different easement than was noticed of record as of the effective date of the CEMEX Settlement Agreement.

Although Coastal Commission Staff found it difficult to predict how the Project would impact public access and recreation due to the lack of information (Staff Report, at 81), enough is actually known about the Project's impacts on public access and recreation to conclude that it is contrary to the Coastal Act and the LCP's policies. In fact, the easements stretch across the entire dunes to the water's edge, blocking both vertical and lateral access to the shore. Without any enforceable assurances from CalAm that public access will be protected, activities from construction, fencing, maintenance, and operation could occur anywhere within this 40-acre total area.

Such activities would directly conflict with the City's plans for the area once the CEMEX site is dedicated to conservation and public recreational use(s) pursuant to the CEMEX settlement agreement. In fact, the City has worked with a landscape architect to develop a conceptual plan that would include a parking lot, educational center, boardwalk system, beach platform, and picnic area that is wheelchair and otherwise accessible to the public in this area. This area is particularly special because the City has only two flat access points to the water and this area is one of those access points. Therefore, losing access to this area due to the Project's construction and operation activities within the easement area is contrary to the Coastal Act, the City's LCP policies, and the City's plans for this area. The Project is not in conformance with Coastal Act and Marina LCP public access requirements and must be denied on this basis.

IV. Environmental Justice Considerations Mandate Denial Of These Coastal Development Permits.

The Commission Staff's environmental justice concerns form an important part of its recommendation that the Commission deny the CDPs for CalAm's Project. At the outset, Commission Staff recognizes that "[t]he Project also involves the most significant environmental justice concerns the Commission has considered since it adopted an Environmental Justice Policy in 2019." Staff Report, at 2.

The 2019 Environmental Justice Policy was carefully developed by the Commission and addresses both procedural and substantive environmental justice issues. Among other provisions, the policy states:

- **Equity**: "Equity is at the heart of the Coastal Act."
- **Equitable Access**: "The Commission will use its legal authority to ensure equitable access to clean, healthy, and accessible coastal environments for communities that have been disproportionately overburdened by pollution or with natural resources that have been subjected to permanent damage for the benefit of wealthier communities."
- **Climate Change**: "Low-income communities are more vulnerable to climate-driven water quality and supply issues that can result from seawater intrusion, contamination from extreme storm events, and drought. The Commission will take this reality into consideration when analyzing the effectiveness and the impacts of sea level rise adaptation and mitigation measures as well as implementation of those measures."
- **Avoid Disproportionate Effects**: The Commission's intent "will be to ensure that low-income communities and communities of color, and other disadvantaged communities are not disproportionately affected by water contamination or overuse, or diminished environmental services such as those provided by healthy ecosystems, fully-functioning wetlands, and clean waters and lands in the coastal zone."

These and other portions of the Environmental Justice Policy are directly implicated by the extensive coastal and other impacts that would be caused by the Project. The City commends Commission Staff for their thorough investigation of environmental justice issues, particularly for the Marina, Seaside and Castroville communities of concern. The City also appreciates the Commission's decision which allowed remote testimony from Marina City Hall for the November 14, 2019 hearing as a procedural recognition of the time and travel difficulties for members of these communities.

The Staff Report undertakes a robust analysis of environmental justice issues posed by the Project. Staff Report, at 86-101. The Report carefully identifies the pertinent communities of concern, assesses the socioeconomic and demographic characteristics of these affected communities, and then addresses their substantive environmental justice concerns. The Staff Report divides the communities of concern into two categories, which we will address in turn.

The first category of affected communities of concern are those that are within CalAm's Monterey District service area, which includes Seaside and Sand City. The Report notes that this service area "currently pay among the highest water rates in the country" and that, based on a MPWMD report, if the Project is implemented and other expected rate increases are imposed, an average residential ratepayer's water bill could nearly double by 2023. *Id.* at 93. The Report

concludes: "The Commission believes that the project will exacerbate the disproportionate burdens on low-income ratepayers as a result of rising rates from the construction and operation of the proposed Project." *Id.* at 95.

Some of the underserved Seaside residents interviewed by the Commission stated that they were concerned that the economic hardship caused by the rate increases "would eventually push them out of this currently affordable coastal community." *Id.* at 95. The Commission appropriately recognized that "[a]lthough coastal access is typically viewed through the lens of providing and protecting recreational infrastructure and other amenities for the public to visit and enjoy, viewing it through the environmental justice lens illustrates that an affordable cost of living is a fundamental part of coastal access for nearby residents." *Id.*

The second community of concern is the disadvantaged residents of the City of Marina, where most of the Project's impacts would occur. According to the Staff Report, 66% of the population of Marina are persons of color, and 33% of the City's population has income below the 200% federal poverty level threshold. *Id.* at 88-89. Further, as the Staff Report observes, "The city [Marina] has a disproportionate amount of nearby industrial development including a regional landfill, regional composting facility and regional sewage plant, all of which serve areas outside Marina. Nearby Fort Ord is a contaminated site listed on the U.S. EPA's national priorities list." *Id.* at 89. Moreover, "Marina also has a thriving culture of committed public engagement, and many residents care deeply about the future of their town." *Id.* at 90.

The Staff Report also takes a close look at the relative environmental justice Project benefits to the disadvantaged community of Castroville, which under the Return Water Settlement Agreement would receive an amount of "return water." Although the Staff found that Castroville would receive the benefit of affordable water, these benefits were more than offset by the Project detriments to other similarly disadvantaged communities. The Staff Report explained this finding as follows:

> Castroville residents would therefore be afforded a discounted rate on the desalinated water. But other Cal-Am ratepayers, many of whom are similarly disadvantaged, would absorb that cost. Those higher rates would disproportionately burden low-income ratepayers in Cal-Am's service area, including Seaside. The discount to Castroville would also not offset impacts to the underserved communities of Marina, Seaside, and others throughout the service area. Although Castroville has 3,742 individuals with income below 200 percent of the federal poverty level, the number of individuals with income below the same poverty guideline in Marina and the CalAm service area is 27,525, or approximately 7 times greater (see Table 2). Similarly, while Castroville has a larger proportion of people of color living in its jurisdiction, a greater number of people of color live throughout the service area and Marina combined (see Table 1). In other words, the benefits of this project going to one community of concern would come at the expense of the other underserved communities.

Staff Report, at 97-98.

Based on this extensive analysis, the Staff Report appropriately reached the following conclusions relating to environmental justice:

> For the reasons described above, the Commission finds that although the proposed Project would benefit one underserved community, Castroville, it will disproportionately burden a greater number of residents within communities of concern in Seaside and elsewhere within Cal-Am's service area by increasing potable water costs significantly more than the identified alternative water supply project. *The proposed Project also results in adverse coastal resource effects within the community of Marina that is already disproportionately burdened by many other industrial uses and would receive none of the project benefits. There is a long history of government institutions allowing unwanted industrial development to be concentrated in underserved communities of color without their consent. Approving yet another would perpetuate this discriminatory land use practice in Marina.*
>
> As addressed in Section II.O [of] this report, the Commission finds that the Pure Water Expansion Project is a feasible alternative to the proposed Project with fewer environmental justice impacts than Cal-Am's Project. It would provide adequate current and future water supplies to meet the area's water needs in a more affordable manner and would also eliminate adverse coastal impacts and reduce environmental justice concerns consistent with the Commission's Environmental Justice Policy and Coastal Act Sections 30604(h) and 30107.3.

Staff Report, at 101.

As a result of these and many other adverse project impacts on these communities of concern discussed herein, the City agrees with the Coastal Commission Staff recommendation that the "appealed" and "consolidated" coastal development permits sought by CalAm should be denied.

V. The Project Fails To Qualify For An "Override" Under Coastal Act Section 30260.

Coastal Act Section 30260 authorizes a local coastal agency or the Coastal Commission to authorize certain types of industrial facilities that are inconsistent with Coastal Act policies if they can meet four stringent criteria. Specifically, Section 30260 provides that "new or expanded coastal-dependent industrial facilities" can be permitted if the following tests are met:

> (1) alternative locations are infeasible or more environmentally damaging; (2) to do otherwise would adversely affect the public welfare; and (3) adverse environmental effects are mitigated to the maximum extent feasible.

Thus, to qualify for a Section 30260 approval, which essentially overrides inconsistencies with LCP and Coastal Act policies, a project must satisfy each of four tests:

- That the Project qualifies as a "coastal-dependent industrial facility;"
- That alternative locations are infeasible or more environmentally damaging;
- That failure to authorize the Project at the CEMEX site "would adversely affect the public welfare;" and
- That adverse environmental effects are "mitigated to the maximum extent feasible."

The Marina Planning Commission, in its March 7, 2019 decision denying the CDP for the Project, found that the Project fails to meet any of these four tests. The 2019 Coastal Commission Staff Report agreed that the Project does not qualify for a permit under the Section 30260 "override" provisions. The Staff Report disagreed with Marina and found that the Project qualifies as a "coastal-dependent industrial facility," but agreed with Marina that the Project does not meet any of the three alternatives, public welfare, or maximum mitigation tests. 2019 Staff Report, at 101-105. We will examine each issue below.

A. Not A Coastal-Dependent Industrial Facility

The City agrees that the Project as a whole qualifies as an "industrial facility," but as the Planning Commission Resolution reflects, the City believes that it is not a "coastal-dependent" facility. The Coastal Act and the City's LCP do not define the term "coastal-dependent industrial facility." The only helpful legal guidance on point is provided in Coastal Act Section 30101, which defines the broader term of "coastal-dependent development or use" as "any development or use which *requires* a site on, or adjacent to, the sea to be able to function at all." (Emphasis added.)

The Planning Commission explained its reasoning as follows:

> The proposed Project does not qualify as a "coastal dependent industrial facility." Although it was originally envisioned as a facility that would draw seawater from beneath the ocean floor, the location of the proposed slant wells was moved landward during the time that the application was pending at the CPUC. At the present time, the slant wells are proposed to be drilled into two groundwater aquifers within the Salinas Valley Groundwater Basin (the Dune Sand Aquifer and the 180-foot Aquifer) that are located beneath Marina land and it appears that no or only a tiny fractions of the screened portions of the wells are seaward of the mean high water mark. Rather than being dependent on the extraction of seawater from beneath the ocean floor, these wells are designed to extract brackish groundwater contained within this groundwater basin that would be desalinated for drinking water purposes.

As the Planning Commission further explained, the Project does not have an open ocean intake which requires it to be located right on the ocean, its slant wells do not extend under the

ocean, and the seawater intrusion maps developed by the County reflect that brackish water extends inland as much as five miles from the coastline. In these circumstances, where the Project is only planning to process brackish groundwater, it is not a facility "which requires a site on, or adjacent to, the sea to be able to function at all." Rather, as the Planning Commission found, "[g]iven all of these undisputed facts, this Project could function in any of the many locations within the Basin in which saline intrusion has occurred." *Id.*, Finding 5-3.

The Staff Report analysis on this point is unpersuasive. The Report states that the proposed well field is located to "extract primarily seawater from beneath the seafloor and the shoreline of Monterey Bay" and that the source water pipeline must be here to transport the water from these slant wells. Staff Report, at 149. To the contrary, as Planning Commission Finding 5-1 explains, the undisputed facts reflect that the slant wells do not go beneath the seafloor and they do not need "seawater" to operate. Rather, they are designed to process brackish water and in fact will be significantly cheaper to operate if the salt content is lower. The source water wells could be located away from the coastline within the dozens of square miles of saline groundwater within the seawater intrusion zone, thereby avoiding all coastal impacts. Since the wells would be in another location, the source water pipeline would not be needed within the coastal zone either.

For all of these reasons, the Project is not eligible for a Section 30260 override because it does not qualify as a "coastal-dependent industrial facility."

B. A Feasible And Less Environmentally Damaging Alternative Is Available

A Section 30260 "override" can only be granted if "alternative locations are infeasible or more environmentally damaging." Similarly, Coastal Act Section 30233 (which authorizes an "override" when fill is occurring in ocean waters if three criteria are met) provides that it is only allowed "where there is no feasible less environmentally damaging alternative."

The Staff Report includes a very detailed analysis of the feasible and viable alternative of the expansion of the Pure Water Monterey Project ("PWM Expansion"). As the Staff Report recognizes, the Commission "now has an independent obligation to consider alternatives to the project based on current information." Staff Report, at 107. To do so, the Report takes a close look at the original PWM project and the proposed PWM Expansion and undertakes a comprehensive comparison of the proposed Project and the PWM Expansion in the areas of feasibility, water supply and demand, project objectives, adverse environmental impacts, and areas of uncertainty. *Id.* at 109-46.

The Staff Report concludes that both the PWM Expansion and CalAm Project are feasible, with the PWM Expansion having clear and significant advantages in ratepayer costs (only one-third the price for water), almost no environmental impacts, and no environmental justice impacts. *Id.* at 109-15. In terms of water supply and demand, the Report determines that "[a]lthough Cal-Am's desalination facility would provide more water than would the Pure Water Expansion, *either project, when combined with Cal-Am's other available water sources, would provide more than adequate water supplies for the current and expected future demands* and

would allow the water system to conform to the state's design and capacity requirements." *Id.* at 115 (emphasis added). The Report also essentially concludes that both projects would meet the EIR Project objectives and criteria. *Id.* at 133-40.

The Report concludes that the PWM Expansion has far fewer adverse environmental impacts than CalAm's Project. It states: "the Cal-Am Project would have significant adverse effects on several coastal resources, including environmentally sensitive habitat areas and endangered or threatened species.... Its effects on marine life and ocean water quality have not yet been determined. The Pure Water Expansion would have few, if any, adverse effects on coastal resources, as it would be located entirely outside of the coastal zone and would be constructed largely on an existing industrial site. It would also be greenhouse gas neutral, as it would use electricity generated from landfill gasses." *Id.* at 140. Both projects were found to have various uncertainties. *Id.* at 141-45.

The Staff Report concludes, based on this extensive 40-page analysis, as follows:

> Staff believes, after weighing the evidence in the record at this time, that the Pure Water Expansion is a feasible alternative to Cal-Am's Project, will allow Cal-Am to cease its illegal water withdrawals from the Carmel River and meet the region's water needs, and is the preferable, least environmentally damaging alternative. The Pure Water Expansion would also result in fewer environmental and economic burdens to the communities of concern within Cal-Am's service area, would avoid environmental burdens to the City of Marina, and appears to have fewer significant hurdles to clear before it could be implemented. ... *Staff recommends finding that the Project is inconsistent with relevant Coastal Act and LCP policies and that the Commission may not approve the project despite those inconsistencies because the PWM Expansion is a feasible, less damaging alternative that will adequately provide water and protect the public welfare.*

Staff Report, at 3-4 (emphasis added).

The City agrees completely with these findings, which are supported by myriad documents in the Commission record developed over the last 18 months. The City wants to emphasize that the PWM Expansion also is correctly sized for the anticipated demand of CalAm's Monterey District for at least the next 24 years and likely many years beyond that. In September 2019, the General Manager of the Monterey Peninsula Water Management District issued a new report analyzing the latest water supply and water demand figures for this service area. The Report found that the PWM Expansion, combined with the other assured water supply sources other than the CalAm desalination project, would meet all anticipated future water demand until at least 2043 and under almost all scenarios for decades thereafter. This significant new information, prepared by the agency with the expertise to make this determination, demonstrates that this is a feasible alternative with significantly fewer environmental impacts than CalAm's Project.

The City of Marina asked a well-known water demand and supply expert, Dr. Lon House of Energy and Water Consulting, to provide a peer review of a water demand/supply report prepared by the Monterey Peninsula Water Management District ("MPWMD") in September 2019 and then updated in December 2019 and March 6, 2020, and to respond to a report prepared by a CalAm consultant that criticized the MPWMD report. Dr. House's Report dated April 2020 is enclosed herewith as **Exhibit 5**.

At the outset, Dr. House observed that MPWMD is the agency charged by the California Legislature with making these water supply/demand determinations. Its enabling legislation requires it to file annual reports on present and future water demand and supply in this district. Water Code Appendix § 118-350(b). He then examined the MPWMD demand and supply projections and found them to be reasonable and accurate and consistent with his own calculations. He concluded that "the expansion of the Pure Water Monterey project will meet area water demands through 2050 and at lower water rate impacts than the MPWSP." *Id.* at 13.

Dr. House also addressed a key issue that is often lost in water supply/demand debates: the interrelationship of water price and water demand. *Id.* at 10-12. He first observes: "MPWSP desal water is very expensive, running 22 times as much as the most expensive current supply (Carmel River) and 3 times as much as PWM Expansion water." He then notes that the MPWSP is composed primarily of fixed costs, estimated at over $30 million per year, that will need to be recovered no matter how much water it produces. If, as expected, the desalination plant is running far below capacity, the price of the water will become increasingly expensive due to the fixed costs, such that if only 1,500 afy of water is produced in a year, CalAm ratepayers will need to pay the equivalent of over $21,000 per acre foot, which is more than three times the already very expensive cost of about $6,000 per acre foot if full capacity is reached. These astronomical costs will hit low income customers particularly hard.

Dr. House concluded as follows: "The MPWSP is simply too expensive water. Adding a capital project that costs an additional $30M annually regardless of whether it operates or not and costs about $1,255 per af when it does operate presents an unacceptable burden on the area, particularly when there are less expensive options available that will meet area water demands." *Id.* at 13.

C. Public Welfare Balance Compels Denial

The Staff Report undertakes a robust and balanced evaluation of the public welfare implications of the Project. The Report acknowledges CalAm's need for a new water supply and explained the requirements of the Cease and Desist Order first issued by the State Water Resources Control Board in 1995.

However, the Report also carefully examines key countervailing public welfare concerns, including the end of CEMEX sand mining, the availability of the feasible PWM Expansion, the significant environmental justice issues summarized in great detail by the Report, and the avoidance of groundwater resource impacts. *Id.* at 151-152. For all of these reasons, the Report, concludes that "denying the proposed project would not adversely affect the public welfare."

On the contrary, denying the project "is likely to lead to implementation of a project alternative that would benefit the public welfare." The project therefore does not meet the second test of Section 30260. Staff Report, at 152-53

We will briefly address and provide a little more context in each of these areas. At the outset, it is important to note that the "public welfare" determination is fairly unique to Coastal Act determinations. The Final EIR for the Project and the CPUC permit decision did not make any determination regarding whether and how the Project would affect the "public welfare." Rather, it is up to the local coastal agency and the Coastal Commission to make this determination in the coastal development permit context.

The Marina Planning Commission, in its denial decision, made the following analysis of the individual components of the public welfare impacts of the Project on the City:

> (1) the City will bear the primary burden of the construction and operation of the Project, but will not receive any desalinated water that the Project produces; (2) the Project threatens the integrity of the groundwater basin on which the City is 100% dependent upon for its drinking water; (3) the Project would permanently destroy important ecosystem ESHA on which many species depend; (4) the Project threatens to completely undermine the decades-long efforts by the City to end the destructive sand mining operations on the CEMEX site in favor of conservation and recreation, and would be replaced by yet another environmentally impactful use; (5) the Project would greatly impair the business environment and social fabric of the Marina community; and (6) the Project would have other impacts on public access and coastal resources discussed above.

The Settlement Agreement that will end the CEMEX sand mining by December 2020 is a very important factor in both the Staff Report denial recommendation and Marina Planning Commission CDP denial for the Project. Marina was involved for decades in efforts to end the sand mining activities on the CEMEX site, which was an environmentally destructive use of these resources. In 2017, after combined enforcement actions by the Coastal Commission, the City and the State Lands Commission, a comprehensive settlement agreement was entered into with RMC Pacific Minerals, doing business as CEMEX, to end this use.

The environmental justice impacts of the Project, addressed in great detail in the Staff Report (pages 68-76), also provide a compelling reason for finding that denying the requested permits would not adversely affect the public welfare, but in fact would promote it. The Marina Planning Commission made the following public welfare findings in this context:

> The Planning Commission finds that adverse environmental justice impacts on Marina would also be significant. The City is a unique community, with a working-class ethnic population, many of whom do not read or speak English. It is a "disadvantaged community" under federal and state definitions, with a census track that is one of the most burdened in the State. The Planning Commission

also finds that the Project would impose an unfair and disproportionate burden on Marina.

Due to its illegal extraction/diversion of water from both the Seaside Basin and Carmel River, CalAm has been ordered to reduce (Seaside Basin) or eliminate (Carmel River) its water use from these sources. However, it is important not to substitute the adverse impacts of this historic unlawful activity with a Project that causes a new set of environmental depredations on another community (Marina). The Monterey area needs a regional water solution that does not impose major social, cultural, economic and environmental impacts on certain communities for the benefit of others, and this is an overriding imperative for the entire region.

For all of these reasons, the City continues to fully support the determination in the Staff Report that the Project does not meet the "public welfare" prong of the Section 30260 "override" test, therefore compelling denial of an override for these requested CDPs.

D. No Mitigation To The Maximum Extent Feasible

The third of the stringent Section 30260 "override" tests is that the adverse environmental effects of the Project must be "mitigated to the maximum extent feasible." Under the City's LCP, these impacts must be "fully mitigated." Although the Staff Report states that there is no need to reach this third test because the first two Section 30260 tests are not met, the Staff Report concludes that "the Commission finds that the project does not meet the third test of Section 30260." Staff Report, at 153.

The Staff Report bases this determination on (1) the Project's ESHA impacts ("the Project's adverse effects on ESHA could be fairly extensive – up to about 35 acres of terrestrial ESHA – yet Cal-Am's currently proposed mitigation strategy would result in a net loss of ESHA"); (2) the Project's inconsistencies with the City LCP's coastal hazards provisions; (3) the outfall liner impacts which have not yet been fully evaluated; and (4) the Project's impacts and necessary mitigation measures on groundwater resources.

As explained above, in June 2020, CalAm submitted an HMMP to Coastal Commission Staff which it believes is appropriate to mitigate the Project impacts to the coastal ecosystems. However, as the City's coastal consultant, Dr. Mike Josselyn, determined in his expert report enclosed as **Exhibit 1** herein, this HMMP is woefully deficient in multiple respects and fails to meet the "maximum mitigation" standard required for a Coastal Act Section 30260 override determination. Accordingly, this key override test is not met.

In sum, the City strongly agrees with the findings in the Staff Report which demonstrate that the Project's adverse impacts have not been mitigated to the "maximum mitigation" and "fully mitigated" standards required by Section 30260.

VI. New Information of Substantial Importance Exists.

The Coastal Commission is a responsible agency pursuant to CEQA. CEQA Guidelines § 15096. Therefore, it must analyze the previously prepared EIR, which was prepared by the CPUC and MBNMS, and reach its own conclusions on the EIR's adequacy and whether it should approve the project. *Id.* at § 15096(a). Additionally, if the Coastal Commission were to approve the Project then it is required to consider alternatives and mitigation measures that would mitigate or avoid the direct or indirect effects of the Project. CEQA Guidelines § 15096(g)(1). Indeed, the Coastal Commission is *prohibited* from approving a project if it "finds any feasible alternative or feasible mitigation measures within its powers that would substantially lessen or avoid any significant effect the project would have on the environment." CEQA Guidelines §15096(g)(2); *see also RiverWatch v. Olivenhain Municipal Water Dist.,* 170 Cal. App. 4th 1186, 1207 (2009) ("if a responsible agency approves all or part of a project without first considering an EIR that has been or is being prepared by the lead agency and without making required findings, the responsible agency has not complied with CEQA and its approval must be set aside"). But the Coastal Commission is also within its power to deny the Project "in order to avoid direct or indirect environmental effects of that part of the project which the Responsible Agency would be called on to carry out or approve." CEQA Guidelines §15042.

Here, Coastal Commission Staff recommends that the Commission *disapprove* the CDPs and the City of Marina supports this conclusion. If the Commission denies the Project, then the Coastal Commission will not be called upon to consider new information that has come to light since the Final EIR was certified. With a denial, the Coastal Commission also will not be required to consider alternatives or mitigation measures within its powers which are feasible and would substantially lessen or avoid any significant effect of the Project, adopt findings for those impacts within the scope of its jurisdiction, or adopt a reporting or monitoring program and/or a statement of overriding consideration. CEQA Guidelines §§ 15043, 15093, 15096; Pub. Res. Code § 21081.6.

However, if the Coastal Commission *rejects* staff's recommendation and decides to *approve* the Project (which it should not), it is required to conduct subsequent or supplemental environmental review before it approves the CDPs. This is because new information of substantial importance exists. In particular, the CEQA Guidelines explain that a subsequent or supplemental EIR must be prepared if, based on substantial evidence in light of the whole record, one or more of the following events occur:

> (1) Substantial changes are proposed in the project which will require major revisions of the previous EIR due to the involvement of new significant effects or a substantial increase in the severity of previously identified effects;
>
> (2) Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

> (3) New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the negative declaration was adopted, shows any of the following:
>
> > (A) The project will have one or more significant effects not discussed in the previous EIR or negative declaration;
> >
> > (B) Significant effects previously examined will be substantially more severe than shown in the previous EIR;
> >
> > (C) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or
> >
> > (D) Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

CEQA Guidelines § 15162.

Here, substantial evidence shows that the Project may have one or more significant effects not discussed in the CPUC's Final EIR and that a feasible alternative exists that would substantially reduce one or more significant effects on the environment; therefore, at least two of the triggering conditions in Section 15162 have occurred. CEQA Guidelines § 15162 ("no subsequent EIR shall be prepared for that project unless the lead agency determines, on the basis of substantial evidence in the light of the whole record, one of more of the following [triggering actions has occurred]"); § 15164 ("The [agency's] explanation [to not prepare a subsequent EIR pursuant to Section 15162] must be supported by substantial evidence."). In such situations, case law makes clear that the requirement to perform subsequent or supplemental review is mandatory: "[i]f qualified new information thereafter develops, a supplemental or subsequent EIR must be prepared in connection with the next discretionary approval, if any." *Fort Mojave Indian Tribe v. Department of Health Services,* 38 Cal. App. 4th 1574 (1995).

To be specific, there is new information of substantial importance regarding (1) the feasibility of the PWM Expansion project, (2) impacts to the groundwater basin, and (3) Project impacts to Marina's vernal pools and coastal wetlands. CEQA Guidelines §§ 15162, 15163. First, new information demonstrates that the PWM Expansion is a feasible alternative to CalAm's Project. A recent analysis by the Monterey Peninsula Water Management District reflects that the PWM Expansion is not only feasible but also the superior project. It would provide sufficient water for this service area for the next two decades, it would produce water at one-third of the cost of expensive desalinated water, it would have virtually no environmental impacts, and it can be on-line before CalAm's Project. In light of this new information of

substantial importance, the Coastal Commission should find that the PWM Expansion project would need to be evaluated in a subsequent or supplemental EIR.

Second, significant new information has emerged about the Project's impacts to Basin groundwater. Indeed, the Coastal Commission's independent review of groundwater impacts found that the Project would likely result in greater adverse effects on groundwater resources than were previously determined. 2019 Staff Report Addendum, at 5, 9. This constitutes significant new information that must be analyzed in a subsequent or supplemental EIR.

Third, as described in detail in Section III(C) herein, the Project is expected to have extensive impacts on Marina's nearby protected vernal ponds and wetlands.

Also, there is new information about the landward groundwater gradients that will dominate regional groundwater flow throughout the life of the Project. To be clear, recent data apparently shows that the hydraulic gradient has switched from landward to seaward and, with this switch, significant groundwater impacts likely would result. However, the CPUC disregarded this significant new information about the landward groundwater gradient and the resulting impacts. Here, to the contrary, the Coastal Commission should conclude that subsequent or supplemental review is necessary to analyze the new information relating to groundwater impacts. CEQA Guidelines § 15162.

In short, the Coastal Commission should find that there is significant new information that has developed since the CPUC certified the Final EIR. As a result, if the Coastal Commission decides to approve the CDPs (and it should not), then it must prepare a subsequent or supplemental EIR to evaluate the PWM Expansion project as a feasible alternative, the Project's impacts to groundwater, and the Project's impacts on these coastal wetlands. Further, subsequent or supplemental review must occur before any approval. Failing to do so will amount to an abuse of discretion for failure to proceed in a manner required by CEQA. Pub. Res. Code Sections 21168, 21168.5.

VII. The Project Would Interfere With The Coastal Commission's Affirmative Public Trust Duty To Protect The Coast.

The public trust doctrine creates an affirmative and ongoing fiduciary duty in all California public agencies, including the Coastal Commission, to protect and preserve public trust resources for the benefit of all Californians and future generations. *National Audubon Society v. Superior Court*, 33 Cal. 3d 419, 446 (1983) ("The state has an affirmative duty to take the public trust into account in the planning and allocation of water resources, and to protect public trust uses whenever feasible."); *see also Marks v. Whitney*, 6 Cal. 3d 251 (1971) (public trust protects environmental and recreational values).

The doctrine is well suited to accommodate changing public needs. It has evolved to include "not just navigation, commerce, and fishing, but also the public right to hunt, bathe or swim." *San Francisco Baykeeper, Inc. v. State Lands Commission,* 242 Cal. App. 4th 202, 233 (2015) (internal quotation and citations omitted). As the Court in *San Francisco Baykeeper*

consisting of wetlands and vernal ponds -- connected to and supported by the Dune Sand Aquifer could be impacted by the Project's operations. As discussed in the Draft GSP, Chapter 3.2.6.1.2, nearby potential GDEs include "riverine wetlands and riparian habitat along the banks of the Salinas River, and palustrine and emergent wetland areas that are seasonally flooded in depressions south in the City of Marina. Furthermore, despite the GDEs sometimes seasonal nature, they are considered coastal wetlands and they provide habitat and cover for migratory waterfowl and a number of animals, including the endangered black legless lizard." *Id.*

The hydrological conditions in the Dune Sand Aquifer, and possibly the 180-Foot Aquifer, are akin to those in the *Environmental Law Foundation* case. Thus, the court's holding (that the public trust doctrine applied to the groundwater that was hydrologically connected to surface water) is directly applicable here. As such, the Coastal Commission is under a duty to protect the resources sustained by the interconnected groundwater that the Project will likely adversely impact. *San Francisco Baykeeper, Inc.*, 242 Cal. App. 4th at 233; *see also National Audubon Society*, 33 Cal. 3d at 446. The public trust would be best served by denying the CDPs.

VIII. The Project Is Fatally Flawed Because It Lacks Any Current Water Rights And Has No Reasonable Or Accepted Path Forward To Obtain Such Rights.

It is undisputed that the Project lacks any current water rights to extract groundwater from the Basin. CalAm has no overlying water rights, no existing appropriative rights, and no existing prescriptive groundwater rights for the Project in the Basin. Indeed, it has no accepted future path forward to obtain any *overlying* water rights because it will not be using the water on land it owns within the Basin. It also is barred from establishing future *appropriative* water rights in "surplus water" because it is undisputed that this basin is "critically overdrafted." Finally, since the Sustainable Groundwater Management Act ("SGMA") bars appropriators from obtaining *prescriptive* water rights in high priority basins after January 1, 2015, CalAm missed the deadline for establishing future prescriptive rights in the Basin.

CalAm also does not have any recognized permit path forward to obtain such water rights. Instead, CalAm apparently plans to assert at a later time that it is creating "salvaged water" or "developed water," which is "surplus" to the water currently in the Basin and which, therefore, supposedly will be available. That claim is based on CalAm's unsupported belief that any groundwater in which the Total Dissolved Solids ("TDS") exceed 500 milligrams per liter ("mg/l") is "waste" because it supposedly is not available for "beneficial uses" by Basin users. CalAm cannot identify even one case in which water rights have been established on a salvaged/developed water theory involving brackish groundwater.

There are also many other fatal flaws in CalAm's assertion. First, this analysis ignores the State Water Resources Control Board's Resolution No. 88-63, which states that *all* groundwater in the State (regardless of its TDS concentration) is presumptively considered suitable or potentially suitable for the drinking water beneficial use and it establishes a 3,000 mg/l threshold of TDS for determining suitability. The groundwater that CalAm hopes to extract is thus suitable or potentially suitable for this beneficial use and cannot constitute "waste." Moreover, the State Board does not classify brackish groundwater as "waste." Rather, "waste" is

defined as "sewage and any and all other waste substances [...], associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation, including waste placed within containers of whatever nature prior to, and for the purposes of, disposal." Cal. Water Code § 13050(d). Brackish groundwater is not "waste."

Even if CalAm could articulate a recognizable legal theory to obtain a water right (which it cannot), its attempt to establish the right will be barred because it cannot meet its burden to prove that the Project "will not harm or cause injury to any other legal user" of the groundwater. This "no injury" rule has been a bedrock principle of California surface water and groundwater law since the 1800s. A landmark California Supreme Court case applied the "no injury" rule to exports from groundwater basins. *Allen v. Cal. Water and Tel. Co.*, 29 Cal. 2d 466 (1946). In short, CalAm's future ability to establish a future water supply is completely speculative and almost certain not to be established because of the lack of current water rights, the overdrafted state of the Basin, the lack of any recognized basis for the supposed future right, the dramatic impact of SGMA, and the multitude of state water rights legal requirements that will prevent establishment.

Finally, the groundwater withdrawal and export restrictions that apply to the CEMEX property where the slant wells would be drilled bar the Project's proposed groundwater extractions and export. In 1996, the owner of the CEMEX property entered into an Annexation Agreement and Groundwater Mitigation Framework for Marina Area Lands that limits future groundwater extractions from the CEMEX property to 500 afy and bans any export of the groundwater to users outside the Basin. These restrictions are binding on all successors and assigns. The Project's proposed extractions of 17,300 afy and its export of almost all of the produced water clearly violate these restrictions. The City of Marina has filed litigation addressing this issue in Monterey County Superior Court, and this litigation is currently pending.

IX. Conclusion

For all of the reasons set forth above, the City of Marina fully supports the recommendation of Coastal Commission Staff, in its August 25, 2020 Staff Report, that the Commission deny the appealed and consolidated coastal development permits sought by CalAm for the Project. Although a considerable amount of new information has been developed by or submitted to Commission Staff over the ten months since the November 2019 hearing in this matter, this information fully supports and does not change the key underlying Coastal Act and Marina LCP considerations that led to the original Staff denial recommendation.

The Project continues to be fatally inconsistent with Coastal Act and City of Marina LCP policies regarding ESHA protection, coastal hazards, wetland protections, groundwater depletion, public access and marine resource protection. It violates many of the basic principles

of the Coastal Commission's new Environmental Justice Policy. It fails to meet any of the stringent tests to receive an override under Coastal Act Sections 30260 and 30233. In sum, the Coastal Commission must deny these Coastal Development Permits.

Very truly yours,

Paul P. "Skip" Spaulding, III

ANALYSIS OF CAL-AM HABITAT MITIGATION AND MONITORING PLAN
Monterey Peninsula Water Supply Project
Appeal to Coastal Commission on City of Marina LCP Denial
A-3-MRA-19-0034

Prepared for

City of Marina
211 Hillcrest Avenue
Marina, CA 93933

July 29, 2020

Purpose

The purpose of this report is to provide the City of Marina (City) with a technical review of the Habitat Mitigation and Monitoring Plan as submitted to the Coastal Commission in June 2020 for the Monterey Peninsula Water Supply Project (MPWSP or Project).

Background

The MPWSP is a desalination project proposed by Cal-Am that involves the installation of slant wells and ancillary infrastructure within Primary and Secondary Habitat constituting Environmentally Sensitive Habitat Areas (ESHA) within the jurisdiction of the City of Marina's LCP. The City of Marina Planning Commission denied a Coastal Development Permit (CDP) for the Cal Am Project, finding that the Project was inconsistent with the applicable coastal land use plans and Coastal Act requirements. The City's denial was based on a number of findings, including the lack of sufficient mitigation to meet the City's policy that industrial projects within Primary and Secondary Habitat, if allowed, be "fully mitigated". Cal-Am subsequently appealed the City's decision to the California Coastal Commission. The CCC staff prepared a report (Staff Report) on October 28, 2019 that recommended denial of the CDPs for the proposed Project facilities within the coastal zone. A public hearing was held by the CCC on November 14, 2019, but no action was taken by the Commission.

The proposed Project, as described in the Staff Report, has significant impacts to Environmentally Sensitive Habitat Areas, is inconsistent with the Coastal Hazards provision of the City of Marina's LCP, and there is an alternative to the proposed project that is feasible and less damaging. The Staff Report found that the Project did not qualify for approval under Section 30260 of the Coastal Act under the two of three tests because there is a feasible and less damaging alternative to the Project using the Pure Water Monterey Expansion water supply project and because denial of the Project would not harm public welfare and in fact, would result in excessive burdens to City of

Marina citizens and some ratepayer communities, many of whom are communities of color and low income.

The Staff Report determined that the third test, where the proposed project's impacts were mitigated to the maximum extent feasible, was not met; however, the staff deferred any detailed review on this requirement Section 30260 because the project failed the first two tests. The City of Marina denied Cal-Am's application due, in part, to the refusal of the applicant to provide a Habitat Mitigation and Monitoring Plan (HMMP) and a Long Term Management Plan (LTMP). The Commission Staff Report found that the City was within its authority to require such documentation and that mitigation required under the Coastal Act can be significantly more than under CEQA. The Coastal Commission cannot make a determination under (1) Section 30260, or (2) for the appeal of the City CDP decision under the "fully mitigated" standard specified in the City's Local Coastal Program (LCP), without an HMMP that contains the information that the Coastal Commission's incomplete notice requested from Cal Am.

The Staff Report found that the "mitigation strategy" document as submitted by Cal-Am with its application was not consistent "with Commission guidance and past approvals" as to what is required to provide adequate mitigation. The Staff Report found a number of inconsistencies, including reliance on an "in-lieu fee approach"; the strategy only dealt with impacts at the CEMEX site; the areas proposed for mitigation are currently undisturbed and functioning dune habitat; the proposal would result in a net loss of habitat acreage; and permanent and temporary impacts could total up to 35 acres.

Significance of Flandrian Dune Habitat and Need for Robust Mitigation Plan

The Project is proposed within a unique and very significant coastal dune habitat known as Flandrian dunes. The Coastal Commission considers this habitat as ESHA and the City categorizes it as Primary Habitat with equivalent protections to ESHA. Flandrian dunes are a unique habitat bordering Monterey Bay. This habitat has developed on large sand dunes that shift over time by wind and wave action. It once covered extensive areas of the coastline in Monterey Bay south of the Salinas River. Sand mining, development, and recreational use have severely impacted these coastal dunes. In addition, the encroachment of non-native (exotic) species planted for erosion control, such as iceplant and Holland dune grass, have severely affected its diversity.

The presence of over 30 special status species, including seven plants and four animal species listed as threatened or endangered, at this location within the Flandrian dune habitat and their complex linkages justify considering the entire coastal dune habitat as an Ecosystem ESHA (WRA 2019). Compensatory mitigation for individual species is largely inadequate when considering how to restore an entire ecosystem. Rather, mitigation for such ecosystem-level ESHAs must consider the foundational aspects of the habitat as well as the interactions between species. Due to the difficulty of restoring these types of ecosystem-level ESHAs, avoidance of these sensitive habitats must be given the highest priority when evaluating projects. If impacts are unavoidable, measures that minimize impacts to the habitat are preferred. Only after such consideration will compensatory mitigation that replaces lost habitat be evaluated. A robust HMMP is necessary for the Coastal Commission to accomplish each step of this mitigation analytical framework.

The applicable Coastal Commission LCP update guide (2013) states that Natural Resource Components of LCPs should include "requirements for ensuring complete and detailed restoration and monitoring plans for projects involving habitat mitigation and restoration" (CCC 2013). It is also typical for the Coastal Commission to require preparation of HMMPs, Restoration Plans, or comparable documents during its review of a project, particularly for controversial projects or projects involving impacts to federal and/or state listed species. It is critically important for the Coastal Act permitting agency to have the necessary biological foundation to be able to evaluate the adequacy of the mitigation action.

Given the importance of Flandrian Dune habitat in the region, a specific restoration and/or creation plan must be provided that takes degraded or non-ESHA habitat and restores it to the quality that is required to assure that the ecosystem processes that occur within this habitat are replaced and fully mitigated. These Coastal Act requirements are more stringent than a CEQA level mitigation to reduce the Project's impacts to less than significant levels.

Another reason why habitat replacement is necessary is that the area where the permanent impacts for the well sites and access road are occurring was designated in the CEMEX settlement agreements (which settled the combined enforcement actions of the Coastal Commission, the City, and the State Lands Commission) as an area where the CEMEX Reclamation Plan would restore native dune habitat. In other words, in the absence of the Applicant's Project, the three public agencies have already been assured that this area would be dune habitat in the future. The net loss of habitat, if Applicant's Project is allowed, must be replaced in kind elsewhere. There are, in addition, indirect impacts associated with the Project in that the proposed Reclamation Plan will need to be revised to allow for stabilization of dunes in the areas surrounding the wells and the roads. Given the natural forces that shape the dunes and create conditions suitable for specific plant and animal species, these indirect effects also need to be mitigated.

Under both the Coastal Commission and City LCP requirements, a Long Term Mitigation and Monitoring Plan (LTMP) must also be prepared and submitted. Given the known threats to dune habitats in the region from invasive plants, actions are needed to manage these habitats over the long term to assure their viability.

WRA Review

WRA performed a Technical Review of the MPWSP project and its impact on Primary and Secondary Habitat for the City on February 7, 2018 and prepared comments to the Coastal Commission dated October 17, 2019. The reviews found numerous inadequacies in the application materials and the complete failure of the Project to meet the standards for adequate mitigation as required by the City and the CCC. Among other findings, WRA determined that the total "fully mitigated" habitat area within the City's LCP jurisdiction that needed to be replaced was 50.72 acres (Table 1). Cal-Am did not provide a HMMP or LTMP to the City (in early 2019) or the CCC (in fall 2019) that met the standards of either agency.

Table 1. Primary and Secondary Habitat Recommended Habitat Replacement Ratios (WRA 2019)

Resource	Area of Impact (acres)	FEIS/FEIR Mitigation Ratio / Area (acres)	Recommended Fully Mitigated Habitat Replacement Ratio / Area (acres)
Primary habitat – permanent impacts	2.21 acres	2:1 ratio 4.42 acres	3:1 ratio 6.63 acres
Primary habitat – temporary impacts	6.45 acres	1:1 ratio 6.45 acres*	3:1 ratio 19.35 acres
Secondary habitat – temporary impacts	12.37 acres	1:1 ratio 12.37 acres *	2:1 ratio 24.74 acres
Total	21.03 acres	23.24 acres	50.72 acres

*Temporary impacts proposed to be restored in place

In June 2020, the MPWSP submitted an HMMP to the California Coastal Commission. WRA has reviewed that HMMP and provides the following comments to the City and Commission staff:

Lack of Overall Management Plan for Restoration

The proposed project will occur on property that is subject to protection under a Consent Settlement Agreement and Cease and Desist Order (Agreement) and related agreements signed in June 2017. The parties to the Agreement (CEMEX, City of Marina, and Coastal Commission) determined that the property, including the area proposed under the HMMP, will be sold at a reduced price to an entity approved by the Coastal Commission that will commit to holding and managing the site for conservation purposes and other allowable uses. At this time, there is no indication that funding and management of the property will not occur as anticipated in the Agreement.

If the property is purchased by the State, any activities proposed in this HMMP would be subject to approval by the State and the land subject to lease to MPWSP should it be permitted to undertake mitigation on the property. In addition, it is expected that once a government or non-profit entity has acquired the property, a restoration and management plan will be prepared to identify the types of restoration actions needed and where they may occur. The management plan will likely include other measures for the protection of habitat, phasing of restoration actions, public access, and research and educational actions. A recent management plan prepared for Salinas River State Beach provides an example of the issues that need to be planned before major actions are undertaken[1].

The proposed MPWSP HMMP here has been prepared in a vacuum and there is no certainty that the MPWSP proposal will be consistent with restoration goals of the entity that will be purchasing the land until such a management plan is prepared. As a result, there is no assurance that the

[1] Central Coast Wetlands Group and Coastal Conservation and Research. 2020. Salinas River State Beach: Dune Restoration and Management Plan. 53 pages

restoration actions as proposed would occur as described until an overall management plan is prepared.

Funding for Purchase of Restoration Area

The HMMP provides three options for completion depending upon the timing of the property transfer. Under the first option, Cal-Am would develop, implement, and fund the HMMP prior to the transfer of the property[2]. Under the second option it would fund implementation of the HMMP to be undertaken by another entity. Under the third, Cal-Am would fund an endowment equal to the cost to implement the HMMP and long term mitigation and Cal-Am also states that it would "contribute to the purchase of the CEMEX site". Cal Am should be responsible for funding (or reimbursing the purchaser) for the land acquisition to meet the mitigation requirements under all options, if mitigation is approved within this area. Funds should be sufficient for any buffer areas or additional lands as needed to fully mitigate project impacts (see below).

Fully Mitigated Requires Restoration of Slant Well Site at End of Project Life

The Coastal Commission Staff Report noted that the previously submitted "mitigation strategy" by MPWSP would result in a net loss of habitat. While restoration of coastal dunes through invasive plant removal and replanting is a needed restoration action, the permanent loss of important Flandrian dune habitat at the project site is not replaced. Restoration of the area of the slant wells should be included in the HMMP when the wells are no longer being used or the project life has ended. All areas around the slant wells will be reclaimed by CEMEX so the slant well pads and access roads should be returned to a natural state consistent with the surrounding area. The HMMP should include a restoration plan for the slant wells consistent with the reclamation plan and Cal-Am should be responsible for its implementation.

Amount of Mitigation Required is Understated

The HMMP is focused on mitigation for permanent impacts of approximately 2.2 acres. It describes the actions that MPWSP will take to mitigate that impact at 3:1 through removal of invasive plant species, revegetation with native species, and compliance with performance standards within five years. WRA found that within the City of Marina, there were also impacts that Cal-Am characterizes as "temporary" to Primary Habitat (6.45 acres) and to Secondary Habitat (12.37 acres). The total impacts within the City of Marina LCP jurisdiction are 21.03 acres (Table 1). The Staff Report found up to 35 acres of permanent and temporary impacts; however, no detail was provided.

The proposed MPWSP HMMP concurs on the amount of permanent impacts to Primary Habitat; however, it describes temporary impacts as 6.26 acres to Primary Habitat and 4.46 acres to Secondary Habitat for a total of 15.31 acres due to additional avoidance measures during the design phase. The City has not been provided with these drawings for verification and this should be done as part of the evaluation of the HMMP proposal.

---

[2] Under the Agreement, CEMEX cannot provide any party use of the property until it is transferred unless specifically approved by the Executive Director of the Coastal Commission (Section 6.2B).

MPWSP states that all restoration in areas of temporary impact "will be concurrent with Project construction"; however, it does not provide a time table to verify that they would qualify under CCC precedents in regard to restoration within one year of impact[3]. The MPWSP application states that temporary impacts would occur to Primary Habitat on the CEMEX property over a 17-month period, plus additional time for testing. Temporary impacts to Secondary Habitat along the TAMC ROW would occur over a 15-month period[4]. Pipeline installation would occur in segments, with excavation and backfilling occurring within one year; however, seeding or other revegetation activities would not likely occur until the entire pipeline is installed and tested to ensure proper function.

Thus, the time between initial disturbance and restoration to pre-project conditions in both primary and secondary habitat areas could well be longer than one year[5]. Therefore, the temporary impacts must be considered permanent impacts and are subject to the 3:1 mitigation ratios. In that case, the amount of mitigation described under the HMMP would not meet the standards normally required by the Commission and the HMMP as submitted does not provide any detail on the other areas that would be restored Ito meet this mitigation requirement.

The schedule for the implementation of the HMMP will be delayed to some period after the construction according to Table 7-1. It should be concurrent with the project implementation or additional mitigation should be required due to the time delay in implementation.

Issues Affecting Likelihood Of Success

Ice plant cover is extensive adjacent to the areas where Cal-Am is proposing removal, especially in the western portion of the proposed mitigation area. Other projects have found that re-invasion from surrounding populations can affect the ability to meet long term performance standards.[6] Given that these areas may be reinvaded by invasive species due to the surrounding conditions, the City's "fully mitigated" standard will not be met. A buffer area for removal of invasive plants of 100 meters around the restoration site is necessary to assure long term success of the mitigation and to achieve full ecological function.

The HMMP discusses the agricultural runoff to the mitigation site as a cause of the degradation of this area. The HMMP does not confirm that this runoff has ceased and, if not, it will continue

---

[3] In their denial of the Foothill Transportation Corridor project (CC-018-07), the Commission wrote that it has generally considered "temporary" impacts that result in destruction of vegetation or alteration of the soil, especially those lasting one year or more, to be equivalent to permanent impacts. Such areas require restoration and hence the loss of habitat function may be considerably longer than the "temporary impact." In addition, there will be uncertainty regarding the success of the restoration. For those reasons, a mitigation ratio greater than 1:1 is generally appropriate.

[4] An easement agreement proposed with the TAMC states the temporary construction easement is expected to require up to the full 100 foot width for construction activities for a two year period, not 15 months as stated in the application.

[5] In CC-0003-19 (UPRR), the Commission staff wrote "While all ESHA impacts are defined as temporary by UPRR, the Commission has historically considered wetland and ESHA disturbances up to a year to warrant mitigation and be treated, for mitigation purposes, similar to permanent impacts."

[6] Tidal Influence. 2009. Newport Beach Dunes Restoration Project. Dune Vegetation Monitoring Report

to adversely affect the site. The excess water will promote invasive species. No plan is provided to address continued agricultural drainage to this area and its effect on the ability of the site to meet the performance standards. If the agricultural runoff cannot be diverted from this area, the proposed mitigation will not be successful and therefore, not feasible.

Proposed Optional Mitigation within Existing Reclamation Plan

The HMMP proposes to undertake an additional 1.825 acre iceplant removal area. However, this area is within the Reclamation Plan to be implemented by CEMEX. A revegetation plan prepared by LSA for the Reclamation Plan already proposes to remove ice plant and revegetate with native species. Cal-Am states that its proposed work is not required but it is offering it as part of the HMMP but includes this area within its summary on mitigation provided (Table 3.4). However to qualify as an additional mitigation, this work would need to be done in areas outside of the Reclamation Plan.

No Long Term Management Plan Or Endowment Provided

Monitoring is only proposed for 5 years pending meeting the performance standards. No Long Term Maintenance Plan (LTMP) as required by the City (beyond the 5 year monitoring program) is included in the document. As a result, the costs associated with long-term management actions are unknown and cannot be determined for the endowment. A LTMP is needed in order to determine if the endowment is sufficient to provide for success of the mitigation area for the duration of the operation of the slant wells. It is well known that iceplant can recolonize dune habitats and overtake native habitats (NPS 2015)[7]. Maintenance actions to control ice plant within the mitigation areas will be necessary and need to be continued for the life of the proposed Project to assure that the impacts to dune habitat are fully mitigated. Once these costs have been determined, the financial instrument(s) to assure that the funds are available to the entity responsible for the mitigation sites are available in perpetuity. A process of accounting should be provided so that should the endowment not be sufficient to assure long-term success, Cal-Am will retain responsibililty for additional funding to the endowment.

Contingency measures should identify additional areas for restoration should the performance standards not be met after a certain period of time due to factors that cannot be remediated.

Lack of Approval of HMMP from Resource Agencies

The City and the Commission should receive confirmation from the US Fish and Wildlife Service and the California Department of Fish and Game that the HMMP is acceptable to them. The Biological Opinion issued by the Service stated that no Habitat Mitigation and Monitoring Plan had been submitted by the applicant but was required prior to construction and subject to Service approval. No action has been finalized as of yet by the California Department of Fish and Game

[7] National Park Service. 2015. Coastal Dune Habitat Restoration Projects: Why is Dune Restoration Important? Last updated February 28, 2015. (Available online: https://www.nps.gov/pore/learn/management/planning_dunerestoration_importance.htm)

as it relates to an Incidental Take Permit (ITP) so the Commission cannot be certain that the Department concurs with the proposed HMMP. In its comments on the ITP application, the Department found that the calculation of temporary and permanent impacts were not consistent for the species and additional information was required. The Department found that the compensatory mitigation proposed may not be sufficient to fully mitigate for the proposed taking. Most notably, the Department concluded that "it is not clear if the proposed compensation for Project impacts is commensurate with the level of take for each species listed in the IPT application." The Commission should confer with the Department on its recommendation prior to final approval.

Sea Level Rise

MPWSP must also address sea level rise as it relates to the longevity of the proposed mitigation area for the duration of the proposed project life. A sea-level rise and shoreline retreat analysis using the Commission's most recent guidance should be done for the mitigation area to assure that the area will be present during the life of the Project slant wells.

REGISTERED GEOLOGIST MICHAEL TIETZE No. HG 63 EXP. 04/30/21 CERTIFIED HYDROGEOLOGIST STATE OF CALIFORNIA

1 INTRODUCTION

Formation Environmental, LLC (Formation) has prepared this Technical Memorandum at the request of the City of Marina (City) to describe key information regarding wetlands, vernal ponds and other groundwater-dependent ecosystems (GDEs) in and near the City that are sustained by groundwater in the Dune Sand Aquifer, which is the uppermost aquifer that underlies the area south of the Salinas River and near the coast. Slant wells are proposed to be installed into the Dune Sand Aquifer near the coast as part of the proposed Monterey Peninsula Water Supply Project (MPWSP) and would be pumped to provide raw water for desalination ("makeup water"). This memorandum identifies potential GDEs, summarizes the results of assessments to verify whether they are reliant on shallow groundwater, reviews selected regulatory, planning and legal requirements for the management of GDEs, and examines the potential effect of water extraction from the proposed slant wells on protected GDEs in the area that are in hydraulic communication with the Dune Sand Aquifer.

During preparation of the Groundwater Sustainability Plan (GSP) for the Marina Groundwater Sustainability Agency (MGSA) Area of the 180/400 Foot Aquifer Subbasin (Subbasin), Formation characterized the hydrogeologic setting, water budget and existing beneficial uses of groundwater in the vicinity of the City of Marina (Figure 1). The assessment included evaluation of the aquifer system and its potential interaction with groundwater-connected surface water and GDEs located near the MGSA Area. The MGSA Area includes the proposed location for the MPWSP slant wells. During the assessment, several GDEs and potential GDEs were identified in the area between the coast and the Salinas River in the vicinity of the City which is projected to be affected by drawdown induced by water extraction from the proposed slant wells.

This memorandum presents the methods and results of the investigation to identify and characterize GDEs in the area near the City south of the Salinas River, assess whether they may be impacted by pumping of raw makeup water for the proposed MPWSP, identify important data gaps; and provide

recommendations for future investigation, monitoring, and management. The investigation generally followed steps outlined in the guidance document developed by The Nature Conservancy (TNC) for the identification and evaluation of GDEs (TNC 2018). The following sections are included in this memorandum:

- Section 2 - Describes the procedures used to identify mapped potential GDEs from existing databases and to confirm their connection with groundwater based on local data.
- Section 3 - Presents a characterization of the GDEs, including a description of the associated aquifer system characteristics, and a summary of the GDE's ecological conditions.
- Section 4 - Provides information regarding the potential effect of groundwater withdrawals from the proposed MPWSP slant wells on the GDEs, including hydrologic effects and potential ecological / biological changes.
- Section 5 - Outlines regulations applicable to the management of the GDEs.
- Section 6 - Presents our recommendations for GDE management and proposed procedures to address data gaps.
- Section 7 - Lists the references cited in this memorandum.

2 IDENTIFICATION OF GDES

2.1 IDENTIFICATION OF POTENTIAL GDES

To address the requirements of California Code of Regulations Title 23 (23 CCR) Section 354.16(g), Formation used the best available information to identify potential GDEs near the MGSA Area that could be affected by groundwater extraction and management. We identified these features by using the "NC Dataset Viewer" of the Natural Communities Commonly Associated with Groundwater (NCCAG) database[1] compiled by the California Department of Water Resources (DWR) in collaboration with TNC and the California Department of Fish and Wildlife (CDFW) (DWR 2018; Klausmeyer *et al.* 2018). Figure 2 shows the location of potential GDEs in the area underlain by the Dune San Aquifer within the vicinity of the MGSA Area based on the NCCAG dataset.

The NCCAG dataset was derived by compiling data regarding seeps, springs, wetlands and vegetation communities from a number of sources (CDFW, United States Department of Agriculture [USDA] Forest Service, United States Fish and Wildlife Service [USFWS], California Department of Forestry [CDF], and US Geological Survey [USGS]), and screening them to identify the location and extent of springs, seeps, wetlands, riparian vegetation and other habitats and vegetation communities that are commonly dependent on groundwater. The potential GDEs shown in Figure 2 include both wetland and vegetation

[1] *The Department of Water Resources' Naturol Communities Commonly Associated with Groundwater dataset is available at: https://gis.water.ca.gov/app/NCDatasetViewer/*

GDEs. Based on information in the NC Dataset and the TNC's GDE Pulse[2] website, the potential GDEs mapped near the MGSA Area are described as follows:

- Potential GDEs in the Coastal Zone in and near the City include the following:
    - Potential Wetland GDEs - Palustrine, emergent, scrub shrub and unconsolidated bottom, permanent, seasonally, semi-permanently and permanently flooded wetlands.
    - Potential Vegetation GDEs - Willow (*Salix* spp.) and willow shrub vegetation.
- Potential GDEs located along the Salinas River include the following:
    - Potential Wetland GDEs - Palustrine, scrub shrub, emergent, riverine, tidal and unconsolidated bottom, permanent, seasonally flooded, permanently flooded and fresh-tidal wetlands.
    - Potential Vegetation GDEs - Riparian, flooded and swamp forest, freshwater marsh, wet meadow and low shrub carr.[3]

Several of the potential GDEs identified in the Coastal Zone near the City are identified as "vernal ponds" that are afforded specific protection and management under several land use plans. These vernal ponds consist of wetlands, seasonal ponds and perennial ponds that are believed to be remnants of marshes that occurred within the Salinas River floodplain approximately 12,000 years ago, and were subsequently covered by encroaching coastal sand dunes (The Habitat Group 1994). These ponds are described in the City's planning documents as water pools that expand during the wet season and support marshy wetlands that provide habitat for plants and animals much of the year (City of Marina 2013a). They represent unique coastal ecosystems that are important stopover points for migratory waterfowl and provide habitat to a number of sensitive plant and animal species. The City's Local Coastal Plan, certified by the California Coastal Commission (CCC) on April 20, 1982, guides development within the coastal zone in Marina and recognizes the importance and unique nature of these vernal ponds, which are designated for protection as Environmentally Sensitive Habitat Areas (ESHAs) under the California Coastal Act.

A request for development of a Comprehensive Management Plan (CMP) was initiated in 1990 by the CCC in response to development pressures around the City's vernal pond resources. The City engaged stakeholders in a collaborative effort to prepare the CMP. A Technical Advisory Committee comprised of representatives from the City, Monterey Peninsula Regional Park District (MPRPD), California Department of Fish and Game (CDFG, now CDFW), CCC, Sierra Club, residents, and other interested stakeholders was also established to guide development of the plan. Four meetings were held with the Technical Advisory Committee. A public meeting was held on March 18, 1993, to present preliminary findings on the resources of the ponds and solicit comments from the public on management issues. A second public meeting was held on November 18, 1993, to present the draft plan and solicit comments on the proposed

[2] *The Nature Conservancy tool GDE Pulse is availoble at https://gde.codefornature.org/#/home*

[3] A carr is a waterlogged wooded terrain that represents a succession stage between a marsh and the likely eventual formation of a riparian forest. Carrs are wetlands that are dominated by shrubs rather than trees.

management plan recommendations. The final CMP was adopted on February 15, 1994 (*Coastal/Vernal Ponds Comprehensive Management Plan,* The Habitat Restoration Group 1994). It identifies guidelines for the preservation, management and enhancement of these wetland resources, and identifies specific measures to be conducted at each pond to preserve, protect, and enhance sensitive resources. This includes seven ponds, including two hypersaline vernal (i.e., seasonal) ponds, two freshwater perennial ponds, two freshwater vernal ponds, and one fresh to brackish pond that functions as a perennial pond in most years. Table 1 lists the location and current ownership / management of these vernal ponds.

TABLE 1. VERNAL PONDS IN THE COASTAL ZONE NEAR MARINA

Pond	Location	Current Ownership/Management
Pond 1: Robin Drive Pond	West of Lake Drive	City of Marina
Pond 2: Lokke-Paddon Park	Reservation Road and Seaside Avenue	City of Marina
Pond 3: Marina Landing Pond	Reservation Road and Beach Road	Private/City
Pond 4: Marina Coast Water District Pond	North of Reservation Road West of Hwy 1	Marina Coast Water District
Pond 5: Marina State Beach Pond	South of Reservation Road West of Hwy 1	California Department of Parks and Recreation
Pond 6: Armstrong Ranch Ponds	West of Hwy 1	Private (unincorporated land outside City of Marina Limits)
Pond 7: Lake Drive Pond	West of Lake Drive	City of Marina

Source: City of Marina Local Coastal Program Land Use Plan (City of Marina 2014a)

Ponds 3, 5, and 6 are located closest to the MGSA Area:

- Pond 3 – Marina Landing Pond is south east of the MGSA Area.
- Pond 6 – Armstrong Ranch Complex Ponds is immediately to the east of the MGSA Area.
- Pond 5 – Marina Cost Water District Pond is south of the MGSA Area.

As shown on Figure 2, several additional similar wetland areas are located north of the Armstrong Ranch Complex Ponds, including several within the Salinas River National Wildlife Refuge.

2.2 VERIFICATION OF GROUNDWATER CONNECTION

To verify the connection of the mapped potential GDEs to groundwater, the depth to groundwater mapped in the uppermost aquifer underlying the area was compared to ground surface elevations in the area to assess whether (1) depth to groundwater meets the criteria for a potential groundwater connection; and (2) the spatial distribution of shallow groundwater coincides with locations where GDEs are mapped. To do this, a map of the groundwater table elevation in the Dune Sand Aquifer in April 2018 was prepared based on data from shallow groundwater monitoring wells located in the area and

the groundwater table elevation was subtracted from the ground surface elevation in the USGS Digital Elevation Model for the area. The area of comparison only includes the area where groundwater levels could be reliably interpolated from the available data. The results are presented in Figure 3.

As shown in Figure 3, the locations of the shallowest depth to groundwater coincided with the locations of mapped potential GDEs associated with the Armstrong Ranch Pond Complex. TNC suggests a depth to groundwater criterion of 30 feet to assess the potential groundwater connection of GDEs (TNC 2018); however, for shallow-rooted herbaceous wetland species, shallower depths may be more appropriate. In the area of the Armstrong Ranch Pond Complex, the depth to groundwater was interpreted to be approximately 2 to 5 feet. These ponds are "dry" but still occupied by freshwater marsh species except during portions of the rainy season when there is surface water present. Per TNC guidance, these GDEs should be considered and managed as being groundwater connected unless additional data indicate they will not be harmed by groundwater withdrawal. Hence, they are simply referred to as "GDEs" or "identified GDEs" in the subsequent portions of this document.

The identified GDEs were then further evaluated by assessing the relationship between groundwater levels and summer evapotranspiration (ET) at one of the ponds of the Armstrong Ranch Pond Complex. Vegetation ET is directly proportional to biomass productivity and release of water to the atmosphere through transpiring plants or direct evaporation. In a Mediterranean climate, soil moisture is typically expected to be sparingly available in the summer, and in the absence of irrigation or a surface water source, vigorous plant growth and correspondingly high ET is typically expected to indicate transpiration of groundwater. An analysis of summer (June, July, and August) evapotranspiration from 2010 through 2018 was conducted using data developed by Formation under contract to DWR. The analysis applied the surface energy balance method (Paul *et al.* 2018) to calculate ET on a 30-meter grid using remote sensing data generated by the Landsat Satellite mission and local meteorological data. The results are presented in Figure 4 and show summer ET was significantly higher within the footprint of the pond than in the surrounding area, which is indicates groundwater evapotranspiration. The calculated ET values in the pond varied with depth to groundwater in the nearby monitoring well (MW-4S). ET ranged from approximately 5 to 10 inches from 2010 to 2013, then decreased as groundwater levels fell during subsequent years to approximately 1 to 5 inches in 2014 and 2015, and 1 to 3 inches in 2016. In 2017, ET increased to approximately 3 to 10 inches as groundwater levels recovered. In 2018, ET was approximately 5 to 12 inches.

This analysis (1) demonstrates a distinct correlation between groundwater levels and ET from the wetland, and (2) illustrates its sensitivity to groundwater level declines. The best available data thus strongly support that this wetland is groundwater reliant, and for the purposes of groundwater management, confirm the existence of a GDE at this location. We believe that this wetland is likely representative of the groundwater and ecological features of the other protected vernal ponds in Figure 1, and that this conclusion can and should be extrapolated to those as well, and they should be considered and managed as identified GDEs. The other coastal wetlands near the City occur in similar settings and include perennial ponds with water surface elevations in the range of 0.5 to 5 feet above mean sea level (amsl), which is similar to groundwater table elevations in the Dune Sand Aquifer.

Therefore, the remaining wetland GDEs in the Coastal Zone near the City should also be managed as GDEs.

In addition, groundwater levels in the Dune Sand Aquifer near the Salinas River are relatively shallow, indicating the river is likely in communication with the Dune Sand Aquifer in this area. The following data support this conclusion:

- Measured groundwater elevations in wells within this area range from 6 to 8 feet amsl, which is less than 20 feet below the lowest elevation within the Salinas River (i.e., the thalweg) in this area (MGSA 2020).
- In early 2016, groundwater elevations measured in the shallow cluster monitoring wells (MW-6, MW-8 and MW-9) near the Salinas River showed a rapid and pronounced groundwater elevation increase (up to approximately 7 feet) which was closely correlated with a rise (from 2 to 20 feet) in the Salinas River stage at the Spreckels gaging station (GSS 2019).
- Geophysical data collected in 2017 indicate that groundwater elevations in the Dune Sand Aquifer are close to the river stage elevation and decline away from the river, suggesting that the river is recharging the aquifer in this location, and is therefore interconnected (Gottschalk *et al.* 2018).

Based on the above information, the mapped potential GDEs along the Salinas River are likely to be dependent on shallow groundwater that is hydraulically connected to the regional aquifer system in this area. Shallow groundwater levels near the river are likely maintained by infiltrating river water; however, they would also be affected by groundwater level declines. Thus, these potential GDEs should also be considered and managed as identified GDEs.

3 RESOURCE CHARACTERIZATION

3.1 AQUIFER CHARACTERISTICS

Figure 5 shows the area south of the Salinas River in the vicinity of the City where the GDEs discussed in this memorandum are located is underlain by highly permeable Quaternary dune sands. The Dune Sand Aquifer is contained within these sands and is the predominant unconfined aquifer in the Marina and Fort Ord areas. It is composed of fine- to medium-grained, well sorted, aeolian sand of Pleistocene to Recent age that extends offshore and up to 4 miles inland. At the coast near the MGSA Area, these deposits extend to depths up to 85 to 95 feet beneath the ground surface.

Within much of the Marina and Fort Ord areas, the Dune Sand Aquifer overlies a clay layer known in Fort Ord groundwater investigations as the Fort Ord- Salinas Valley Aquitard (FO-SVA) and known more regionally as part of the Salinas Valley Aquitard (SVA). When underlain by the SVA, the Dune Sand Aquifer is also referred to as the Perched Dune Sand Aquifer (Hopkins Groundwater Consultants 2016), or the A-Aquifer (Ahtna Environmental Inc., 2017). The underlying SVA or other aquitards, where present, are considered to create a perched or semi-perched condition for the Dune Sand Aquifer. Near

the coast and south of the Salinas River, the SVA thins out, bringing the Dune Sand Aquifer and the underlying 180-Foot Aquifer into hydraulic connection. The thinning of the SVA is coincident with a drop in the hydraulic head in the Dune Sand Aquifer. Here the groundwater enters the underlying Upper 180-Foot Aquifer, and flows southeastward, according to the hydraulic gradient (Ahtna Environmental Inc., 2017). The discontinuous nature of the SVA near the MGSA Area was also identified by geophysical investigations in the area (Gottschalk *et al.*, 2018).

As a result of the relatively high permeability of the Dune Sand Aquifer, it supports high recharge rates and has little to no runoff. As such, south of the Salinas River there are no major creeks, streams, or rivers that drain in the vicinity of the City, which relates to the high permeability and high recharge rate of the Dune Sand Aquifer. Groundwater occurs at depth beneath the tall, active dunes at the coast, but as noted in Section 2, can be relatively shallow further inland and beneath hollows and depressions, such as where the coastal wetland GDEs discussed in this memorandum are located. While it has been asserted that the vernal ponds near the City are supplied by the lateral inflow of perched groundwater on low permeability layers in the Quaternary dune sands, these layers have not been confirmed to be present or continuous at all of the pond locations (The Habitat Group 1994; Balance Hydrologics 2012), and the groundwater elevations, pond elevations, and conditions noted above are not consistent with perched aquifers that are isolated from an underlying aquifer system. Rather, the available data indicate that these areas are underlain with a continuous saturated zone that extends through the Dune Sand Aquifer to the GDEs.

Groundwater modeling conducted for the MPWSP indicates that the GDEs discussed in Section 2.0 are located within the area of predicted drawdown influence from pumping of the proposed MPWSP slant wells (ESI 2018). This is further supported by review of the MPWSP monitoring well hydrographs for the five well clusters with wells completed in the Dune Sand Aquifer (MW-4, MW-6, MW-7, MW-8 and MW-9) (Geoscience Support Services, 2019), the Dune Sand Aquifer east of the MGSA Area, where the GDEs are located, is in hydraulic communication with the aquifer interval from which groundwater was extracted during MPWSP test slant well pumping between 2015 and 2018. There were two major shut down events during test slant well pumping that occurred after extended periods of pumping (March 4, 2016, and February 28, 2018) that resulted in groundwater level recovery at many of these wells, indicating they were subject to drawdown influence from the test slant well. Specifically, there were a total of 30 recovery events logged in these hydrographs. There was a distinct and abrupt recovery of several feet in groundwater levels at all five locations in the 180-Foot and 400-Foot Aquifers during both shutdowns, for a total of 20 events. At the same time, there was an abrupt recovery of about 2 feet in the Dune Sand Aquifer wells during two recovery events, a slight recovery during four recovery events, and no observed recovery during four recovery events. Groundwater recovery in shallow wells may also be influenced by changes in regional pumping, recharge events or stage variation in the Salinas River, or recovery signals may be muted by local drawdown. However, the observation of a potential recovery signal in 60 percent of Dune Sand Aquifer wells correlated with a distinct recovery signal in the deeper wells indicates the Dune Sand Aquifer is hydraulically connected with the underlying aquifers at many locations, and that pumping of the test slant well produced attenuated drawdown at these locations.

In the MGSA Area, the Dune Sand Aquifer is seawater intruded; however, high recharge rates have resulted in a large zone of groundwater containing lower concentrations of total dissolved solids (TDS) immediately east of, and extending into the eastern portion of the MGSA Area, and underlying many of the GDEs identified in this memorandum (Gottschalk *et al* 2018). The concentrations of TDS detected in samples from these wells in April 2019 ranged from 896 to 32,600 milligrams per liter (mg/L) in April 2019, with the highest concentrations detected in wells adjacent to the coast (GSS 2019). However, airborne electromagnetic surveys of the Dune Sand Aquifer indicate that the uppermost groundwater TDS concentrations east of the MGSA Area are generally below 3,000 mg/L. As such, the available data indicate that shallow groundwater in the Dune Sand Aquifer can support GDEs with a variety of salt tolerances, as noted below in the Section 3.2.

3.2 BIOLOGICAL RESOURCES

The vernal ponds in the coastal zone near the City study area are an extremely valuable set of coastal ecosystems within the Monterey Bay region. The CMP states the following: "*Seasonal and permanent wetlands are critical habitat for a variety of wildlife species, and the near-coastal proximity of the ponds promotes use by species associated with the bay shoreline and other coastal wetlands*" (The Habitat Group 1994). By virtue of differences in hydrology, water quality, and associated vegetation, each of the seven ponds in the area possesses unique wildlife values and attracts a unique assemblage of species. A summary of the nature of the ponds and the associated biological resources is presented below in Table 2.

TABLE 2. BIOLOGICAL RESOURCES ASSOCIATED WITH VERNAL PONDS IN THE COASTAL ZONE NEAR THE CITY OF MARINA

Pond	Seasonality and Type	Natural Plant Communities	Known or Potential Special Status Wildlife Species	Reported Sensitive Habitat	Reported Special Status Plant Species
Pond 1: Robin Drive Pond	Seasonal Salt Marsh	Open Water, Freshwater Marsh, Coastal Saltwater Marsh, Mixed Grassland, Coyote Brush Scrub, Coastal Dune Scrub	Loggerhead Shrike, Monterey Ornate Shrew	Amphibian Breeding, Avocet and Stilt Nesting	Monterey Ceanothus
Pond 2: Lokke-Paddon Park	Perennial Freshwater Marsh	Open Water, Freshwater Marsh, Arroyo Willow Riparian Forest, Coastal Dune Scrub, Coyote Brush Scrub, Non-Native Grassland, Mixed Grassland	California Red-Legged Frog, Black Legless Lizard, Southwestern Pond Turtle, Merlin, Peregrine Falcon, Loggerhead Shrike, Yellow Warbler, Tricolored Blackbird	Tricolored Blackbird Roosting and Nesting, Diving Bird Foraging, American Coot Nesting, Raptor Foraging, Potential Black Legless Lizard	
Pond 3: Marina Landing Pond	Perennial Freshwater Marsh	Open Water, Coastal Freshwater Marsh, Arroyo Willow Riparian Forest, Mixed Grassland, Coastal Dune Scrub	Merlin, Peregrine Falcon	Diving Bird and Waterfowl Foraging, Waterfowl Nesting	

Pond	Seasonality and Type	Natural Plant Communities	Known or Potential Special Status Wildlife Species	Reported Sensitive Habitat	Reported Special Status Plant Species
Pond 4: Marina Coast Water District Pond	Perennial/ Seasonal Salt Marsh	Open Water, Coastal Saltwater Marsh, Non-native grassland, Mixed Grassland	Smith's Blue Butterfly, Black Legless Lizard, Coast Horned Lizard, Merlin, Peregrine Falcon, Loggerhead Shrike, Monterey Ornate Shrew	Shorebird Foraging, Potential Black Legless Lizard and Smith Blue Butterfly	Branching Beach Aster, Coast Wallflower, Monterey Spineflower
Pond 5: Marina State Beach Pond	Seasonal Brackish Marsh	Coastal Saltwater Marsh, Non-Native Grassland, Coastal Dune Scrub, Coyote Brush Scrub, Rose Scrub	Smith's Blue Butterfly, Western Spadefoot Toad, Coast Horned Lizard, Merlin, Peregrine Falcon, Loggerhead Shrike	Shorebird Foraging, Potential Black Legless Lizard and Smith Blue Butterfly	Branching Beach Aster, Coast Wallflower, Monterey Spineflower, Sand Gilia
Pond 6: Armstrong Ranch Ponds	Seasonal Freshwater Marsh	Wet Meadow/Freshwater Marsh, Non-Native Grassland	Merlin, Peregrine Falcon, California Horned Lark, Loggerhead Shrike, Tricolored Blackbird	Potential Amphibian Breeding	
Pond 7: Lake Drive Pond	Perennial/ Seasonal Freshwater Marsh	Open Water, Wetlands	California Red-Legged Frog, Black Legless Lizard, Coast Horned Lizard, Merlin, Peregrine Falcon,	Diving Bird and Waterfowl Foraging, Waterfowl Nesting	Monterey Ceanothus

Source: Coastal/Vernal Pond Comprehensive Management Plan (The Habitat Group 1994)

The ecological water requirements and thresholds of responses to changes in groundwater levels differ among GDEs. Wetlands such as the vernal ponds present east of the MGSA Area are likely to be more highly groundwater dependent and contain sensitive communities that could be adversely affected by drawdown. Herbaceous wetland vegetation generally has a relatively shallow rooting depth and requires a relatively consistent groundwater depth. The reported rooting depth of Arroyo willow (*Salix lasiolepsis*) is up to approximately 26 inches (USDA, 2020). The ability of such GDEs to adapt or recover from groundwater declines depends largely on the overall water budget and the degree to which the GDE is dependent on groundwater versus surface water inflow. The degree of interaction between wetlands and groundwater can vary greatly and depends on many factors including their position in the landscape, substrate permeability, water table depth, and seasonal fluctuations in water inputs. GDEs develop in response to unique timing, duration, frequency, and chemistry of water inputs. Major changes in wetland hydrology would be expected to significantly affect ecological function. However, minor changes in hydrology may result in little to no change in the ecological function of wetlands, depending on baseline conditions and whether those changes are short- or long-term and offset by seasonal recharge of the aquifer or surface inputs (JJ&A 2018).

The rooting depth of Fremont cottonwood (*Populus fremontii*) is reported to be up to 6.89 feet (Stromberg, 2013), depending on water table declination rates and other parameters,); and the rooting depth of Coastal live oak (*Quercus agrifolia*) is reported to be up to approximately 35 feet (Schenk and Jackson, 2002). Both of these species are reported to be present in the riparian areas along the Salinas River, as is arroyo willow and giant reed (*Arundo donax*). Giant reed is an invastive cane reed believed to be responsible for excess ET in many areas along the Salinas River. Deep-rooted phreatophytes such as cottonwoods and oak trees are not expected to be significantly affected by drawdown which is within the range of natural groundwater level fluctuations or occurs gradually over a period of years. Groundwater level fluctuations within the natural range or a gradual decline in groundwater levels can give riparian and phreatophyte species an opportunity to adapt to changing conditions. In addition, groundwater level fluctuations tend to be muted in riparian zones near streams, such as the Salinas River, due to infiltration from streamflow.

Risk assessment guidelines for GDEs developed by the State of New South Wales in Australia characterize drawdowns that are less than seasonal fluctuations as posing a low risk of adverse impacts (New South Wales Department of Primary Industries [NSWDPI], 2012). Research has shown that root distribution tends to be related to groundwater history; therefore, a rapid decline in water table relative to the condition under which roots developed may strand plant roots so they cannot obtain sufficient moisture (Shafroth, Stromberg and Patten, 2000). Although roots do tend to redistribute with the water table, plants cannot proliferate new roots if the water table decline is too rapid (Richards *et al* unpublished; Stella and Battles, 2010; Stella et al., 2010). A rapid decline in groundwater levels of even as little as approximately 1 foot induced by groundwater pumping was shown to cause leaf death in riparian plains cottonwoods (*Populus deltoides*) and declines of 3 feet caused whole tree stress judged likely to lead to tree mortality (Cooper and Merritt, 2012). A rate of decline of as little as 3 centimeters / day was shown to be fatal to young Fremont cottonwood (*Populus fremontii*) seedlings (Stella and Battles, 2010). Therefore, relatively modest groundwater level declines can also significantly decrease the recruitment of new seedlings even if more mature trees ultimately adapt, potentially resulting in long-term riparian habitat decline or change (TNC, 2018; Amlin and Rood, 2002).

4 SELECTED REGULATORY REQUIREMENTS

4.1 CITY OF MARINA LOCAL COASTAL PROGRAM

The California Coastal Act requires that local governments in the Coastal Zone create and implement Local Coastal Programs (LCPs) to conserve coastal dependent land use. The City has an approved LCP that consists of a Local Coastal Land Use Plan (LCLUP) and a Local Coastal Implementation Plan (LCIP) (City of Marina 2013a, 2013b). Under the California Coastal Act, the City manages coastal development within its jurisdictional boundaries, including addressing the challenges presented by coastal hazards like storms, flooding, and erosion, and the California Coastal Commission (CCC) is the jurisdictional regulatory agency that oversees these issues below the mean high tide line.

The MGSA Area is within the Coastal Zone. The City's Coastal Zone includes Highway 1 and all lands west of Highway 1 within the incorporated limits. In addition, the Coastal Zone includes two other areas:

- Vacant lands west of Del Monte Boulevard between Reservation Road and the City's southern boundary, including coastal dunes, cultivated acreage, and some substantial vernal ponds with associated wetlands; and

- A narrow strip about 2 miles long west of Highway 1 within the Ford Ord boundary, including the coastal bikeway and the Southern Pacific Railroad tracks.

The MGSA Area is comprised of Primary and Secondary Habitat as defined under the City's LCP (City of Marina 2013a), which are considered ESHAs that are designated protected areas within the Coastal Zone of California under the California Coastal Act. Primary Habitat includes:

> *"1. Habitat for all identified plant and animal species which are rare, endangered threatened, or are necessary for the survival of an endangered species.*
>
> *2. Vernal ponds and their associated wetland vegetation.*
>
> *3. All native dune vegetation, where such vegetation is extensive enough to perform the special role of stabilizing Marina's natural sand dune formations.*
>
> *4. Areas otherwise defined as Secondary Habitat that have an especially valuable role in an ecosystem for sensitive plant or animal life, as determined by a qualified biologist approved by the City [Resolution No. 2001-118 (October 16, 2001); approved by the California Coastal Commission on November 14, 2001]."*

The Coastal Act requires that ESHAs *"shall be protected against any significant disruption of habitat values, and only uses dependent on those resources shall be allowed within those areas"* (Public Resources Code, § 30240(a)). Similarly, the Marina LCP limits development in Primary Habitat.

The critical coastal planning issues in Marina include the protection of the entire unique coastal ecosystem, including the wetlands, the beach areas, the Flandrian dunes, and all of the protected species that depend on them. Preserving public access is also of key interest to the City. Since sand mining will cease in December 2020, focus on the future of the dunes and vernal ponds, and on establishing uses that would be compatible with the existing ESHA constraints present in the City's Coastal Zone is a priority. The policies of the LCLUP, as well as the land use designations, address these concerns and resolve them in terms of the mandates of the California Coastal Act for the beach, dunes, and vernal ponds. Policies related to habitat management relevant GDE management are as follows:

- **Vernal Ponds –** To protect and encourage the restoration of the vernal ponds to their original state and allow only those uses adjacent, which will reinforce and conserve the unique habitat qualities of these ponds (Policy 24).
- **Dunes –** To protect the habitat of recognized rare and threatened / endangered species found in the coastal dune area (Policy 25).

The emphasis of the LCLUP is to maximize public access consistent with the environmental sensitivity of the dune habitat and resident rare and threatened / endangered plants and animals. However, direct access to the dune vegetation is limited due to the level of use that the vegetation can withstand.

4.2 CITY OF MARINA GENERAL PLAN

The City's General Plan specifies open space policies to ensure retention of land with significant natural resource values (Policy 2.3.3) and include habitat reserves and other open space for the protection of important habitat and scenic areas (Policy 2.7.1). Habitat reserve and open space include coastal strand and dune areas adjacent to Monterey Bay and wetlands, which provide habitat for rare, threatened wildlife and plant species. Some of the lands designated as "Habitat Reserve and Other Open Space" in the General Plan are as follows and presented in Figure 2-7 of the General Plan:

- Approximately 1,600 acres west of Highway 1 are designated as Habitat Reserve for this purpose (Policy 2.10.2).
- An area of 80 acres on the Armstrong Ranch property between Del Monte Boulevard and Highway 1 is designated as Habitat Reserve due to the presence of vernal ponds (Policy 2.10.4).

The General Plan recognizes that future water demands will require changes in the management of water resources in the area, and water conservation and water reclamation and reuse will constitute major components of future water management efforts. The policies and programs of the General Plan are designed to promote both water conservation and the use of recycled water to protect water quality and to ensure that the demand of future community development does not exceed the capacity to provide water in an environmentally acceptable way (Policy 3.42).

4.3 MONTEREY COUNTY GENERAL PLAN

The Monterey County General Plan applies to land use and resource management decisions in the unincorporated areas east of the MGSA Area where many of the GDEs identified in this memorandum are located. The Plan includes the following goals and policies related to land use, conservation and open space, public water supply and agriculture that are relevant to GDEs:

- Promote appropriate and orderly growth and development while protecting desirable existing land uses [GOAL LU-1].
    - Land uses shall be designated to achieve compatibility with adjacent uses [LU-1.5].
- Encourage the provision of open space lands as part of all types of development including residential, commercial, industrial, and public [GOAL LU-8].
    - Creation of private, nonprofit land trusts and conservation organizations to receive development rights on any lands to be preserved and maintained as open space shall be supported [LU-8.6].
- Conserve listed species, critical habitat, habitat and species protected in area plans; avoid, minimize and mitigate significant impacts to biological resources [GOAL OS-5].

- Conservation of listed species shall be promoted [OS-5.1].
- Conservation of species shall be promoted as provided in the Area Plans [OS-5.2].
- Development shall be carefully planned to provide for the conservation and maintenance of critical habitat [OS-5.3].
- Development shall avoid, minimize, and mitigate impacts to listed species and critical habitat to the extent feasible [OS-5.4].
- Efforts to obtain and preserve natural areas of particular biologic, scientific, or educational interest, and restrict incompatible uses from encroaching upon them, shall be encouraged [OS-5.13].
- The County shall prepare, adopt, and implement a program that allows projects to mitigate the loss of critical habitat [OS-5.17].
- Prior to disturbing any federal or state jurisdictional areas, all applicable federal and state permitting requirements shall be met, including all mitigation measures for development of jurisdictional areas and associated riparian habitats [OS-5.18].
- In order to preserve riparian habitat, conserve the value of streams and rivers as wildlife corridors and reduce sediment and other water quality impacts of new development, the county shall develop and adopt a Stream Setback Ordinance [OS-5.22].

- Ensure that new development is assured a long-term sustainable water supply [GOAL PS-3].
  - Specific criteria for proof of a Long-Term Sustainable Water Supply and an Adequate Water Supply System for new development requiring a discretionary permit shall be developed by ordinance. The following factors shall be used [PS-3.2]:
    - Water quality
    - Production capacity
    - Capability of the water purveyor
    - Source of the water supply and nature of the water rights
    - Cumulative impacts of existing and projected future water demand, and the ability to reverse trends contributing to an overdraft condition
    - Effects of additional extraction or diversion of water on the environment including on in-stream flows necessary to support riparian vegetation, wetlands, fish or other aquatic life
    - Projects or best management practices to renew or sustain aquifer functions.
  - Specific criteria shall be developed by ordinance for use in the evaluation and approval of adequacy of all domestic wells [PS-3.3].
  - The County shall request an assessment of impacts on adjacent wells and instream flows for new high-capacity wells where there may be a potential to affect existing adjacent domestic or water system wells adversely or in-stream flows necessary to support riparian vegetation, wetlands, fish, and other aquatic life [PS-3.4].

Similar to the City General Plan, the County General Plan requires that decisions regarding groundwater management, well permitting and projects that may affect groundwater resources should consider effects of those projects and approvals on GDEs and provide mitigation for potential adverse effects. In addition,

the County General Plan prescribes specific policies and goals intended to protect riparian and wetland habitat, including GDEs.

4.4 APPLICABLE CALIFORNIA WATER CODE REGULATIONS AND LAW

The GSP Regulations include specific requirements to identify and consider GDEs (23 CCR § 354.16(g)) when determining whether groundwater conditions are having potential effects on beneficial uses and users. GSAs must also assess whether sustainable management criteria may cause adverse impacts to beneficial uses, which include environmental uses, such as for plants and wildlife.

The regulations specifically require a GSP to identify GDEs "within the basin" (*id.* § 354.16(g)). SGMA requires that all beneficial uses and users, including environmental users of groundwater, be considered in the development and implementation of GSPs (California Water Code (CWC) § 10723.2). It is clear from the regulations that in drafting a GSP, a GSA must assess whether groundwater extraction and management within its jurisdictional boundaries may cause adverse impacts to beneficial uses and users (including GDEs) both within and surrounding its jurisdictional boundaries. Similarly, as in developing sustainable management criteria, undesirable results within and surrounding a GSA must be considered and addressed. As such, the basin characterization information and sustainable management criteria in a GSP are intended to be used by a GSA to inform groundwater management within its jurisdictional boundaries and to coordinate plan implementation in accordance with 23 CCR § 357.4.

4.5 PUBLIC TRUST RESOURCES

A recent California Court of Appeal case held that counties have an obligation to consider public trust resources when granting well construction permits near navigable waters that are groundwater connected (*Envtl. Law Found. v. State Water Res. Control Bd.,* 26 Cal. App. 5th 844 (Ct. App. 2018)). The case arose in 2009 in the context of a lawsuit over Siskiyou County's obligations in administering groundwater well permit and management programs with respect to the Scott River, a navigable waterway tributary to the Klamath River that is hydraulically connected to groundwater resources in the Scott River Groundwater Basin. The court held that when issuing well permits, Siskiyou County is required by the public trust doctrine to consider the potential impairment of public trust resources caused by groundwater extraction, and to protect those resources when feasible. Although the duty to consider the trust is imposed on the State, the court held that the county is also subject to that duty as a subdivision of the State. The court further held that the passage of the Sustainable Groundwater Management Act (SGMA) does not preempt or abrogate this requirement. The case was subsequently appealed to the California Supreme Court, which declined to hear it. Based on the Appeals Court decision in this case, the Public Trust Doctrine imposes an obligation for public agencies to consider how groundwater management affects public trust resources (CDFW 2020). Thus, when groundwater is interconnected with surface water resources protected under the trust, prior to issuing permits or approvals that result in groundwater extraction, any state agency or other subdivision of the State has a duty to consider the potential effect of that extraction on public trust resources, and to protect those resources when feasible. This includes direct effects on the protected resources, or indirect effects through depletion of tributary waters that are not directly protected under the Public Trust Doctrine.

This decision is important and directly applicable to the management of groundwater resources under the City of Marina and the approval of the proposed slant wells for the MPWSP. The Salinas River is a navigable inland waterway subject to the public trust. Based on the available data, the river and associated wetland and riparian vegetation GDEs are likely in hydraulic communication with the Dune Sand Aquifer and could be affected by groundwater withdrawal or drawdown in this aquifer induced by the MPWSP. In addition, the data indicate that the protected vernal pond GDEs identified in the Coastal Zone in and surrounding the City are also hydraulically connected with and dependent on shallow groundwater in the could also be adversely affected by groundwater withdrawals or drawdown. A letter filed with the California Coastal Commission on behalf of the City of Marina on November 8, 2019 by the City's attorneys discusses in detail why these vernal pond wetlands should also be protected under the Public Trust Doctrine (FBM 2019). Thus, given the above information, state and county agencies issuing permits approving the proposed MPWSP slant wells must conduct an analysis of the potential impacts of the proposed groundwater withdrawal on public trust resources, assess the feasibility of protecting these resources, and protect them to the extent required by law.

5 POTENTIAL IMPACTS RESULTING FROM GROUNDWATER EXTRACTION

The proposed extraction of 17,400 acre-feet per year from the proposed slant wells for the MPWSP has the potential to adversely affect GDEs near the MGSA area through drawdown-induced groundwater level decline. The Environmental Impact Report/Environmental Impact Statement for the MPWSP presents the results of groundwater modeling which indicate that pumping from the Dune Sand and 180-Foot Aquifers to supply water for the project is expected to result in drawdown ranging from 1 to 5 feet in the Dune Sand Aquifer in the area between the MPWSP and the Salinas River, and a flow depletion of approximately 400 acre feet per year in the river (ESA, 2018). The CCC employed an independent hydrogeologic expert who concluded that the groundwater model used to derive these estimates is based on a flawed conceptual model that may underestimate the MPWSP's extraction of aquifer water and the interconnection between different aquifer units (Weiss Associates, 2019). It is therefore possible that the drawdown and surface water depletion effects from operation of the proposed slant wells are similarly underestimated.

The ecological water requirements and thresholds of response to changes in groundwater levels differ among GDEs. GDEs develop in response to unique timing, duration, frequency and chemistry of water inputs. The ability of GDEs to adapt or recover from groundwater declines depends largely on the overall water budget, degree to which a GDE is dependent on groundwater, interaction of plant root systems with a changing water table, species present, and the ability of species to adapt to changing conditions and recover from stress. The degree of interaction between wetlands and groundwater also depends on their position in the landscape, the permeability of the substrate, depth to the water table, and seasonal fluctuations in water inputs.

A compilation of studies conducted by TNC in the western United States that examined plant response of 17 herbaceous wetland indicator species (11 common and six rare) to groundwater drawdown indicated gradual loss of indicator species starting with as little as 0.66 feet (0.2 meters) of drawdown, with a median of 2.99 feet (0.91 meters), and complete loss at 6.23 feet (1.9 meters) (Gerla *et al.* 2015). Rhode *et al.*

(2017) reviewed policies adopted for management of GDEs in the United States and globally, and assessed that thresholds for GDE responses to groundwater level decline are often assumed to follow linear, curvilinear, or step-wise functions, but that in reality they are likely habitat specific. A study of the effects of regulatory drawdown thresholds on inundation area and plant community composition in southeast Australia suggested that drawdowns from 0.82 feet (0.25 meters) to 0.98 feet (0.3 meters) represent a threshold where community composition is likely to change (Deane *et al.* 2017). The study setting was a regional unconfined aquifer with shallow groundwater levels and wetlands dependent on groundwater discharge, and included wetlands considered sensitive to even small declines in groundwater level. Thresholds were assigned based on ecological value, with higher functioning wetlands sensitive to changes assigned a threshold of up to 0.82 feet (0.25 meters) of acceptable drawdown over the course of five years; regional triggers were set at 1.64 feet (0.50 meters) over five years. Drawdown in shallow groundwater systems may alter community composition by increasing cover of exotic and upland or terrestrial species and increasing soil salinity from evapotranspiration; drawdown of deeper water systems may result in community change with conditions supporting greater cover of sedge species.

The Armstrong Ranch Pond Complex (Vernal Pond #6 in the CMP) are located approximately 300 to 1,000 feet east of the MGSA Area and include a series of seasonal wetlands with ponded water in the winter and wet herbaceous meadows likely subsisting on shallow groundwater during the dry season (The Habitat Restoration Group 1994). The calculated water evaporation and use by plants (i.e., ET) in the pond is shown in Figure 4 and ranged from approximately 5 to 10 inches from 2010 to 2013, then decreased to approximately 1 to 5 inches in 2014 and 2015, and 1 to 3 inches in 2016. In 2017, ET increased to approximately 3 to 10 inches, and in 2018 ET was approximately 5 to 12 inches. Although the decline in ET from 2014 to 2016 occurred during a period of severe drought, the slant well pumping test was also conducted from April 2015 to February 2018 (GSS, 2019). The hydrograph for well MW-4S indicates that the seasonal fluctuation in groundwater elevations in this area was approximately 2 feet and suggests that pumping-induced drawdown was approximately 1 foot below the normal range of groundwater level fluctuation during the drought period. The lowest groundwater elevations were observed in the summer of 2016 and averaged about 2 feet lower than in the subsequent summers of 2017 and 2018. The ET response associated with this groundwater level decline indicates a period of vegetative stress followed by recovery that coincided with a rise in groundwater levels; however, it is not known whether the species responsible for the recovery were the same species that experienced the distress or if some level of habitat degradation or succession occurred. The correlation between changes in groundwater elevations and GDE responses is a data gap because species compositional changes were not documented during the corresponding timeframe.

Research has shown that root distribution tends to be related to groundwater history; therefore, a rapid decline in water table relative to the condition under which roots developed may strand plant roots so they cannot obtain sufficient moisture (Shafroth, Stromberg and Patten, 2000). Although roots do tend to redistribute with the water table, plants cannot proliferate new roots if the water table decline is too rapid (Richards *et al* unpublished; Stella and Battles, 2010; Stella et al., 2010). A rapid decline in groundwater levels of even as little as approximately 1 foot induced by groundwater pumping was shown to cause leaf death in riparian plains cottonwoods (*Populus deltoides*) and declines of 3 feet caused whole

tree stress judged likely to lead to tree mortality (Cooper and Merritt, 2012). A rate of decline of as little as 3 centimeters / day was shown to be fatal to young Fremont cottonwood (*Populus fremontii*) seedlings (Stella and Battles, 2010). Therefore, relatively modest groundwater level declines can also significantly decrease the recruitment of new seedlings even if more mature trees ultimately adapt, potentially resulting in long-term riparian habitat decline or change (TNC, 2018; Amlin and Rood, 2002). As such, it is possible that pumping for the proposed MPWSP could adversely affect riparian vegetation near the Salinas River, but the extent of drawdown and the potential for adverse effects cannot be assessed at this time.

6 CONCLUSIONS AND RECOMMENDATIONS

During preparation of the GSP for the MGSA Area, a number of potential GDEs were identified in the area south of the Salinas River near the City of Marina. These potential GDEs were evaluated in accordance with guidelines developed by TNC to confirm they should be managed as GDEs under SGMA. Additional evaluations of the response of a representative vernal pond GDE near the MGSA area to groundwater level decline further confirmed the likely groundwater dependence of this GDE and, by extension, similar GDEs in the area. The identified GDEs include protected species and habitats that are managed under several existing management plans and protected under state and federal laws and the Public Trust Doctrine. Evaluation of the available data indicates these GDEs could be adversely affected by groundwater withdrawal from the proposed MPWSP slant wells, if approved and installed.

An analysis of historical ET variability, groundwater levels and drawdown at one of the Armstrong Ranch ponds demonstrates (1) a correlation between groundwater levels and biomass productivity in this GDE, and (2) illustrates its sensitivity to groundwater level declines. Biomass productivity rebounded with groundwater levels; however, it is not known whether the stress induced in the GDE resulted in a change in the vegetation community, habitat degradation, or habitat succession that is not readily reversible. Similarly, the available data indicate that adverse impacts to riparian vegetation can occur in response to even relatively modest groundwater level declines if they are rapid enough or of sufficient amplitude to affect the recruitment of new seedlings. Thus, at this time, it is not possible to determine precisely what level of drawdown imposed on natural groundwater elevation fluctuations would have a significant and unreasonable impact on the GDEs near the MGSA Area as defined under SGMA, or a significant impact under CEQA; however, substantial adverse impacts are possible.

To address this data gap, the GSP for the MGSA Area contains a recommendation that a qualified biologist and a hydrogeologist perform a baseline assessment of the vernal ponds that may be affected by groundwater level declines. The purpose of this baseline assessment will be to characterize these wetlands in terms of (1) their dependence on groundwater, (2) their potential sensitivity to groundwater level declines, and (3) establish baseline conditions for future comparison. Based on the findings of this assessment, a monitoring plan would be developed to assess changes in the vigor and quality of the GDE habitats over time and allow correlation of changes to shallow groundwater elevations. Quantitative approaches, such as the development of habitat suitability index models, state and succession models, or similar assessment tools, would be developed to assess possible future changes in habitat quality, services

and succession. In our experience, remote sensing coupled with photo documentation and on the ground surveys, when warranted, would support an effective monitoring and management strategy.

In addition and to comply with the SGMA regulations, which require that sustainable management criteria be established that will assure sustainable groundwater management ***while*** data gaps are addressed, the GSP for the MGSA Area outlines appropriate monitoring, measurable objectives and minimum thresholds governing the area to assure their protection (*See* 23 CCR §§ 354.24 and 355.4(b)). The GSP for the MGSA Area has been adopted by the City and submitted to the DWR; however, the GSP is currently on hold pending resolution of a lawsuit regarding its implementation. Deferring implementation of sustainable management criteria while data gaps are filled may allow irreversible damage to these protected habitats if the MPWSP project proceeds before this issue is resolved.

EXECUTIVE SUMMARY

The purpose of this report is to provide an update to The Coastal/Vernal Pond Comprehensive Management Plan (CVCMP), developed in the early 1990s and adopted by the Marina City Council in November 1994, to identify the current hydrologic conditions and biological resources of six ponds within or adjacent to the City of Marina. This report also identifies potential resources, such as sensitive habitat and special-status species that are subject to regulatory constraints to activities that could impact the six ponds. On June 9 and 18, 2020, WRA, Inc. performed an assessment of current hydrologic conditions and biological resources at the six ponds within the City of Marina (Study Area).

WRA observed five aquatic and three upland sensitive biological communities within the Study Area. Six special-status plants were observed within the Study Area, and an additional 26 species have potential to occur within the Study Area. Twelve (12) special-status wildlife species have the potential to occur within the Study Area. In addition, four (4) species not listed in CNDDB were determined to have a moderate potential to occur. Five (5) of the special-status species with potential to occur are birds, which could nest in trees and other vegetation that occurs within the Study Area.

Ponds 2, 3, and 7 now contain pockets of facultative hydrophytic vegetation, not described in the CVCMP, in areas where freshwater runoff from culverts and adjacent paved areas appears to pond against riparian and perennial marsh vegetation. With the exception of increases in the footprint of freshwater seasonal wetland, indicative of urban and road runoff, and riparian willow forest, groundwater-dependent ecosystems within the Study Area remain roughly as described in the CVCMP. The die off of perennial marsh vegetation at two ponds does not appear to be the result of changes in groundwater hydrology, though additional water quality analyses may be needed to confirm.

A high water table was observed within each pond at one or more sample points, and five of the ponds contained open water at the time of the June 2020 site visits, conducted well after the conclusion of the dry season. Willow riparian vegetation, which is dependent upon groundwater, was observed to have either established or increased substantially in footprint at three ponds, and perennial marsh vegetation was generally observed to be in good condition at all six ponds. Despite the recent establishment of pockets of freshwater seasonal wetland, all six ponds assessed in this report are reliant upon groundwater and therefore should be considered groundwater-dependent ecosystems. Perennial marsh vegetation and willow riparian vegetation within all six ponds could be adversely affected by future activities that cause groundwater drawdown.

1.0 INTRODUCTION

On June 9 and 18, 2020, WRA, Inc. (WRA) performed an assessment of biological resources at six ponds located in or adjacent to the City of Marina, Monterey County, California (Figure 1). Location details for each pond are included in Table 1, and depicted in Figure 2. The Study Area consists of wetland habitat associated with each pond and a buffer that extends roughly 50 feet upland from the wetland edge.

The Coastal/Vernal Pond Comprehensive Management Plan ([CVCMP] The Habitat Group 2014) was developed in 1994 to identify guidelines for the preservation, management, and enhancement of Marina's wetland resources (The Habitat Group 2014). The CVCMP identifies the hydrologic conditions, biological resources, and land uses of the seven vernal/coastal ponds within Marina. The CVCMP also identifies specific measures to be conducted at each pond to preserve, protect and enhance sensitive resources. The purpose of this report is to provide an update to the findings of the 1994 CVCMP based on current conditions observed at six of the seven ponds (Pond 6, the Armstrong Ranch Ponds, was not accessible at the time of the site visits). This assessment gathers information necessary to evaluate potential biological resources that could be considered constraints to activities that could influence hydrological influences of each pond.

This report describes the results of the site visits, which assessed the Study Area for the (1) potential to support special-status species; (2) presence of other sensitive biological resources protected by local, state, and federal laws and regulations; and (3) the biological, edaphic, and hydrological indicators of groundwater dependence. Specific findings on the habitat suitability or presence of special-status species or sensitive habitats may require that protocol-level surveys be conducted. This report also contains an evaluation of potential impacts to special-status species and sensitive biological resources that may occur as a result of a possible future development project.

The biological surveys conducted for this analysis do not constitute protocol-level surveys for listed species that may be required for project approval by local, state, or federal agencies. This assessment is based on information available at the time of the study and on site conditions that were observed on the dates of the site visits.

Table 1. Ponds Included in the Study Area; see also Figure 2.

Pond	Location	Current Ownership/Management
Pond 1: Robin Drive Pond	West of Lake Drive	City of Marina
Pond 2: Locke-Paddon Park	Reservation Road and Seaside Avenue	City of Marina
Pond 3a: Marina Landing Pond	Reservation Road and Beach Road, east of Reservation Road	Private/City of Marina
Pond 3b: Marina Landing Pond	Reservation Road and Beach Road, west of Reservation Road	Private/City of Marina
Pond 4: Marina Coast Water District Pond	North of Reservation Road, West of Highway 1	Marina Coast Water District

Pond	Location	Current Ownership/Management
Pond 5: Marina State Beach	South of Reservation Road, West of Highway 1	California Department of Parks and Recreation
Pond 7: Lake Drive Pond	West of Lake Drive	City of Marina

2.0 REGULATORY BACKGROUND

The following sections explain the regulatory context of the biological assessment, including applicable laws and regulations that were applied to the field investigations and analysis of potential project impacts.

2.1 Sensitive Biological Communities

The California Environmental Quality Act (CEQA) provides protections for particular vegetation types defined as sensitive by the California Department of Fish and Game (CDFW), and aquatic communities protected by laws and regulations administered by the U.S Army Corps of Engineers (Corps), State Water Resources Control Board (SWRCB), and Regional Water Quality Control Boards (RWQCB). The laws and regulations that provide protection for these resources are summarized below.

Sensitive Natural Communities: Sensitive natural communities include habitats that fulfill special functions or have special values. Natural communities considered sensitive are those identified in local or regional plans, policies, regulations, or by the CDFW. CDFW ranks sensitive communities as "threatened" or "very threatened" (CDFG 2010, CDFW 2020a) and keeps records of their occurrences in its California Natural Diversity Database (CNDDB; CDFW 2020a). CNDDB vegetation alliances are ranked 1 through 5 based on NatureServe's (2020) methodology, with those alliances ranked globally (G) or statewide (S) as 1 through 3 considered sensitive. Impacts to sensitive natural communities identified in local or regional plans, policies, or regulations or those identified by the CDFW or U.S. Fish and Wildlife Service (USFWS) must be considered and evaluated under CEQA (CCR Title 14, Div. 6, Chap. 3, Appendix G).

Waters of the United States, Including Wetlands: The Corps regulates "Waters of the United States" under Section 404 of the Clean Water Act (CWA). Waters of the United States are defined in the Code of Federal Regulations (CFR) as including the territorial seas, and waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, such as tributaries, lakes and ponds, impoundments of waters of the U.S., and wetlands (33 CFR 328.3). Potential wetland areas, according to the three criteria used to delineate wetlands as defined in the Corps Wetlands Delineation Manual (Environmental Laboratory 1987), are identified by the presence of (1) hydrophytic vegetation, (2) hydric soils, and (3) wetland hydrology. Unvegetated waters including lakes, rivers, and streams may also be subject to Section 404 jurisdiction and are characterized by an ordinary high water mark (OHWM) identified based on field indicators such as the lack of vegetation, sorting of sediments, and other indicators of flowing or standing water. The placement of fill material into Waters of the United States generally requires a permit from the Corps under Section 404 of the CWA.

The Corps also regulates construction in navigable waterways of the U.S. through Section 10 of the Rivers and Harbors Act (RHA) of 1899 (33 USC 403). Section 10 of the RHA requires Corps approval and a permit for excavation or fill, or alteration or modification of the course, location,

condition, or capacity of, any port, roadstead, haven, harbor, canal, lake, harbor or refuge, or enclosure within the limits of any breakwater, or of the channel of any navigable water of the United States. Section 10 requirements apply only to navigable waters themselves, and are not applicable to tributaries, adjacent wetlands, and similar aquatic features not capable of supporting interstate commerce.

Waters of the State, Including Wetlands: The term "Waters of the State" is defined by the Porter-Cologne Act as "any surface water or groundwater, including saline waters, within the boundaries of the state." The SWRCB and nine RWQCBs protect waters within this broad regulatory scope through many different regulatory programs. Waters of the State in the context of a CEQA Biological Resources evaluation include wetlands and other surface waters protected by the *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State*. The SWRCB and RWQCB issue permits for the discharge of fill material into surface waters through the State Water Quality Certification Program, which fulfills requirements of Section 401 of the CWA and the Porter-Cologne Water Quality Control Act. Projects that require a CWA permit are also required to obtain a Water Quality Certification. If a project does not require a federal permit, but does involve discharge of dredge or fill material into surface waters of the State, the SWRCB and RWQCB may issue a permit in the form of Waste Discharge Requirements.

Sections 1600-1616 of California Fish and Game Code: Streams and lakes, as habitat for fish and wildlife species, are regulated by CDFW under Sections 1600-1616 of California Fish and Game Code (CFGC). Alterations to or work within or adjacent to streambeds or lakes generally require a 1602 Lake and Streambed Alteration Agreement. The term "stream", which includes creeks and rivers, is defined in the California Code of Regulations (CCR) as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life [including] watercourses having a surface or subsurface flow that supports or has supported riparian vegetation" (14 CCR 1.72). The term "stream" can include ephemeral streams, dry washes, watercourses with subsurface flows, canals, aqueducts, irrigation ditches, and other means of water conveyance if they support aquatic life, riparian vegetation, or stream-dependent terrestrial wildlife (CDFG 1994). Riparian vegetation has been defined as "vegetation which occurs in and/or adjacent to a stream and is dependent on, and occurs because of, the stream itself" (CDFG 1994). Removal of riparian vegetation also requires a Section 1602 Lake and Streambed Alteration Agreement from CDFW.

Environmentally Sensitive Habitat Areas: The California Coastal Act Section 30107.5 defines Environmentally Sensitive Habitat Areas (ESHAs) as "any area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which could be easily disturbed or degraded by human activities and developments." Coastal Act Section 30240 protects ESHAs from "significant disruption of habitat values" limits allowable land uses within ESHAs, and requires adjacent uses to be designed to be compatible with habitat benefits provided by ESHAs. The Coastal Act includes wetlands as ESHAs, but does not specifically define every vegetation community defined as an ESHA. Instead, the California Coastal Commission (CCC) often delegates the responsibility for administering the California Coastal Act to local municipalities through the approval of Local Coastal Programs (LCPs). Many LCPs provide more specific lists of communities that are considered ESHAs.

City of Marina Local Coastal Land Use Plan:

The City of Marina has an approved LCP that consists of a Local Coastal Land Use Plan and a Local Coastal Implementation Plan (City of Marina 2013a, 2013b). Under the California Coastal Act, the City of Marina manages coastal development within its jurisdictional boundaries, including addressing the challenges presented by coastal hazards like storms, flooding, and erosion, and the CCC is the jurisdictional regulatory agency that oversees these issues below the mean high tide line. Primary and Secondary Habitat, as defined under the City's LCP (City of Marina 2013a), are considered ESHAs that are designated protected areas within the Coastal Zone. Primary Habitat includes:

- habitat for all identified plant and animal species which are rare, endangered or threatened, or are necessary for the survival of an endangered species;
- vernal ponds and their associated wetland vegetation; and
- all native dune vegetation, where such vegetation is extensive enough to perform the special role of stabilizing Marina's natural sand dune formations.

Secondary Habitat is defined as other areas that have an especially valuable role in an ecosystem for sensitive plant or animal life, as determined by a qualified biologist approved by the City of Marina.

City of Marina General Plan:

The City of Marina's General Plan (City of Marina 2010) specifies open space policies to ensure retention of land with significant natural resource values (Policy 2.3.3) and include habitat reserves and other open space for the protection of important habitat and scenic areas (Policy 2.7.1). Habitat reserve and open space include coastal strand and dune areas adjacent to Monterey Bay and wetlands, which provide habitat for rare, threatened and endangered wildlife and plant species.

The City of Marina's General Plan recognizes that future water demands will require changes in the management of water resources in the area, and water conservation and water reclamation and reuse will constitute major components of future water management efforts. The policies and programs of the General Plan are designed to promote both water conservation and the use of recycled water to protect water quality and to ensure that the demand of future community development does not exceed the capacity to provide water in an environmentally acceptable way (Policy 3.42).

Ponds 1, 2, 3, and 7 are within the boundaries of the City of Marina.

Monterey County General Plan:

The Monterey County General Plan (County of Monterey 2010) applies to land use and resource management decisions in the unincorporated areas east of the City of Marina. Similar to the City General Plan, the County General Plan contains goals and policies related to the conservation of listed species and critical habitat; and avoidance, minimization, and mitigation of significant impacts to biological resources. The Monterey County General Plan requires that decisions regarding groundwater management, well permitting, and projects that may affect groundwater resources should consider effects of those projects and approvals on groundwater-dependent ecosystems and provide mitigation for potential adverse effects. In addition, the County General Plan prescribes specific policies and goals intended to protect riparian and wetland habitat, such as an assessment of impacts on adjacent wells and instream flows for new high-capacity wells

where there may be a potential to affect existing adjacent domestic or water system wells adversely or in-stream flows necessary to support riparian vegetation, wetlands, fish, and other aquatic life [PS-3.4].

Ponds 4 and 5 fall under the Monterey County General Plan.

Marina Groundwater Sustainability Agency Groundwater Sustainability Plan

The Sustainable Groundwater Management Act (SGMA) requires Groundwater Sustainability Agencies (GSAs) to prepare Groundwater Sustainability Plans (GSPs) to achieve sustainable groundwater conditions in medium and high priority groundwater basins and subbasins designated by the California Department of Water Resources. The City of Marina GSA (MGSA) covers an area north of the urban growth center, in an area with a land use designation of Habitat Preserve and Other Open Space (MGSA 2020). The GSP Regulations include specific requirements to identify and consider Groundwater-Dependent Ecosystems (23 CCR § 354.16(g)) when determining whether groundwater conditions are having potential effects on beneficial uses and users. GSAs must also assess whether sustainable management criteria may cause adverse impacts to beneficial uses, which include environmental uses, such as plants and wildlife (MGSA 2020).

2.2 Special-Status Species

Special-status species include those plants and wildlife species that have been formally listed, are proposed as endangered or threatened, or are candidates for such listing under the federal Endangered Species Act (ESA) or California Endangered Species Act (CESA). These Acts afford protection to both listed and proposed species. In addition, CDFW Species of Special Concern, which are species that face extirpation in California if current population and habitat trends continue, USFWS Birds of Conservation Concern, and CDFW special-status invertebrates are all considered special-status species. Although CDFW Species of Special Concern generally have no special legal status, they are given special consideration under CEQA.

In addition to regulations for special-status species, most birds in the United States, including non-status species, are protected by the Migratory Bird Treaty Act (MBTA) of 1918. Under this legislation, destroying active nests, eggs, and young is illegal. Bat species designated as "High Priority" by the Western Bat Working Group (WBWG) qualify for legal protection under Section 15380(d) of the CEQA Guidelines.

Plant species on the California Native Plant Society (CNPS) Rare and Endangered Plant Inventory (Inventory; CNPS 2020a) with a CNPS Rare Plant Rank (Rank) of 1, 2, or 3 are also considered special-status plant species and must be considered under CEQA. A description of the Ranks is provided below in Table 2.

Table 2. Description of CNPS Ranks and Threat Codes

CNPS Rare Plant Ranks (formerly known as CNPS Lists)	
Rank 1A	Presumed extirpated in California and either rare or extinct elsewhere
Rank 1B	Rare, threatened, or endangered in California and elsewhere
Rank 2A	Presumed extirpated in California, but more common elsewhere
Rank 2B	Rare, threatened, or endangered in California, but more common elsewhere

Rank 3	Plants about which more information is needed - A review list
Rank 4	Plants of limited distribution - A watch list
Threat Ranks	
0.1	Seriously threatened in California
0.2	Moderately threatened in California
0.3	Not very threatened in California

Critical Habitat

Critical habitat is a term defined in the ESA as a specific geographic area that contains features essential for the conservation of a threatened or endangered species and that may require special management and protection. The ESA requires federal agencies to consult with the USFWS to conserve listed species on their lands and to ensure that any activities or projects they fund, authorize, or carry out will not jeopardize the survival of a threatened or endangered species. In consultation for those species with critical habitat, federal agencies must also ensure that their activities or projects do not adversely modify critical habitat to the point that it will no longer aid in the species' recovery. In many cases, this level of protection is similar to that already provided to species by the ESA jeopardy standard. However, areas that are currently unoccupied by the species but which are needed for the species' recovery are protected by the prohibition against adverse modification of critical habitat.

3.0 METHODS

On June 9 and 18, 2020, the Study Area was traversed on foot to determine (1) whichplant communities are present within the Study Area, (2) if existing conditions provided suitable habitat for any special-status plant or wildlife species, (3) if sensitive habitats are present, and (4) if current hydrology has substantially changed since the CVCMP was published in 1994. Ponds 1, 3, and 4 were visited on June 9, 2020, and Ponds 2, 5, and 7 were visited on June 18, 2020. For the purpose of the discussion of results, Pond 3 was subdivided into Pond 3a (east of Reservation Road) and Pond 3b (west of Reservation Road) (Figure 5-3). The Study Area was defined to include wetland habitat associated with each pond, and a buffer from the edge of wetland vegetation extending 50 feet into the upland. However, the site visits focused mainly on wetland habitat, and the buffer was cursorily examined for ability to support special-status plant or wildlife species and general conditions that might affect wetland and water quality. Plant nomenclature follows the Jepson Flora Project (Jepson eFlora 2020), except where noted. For cases in which regulatory agencies, CNPS, or other entities base rarity on older taxonomic treatments, precedence was given to the treatment used by those entities.

3.1 Biological Communities

Prior to the site visit, aerial imagery (Google Earth 2020); the National Wetlands Inventory (NWI; USFWS 2020a); the CVCMP (The Habitat Group 2014); and a recent assessment of groundwater-dependent ecosystems within the City of Marina ([Technical Memorandum]; Formation Environmental 2020) were reviewed to determine if any plant communities and/or aquatic features were present or had the potential to be present in the Study Area. Where possible, biological communities were classified based on existing descriptions from the CVCMP.

If not previously described, wetland communities were classified based on the descriptions used by the NWI. Biological communities were classified as sensitive or non-sensitive as defined by CEQA and other applicable laws and regulations.

3.1.1 Non-sensitive Biological Communities

Non-sensitive biological communities are those communities that are not afforded special protection under CEQA, and other state, federal, and local laws, regulations and ordinances. These communities may, however, provide suitable habitat for some special-status plant or wildlife species and are identified or described in Section 4.1.1 below.

3.1.2 Sensitive Biological Communities

Sensitive biological communities are defined as those communities that are given special protection under CEQA and other applicable federal, state, and local laws, regulations and ordinances. Applicable laws and ordinances are discussed above in Section 2.0.

The Study Area was inspected for streams and riparian vegetation that may be regulated as Waters of the State by RWQCB Section 401 of the CWA and/or by CDFW under Sections 1600-1616 of the CFGC. The Study Area was not formally assessed for the presence of waters of the State or waters of the U.S. including wetlands, and non-wetland waters using the methods described in the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987). Identification of wetlands focused primarily on updating the boundary of wetlands identified in the 1994 CVCMP based on the extent of hydrophytic vegetation and indicators of wetland hydrology.

3.1.3 Groundwater-Dependent Ecosystems

Each pond within the Study Area was assessed for potential changes in hydrology since the CVCMP was published, and for indicators of its potential groundwater-dependent ecosystem status. Prior to site visits, the CVCMP (The Habitat Group 2014) and the Technical Memorandum (Formation Environmental 2020) were evaluated to determine baseline hydrology conditions. During the site visit, hydrology inputs to each pond were assessed, and each pond was classified as predominantly precipitation- or groundwater-dependent, based on observed potential hydrological inputs, plant species composition and general hydrophytic vegetation condition, water salinity, and depth of soil saturation and roots within the soil profile. Additionally, the condition of the buffer around each pond was assessed for potential impacts to wetland and water quality. Four to five photopoints were established at each pond to serve as reference points for any potential future changes to wetland hydrology and/or vegetation.

Salinity

Salinity and temperature readings were taken at each pond location using a handheld YSI unit. Salinity readings were recorded in parts per thousand (PPT) and temperature was recorded in degrees Celsius. The YSI probe was left in water for a minimum of 20 seconds for each reading to ensure accuracy. Four salinity readings were taken at Ponds 2, 3, 3a, 4, and 7. Due to its larger size, five readings were taken at Pond 1 for increased accuracy. No open water was present at Pond 5, however a single salinity reading was taken in the location of an excavated soil pit, where water had pooled. Salinity readings were taken in association with benchmark photo points, providing approximate sample locations (Figure 5).

Water Table

One to two soil pits were dug to a depth of approximately 14 inches at each pond. When more than one wetland habitat type was present, a sample pit was excavated in each wetland habitat type. Pits were preferentially dug in areas with perennial hydrophytic vegetation, and were dug at the upland edge of the wetland habitat whenever possible. The soil profile, including soil matrix color, texture, redoximorphic concentrations, and plant species present were characterized at each pit location. Within the soil pit, depth to saturation, water table, and the depth to the end of the root zone were recorded.

3.2 Special-Status Species

3.2.1 Literature Review

Potential occurrence of special-status species in the Study Area was evaluated by first determining which special-status species occur in the vicinity of the Study Area through a literature and database search. Database searches for known occurrences of special-status species focused on the Marina, Monterey, Moss Landing, Prunedale, Salinas, Seaside, and Spreckels U.S. Geological Survey 7.5-minute quadrangle maps. The following sources were reviewed to determine which special-status plant and wildlife species have been documented to occur in the vicinity of the Study Area:

- CNDDB records (CDFW 2020a)
- USFWS Information for Planning and Consultation database (USFWS 2020b)
- CNPS Inventory records (CNPS 2020a)
- Consortium of California Herbaria records (CCH 2020)
- CDFG publication "California's Wildlife, Volumes I-III" (Zeiner et al. 1990)
- CDFG publication "Amphibians and Reptile Species of Special Concern in California" (Jennings 1994)
- A Field Guide to Western Reptiles and Amphibians (Stebbins 2003)

3.2.2 Site Assessment

A site visit was made to the Study Area to search for suitable habitats for special-status species. Habitat conditions observed at the site were used to evaluate the potential for presence of special-status species based on these searches and the professional expertise of the investigating biologists. The potential for each special-status species to occur in the Study Area was then evaluated according to the following criteria:

- No Potential. Habitat on and adjacent to the site is clearly unsuitable for the species requirements (foraging, breeding, cover, substrate, elevation, hydrology, plant community, site history, disturbance regime).
- Unlikely. Few of the habitat components meeting the species requirements are present, and/or the majority of habitat on and adjacent to the site is unsuitable or of very poor quality. The species is not likely to be found on the site.
- Moderate Potential. Some of the habitat components meeting the species requirements are present, and/or only some of the habitat on or adjacent to the site is unsuitable. The species has a moderate probability of being found on the site.

- High Potential. All of the habitat components meeting the species requirements are present and/or most of the habitat on or adjacent to the site is highly suitable. The species has a high probability of being found on the site.
- Present. Species is observed on the site or has been recorded (i.e. CNDDB, other reports) on the site recently.

The site assessment is intended to identify the presence or absence of suitable habitat for each special-status species known to occur in the vicinity to determine its potential to occur in the Study Area. The site visit does not constitute protocol-level surveys and is not sufficient to conclude the absence of a species. In cases where little information is known about species occurrences and habitat requirements, the species evaluation was based on best professional judgment of WRA biologists with experience working with the species and habitats.

If a special-status species was observed during the site visit, its presence was recorded, and it is discussed below in Section 4.2. For some species, a site assessment visit at the level conducted for this report may not be sufficient to determine presence or absence of a species to the specifications of regulatory agencies. In these cases, a species may be assumed to be present or further protocol-level special-status species surveys may be necessary. Special-status species for which further protocol-level surveys may be necessary are described below in Section 4.2.

4.0 RESULTS

Vernal ponds included within the Study Area are situated within the coastal plain of Monterey Bay, within 1 mile of the Pacific Ocean, and approximately 2 miles east of the Salinas River. The elevation of the ponds ranges between approximately 0 and 5 feet above mean sea level, while the surrounding dune deposits reach elevations over 100 feet above mean sea level. The ponds lay within highly permeable Quaternary sand dune deposits, which contain the Dune Sands Aquifer, the predominant aquifer in the Marina area (The Habitat Group 1994, Formation Environmental 2020). Surrounding land uses vary between ponds, but include paved roads and Highway 1; housing and commercial developments; and managed lands such as the Marina Dunes Preserve, Marina State Beach, and Locke-Paddon Park. Adjacent habitat types to the east include coastal dunes, coastal scrub, and the Pacific Ocean. Adjacent habitat types to the north, south, and west include a matrix of ruderal grassland, ornamental plantings, and developed and landscaped areas.

Recent hydrogeological research performed during preparation of the Groundwater Sustainability Plan for the MGSA, reached the following conclusions regarding the hydrogeological connection of the Marina vernal ponds with the underlying aquifers:

> *Groundwater occurs at depth beneath the tall, active dunes at the coast, but as noted in Section 2, can be relatively shallow further inland and beneath hollows and depressions, such as where the coastal wetland GDEs discussed in this memorandum are located. While it has been asserted that the vernal ponds near the City are supplied by the lateral inflow of perched groundwater on low permeability layers in the Quaternary dune sands, these layers have not been confirmed to be present or continuous at all of the pond locations (The Habitat Group 1994; Balance Hydrologics 2012), and the groundwater elevations, pond elevations, and conditions noted above are not consistent with perched aquifers that are isolated from an underlying aquifer system. Rather, the available data indicate that these areas are underlain with a continuous saturated zone that extends through the Dune Sand Aquifer to the GDEs* (Formation Environmental 2020).

Ponds within the Study Area are believed to be remnants of historic marshes that occurred within the Salinas River floodplain and were subsequently covered by encroaching coastal sand dunes (The Habitat Group 1994). No tidal fluctuation in pond levels has been observed (The Habitat Group 1994). Groundwater in this area is generally shallow, and an assessment conducted by Formation Environmental (2020) interpreted the depth to groundwater near the Armstrong Ranch Pond Complex (Pond 6) to be approximately 2 to 5 feet. In that study, the ponds occurred where groundwater levels were close or intersected the ground surface. The wetlands assessed by WRA occur in a similar setting, and include ponds whose water surface elevations have been measured from 0.5 to 5 feet above mean sea level, similar to the groundwater table elevations in the Dune Sand Aquifer (Formation Environmental 2020).

The ponds experienced some physical modification through the early to mid-20th century by grading and filling (The Habitat Group 1994). In the 1950s through early 1980s, substantial modifications occurred with construction of Highway 1 in 1976, as well as the construction residential subdivisions (The Habitat Group 1994). Hydrologic modifications included paving over dune areas with impervious road and roof surfaces; runoff from some areas was piped and discharged directly to several of the ponds (Ponds 1, 2, 3, and 7; The Habitat Group 1994). Additionally, portions of Ponds 1 and 4 and associated wetlands were filled during this time (The Habitat Group 1994). In 1988, Pond 2 was developed as a Park, and groundwater was discharged into it to raise its summer level to 4.5 feet above mean sea level (The Habitat Group 1994. In 1993, Pond 3 was modified as part of the Marina Landing Shopping Center development (The Habitat Group 1994). A review of recent aerial imagery (Google Earth 2020) shows that the approximate footprint and surrounding land uses of each pond has remained relatively unchanged since 1998 (no aerial imagery was available between 1994 and 1998).

4.1 Biological Communities

Table 3 summarizes the area of each biological community observed in the Study Area. Sensitive aquatic biological communities associated with the ponds include coastal freshwater marsh, coastal saltwater marsh, willow riparian forest, freshwater seasonal wetland, and open water. Sensitive upland biological communities include coastal dune scrub, California blackberry scrub, and rose scrub. Non-sensitive upland biological communities include non-native grassland, non-native vegetation, native landscaping, and coyote brush. Upland biological communities occurred within the 50-foot upland buffer and therefore were not included in mapping efforts and area calculations, which focused on the within pond habitats directly related to pond hydrology. Descriptions for each biological community are included in sections 4.1.1 and 4.1.2. Wetland communities within the Study Area are shown in Figure 5.

Table 3. Summary of Biological Communities in the Study Area

Community Type	Area (Acres) by Pond*						Total Area (Acres)
	1	2	3	4	5	7	
Upland							
Non-Sensitive							
Non-Native Grassland	-	X	X	-	-	-	**N/A**
Non-Native Vegetation	X	X	X	X	X	X	**N/A**
Native Landscaping	-	X	X	-	-	-	**N/A**
Coyote Brush Scrub	X	X	-	-	-	X	**N/A**
Sensitive							
Coastal Dune Scrub	X	-	X	X	X	X	**N/A**
Rose Scrub	-	-	-	-	X	-	**N/A**
California Blackberry Scrub	-	X	-	-	-	-	**N/A**
Aquatic							
Coastal Freshwater Marsh	-	8.17	0.56	-	-	1.61	**10.34**
Coastal Saltwater Marsh	4.58	-	-	0.33	0.38	-	**5.29**
Willow Riparian Forest	0.01	2.60	1.27	-	-	-	**3.88**
Freshwater Seasonal Wetland	-	0.40	0.02	-	-	0.01	**0.43**
Open Water	1.03	1.83	0.32	1.00	-	0.47	**4.65**
Total Area (Acres)	**5.62**	**13**	**2.17**	**1.33**	**0.38**	**2.09**	**24.59**

*Only wetlands, waters, and riparian areas were the focus of mapping activities and area calculations. Biological communities encountered in the upland buffer are characterized as either present ("X") or absent ("-") at each pond, with no calculation of area

4.1.1 Upland Biological Communities

Non-Native Grassland

Non-native grassland is associated with Ponds 2 and 3. Non-native grassland surrounding wetland vegetation is dominated by non-native annual grasses, such as slim oat (*Avena barbata*), ripgut brome (*Bromus diandrus*), and soft chess (*Bromus hordeaceus*), and forbs, such as Canada horseweed (*Erigeron canadensis*), prickly lettuce (*Lactuca serriola*), prostrate knotweed (*Polygonum* aviculare), and common plantain (*Plantago major*). At Pond 2, non-native grassland

occurs in and near the vicinity of the picnic area near the intersection of Reservation Road and Seaside Avenue. Mixed grassland community installed in the upland areas around Pond 3 in 1993 and 1994 appears to have converted to non-native grassland, although some beardless wild rye (*Elymus triticoides*) is still present.

Non-Native Vegetation

Non-native vegetation is present within the upland buffers surrounding each pond. This community consists of woody and herbaceous non-native vegetation that has been planted or naturally established in previously disturbed areas. Canopy species include acacia (*Acacia* sp.), blue gum (*Eucalyptus globulus*), Monterey cypress (*Hesperocyparis macrocarpa*), and Monterey pine (*Pinus radiata*). The understory consists of non-native herbaceous species, such as short-podded mustard (*Hirschfeldia incana*), wild radish (*Raphanus sativus*), and iceplant (*Carpobrotus chilensis*, *C. edulis*). Monotypic iceplant mats were observed at Ponds 1, 3, and 4; these iceplant mats appear to have increased in footprint since 1994 and are beginning to encroach upon coastal dune scrub at Ponds 1 and 4.

Native Landscaping

Areas surrounding Ponds 2 and 3 have been planted with native species. Linear segments along Reservation Road (Pond 2) and Beach Road (Pond 3) have been planted with native scrub species, including coyote brush (*Baccharis pilularis*), mock heather (*Ericameria ericoides*), and coastal bush lupine (*Lupinus arboreus*). The southeastern edge of Pond 2 has been planted with native plants, dominated by coast live oak (*Quercus agrifolia*), California blackberry (*Rubus ursinus*), field sedge (*Carex praegracilis*), and Brewer's rush (*Juncus breweri*). This community appears to have been relatively stable in footprint and species composition since 1994.

Coyote Brush Scrub

Small pockets of upland areas surrounding Ponds 1, 2, and 7 are dominated coyote brush scrub, sometimes co-dominant with California blackberry. This community appears to have been relatively stable since 1994.

Coastal Dune Scrub

This community occurs on the backs of dune slopes surrounding Ponds 4 and 5, and is also associated with portions of Ponds 1, 3, and 7. The vegetation of the coastal dune scrub community is characterized by low-growing shrubs and herbs, including false iceplant (*Conicosia pugioniformis*), sand lettuce (*Dudleya caespitosa*), mock heather, coast buckwheat (*Eriogonum latifolium*) sea cliff buckwheat (*Eriogonum parvifolium*), lizard tail (*Eriophyllum staechadifolium*), and iceplant. Coastal dune scrub within the Study Area is similar in footprint and species composition as described in 1994 (The Habitat Group, although monotypic iceplant mats are expanding in size at Ponds 1 and 4. Areas mapped as coastal dune scrub are considered an ESHA under the Coastal Act, and are also covered by the City of Marina (Ponds 1, 3, and 7) and Monterey County (Ponds 4 and 5) General Plans. This habitat would be considered sensitive under CEQA.

California Blackberry Scrub

Pond 2 contains a small pocket of monotypic California blackberry scrub, as described in 1994 (The Habitat Group). California blackberry (*Rubus ursinus* Shrubland Alliance) is ranked as S3 and is therefore considered sensitive under CEQA.

Rose Scrub

The upland buffer surrounding Pond 5 is dominated by dense California rose (*Rosa californica*) with interspersed coyote brush and California blackberry. Rose scrub (*Rosa californica* Shrubland Alliance) is ranked as S3 and are therefore considered sensitive under CEQA.

4.1.2 Aquatic Biological Communities

Areas mapped as sensitive biological communities below are likely to meet the requirements as a potentially jurisdictional features subject to agency approval under Sections 401 and 404 of the CWA and the Porter-Cologne Water Quality Control Act. Additionally, riparian vegetation may be regulated under Section 1602 of the CFGC.

Coastal Freshwater Marsh

Ponds 2, 3, and 7 contain coastal freshwater marsh around the perimeter of open, unvegetated waters. Coastal freshwater marsh associated with Ponds 2 and 7 remain relatively similar in extent and species composition as described in 1994 (The Habitat Group), and have been successfully established at Pond 3 since that time. The interior of coastal freshwater marsh within the Study Area is dominated by tule (*Schoenoplectus acutus* var. *occidentalis*) and broadleaf cattail (*Typha latifolia*), while the outer edges are dominated by salt marsh baccharis (*Baccharis glutinosa*), Brewer's rush, chairmaker's bulrush (*Schoenoplectus americanus*), and stinging nettle (*Urtica dioica*).

Coastal Saltwater Marsh

Ponds 1, 4, and 5 contain coastal saltwater marsh in roughly the same footprint and with similar species composition as described in 1994 (The Habitat Group). Coastal saltwater marsh occurs along the fringe of open water at Ponds 1 and 4, and throughout the entirety of Pond 5. This community is dominated by herbaceous vegetation and graminoids, including fat hen (*Atriplex prostrata*), saltmarsh bulrush (*Bolboschoenus maritimus* ssp. *paludosus*), alkali heath (*Frankenia salina*), jaumea (*Jaumea carnosa*), Brewer's rush, silver weed cinquefoil (*Potentilla anserina*), and pickleweed (*Salicornia pacifica*). At Pond 5, only the lowest portion of the pond contains dense halophytic vegetation, while the fringe of the feature is dominated by a near monotypic stand of Brewer's rush, interspersed with scattered alkali heath, silver weed cinquefoil, and California blackberry. Within some areas to the north that appear to be receiving increased freshwater runoff (see Section 4.1.3), freshwater herbs and graminoids such as tall cyperus (*Cyperus eragrostis*), curly dock (*Rumex crispus*), and spike rush (*Eleocharis macrostachya*) are beginning to co-dominate with halophytic species.

Less than one acre along the northwestern edge of Pond 1, west of the Robin Drive cul-de-sac, previously mapped as coastal saltwater marsh was reclassified as upland based on the lack of wetland hydrology indicators or hydric soil indicators during the June 2020 site visit. In June of 2020, this area was dominated by field sedge (*Carex praegracilis*), with scattered coyote brush and encroaching ice plant mats.

Willow Riparian Forest

Willow riparian forest was previously only mapped at Pond 2 (The Habitat Group 1994). Willow riparian habitat appears to have increased in footprint at Pond 2. Additionally, the fringes of Ponds 3a and 3b, and a small portion at the eastern end of Pond 1, now contain riparian vegetation dominated by willow. At Pond 1, this biological community consists of a small stand of arroyo willow. Willow riparian forest at Pond 2 is dominated by a dense overstory of arroyo willow (*Salix lasiolepis*) and red willow (*Salix laevigata*), with an understory of California blackberry and stinging nettle. At Pond 3, willow riparian forest is dominated by arroyo willow interspersed with acacia and toyon (*Heteromeles arbutifolia*), with an understory dominated by California blackberry and stinging nettle. These features are dependent upon groundwater associated with each pond.

Freshwater Seasonal Wetland

Freshwater seasonal wetland (NWI Classification PEM: Freshwater Emergent Wetland) was not previously mapped within the Study Area. However, Ponds 2, 3, and 7 now contain pockets of facultative hydrophytic vegetation in areas where freshwater runoff appears to pond against riparian and perennial marsh vegetation. Within the Study Area, seasonal wetlands are dominated by field sedge (*Carex praegracilis*), tall cyperus, western goldenrod (*Euthamia occidentalis*), Italian wild rye (*Festuca perennis*), alkali heath, Mediterranean barley (*Hordeum marinum* ssp. *gussoneanum*), annual beard grass (*Polypogon monspeliensis*), silver weed cinquefoil, California blackberry, and curly dock, with scattered perennial marsh vegetation such as chairmaker's bulrush.

At Pond 2, freshwater seasonal wetland occurs below a culvert at the northern end of the pond, as well as along the southern and eastern fringes of the pond, where runoff from adjacent paved roads ponds against riparian and marsh vegetation. Freshwater seasonal wetland at Pond 3a occurs at the northern end of the pond, where runoff from Reservation Road appears to pond against riparian vegetation, and at the eastern end of the pond, which appears to receive runoff from an ephemeral upland swale to the east. Freshwater seasonal wetland at Pond 7 is associated with runoff from two culverts on the western side of the pond.

Open Water

Areas of Ponds 1, 2, 3, 4, and 7 that were inundated at the time of the site visit and contained less than 5 percent vegetation were classified as open water.

4.1.3 Groundwater-Dependent Ecosystems

Groundwater-dependent ecosystems within the Study Area include coastal freshwater marsh, coastal saltwater marsh, and willow riparian forest. Aside from apparent increases in freshwater hydrology inputs, and an increase in the footprint of willow riparian forest and coastal freshwater marsh, groundwater-dependent vegetation appears to be in relatively similar condition to conditions described in the CVCMP, as outlined in Section 4.1.2 above. Urban and road runoff appears to impact all six ponds degrees, as identified in the CVCMP, and as evidenced by the appearance of the new freshwater seasonal wetland habitat observed at Ponds 2, 3, and 7 during the June 2020 site visits.

In general, vegetation associated with groundwater-dependent ecosystems were in good condition, although large swaths of tule and broadleaf cattail associated coastal freshwater marsh are beginning to die off along the edges of the western and southern sides of Pond 7 and the

southern edges of Pond 2. Areas with perennial freshwater marsh vegetation die off appear to still have perennial wetland hydrology, as indicated by standing water at the time of the June 2020 site visits, so the die off is likely due to causes other than changes in groundwater (though no additional water quality samples were collected). Upland vegetation adjacent to marsh vegetation die offs at Pond 7 also appear to have died off during the 2020 growing season. Furthermore, healthy tule and broadleaf cattail vegetation appears to have been recently driven over with a motorized vehicle in small portions of Pond 7.

Salinity

Salinity and temperature readings, recorded with the YSI probe, are documented below in Table 4. Ponds 1 and 4 had higher salinity readings, ranging from 15.5 to 30.5 ppt. Ponds 2, 3, and 7 had lower salinity readings, ranging from 0.2 to 0.9 ppt, and groundwater sampled at Pond 5 had an intermediate salinity reading of 4.4 ppt. These findings correspond to what was observed in the CVCMP, which characterizes Ponds 1 and 4 as brackish to hypersaline, Pond 2 as fresh, and Ponds 3 and 7 as fresh to brackish (The Habitat Group 1994). Pond 5 did not have any standing water, and was completely vegetated, during the June 2020 site visit; this finding is consistent with what was documented in the CVCMP (The Habitat Group 2014).

Table 4. Salinity and Temperature Readings

Pond	Salinity (PPT)	Temperature (°C)	Classification
1	16.9	24.5	Brackish to Strongly Brackish
	17.5	24.6

	0.3	30.8	
	0.3	25.4	
Pond 7 Average	0.3	27.6	

Water Table

The locations of soil pits excavated to assess the water table and root zone depth at each pond are depicted in Figure 5. Soil textures in each of the pits predominantly consisted of sand, with some sandy clay and sandy silt, often with inclusions of decomposing organic matter in the upper horizon of the soil profile. Soils in Pit P3-2 also contained inclusion of small pockets of clay below a depth of 2 inches. Table 5 summarizes the wetland habitat, dominant plant species, depth to saturation, depth to water table, and depth of the root zone at each of the soil pits excavated in June of 2020.

In general, perennial marsh (coastal saltwater and coastal freshwater) contained a high water table within 14 inches of the soil surface, indicating groundwater hydrology. However, the edges of wetland vegetation associated with Ponds 1 and 5 did not contain an observable water table (the water table was at a depth greater than 14 inches), despite the presence of perennial marsh vegetation. Depth to the water table for freshwater seasonal wetland ranged from 12.5 to greater than 14 inches.

Table 5. Summary Soil Pit Data

Pond	Pit ID	Habitat Type	Plant Species	Saturation Depth (inches)	Water Table Depth (inches)	Root Zone Depth (inches)
1	P1-1	Coastal saltwater marsh	Salt marsh bulrush, silver weed cinquefoil	8	10	14
	P1-2	Coastal freshwater marsh	Jaumea, alkali heath	>14	>14	>14
2	P2-1	Coastal freshwater marsh	Tall cyperus, silver weed cinquefoil, annual beard grass	5	8	8
	P2-2	Freshwater seasonal wetland	Arroyo willow, salt grass	11	12.5	10.5
3a	P3a-1	Coastal freshwater marsh	Chairmaker's bulrush, alkali heath, curly dock	5	7.5	5

Pond	Pit ID	Habitat Type	Plant Species	Saturation Depth (inches)	Water Table Depth (inches)	Root Zone Depth (inches)
	P3a-2	Freshwater seasonal wetland	Italian wild rye, Mediterranean barley	8	>14	8
3b	P3b-1	Coastal freshwater marsh	Spike rush, Brewer's rush, annual beard grass, chairmaker's bulrush	6	9.5	6
4	P4-1	Coastal saltwater marsh	Brewer's rush, alkali heath, pickleweed	7	8	10
5	P5-1	Coastal saltwater marsh	Brewer's rush, alkali heath	>14	>14	8
	P5-2	Coastal saltwater marsh	Salt grass, salt marsh bulrush, pickleweed	11.5	13.5	7.5
7	P7-1	Coastal freshwater marsh	Watercress (*Nasturtium officinale*), fat hen, chairmaker's bulrush, dotted smartweed (*Persicaria punctata*)	9.5	12	9

4.1.4 Summary Pond Descriptions

The following section summarizes aquatic biological communities and groundwater-dependent ecosystem analyses, briefly described above in Sections 4.1.1 and 4.1.2, in greater detail by pond.

Pond 1

Pond 1 contained open water, with less than 5 percent vegetative cover, at the time of the June 2020 site visit (Figure 5-1). Open water at Pond 1 is surrounded by a fringe of coastal saltwater marsh. The interior of the ring of coastal saltwater marsh at Pond 1 is dominated by pickleweed and perennial graminoids, such as saltmarsh bulrush and tule. The exterior of the ring of coastal salt marsh is dominated by a dense carpet of halophytic forbs, including jaumea and alkali heath. A small stand of arroyo willow occurs in the southeastern corner of Pond 1. Less than one acre along the northwestern edge of Pond 1, west of the Robin Drive cul-de-sac, previously mapped as coastal saltwater marsh was reclassified as upland based on the lack of wetland hydrology indicators or hydric soil indicators during the June 2020 site visit. In June of 2020, this area was

dominated by field sedge (*Carex praegracilis*), with scattered coyote brush and encroaching ice plant mats.

Aquatic vegetation at Pond 1 was generally in good condition at the time of the June 2020 site visit. Salinity measurements at Pond 1 ranged from 15.5 to 17.5 ppt, indicating that salinity at the pond ranges from brackish to strongly brackish. Urban runoff, from paved residential areas and Highway 1, appears to marginally contribute to the hydrology of Pond 1, particularly along the western and southern edges of the pond. Within the interior ring of coastal saltwater marsh vegetation, the water table was observed at a depth of 8 inches; however, within the exterior ring of coastal saltwater marsh vegetation, a high water table was not observed despite the presence of perennial coastal saltwater marsh vegetation. However, the presence of a high water table within the interior ring of coastal saltwater marsh vegetation, along with the presence of open water, several months after the conclusion of the wet season indicates that the hydrology of Pond 1 relies on groundwater; therefore, Pond 1 should be considered a groundwater-dependent ecosystem. Perennial marsh species that dominate coastal saltwater marsh, such as saltmarsh bulrush and tule, and arroyo willow are reliant on a source of year-round water and could be negatively impacted by activities that affect the groundwater table associated with Pond 1.

Pond 2

Pond 2 contained open water, with less than 5 percent vegetative cover, at the time of the June 2020 site visit (Figure 5-2). Open water at Pond 2 is surrounded by coastal freshwater marsh vegetation, dominated by tule and cattail in the interior; and salt marsh baccharis, Brewer's rush, chairmaker's bulrush, and stinging nettle in the exterior. Willow riparian habitat appears to have increased in footprint since the publication of the CVCMP. Willow riparian forest at Pond 2 is dominated by a dense overstory of arroyo and red willow, with an understory of California blackberry and stinging nettle. Freshwater seasonal wetland, not previously described in the CVCMP, occurs below a culvert at the northern end of the pond, as well as along the southern and eastern fringes of the pond, where runoff from adjacent paved roads ponds against riparian and marsh vegetation. Freshwater seasonal wetland surrounding Pond 2 is largely dominated by tall cyperus, annual beard grass, salt grass, and silver weed cinquefoil.

In general, aquatic vegetation associated with Pond 2 was in good condition at the time of the June 2020 site visit, although large swaths of tule and broadleaf cattail associated coastal freshwater marsh are beginning to die off along the southern edges of coastal freshwater marsh vegetation. Areas with perennial freshwater marsh vegetation die off appear to still have perennial wetland hydrology, as indicated by standing water at the time of the June 2020 site visits, so the die off is likely due to causes other than changes in groundwater. Salinity measurements at Pond 2 ranged from 0.2 to 0.6 ppt; therefore Pond 2 can be classified as fresh to slightly brackish. The water table was observed at a depth of 8 inches within coastal freshwater marsh, and at 12.5 inches within the freshwater seasonal wetland habitat. The expansion of willow riparian forest around the edges of Pond 2, high water table within coastal freshwater marsh and freshwater seasonal wetland vegetation, and the presence of open water several months after the conclusion of the wet season all indicate that the hydrology of Pond 2 relies on groundwater; therefore, Pond 2 should be considered a groundwater-dependent ecosystem despite apparent freshwater inputs from culvert runoff. Perennial marsh species that dominate coastal freshwater marsh, such as salt marsh baccharis, chairmaker's bulrush, cattail, and tule, and arroyo and red willow are reliant on a source of year-round water and could be negatively impacted by activities that affect the groundwater table associated with Pond 2.

Pond 3

Pond 3a (Figure 5-3) contained open water, with less than 5 percent vegetative cover, at the time of the June 2020 site visit. Pond 3b (Figure 5-3) also contained standing water at the time of the June 2020 site visit; however, the entirety of the feature contained greater than 5 percent vegetative cover. Both Ponds 3a and 3b contain coastal freshwater marsh vegetation, surrounded by willow riparian forest. Coastal freshwater marsh at Pond 3a is dominated by tule and chairmaker's bulrush; coastal freshwater marsh at Pond 3b is dominated by tule in the interior, and spike rush, Brewer's rush, annual beard grass, and chairmaker's bulrush around the fringes. Willow riparian forest is dominated by arroyo willow interspersed with acacia and toyon (*Heteromeles arbutifolia*), with an understory dominated by California blackberry and stinging nettle. Two small pockets of freshwater seasonal wetland, not described in the CVCMP, were observed at Pond 3a at the northern end of the pond, where runoff from Reservation Road appears to pond against riparian vegetation, and at the eastern end of the pond, which appears to receive runoff from an ephemeral upland swale to the east. Freshwater seasonal wetland was dominated by Italian wild rye, Mediterranean barley, curly dock, tall cyperus, and silver weed cinquefoil.

Aquatic vegetation associated with Ponds 3a and 3b were in good condition at the time of the June 2020 site visit. A deep erosional rill was observed on the eastern edge of Pond 3b in willow riparian forest, associated with runoff from Reservation Road. Both Ponds 3a and 3b appear to receive runoff from Reservation Road and culverts, as well as from an ephemeral upland swale east of Pond 3a. Salinity measurements at Pond 3a ranged from 0.2 to 0.6 ppt, classifying it as fresh to slightly brackish. Pond 3b remained stable at 0.9 ppt, classifying it as slightly brackish. The water table in coastal freshwater marsh vegetation was observed at a depth of 7.5 inches at Pond 3a, and 9.5 inches at Pond 3b. A high water table was not observed in freshwater seasonal wetland vegetation at Pond 3a; however, saturation was observed as a depth of 8 inches. The successful establishment of perennial marsh and willow riparian vegetation since the publication of the CVCMP, high water table within coastal freshwater marsh and freshwater seasonal wetland vegetation, and the presence of open water several months after the conclusion of the wet season all indicate that the hydrology of Ponds 3a and 3b rely on groundwater; therefore, Ponds 3a and 3b should be considered groundwater-dependent ecosystems despite apparent freshwater inputs from runoff. Perennial marsh species that dominate coastal freshwater marsh, such as tule, chairmaker's bulrush, and spike rush, and arroyo willow are reliant on a source of year-round water and could be negatively impacted by activities that affect the groundwater table associated with Pond 3.

Pond 4

Pond 4 contained open water, with less than 5 percent vegetative cover, at the time of the June 2020 site visit (Figure 5-4). Open water at Pond 4 is surrounded by a fringe of coastal saltwater marsh, within roughly the same footprint described in the CVCMP, dominated by alkali heath and pickleweed with stands of dense Brewer's rush.

In general, aquatic vegetation associated with Pond 4 was in good condition at the time of the June 2020 site visit, although monotypic iceplant mats in upland areas are beginning to encroach upon coastal saltwater marsh vegetation. Pond 4 appears to receive minimal urban runoff from surrounding areas, with the exception of a culvert observed at the northern end of the pond. Salinity measurements at Pond 4 ranged from 26 to 30.5 ppm, classifying it as strongly brackish. The water table was observed in coastal saltwater marsh vegetation at a depth of 8 inches. The presence of a high water table within coastal saltwater marsh vegetation, and the presence of open water several months after the conclusion of the wet season, indicate that the hydrology of Pond 4 relies on groundwater; therefore, Pond 4 should be considered a groundwater-dependent

ecosystem. Perennial marsh species that dominate coastal saltwater marsh, such as pickleweed, are reliant on a source of year-round water and could be negatively impacted by activities that affect the groundwater table associated with Pond 4.

Pond 5

Pond 5 contains coastal saltwater marsh in roughly the same footprint and with similar species composition as described in the CVCMP (Figure 5-5). Only the lowest portion of the pond contains dense halophytic vegetation, dominated by alkali heath, pickleweed, and saltmarsh bulrush, while the fringe of the feature is dominated by a near monotypic stand of Brewer's rush, interspersed with scattered alkali heath, silver weed cinquefoil, and California blackberry. Within some areas to the north that appear to be receiving increased freshwater runoff, freshwater herbs and graminoids, such as tall cyperus, curly dock, and spike rush, are beginning to co-dominate with halophytic species.

Aquatic vegetation associated with Pond 5 was in good condition at the time of the June 2020 site visit. A culvert located at the southern end of Pond 5 appears to convey significant seasonal flows to the pond, as evidenced by a wrack line and dense dried algal matting emanating from the culvert into coastal saltwater marsh vegetation. Water appears to flow and pond at the lowest point of the feature, located in the northern portion of the pond, where dense halophytic vegetation occurs. The water table was observed at a depth of 13.5 inches at this portion of Pond 5; groundwater sampled from this soil pit had a salinity of 4.4 ppt, classifying it as brackish. Although Pond 5 appears to receive significant input from culvert runoff, the presence of a high water table several months after the conclusion of the wet season indicates that the hydrology of Pond 5 relies on groundwater to some extent; therefore, Pond 5 should be considered a groundwater-dependent ecosystem. Perennial marsh species that dominate coastal saltwater marsh, such as pickleweed and spike rush, are reliant on a source of year-round water and could be negatively impacted by activities that affect the groundwater table associated with Pond 5. However, seasonal flows from the culvert to the south of the feature may offset any effects of a drawdown of groundwater.

Pond 7

Pond 7 contained open water, with less than 5 percent vegetative cover, at the time of the June 2020 site visit (Figure 5-1). Open water at Pond 7 is surrounded by coastal freshwater marsh vegetation, dominated by tule and cattail in the interior; and chairmaker's bulrush, curly dock, tall cyperus, and dotted smartweed along the outer fringes. Two small pockets of newly-observed freshwater seasonal wetland, dominated by curly dock and annual beard grass, were observed in the northern and southern portions of the pond, apparently sustained by culvert runoff.

Aquatic vegetation at Pond 7 was generally in good condition at the time of the June 2020 site visit, although large swaths of tule and cattails were beginning to die off along the edges of the western and southern sides of the pond. Areas with perennial freshwater marsh vegetation die off appear to still have perennial wetland hydrology, as indicated by standing water at the time of the June 2020 site visits, so the die off is likely due to causes other than changes in groundwater (though no additional water quality samples were collected). Upland vegetation adjacent to marsh vegetation die offs also appear to have died off during the 2020 growing season. Furthermore, healthy tule and broadleaf cattail vegetation appears to have been recently driven over with a motorized vehicle in small portions coastal saltwater marsh.

Salinity measurements at Pond 7 remained stable at 0.3 ppt, indicating that it is a freshwater pond. Urban runoff from culverts appears to contribute to the hydrology of Pond 7 (Figure 5-1).

Within the coastal freshwater marsh habitat, the water table was observed at a depth of 12 inches. The presence of a high water table within coastal freshwater marsh vegetation, along with the presence of open water several months after the conclusion of the wet season, indicates that the hydrology of Pond 7 relies on groundwater; therefore, Pond 7 should be considered a groundwater-dependent ecosystem despite apparent freshwater inputs from culvert runoff. Perennial marsh species that dominate coastal freshwater marsh, such as tule, cattail, and chairmaker's bulrush, are reliant on a source of year-round water and could be negatively impacted by activities that affect the groundwater table associated with Pond 7.

4.2 Special-Status Species

A list of plant and wildlife species observed during the June 2020 site visits is included in Appendix B. A list of special-status species documented to occur in the vicinity of the Study Area is included in Appendix C.

4.2.1 Plants

Based upon a review of the resources and databases given in Section 3.2.1, 74 special-status plant species have been documented in the vicinity of the Study Area (Appendix C). Figure 3 depicts special-status species documented in the CNDDB within a 5-mile radius of the Study Area. The Study Area is unlikely or has no potential to support 42 of these species for the following reasons:

- Hydrologic conditions (*e.g.*, vernal pool, riverine) necessary to support the special-status plant species are not present in the Study Area;
- Edaphic (soil) conditions (*e.g.*, serpentine, clay) necessary to support the special-status plant species are not present in the Study Area;
- Associated vegetation communities (*e.g.*, north coast coniferous forest, closed cone coniferous forest) necessary to support the special-status plant species are not present in the Study Area;
- The Study Area is outside the known elevation range of the special-status plant species, which typically occurs further inland; and
- Historic occurrences of the special-status species are presumed to be extirpated from the vicinity due to habitat conversion and disturbance.

Of the remaining 32 special-status plant species, 19 were identified as having potential to occur within the Study Area in 1994 (The Habitat Group); one of the species identified in 1994 (large-flowered linanthus, *Linanthus grandiflorus*), is no longer considered special-status. The remaining 33 special-status plant species with potential to occur within the Project Area have either been listed as special-status, or have new occurrences documented in the vicinity of the Study Area, since 1994.

All but two special-status plant species, South Coast branching phacelia (*Phacelia ramosissima* var. austrolitoralis) and saline clover (*Trifolium hydrophilum*) are solely associated with coastal dune and coastal dune scrub habitat found in upland areas surrounding Ponds 1, 3, 4, and 5. As the quality of coastal dune within the Study Area with the potential to support special-status plant species is relatively unchanged since 1994, all 32 special-status plant species still have potential to occur within the Study Area. These special-status plant species, and their potential to occur within the Study Area, are summarized in Table 6. Six of these special-status plant species, which have been observed in the vicinity of the Study Area, are described in greater detail below.

Table 6. Special-Status Plant Species with Potential to Occur within the Study Area

Scientific Name	Common Name	Status	Potential Habitat	Potential for Occurrence
Allium hickmanii	Hickman's onion	Rank 1B.2	Coastal dune scrub	Moderate
Arctostaphylos hookeri ssp. *hookeri*	Hooker's manzanita	Rank 1B.2	Coastal dune scrub	Moderate
Arctostaphylos pajaroensis	Pajaro manzanita	Rank 1B.1	Coastal dune scrub	Moderate
Arctostaphylos pumila	sandmat manzanita	Rank 1B.2	Coastal dune scrub	High
Astragalus nuttallii var. *nuttallii*	ocean bluff milk-vetch	Rank 4.2	Coastal dune scrub	Moderate
Astragalus tener var. *titi*	coastal dunes milk-vetch	Federal Endangered, State Endangered, Rank 1B.1	Coastal dune scrub	Moderate
Castilleja ambigua var. *insalutata*	pink Johnny-nip	Rank 1B.1	Coastal dune scrub	Moderate
Castilleja latifolia	Monterey Coast paintbrush	Rank 4.3	Coastal dune scrub	High
Ceanothus rigidus	Monterey ceanothus	Rank 4.2	Coastal dune scrub	**Present**
Chorizanthe minutiflora	Fort Ord spineflower	Rank 1B.2	Coastal dune scrub	Moderate
Chorizanthe pungens var. *pungens*	Monterey spineflower	Federal Threatened, Rank 1B.2	Coastal dune scrub	**Present**
Chorizanthe robusta var. *robusta*	robust spineflower	Federal Endangered, Rank 1B.1	Coastal dune scrub	High
Clarkia lewisii	Lewis' clarkia	Rank 4.3	Coastal dune scrub	Moderate
Cordylanthus rigidus ssp. *littoralis*	seaside bird's-beak	State Endangered, Rank 1B.1	Coastal dune scrub	Moderate
Corethrogyne leucophylla	branching beach aster	Rank 3.2	Coastal dune scrub	**Present**

Scientific Name	Common Name	Status	Potential Habitat	Potential for Occurrence
Delphinium hutchinsoniae	Hutchinson's larkspur	Rank 1B.2	Coastal dune scrub	Moderate
Eriastrum virgatum	virgate eriastrum	Rank 4.3	Coastal dune scrub	Moderate
Ericameria fasciculata	Eastwood's goldenbush	Rank 1B.1	Coastal dune scrub	Moderate
Erysimum ammophilum	sand-loving wallflower	Rank 1B.2	Coastal dune scrub	**Present**
Erysimum menziesii	Menzies' wallflower	Federal Endangered, State Endangered, Rank 1B.1	Coastal dune scrub	Moderate
Gilia tenuiflora ssp. *arenaria*	Monterey gilia	Federal Endangered, State Threatened, Rank 1B.2	Coastal dune scrub	**Present**
Horkelia cuneata var. *sericea*	Kellogg's horkelia	Rank 1B.1	Coastal dune scrub	High
Horkelia marinensis	Point Reyes horkelia	Rank 1B.2	Coastal dune scrub	Moderate
Layia carnosa	beach layia	Federal Endangered, State Endangered, Rank 1B.1	Coastal dune scrub	Moderate

Trifolium hydrophilum	saline clover	Rank 1B.2	Coastal freshwater marsh	Moderate

*Assumed present but may require verification from a botanist with taxonomic expertise; see discussion below.

Monterey ceanothus (*Ceanothus rigidus*). Rank 4.2. Present (Pond 7). Monterey ceanothus is an evergreen shrub in the buckhorn family (Rhamnaceae) that blooms from February to June, but is typically identifiable by vegetative structures throughout the year. It typically occurs on sand dunes, coastal strand, and sandy bluff habitats at elevations ranging from 0 to 605 feet (CDFW 2020a, CNPS 2020a). Monterey ceanothus was observed in coastal dune scrub in 2014 (The Habitat Group). This species was not observed during the June 2020 site visit; however, this site visit focused primarily on aquatic habitat. Since coastal dune scrub habitat that could support this species is still present and of similar quality, this species should still be considered present at Ponds 1 and 7, with high potential to occur at Ponds 4 and 5, and moderate potential to occur at Pond 3, in coastal dune scrub habitat.

Monterey spineflower (*Chorizanthe pungens* var. *pungens*). Federal Threatened, Rank 1B.2. Present (Ponds 4, 5). Monterey spineflower is an annual forb in the buckwheat family (Polygonaceae) that blooms from April to August. It typically occurs on sandy terraces and bluffs or in loose sand at elevations ranging from 5 to 985 feet (CDFW 2020a, CNPS 2020a). Monterey spineflower was observed at Ponds 4 and 5 in 1994 (The Habitat Group), and at Pond 4 during the June 9, 2020 site visit. Positively identified Monterey spineflower at Pond 4 in June 2020 had already senesced, and therefore could also have been present but not identified at Pond 5. This species should be considered present at Ponds 4 and 5, with moderate potential to occur at Ponds 1, 3 and 7 in coastal dune scrub habitat.

Branching beach aster (*Corethrogyne leucophylla*). Rank 3.2. Present (Ponds 4, 5). Branching beach aster is a perennial herb in the sunflower family (Asteraceae) that blooms May, July through October, and December. It typically occurs in closed-cone coniferous forest and coastal dunes at elevations ranging from 5 to 195 feet (CNPS 2020a). Branching beach aster was observed at Ponds 4 and 5 in 1994 (The Habitat Group), but was not observed during the June 2020 site visits. However, these site visits occurred outside the bloom period for this species, which may have been present but not identifiable. Branching beach aster should be considered present at Ponds 4 and 5, with moderate potential to occur at Ponds 1, 3, and 7 in coastal dune scrub habitat.

Sand-loving wallflower (Erysimum ammophilum). Rank 1B.2. Present (Ponds 4, 5). Sand-loving wallflower is a perennial herb in the mustard family (Brassicaceae) that blooms from February to June. It typically occurs in maritime chaparral, coastal dunes, and coastal scrub habitat in sandy openings at elevations ranging from 0 to 195 feet (CDFW 2020a, CNPS 2020a). Sand-loving wallflower was observed at Ponds 4 and 5 in 1994 (The Habitat Group), but was not

observed during the June 2020 site visits. However, these site visits occurred at the end of the bloom period for this species, which may have been present but not identifiable. Sand-loving wallflower should be considered present at Ponds 4 and 5, with moderate potential to occur at Ponds 1, 3 and 7 in coastal dune scrub habitat.

Monterey gilia (*Gilia tenuiflora* ssp. *arenaria*). Federal Endangered, State Threatened, Rank 1B.2. Present (Pond 5). Monterey gilia is an annual forb in the phlox family (Polemoniaceae) that blooms from April to June. It typically occurs in maritime chaparral, cismontane woodland, coastal dunes, and coastal scrub habitat in sandy openings in bare wind-sheltered areas, at elevations ranging from 0 to 260 feet (CDFW 2020a, CNPS 2020a). Monterey gilia was observed at Ponds 4 and 5 in 1994 (The Habitat Group), but was not observed during the June 2020 site visits. However, these site visits occurred at the end of the bloom period for this species, which may have been present but not identifiable. Monterey gilia should be considered present at Pond 5, with high potential to occur at Pond 4 and moderate potential to occur at Ponds 1, 3 and 7, in coastal dune scrub habitat.

South Coast branching phacelia (*Phacelia ramosissima* var. *austrolitoralis*). Rank 3.2. Assumed Present (Pond 4). South coast branching phacelia is a perennial herb in the forget-me-not family (Boraginaceae) that blooms March through August. It typically occurs at sandy, sometimes rocky sites in chaparral, coastal dune, coastal scrub, and coastal saltwater marsh habitat at elevations ranging from 15 to 985 feet. This variety is not currently recognized by the Jepson eFlora (2020), but has been designated as rare by the CNPS. Furthermore, characters distinguishing between varieties of *P. ramosissima* do not work most of the time (CNPS 2020a), and South Coast branching phacelia may require positive identification from a botanist with localized and/or taxonomic expertise. *P. ramosissima* was observed at Ponds 4 and 5 in 1994 (The Habitat Group), prior to the inclusion of South Coast branching phacelia in the CNPS Inventory. *P. ramosissima* was also observed during the June 2020 site visit at Pond 4, and high quality suitable habitat for the species was also observed at Pond 5. Therefore, South Coast branching phacelia should be assumed present at Ponds 4 and 5, with high potential to occur in coastal dune scrub and coastal saltwater marsh habitat associated with Ponds 2, 3, and 7.

4.2.2 Wildlife

Forty-three (43) special-status wildlife species have been documented in the CNDDB within the Marina, Monterey, Moss Landing, Prunedale, Salinas, Seaside, and Spreckels U.S. Geological Survey 7.5-minute quadrangle maps (Figure 4). Of these documented species, 12 have potential to be present based on the habitat within each of the ponds. The table below identifies which species have potential to occur in each of the surveyed ponds. In addition, special-status bird species not listed in CNDDB have a moderate potential to occur in the area. No special-status species were directly observed within the Study Area during the site assessment, but those with potential to occur are discussed below.

Table 7. Special-Status Wildlife Species with Potential to Occur within the Study Area

Pond	Special Status Wildlife Species With Potential to Occur
1	Loggerhead Shrike, Monterey Ornate Shrew, Smith's Blue Butterfly California Legless Lizard, Coast Horned Lizard

Pond	Special Status Wildlife Species With Potential to Occur
2	California Red-Legged Frog, Smith's Blue Butterfly, California Legless Lizard, Western Pond Turtle, Peregrine Falcon, Loggerhead Shrike, Yellow Warbler, Tricolored Blackbird, Nuttall's Woodpecker
3a	Peregrine Falcon, Tricolored Blackbird, Western Pond Turtle, Loggerhead Shrike, Monterey Ornate Shrew, Yellow Warbler
3b	Peregrine Falcon, Western Pond Turtle, Loggerhead Shrike, Monterey Ornate Shrew, Yellow Warbler
4	Smith's Blue Butterfly, California Legless Lizard, Coast Horned Lizard, Peregrine Falcon, Loggerhead Shrike, Monterey Ornate Shrew
5	Smith's Blue Butterfly, Western Spadefoot Toad, Coast Horned Lizard, Peregrine Falcon, Loggerhead Shrike, California Legless Lizard
7	Peregrine Falcon, Tricolored Blackbird, Coast Horned Lizard, Loggerhead Shrike

Species with Potential to Occur Within the Study Area

California red-legged frog (*Rana draytonii*), Federal Threatened Species, CDFW Species of Special Concern. The California red-legged frog (CRLF) is dependent on suitable aquatic, estivation, and upland habitat. During periods of wet weather, starting with the first rainfall in late fall, red-legged frogs disperse away from their estivation sites to seek suitable breeding habitat. Aquatic and breeding habitat is characterized by dense, shrubby, riparian vegetation and deep, still or slow-moving water. Breeding occurs between late November and late April. California red-legged frogs estivate (period of inactivity) during the dry months in small mammal burrows, moist leaf litter, incised stream channels, and large cracks in the bottom of dried ponds.

CRLF has potential to occur in Pond 2, due to the availability of still ponded freshwater, dense riparian vegetation including willow and tule stands, and suitable upland habitat along the western edge of Pond 2.

Coast horned lizard (*Phrynosoma blainvillii*), CDFW Species of Special Concern. The coast horned lizard is a medium-sized lizard with a compressed body and short tail. It is solitary and feeds primarily on harvester ants. Activity patterns are strongly influenced by external temperatures and it hibernates during the winter. Suitable habitat for this species is restricted to southern California and northern Baja California, and includes coastal sage scrub, chaparral, grassland, coniferous forest, oak woodland, riparian, and the margins of higher elevation desert

native vegetation. The primary source of food for this species is spiders and insects including termites, small lepidopterans, beetles, and insect larvae insect larvae (Stebbins 2003).

Legless lizard has potential to occur in Ponds 1, 2, 4, 5 and 7. All ponds contain suitable sandy and loose soils, with areas of leaf litter and other cover.

American peregrine falcon (*Falco peregrinus anatum*); Federal Delisted, State Delisted, CDFW Fully Protected, USFWS Bird of Conservation Concern. This large falcon occurs as a generally uncommon resident as well as a winter visitor and migrant throughout much of California. Occupied habitat (both breeding and non-breeding) is highly variable, but this species is typically associated with open areas and/or bodies of water. Nesting typically occurs on the ledges of steep cliffs, or on man-made structures with ledges above sheer faces such as bridges and the tops of buildings (White et. al 2002). The peregrine falcon preys upon a wide variety of animals, mostly birds; on the Pacific coast, waterbirds (e.g., waterfowl, shorebirds and seabirds) are especially favored (White et. al 2002). This species forages over wide areas, even during the breeding season.

American peregrine falcon has the potential to occur in Ponds 2, 3a, 3b, 4, 5, and 7. Associated manmade structures surrounding these ponds have potential to serve as nesting habitat for this species, and surrounding habitat provide suitable foraging for waterfowl and shorebirds to act as prey for this species.

Smith's Blue Butterfly (*Euphilotes enoptes smithi*) Federal Endangered. This species is most commonly associated with coastal dunes and coastal sage scrub plant communities in Monterey and Santa Cruz counties. The hostplants for this species include both coast and sea cliff buckwheat, which are utilized as both larval and adult host plants.

This species has potential to occur in areas surrounding Ponds 1, 2, 4, and 5. The hostplant for this species was observed on the perimeter of each of these ponds.

Tricolored blackbird (*Agelaius tricolor*); State Candidate (Endangered), CDFW Species of Special Concern, USFWS Bird of Conservation Concern. The tricolored blackbird is a locally common resident in the Central Valley and along coastal California. Most tricolored blackbirds reside in the Central Valley March through August, then moving into the Sacramento-San Joaquin Delta and east to Merced County and coastal locations during winter (Meese et al. 2014). This species breeds adjacent to fresh water, preferring emergent wetlands with tall, dense cattails or tules, thickets of willow or blackberry, and/or tall herbs. Flooded agricultural fields with dense vegetation are also used (Shuford and Gardali 2008). This species is highly colonial; nesting habitat must be large enough to support a minimum of 30 pairs, and colonies are commonly substantially larger (up to thousands of pairs). The tricolored blackbird often intermingles with other blackbird species during the non-breeding season. Individuals typically forage up to 5.6 miles (9 kilometers) from their colonies although in most cases only a small part of the area within this range provides suitable foraging (Hamilton and Meese 2006).

Tricolored blackbird has potential to occur in Ponds 2, 3a, and 7. These ponds contained suitable emergent wetland vegetation, including tall cattails and tules, willow thickets and stands of blackberry.

Western pond turtle (*Actinemys marmorata*), CDFW Species of Special Concern. The western pond turtle (WPT) is the only native freshwater turtle in California. This turtle is uncommon to common in suitable aquatic habitat throughout California, west of the Sierra-

Cascade crest and Transverse Ranges. WPT inhabits annual and perennial aquatic habitats, such as coastal lagoons, lakes, ponds, marshes, rivers, and streams from sea level to 5,500 feet in elevation. Pond turtles also occupies man-made habitats such as stock ponds, wastewater storage, percolation ponds, canals, and reservoirs. This species requires low-flowing or stagnant freshwater aquatic habitat with suitable basking structures, including rocks, logs, algal mats, mud banks, and sand. Warm, shallow, nutrient-rich waters are ideal as they support prey items, which include aquatic invertebrates and occasionally fish, carrion, and vegetation. Turtles require suitable aquatic habitat for most of the year; however, WPT often occupies creeks, rivers, and coastal lagoons that become seasonally unsuitable. To escape periods of high water flow, high salinity, or prolonged dry conditions, WPT may move upstream and/or take refuge in vegetated, upland habitat for up to four months (Rathbun et al. 2002). Although upland habitat is utilized for refuging and nesting, this species preferentially utilizes aquatic and riparian corridors for movement and dispersal.

WPT nests from late April through July. This species requires open, dry upland habitat with friable soils for nesting and prefer to nest on unshaded slopes within 15 to 330 feet of suitable aquatic habitat (Rathbun et al. 1992). Females venture from water for several hours in the late afternoon or evening during the nesting season to excavate a nest, lay eggs, and bury the eggs to incubate and protect them. Nests are well-concealed, though native mammals are occasionally able to locate and predate upon eggs. Hatchlings generally emerge in late fall but may overwinter in the nest and emerge in early spring of the following year.

WPT has potential to occur in Ponds 2, 3a, and 3b. Each of these ponds contained suitable freshwater aquatic habitat and upland nesting habitat.

Western spadefoot (*Spea hammondii*), CDFW Species of Special Concern. The western spadefoot ranges throughout the Central Valley and adjacent foothills. Suitable habitat consists of open areas with sandy or gravelly soils, and includes grassland, scrubland, woodland, washes, and alluvial fans. This species spends most of the year underground in burrows and similar refugia, and often constructs its own burrows. Breeding occurs in shallow, temporary pools formed by heavy winter rains; at least four weeks of continuous inundation are required for successful larval metamorphosis.

Western spadefoot has potential to occur in Pond 5. This pond contained gravelly soils, and did not contain open water at the time of the site visit, indicating that it likely retains water only after winter rains and dries during the summer and fall months, preventing the establishment of predators that would preclude breeding by this species.

(Brewster's) Yellow warbler (*Setophaga petechia brewsteri*), CDFW Species of Special Concern, USFWS Bird of Conservation Concern. The yellow warbler is a neotropical migrant bird that is widespread in North America, but has declined throughout much of its California breeding range. The Brewster's (*brewsteri*) subspecies is a summer resident and represents the vast majority of yellow warblers that breed in California. West of the Central Valley, typical yellow warbler breeding habitat consists of dense riparian vegetation along watercourses, including wet meadows, with willow growth especially being favored (Shuford and Gardali 2008). Insects comprise the majority of the diet.

Yellow warbler has potential to occur in Pond 2, 3a, and 3b. These ponds contained suitable dense riparian vegetation, including stands of willow.

Critical Habitat

There is no designated critical habitat within the Study Area. Western snowy plover critical habitat is located approximately 0.15 miles west of Pond 4, and California red-legged frog critical habitat is located approximately 9 miles south of the Study Area.

5.0 SUMMARY

Sensitive aquatic biological communities associated with the Marina vernal ponds include coastal freshwater marsh, coastal saltwater marsh, willow riparian forest, freshwater seasonal wetland, coastal dune scrub, rose scrub, and open water. Sensitive upland biological communities, associated with the buffers around the ponds, include coastal dune scrub, California blackberry scrub, and rose scrub. Non-sensitive upland biological communities, also associated with the buffers around the ponds, include non-native grassland, non-native vegetation, native landscaping, and coyote brush scrub.

Of the 74 statewide special-status plant species known to occur in the vicinity of the Study Area, six were assumed to be present, and an additional 26 were determined to have high or moderate potential to occur, within the Study Area, primarily in upland coastal dune habitat. Of the 43 special-status wildlife species known to occur in the vicinity of the Study Area, 12 have the potential to occur. In addition, four species not listed in CNDDB were determined to have a moderate potential to occur. Five of the special-status species with potential to occur are birds which could nest in trees and other vegetation that occurs within the Study Area.

Ponds 2, 3, and 7 now contain pockets of facultative hydrophytic vegetation, not described in the CVCMP, in areas where freshwater runoff from culverts and adjacent paved areas appears to pond against riparian and perennial marsh vegetation. With the exception of increases in the footprint of freshwater seasonal wetland, indicative of urban and road runoff, and riparian willow forest, groundwater-dependent ecosystems within the Study Area remain roughly as described in 1994 (The Habitat Group). The die off of perennial marsh vegetation at Ponds 2 and 7 does not appear to be related to changes in groundwater hydrology.

A high water table was observed at each pond at one or more sample points, and all ponds excluding Ponds 3b and 5 contained open water at the time of the June 2020 site visits, conducted well after the conclusion of the dry season. Willow riparian vegetation, which is dependent upon groundwater, was observed to have either established or increased substantially in footprint at Ponds 1, 2, and 3, and perennial marsh vegetation, which requires a year-round water source, was generally observed to be in good condition at all six ponds. Despite the recent establishment of pockets of freshwater seasonal wetland, all six ponds assessed in this report are reliant upon groundwater and should therefore be considered groundwater-dependent ecosystems. Perennial marsh vegetation and willow riparian vegetation at all six ponds could therefore be adversely affected by future activities that cause groundwater drawdown.

Observed Plant and Wildlife Species within the Study Area

This Page Intentionally Left Blank.

Appendix B-1. List of Plant Species Observed within the Study Area. Ponds 1, 3, and 4 were visited on June 9, 2020; Ponds 2, 5, and 7 were visited on June 18, 2020.

Scientific Name	Common Name	Origin	Form	Rarity Status[1]	CAL-IPC Status[2]	Wetland Status[3]	Pond Number					
							1	2	3	4	5	7
Abronia umbellata	Beach sand verbena	native	perennial herb	-	-	-					X	
Acacia sp.	Acacia	non-native	tree	-	-	-			X			
Achillea millefolium	Yarrow	native	perennial herb	-	-	FACU		X		X		
Alisma sp.	Water plantain	-	perennial herb	-	-	-						X
Artemisia californica	Coastal sage brush	native	shrub	-	-	-	X	X		X	X	
Atriplex prostrata	Fat-hen	non-native	annual herb	-	-	FACW	X		X			X
Avena barbata	Slim oat	non-native (invasive)	annual, perennial grass	-	Moderate	-	X	X	X			
Baccharis glutinosa	Salt marsh baccharis	native	perennial herb	-	-	FACW	X	X	X	X		X
Baccharis pilularis	Coyote brush	native	shrub	-	-	-	X	X	X	X	X	X
Bolboschoenus maritimus ssp. *paludosus*	Saltmarsh bulrush	native	perennial grasslike herb	-	-	OBL	X			X	X	X
Bromus diandrus	Ripgut brome	non-native (invasive)	annual grass	-	Moderate	-	X	X	X	X		X
Bromus hordeaceus	Soft chess	non-native (invasive)	annual grass	-	Limited	FACU			X			
Cardionema ramosissimum	Sand mat	native	perennial herb	-	-	-				X		
Carex barbarae	Valley sedge	native	perennial grasslike herb	-	-	FAC		X				
Carex praegracilis	Field sedge	native	perennial grasslike herb	-	-	FACW	X	X		X		

Scientific Name	Common Name	Origin	Form	Rarity Status[1]	CAL-IPC Status[2]	Wetland Status[3]	Pond Number					
							1	2	3	4	5	7
Carpobrotus chilensis	Sea fig	non-native (invasive)	perennial herb	-	Moderate	FACU	X	X	X	X		X
Carpobrotus edulis	Iceplant	non-native (invasive)	perennial herb	-	High	-	X	X	X	X		X
Centaurea melitensis	Tocalote	non-native (invasive)	annual herb	-	Moderate	-		X		X		
Chorizanthe pungens var. *pungens*	Monterey spineflower	native	annual herb	FT, Rank 1B.2	-	-				X		
Cirsium vulgare	Bullthistle	non-native (invasive)	perennial herb	-	Moderate	FACU	X	X				X
Conicosia pugioniformis	False ice plant	non-native (invasive)	perennial herb	-	Limited	-				X		
Conium maculatum	Poison hemlock	non-native (invasive)	perennial herb	-	Moderate	FACW		X	X	X		X
Cotula coronopifolia	Brass buttons	non-native (invasive)	perennial herb	-	Limited	OBL						X
Cyperus eragrostis	Tall cyperus	native	perennial grasslike herb	-	-	FACW		X	X		X	X
Delairea odorata	Cape ivy	non-native (invasive)	perennial herb	-	High	-		X	X			
Distichlis spicata	Salt grass	native	perennial grass	-	-	FAC	X	X	X	X	X	
Dudleya caespitosa	Sand lettuce	native	perennial herb	-	-	-				X		
Echium candicans	Pride of madeira	non-native (invasive)	shrub	-	Limited	-		X				
Ehrharta erecta	Upright veldt grass	non-native (invasive)	perennial grass	-	Moderate	-	X		X			
Eleocharis macrostachya	Spike rush	native	perennial grasslike herb	-	-	OBL			X			
Elymus triticoides	Beardless wild rye	native	perennial grass	-	-	FAC	X	X	X			

Scientific Name	Common Name	Origin	Form	Rarity Status[1]	CAL-IPC Status[2]	Wetland Status[3]	Pond Number					
							1	2	3	4	5	7
Epilobium ciliatum	Slender willow herb	native	perennial herb	-	-	FACW	X		X	X		
Ericameria ericoides	Mock heather	native	shrub	-	-	-						
Erigeron canadensis	Canada horseweed	native	annual herb	-	-	FACU		X				
Eriogonum fasciculatum	California buckwheat	native	shrub	-	-	-			X			
Eriogonum latifolium	Coast buckwheat	native	perennial herb	-	-	-				X	X	
Eriogonum parvifolium	Sea cliff buckwheat	native	shrub	-	-	-		X				
Eriophyllum staechadifolium	Lizard tail	native	perennial herb	-	-	-		X		X		
Erodium cicutarium	Red stemmed filaree	non-native (invasive)	annual herb	-	Limited	-				X		
Eschscholzia californica	California poppy	native	annual, perennial herb	-	-	-			X			
Eucalyptus globulus	Blue gum	non-native (invasive)	tree	-	Limited	-				X		
Euphorbia sp.	Spurge	-	-	-	-	-	X					
Euthamia occidentalis	Western goldenrod	native	perennial herb	-	-	FACW		X			X	
Festuca myuros	Rattail sixweeks grass	non-native (invasive)	annual grass	-	Moderate	FACU		X		X		
Festuca perennis	Italian rye grass	non-native (invasive)	annual, perennial grass	-	Moderate	FAC		X	X			
Foeniculum vulgare	Fennel	non-native (invasive)	perennial herb	-	High	-	X	X				
Frangula californica	California coffeeberry	native	shrub	-	-	-			X			
Frankenia salina	Alkali heath	native	perennial herb	-	-	FACW	X	X	X	X	X	X
Fumaria sp.	Fumitory	-	-	-	-	-						X

Scientific Name	Common Name	Origin	Form	Rarity Status[1]	CAL-IPC Status[2]	Wetland Status[3]	Pond Number					
							1	2	3	4	5	7
Genista monspessulana	French broom	non-native (invasive)	shrub	-	High	-		X				
Geranium dissectum	Wild geranium	non-native (invasive)	annual herb	-	Limited	-						X
Hedera helix	English ivy	non-native (invasive)	vine, shrub	-	High	FACU		X				
Heliotropium curassavicum var. *oculatum*	Seaside heliotrope	native	perennial herb	-	-	FACU	X				X	
Helminthotheca echioides	Bristly ox-tongue	non-native (invasive)	annual, perennial herb	-	Limited	FAC		X				X
Hesperocyparis macrocarpa	Monterey cypress	native	tree	Rank 1B.2	-	-	X	X	X	X	X	X
Heteromeles arbutifolia	Toyon	native	shrub	-	-	-			X			
Heterotheca grandiflora	Telegraph weed	native	annual, perennial herb	-	-	-	X	X	X			
Hirschfeldia incana	Short-podded mustard	non-native (invasive)	perennial herb	-	Moderate	-				X	X	
Holcus lanatus	Common velvetgrass	non-native (invasive)	perennial grass	-	Moderate	FAC		X	X			X
Hordeum marinum ssp. *gussoneanum*	Mediterranean barley	non-native (invasive)	annual grass	-	Moderate	FAC			X			
Hordeum murinum	Foxtail barley	non-native (invasive)	annual grass	-	Moderate	FACU		X				
Hydrocotyle sp.	Pennywort	-	-	-	-	-						X
Jaumea carnosa	Marsh jaumea	native	perennial herb	-	-	OBL	X	X				
Juncus breweri	Brewer's rush	native	perennial grasslike herb	-	-	FACW	X	X	X	X	X	X
Juncus bufonius	Common toad rush	native	annual grasslike herb	-	-	FACW						X

Scientific Name	Common Name	Origin	Form	Rarity Status[1]	CAL-IPC Status[2]	Wetland Status[3]	Pond Number					
							1	2	3	4	5	7
Juncus effusus	Common bog rush	native	perennial grasslike herb	-	-	FACW	X	X	X			
Juncus patens	Common rush	native	perennial grasslike herb	-	-	FACW	X					
Juniperus osteosperma	Utah juniper	native	tree, shrub	-	-	-	X					
Lactuca serriola	Prickly lettuce	non-native	annual herb	-	-	FACU			X			
Lobularia maritima	Sweet alyssum	non-native (invasive)	perennial herb	-	Limited	-		X		X		
Lupinus arboreus	Coastal bush lupine	native	shrub	-	-	-		X	X		X	
Lysimachia arvensis	Scarlet pimpernel	non-native	annual herb	-	-	FAC		X				X
Malva parviflora	Cheeseweed	non-native	annual herb	-	-	-			X			
Medicago polymorpha	Bur clover	non-native (invasive)	annual herb	-	Limited	FACU		X	X			X
Melilotus indicus	Annual yellow sweetclover	non-native	annual herb	-	-	FACU		X	X			
Mimulus sp.	-	-	-	-	-	-		X				
Myoporum laetum	Ngaio tree	non-native (invasive)	tree, shrub	-	Moderate	FACU	X		X			
Nasturtium officinale	Watercress	native	perennial herb (aquatic)	-	-	OBL						X
Persicaria punctata	Dotted smartweed	native	perennial herb	-	-	OBL					X	X
Phacelia ramosissima	Branching phacelia	native	perennial herb	-	-	FACU				X		
Phalaris sp.	-	-	-	-	-	-		X				
Pinus radiata	Monterey pine	native	tree	Rank 1B.1	-	-	X					

Scientific Name	Common Name	Origin	Form	Rarity Status[1]	CAL-IPC Status[2]	Wetland Status[3]	Pond Number					
							1	2	3	4	5	7
Plantago coronopus	Cut leaf plantain	non-native	annual herb	-	-	FAC						X
Plantago major	Common plantain	non-native	perennial herb	-	-	FAC		X				X
Plantago lanceolata	Ribwort	non-native (invasive)	perennial herb	-	Limited	FAC		X				
Poa annua	Annual blue grass	non-native	annual grass	-	-	FAC						X
Polygonum aviculare	Prostrate knotweed	non-native	annual, perennial herb	-	-	FAC		X				X
Polypogon monspeliensis	Annual beard grass	non-native (invasive)	annual grass	-	Limited	FACW	X	X	X	X	X	X
Portulaca oleracea	Common purslane	non-native	annual herb	-	-	FAC		X				
Potentilla anserina	Silver weed cinquefoil	native	perennial herb	-	-	OBL	X	X	X		X	X
Pseudognaphalium luteoalbum	Jersey cudweed	non-native	annual herb	-	-	FAC		X		X		X
Quercus agrifolia	Coast live oak	native	tree	-	-	-		X				
Raphanus sativus	Wild radish	non-native (invasive)	annual, biennial herb	-	Limited	-	X	X	X	X		X
Rosa californica	California wild rose	native	shrub	-	-	FAC				X	X	
Rubus armeniacus	Himalayan blackberry	non-native (invasive)	shrub	-	High	FAC				X		
Rubus ursinus	California blackberry	native	vine, shrub	-	-	FAC		X	X	X	X	X
Rumex crispus	Curly dock	non-native (invasive)	perennial herb	-	Limited	FAC	X	X	X		X	X
Salicornia pacifica	Pickleweed	native	perennial herb	-	-	OBL	X			X	X	
Salix babylonica	Weeping willow	non-native	tree	-	-	FAC		X				
Salix laevigata	Red willow	native	tree	-	-	FACW		X				

Scientific Name	Common Name	Origin	Form	Rarity Status[1]	CAL-IPC Status[2]	Wetland Status[3]	Pond Number					
							1	2	3	4	5	7
Salix lasiolepis	Arroyo willow	native	tree, shrub	-	-	FACW	X	X	X			X
Sambucus nigra ssp. *caerulea*	Blue elderberry	native	shrub	-	-	FAC		X				
Schoenoplectus acutus var. *occidentalis*	Tule	native	perennial grasslike herb	-	-	OBL		X	X			X
Schoenoplectus americanus	Chairmaker's bulrush	native	perennial grasslike herb	-	-	OBL	X	X	X			X
Solanum americanum	White nightshade	native	annual, perennial herb	-	-	FACU					X	
Solanum umbelliferum	Blue witch	native	shrub	-	-	-					X	
Sonchus arvensis	Perennial sow thistle	non-native	perennial herb	-	-	FACU	X	X		X		X
Sonchus oleraceus	Common sow thistle	non-native	annual herb	-	-	UPL		X	X		X	
Stipa miliacea var. *miliacea*	Smilo grass	non-native (invasive)	perennial grass	-	Limited	-	X					
Tetragonia tetragonoides	New Zealand spinach	non-native (invasive)	-	-	Limited	-		X	X	X		
Toxicodendron diversilobum	Poison oak	native	vine, shrub	-	-	FACU				X		
Typha latifolia	Broadleaf cattail	native	perennial herb (aquatic)	-	-	OBL	X	X				X
Urtica dioica	Stinging nettle	native	perennial herb	-	-	FAC		X	X			X
Vicia sativa	Spring vetch	non-native	annual herb, vine	-	-	FACU			X			

All species identified using the *Jepson Flora Project* (Jepson eFlora 2020); nomenclature follows Jepson eFlora. Sp.: "species", intended to indicate that the observer was confident in the identity of the genus but uncertain which species.

[1]Rare Status: The CNPS Inventory of Rare and Endangered Plants (CNPS 2020a)

FE: Federal Endangered
FT: Federal Threatened

SE: State Endangered
ST: State Threatened
SR: State Rare
Rank 1A: Plants presumed extirpated in California and either rare or extinct elsewhere
Rank 1B: Plants rare, threatened, or endangered in California and elsewhere
(*Rank 1B: Rare in native stands only)
Rank 2A: Plants presumed extirpated in California, but more common elsewhere
Rank 2B: Plants rare, threatened, or endangered in California, but more common elsewhere
Rank 3: Plants about which we need more information – a review list
Rank 4: Plants of limited distribution – a watch list

[2]Invasive Status: California Invasive Plant Inventory (Cal-IPC 2020)

High: Severe ecological impacts; high rates of dispersal and establishment; most are widely distributed ecologically.
Moderate: Substantial and apparent ecological impacts; moderate-high rates of dispersal, establishment dependent on disturbance; limited-moderate distribution ecologically
Limited: Minor or not well documented ecological impacts; low-moderate rate of invasiveness; limited distribution ecologically
Assessed: Assessed by Cal-IPC and determined to not be an existing current threat

[3]Wetland Status: National List of Plant Species that Occur in Wetlands, Arid West Region (Lichvar et al. 2016)

OBL: Almost always a hydrophyte, rarely in uplands
FACW: Usually a hydrophyte, but occasionally found in uplands
FAC: Commonly either a hydrophyte or non-hydrophyte
FACU: Occasionally a hydrophyte, but usually found in uplands
UPL: Rarely a hydrophyte, almost always in uplands
NL: Rarely a hydrophyte, almost always in uplands
- : No information

Attachment B-2. List of Wildlife Species Observed within the Study Area. Ponds 1, 3, and 4 were visited on June 9, 2020; Ponds 2, 5, and 7 were visited on June 18, 2020.

Common Name	Scientific Name	Status	Pond Number					
			1	2	3	4	5	7
Birds								
American crow	*Corvus brachyrhynchos*	No status	X	X			X	X
Anna's hummingbird	*Calypte anna*	No status		X				
Barn swallow	*Hirundo rustica*	No status	X	X	X			
Black-necked stilt	*Himantopus mexicanus*	No status	X					X
Black phoebe	*Sayornis nigricans*	No status	X		X	X		X
Bollocks oriole	*Icterus bullockii*	No status		X				
Brewer's blackbird	*Euphagus cyanocephalus*	No status		X				
California towhee	*Melozone crissalis*	No status		X				
American coot	*Fulica americana*	No status						X
European starling	*Sturnus vulgaris*	No status			X	X		
Gull, sp	*Larinae sp.*	No status	X	X	X	X	X	X
House sparrow	*Passer domesticus*	No status				X		
Killdeer	*Charadrius vociferus*	No status	X					
Mallard	*Anas platyrhynchos*	No status	X	X	X			X
Mourning dove	*Zenaida macroura*	No status		X	X			
Red-tailed hawk	*Buteo jamaicensis*	No status			X			
Red-winged blackbird	*Agelaius phoeniceus*	No status		X	X			
Scrub jay	*Aphelocoma californica*	No status		X				
White-crowned sparrow	*Zonotrichia leucophrys*	No status		X				
Wrentit	*Chamaea fasciata*	BCC						X
Reptiles and Amphibians								
Bullfrog	*Lithobates catesbeianus*	No status			X			
Coast gartersnake	*Thamnophis elegans terrestris*	No status	X					
Lizard, sp	*Lacertilia, sp.*	No status				X		
California tree frog	*Pseudacris cadaverina*	No status		X				X
Western fence lizard	*Sceloporus occidentalis*	No status		X		X	X	
Mammals								
Cat	*Felis catus*	No status		X				
Ground squirrel	*Marmotini*	No status		X		X		
Jack rabbit	*Lepus*	No status				X		
Brush rabbit	*Sylvilagus bachmani*	No status					X	
Raccoon	*Procyon lotor*	No status	X					
Rat, sp	*Rattus*	No status				X		

Common Name	Scientific Name	Status	Pond Number					
			1	2	3	4	5	7
Short-tailed weasel	*Mustela erminea*	No status				X		
Fish								
Mosquito fish	*Gambusia affinis*	No status		X	X			X
Invertebrates								
Western bumble bee	*Bombus occidentalis*	SC				X		
Garden snail	*Cornu aspersum*	No status			X			
Red-swamp crayfish	*Procambarus clarkii*	No status	X		X			
Shoulderband snail, sp	*Helminthoglypta walkeriana*	No status				X		
Silver spotted tiger moth	*Lophocampa argentata*	No status				X		
Spotted cucumber beetle	*Diabrotica undecimpunctata*	No status				X		
Striped green sweat bee	*Agapostemon viriscens*	No status				X		
Yellowfaced bumblebee	*Bombus vosnesenskii*	No status	X					

Key to status codes:

FC	Federal Candidate for Listing
FE	Federal Endangered
BGEPA	Bald and Golden Eagle Protection Act Species
FT	Federal Threatened
SC (E/T)	State Candidate for Listing (Endangered/Threatened)
SE	State Endangered
SFP	State Fully Protected Animal
SR	State Rare
SSC	State Species of Special Concern
ST	State Threatened
Rank 1A	CNPS Rank 1A: Plants presumed extinct in California
Rank 1B	CNPS Rank 1B: Plants rare, threatened or endangered in California and elsewhere
Rank 2A	CNPS Rank 2A: Plants presumed extirpated in California, but more common elsewhere
Rank 2B	CNPS Rank 2B: Plants rare, threatened, or endangered in California, but more common elsewhere
Rank 3	CNPS Rank 3: Plants about which CNPS needs more information (a review list)
Rank 4	CNPS Rank 4: Plants of limited distribution (a watch list)
WBWG	Western Bat Working Group High or Medium-high Priority Species
WL	CDFW Watch List

Appendix C. Special-status Species Known to Occur in the Project Area Vicinity. List compiled from the California Department of Fish and Wildlife Natural Diversity Database (CDFW 2020a), U.S. Fish and Wildlife Service Information for Planning and Conservation Database (USFWS 2020b), U.S. Fish and Wildlife Service Threatened and Endangered Species Lists, and California Native Plant Society Electronic Inventory of Rare and Endangered Plants (CNPS 2020a) for the Marina, Monterey, Seaside, Spreckels, Salinas, Prunedale, and Moss Landing USGS 7.5' quadrangles.

SCIENTIFIC NAME	COMMON NAME	STATUS*
PLANTS		
Agrostis lacuna-vernalis	vernal pool bent grass	Rank 1B.1
Allium hickmanii	Hickman's onion	Rank 1B.2
Allium howellii var. howellii	Howell's onion	Rank 4.3
Arctostaphylos hookeri ssp. *hookeri*	Hooker's manzanita	Rank 1B.2
Arctostaphylos montereyensis	Toro manzanita	Rank 1B.2
Arctostaphylos pajaroensis	Pajaro manzanita	Rank 1B.1
Arctostaphylos pumila	sandmat manzanita	Rank 1B.2
Astragalus nuttallii var. *nuttallii*	ocean bluff milk-vetch	Rank 4.2
Astragalus tener var. *tener*	alkali milk-vetch	Rank 1B.2
Astragalus tener var. *titi*	coastal dunes milk-vetch	FE, SE, Rank 1B.1
Bryoria spiralifera	twisted horsehair lichen	Rank 1B.1
Castilleja ambigua var. *insalutata*	pink Johnny-nip	Rank 1B.1
Castilleja latifolia	Monterey Coast paintbrush	Rank 4.3
Ceanothus gloriosus var. *gloriosus*	Point Reyes ceanothus	Rank 4.3
Ceanothus rigidus	Monterey ceanothus	Rank 4.2
Centromadia parryi ssp. *congdonii*	Congdon's tarplant	Rank 1B.1
Chorizanthe douglasii	Douglas' spineflower	Rank 4.3
Chorizanthe minutiflora	Fort Ord spineflower	Rank 1B.2
Chorizanthe pungens var. *pungens*	Monterey spineflower	FT, Rank 1B.2
Chorizanthe robusta var. *robusta*	robust spineflower	FE, Rank 1B.1
Clarkia jolonensis	Jolon clarkia	Rank 1B.2
Clarkia lewisii	Lewis' clarkia	Rank 4.3

SCIENTIFIC NAME	COMMON NAME	STATUS*
Collinsia multicolor	San Francisco collinsia	Rank 1B.2
Cordylanthus rigidus ssp. *littoralis*	seaside bird's-beak	SE, Rank 1B.1
Corethrogyne leucophylla	branching beach aster	Rank 3.2
Cryptantha rattanii	Rattan's cryptantha	Rank 4.3
Delphinium californicum ssp. *interius*	Hospital Canyon larkspur	Rank 1B.2
Delphinium hutchinsoniae	Hutchinson's larkspur	Rank 1B.2
Delphinium umbraculorum	umbrella larkspur	Rank 1B.3
Eriastrum virgatum	virgate eriastrum	Rank 4.3
Ericameria fasciculata	Eastwood's goldenbush	Rank 1B.1
Eriogonum elegans	elegant wild buckwheat	Rank 4.3
Eriogonum nortonii	Pinnacles buckwheat	Rank 1B.3
Erysimum ammophilum	sand-loving wallflower	Rank 1B.2
Erysimum menziesii	Menzies' wallflower	FE, SE, Rank 1B.1
Fritillaria liliacea	fragrant fritillary	Rank 1B.2
Gilia tenuiflora ssp. *arenaria*	Monterey gilia	FE, ST, Rank 1B.2
Grindelia hirsutula var. *maritima*	San Francisco gumplant	Rank 3.2
Hesperocyparis govenia	Gowen cypress	FT, Rank 1B.2
Hesperocyparis macrocarpa	Monterey cypress	Rank 1B.2**
Holocarpha macradenia	Santa Cruz tarplant	FT, SE, Rank 1B.1
Horkelia cuneata var. *sericea*	Kellogg's horkelia	Rank 1B.1
Horkelia marinensis	Point Reyes horkelia	Rank 1B.2
Iris longipetala	coast iris	Rank 4.2
Lasthenia conjugens	Contra Costa goldfields	FE, Rank 1B.1
Layia carnosa	beach layia	FE, SE, Rank 1B.1
Legenere limosa	legenere	Rank 1B.1
Lomatium parvifolium	small-leaved lomatium	Rank 4.2

SCIENTIFIC NAME	COMMON NAME	STATUS*
Lupinus tidestromii	Tidestrom's lupine	FE, SE, Rank 1B.1
Malacothamnus palmeri var. *involucratus*	Carmel Valley bush-mallow	Rank 1B.2
Malacothamnus palmeri var. *palmeri*	Santa Lucia bush-mallow	Rank 1B.2
Malacothrix saxatilis var. *arachnoidea*	Carmel Valley malacothrix	Rank 1B.2
Meconella oregana	Oregon meconella	Rank 1B.1
Micropus amphibolus	Mt. Diablo cottonweed	Rank 3.2
Microseris paludosa	marsh microseris	Rank 1B.2
Mondardella sinuata ssp. *nigrescens*	northern curly-leaved monardella	Rank 1B.2
Monolopia gracilens	woodland woolythreads	Rank 1B.2
Ophioglossum californicum	California adder's-tongue	Rank 4.2
Phacelia ramosissima var. *austrolitoralis*	south coast branching phacelia	Rank 3.2
Pinus radiata	Monterey pine	Rank 1B.1**
Piperia michaelii	Michael's rein orchid	Rank 4.2
Piperia yadonii	Yadon's rein orchid	FE, Rank 1B.1
Plagiobothrys chorisianus var. *chorisianus*	Choris' popcornflower	Rank 1B.2
Plagiobothrys chorisianus var. *hickmanii*	Hickman's popcornflower	Rank 4.2
Potentilla hickmanii	Hickman's cinquefoil	FE, SE, Rank 1B.1
Ramalina thrausta	angel's hair lichen	Rank 2B.1
Ranunculus lobbii	Lobb's aquatic buttercup	Rank 4.2
Rosa pinetorum	pine rose	Rank 1B.2
Sidalcea malachroides	maple-leaved checkerbloom	Rank 4.2
Stebbinsoseris decipiens	Santa Cruz microseris	Rank 1B.2
Trifolium buckwestiorum	Santa Cruz clover	Rank 1B.1
Trifolium hydrophilum	saline clover	Rank 1B.2
Trifolium polyodon	Pacific Grove clover	SR, Rank 1B.1
Trifolium trichocalyx	Monterey clover	FE, SE, Rank 1B.1

SCIENTIFIC NAME	COMMON NAME	STATUS*
WILDLIFE		
Mammals		
Enhydra lutris nereis	Southern Sea Otter	FT
Corynorhinus townsendii	Townsend's big-eared bat	SSC, WBWG High
Eumetopias jubatus	Steller (=northern) sea-lion	MMPA, FD
Lasiurus cinereus	hoary bat	WBWG Medium
Neotoma macrotis luciana	Monterey dusky-footed woodrat	SSC
Sorex ornatus salarius	Monterey shrew	SSC
Taxidea taxus	American badger	SSC

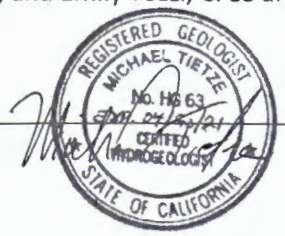
MARINA EXHIBIT 4

TECHNICAL MEMORANDUM



FORMATION ENVIRONMENTAL

REVIEW OF JULY 10, 2020 REPORT PREPARED BY WEISS ASSOCIATES REGARDING GROUNDWATER IMPACTS OF THE MONTEREY PENINSULA WATER SUPPLY PROJECT, MARINA, CALIFORNIA

PREPARED FOR: Layne Long, City Manager, City of Marina

PREPARED BY: Mike Tietze, PG, CHG, CEG, Stephen Carlton, PG, CHG, and Emily Tozzi, CPSS and Certified Arborist, Formation Environmental, LLC

DATE: August 13, 2020

1. INTRODUCTION AND BACKGROUND

At your request, Formation Environmental, LLC (Formation) has reviewed the report titled "*Independent Evaluation, Modification, and Use of the North Marina Groundwater Model to Estimate Potential Aquifer Impacts Associate with the Monterey Peninsula Water Supply Project*," prepared by Weiss Associates (Weiss) on behalf of the California Marine Sanctuary Foundation and the California Coastal Commission (CCC) and dated July 10, 2020 (Weiss 2020 Report). The site location and the locations of nearby monitoring wells referenced in the text below are shown on Figure 1.

In 2019, the California Coastal Commission engaged Weiss Associates to conduct an independent hydrogeologic review of specified groundwater resource issues in connection with the Coastal Commission's decision on whether to grant coastal development permits for the Monterey Peninsula Water Supply Project (MPWSP or Project). The Coastal Commission described the scope of work as follows (CCC 2019): "*To reduce the range of uncertainty and to provide an independent assessment of some key areas of concern, Commission staff contracted with a licensed hydrogeologist to evaluate some of the primary studies and to respond to several key questions about them.*" According to the Coastal Commission:

> "*Other interested parties conducted their own studies or reviewed the above-referenced studies and came to different conclusions about Cal-Am's expected groundwater impacts.*" and "*A key area of concern was whether Cal-Am's groundwater extraction would remove greater volumes of "non-seawater" – that is, fresh or brackish water in the Basin that may be of beneficial use to others – than Cal-Am's models had predicted.*" (CCC 2019)

Pursuant to the Coastal Commission's direction, Weiss reviewed the available data to assess the potential effects of the Project on groundwater resources, taking into account new scientific data,

analyses and other information that was raised by interested parties but that was not considered in the Environmental Impact Report (EIR) for the Project. The results of that review were provided by Weiss in a report dated November 1, 2019 and included several recommendations for improvement of the analysis of groundwater-related impacts by the Project (Weiss 2019 Report). These improvements included refining, recalibrating and converting the existing 2016 version of the North Marina Groundwater Model ($NMGWM^{2016}$) from a steady state into a transient groundwater flow model to support more reliable impact assessment, and conducting investigations to help address several data gaps in the hydrogeologic understanding of the area.

In its 2019 review, Weiss concluded the $NMGWM^{2016}$ is based on a flawed conceptual model that may underestimate the MPWSP's inland hydrologic impacts and extraction of inland aquifer water that is designated as a source of drinking water. Weiss found the model did not consider the effect that existing seaward gradients in the Dune Sand Aquifer (DSA) and foreseeable future gradient changes in the 180-Foot Aquifer would have on (1) the capture zones of the slant makeup water wells proposed for the Project; (2) the distribution of drawdown impacts; and (3) the associated "Ocean Water Percentage" (OWP) of the extracted makeup water. Furthermore, Weiss concluded that the impact analysis in the EIR was flawed because it did not account for potential sources of drinking water that are required by the State Water Resources Control Board to be protected as a source of drinking water. [1] Finally, the $NMGWM^{2016}$ was found to be potentially inadequate for the assessment of Project effects on groundwater for the following reasons:

- The model simulates the groundwater flow system under long-term static (or steady-state) conditions rather than addressing the actual transient seasonal conditions and year-to-year variability that may drive the extent of some of the actual impacts, such as seasonal and inter-annual availability in recharge, gradients and water availability of Groundwater-Dependent Ecosystems (GDEs).

- The model does not consider available information regarding the interconnection between different aquifer units. Specifically, $NMGWM^{2016}$ incorrectly assumes that the Fort Ord/Salinas Valley Aquitard (FO-SVA) which separates the DSA and 180-Foot Aquifer is continuous in areas where the available evidence suggests it is not (Gottschalk et al. 2018).

- The model includes unrealistic water level boundary conditions at the southern edge that differs from actual groundwater levels by up to 90 feet, indicating a fundamental disagreement between the model simulated conditions and actual field conditions.

Based on this analysis, Weiss recommended: (1) additional groundwater investigations east of monitoring well MW-7 and in the area between monitoring wells MW-4 and MW-7 to assess the extent of the FO-SVA and the degree of interconnection between the DSA and the underlying 180-Foot Aquifer;

[1] The available data indicate that over 200,000 acre feet of groundwater is present in the DSA and 180-Foot Aquifer in the area of potential Project effects that contains less than 3,000 milligrams per liter (mg/L) of total dissolved solids (TDS) and is designated by State Water Resources Control Board (SWRCB) Resolution 88-63 and the California Regional Water Quality Control Board (RWQCB), Central Coast Region as having a designated potential beneficial use as drinking water.

(2) incorporation of the investigation findings into the NMGWM^{2016}; and (3) updating of the NMGWM^{2016} to a transient groundwater flow model.

The Coastal Commission requested that Weiss undertake further analysis of certain groundwater issues, which led to preparation of the July 10, 2020 Weiss report, which is the topic of this review. Pursuant to the Coastal Commission's scope of work, Weiss was directed to (1) to use the existing steady-state version of NMGWM^{2016} with several targeted modifications to better understand the range of potential impacts of the MPWSP; and (2) to determine whether the existing NMGWM^{2016} is sufficient to support impact analysis associated with OWP and GDEs. , or if a refined transient version of NMGWM^{2016} and further field investigations are required.

Because the amount of time necessary to conduct the originally recommended model upgrades was deemed greater than the time available prior to the scheduled CCC hearing to make a final determination regarding the Project, the Coastal Commission's scope instead directed Weiss to use the existing steady-state version of NMGWM^{2016} with several targeted modifications to assess the range of potential impacts of the MPWSP. Targeted modifications included simulation of the following:

- The actual seaward gradients observed in the DSA;
- A range of future gradients in the 180-Foot Aquifer that were assumed to be reasonably foreseeable as efforts under the Sustainable Groundwater Management Act (SGMA) to arrest seawater intrusion are implemented;
- Increased vertical permeability in the model layer that simulates the FO-SVA east of MW-7;
- A range of recharge rates to assess the effect of potential climatic variability;
- Correcting the definition of freshwater for the purposes of the OWP analysis to less than 3,000 milligrams per liter (mg/L) of total dissolved solids (TDS), consistent with State Water Resources Control Board (SWRCB) and Regional Water Quality Control Board (RWQCB) requirements;[2] and
- Evaluating the potential impacts of the proposed Project makeup water extractions, 15.5 million gallons per day (MGD), as well as the potential impacts under a theoretical situation if the Project pumping were reduced by half, from 15.5 to 7.75 MGD.

2. EVALUATION OF OCEAN WATER PERCENTAGE

2.1. Findings

Ocean water percentage (OPW) is a measure used in the Final EIR of two primary types of groundwater sources for the MPWSP makeup water extracted from the proposed Project slant wells: freshwater from

[2] The City of Marina and others have contended, and Weiss in its 2019 and 2020 Reports has agreed, that freshwater should be defined consistent with the RWQCB's Water Quality Control Plan (Basin Plan) for the area and SWRCB Resolution 88-63, which designate groundwater containing less than 3,000 mg/L TDS as having a beneficial use for municipal and domestic supply.

the 180/400 Foot Aquifer Subbasin and seawater extracted from the seaward portion of the aquifers. A higher OWP would indicate water with relatively less freshwater content and relatively more seawater content.

The Project OPW was estimated using the NMGWM^{2016}. As noted above, Weiss concluded the NMGWM^{2016} is based on a flawed conceptual model that may underestimate the MPWSP's inland hydrologic impacts and extraction of inland aquifer water (freshwater) that is designated as a source of drinking water. Overestimating the OPW would result in underestimating the adverse impacts to inland fresh groundwater resources, water right holders, and beneficial uses. In addition, the Project is required to provide replacement water to Castroville Community Services District (CCSD) based on the OWP. Overestimating the OWP would result in underestimating the amount of replacement water required to be provided by the Project and conveyed to CCSD.

The Weiss 2020 Report indicates that under the most likely foreseeable gradient, recharge and hydrogeologic conditions, the long-term predicted Project OWP would be 72.4% (approximately 4.28 MGD fresh water), compared with 93 to 96% in the EIR (approximately 0.62 to 1.09 MGD fresh water). For perspective, since the Project is planned to operate every day of the year, the Project would be expected to extract about 1.5 billion gallons of fresh water each year from the critically overdrafted 180/400 Foot Aquifer Subbasin. This represents a 4-fold to 7-fold increase in the estimated volume of fresh water that would be extracted by the Project from the inland aquifers, and hence in the amount of replacement water required to be delivered by the Project to CCSD. If a reduced-capacity project were implemented with approximately half the makeup water demand, the OWP is predicted to decrease to 65.6% (2.67 MGD fresh water),[3] which is still a 2.4 to 4-fold increase in the volume of fresh water extracted from the inland aquifers when compared to the Project evaluated in the EIR.

The available data suggest the prediction presented by the Weiss 2020 Report may underestimate the actual OWP of the Project for the following reasons:

- The DSA is highly permeable and has been designated as a key recharge area in County planning documents. No streams or creeks are sustained in this area, indicating that runoff is minimal, and infiltration of precipitation dominates the surface water system. A sensitivity analysis was conducted by Weiss comparing the average recharge case of 5 inches per year to values of 10 and 15 inches per year, resulting in a further decrease of the OWP by 6.8 and 12.2 %. These results are significant because they span the range of expected year to year recharge under years with above average rainfall.

- The NMGWM^{2016} was implemented as a steady state model, which means the model imposes long-term average groundwater flows and levels as a constant background condition. While this is a commonly used simplification for some groundwater models, it does not consider the actual transient changes a groundwater system experiences in response to climatic variability and

[3] The OWP of the extracted groundwater is projected to decrease with less pumping (*i.e.*, the percentage of freshwater is projected to increase) because the Pacific Ocean represents a constant head boundary that will produce an increasingly greater percentage of the total extracted groundwater volume as pumping increases.

changes in regional groundwater demand and water management. Since the DSA is highly permeable, recharge rates are likely to be variable and highly dependent on the amount of precipitation in any given year. Modeling of the actual transient variability in recharge could substantially increase the predicted OWP during some years or periods.

- The amount of groundwater that the test slant well extracted from the DSA versus from the 180-Foot Aquifer during the pump test was never confirmed by actual measurements and remains unknown. As such, the partitioning of groundwater extraction between the DSA and the 180-Foot Aquifer may not be accurately represented by the NMGWM[2016]. A shift in the extraction percentage could substantially change the OWP of the extracted water. For example, if a greater amount of groundwater is extracted from the DSA than assumed by the model, the amount of inland freshwater captured by the proposed Project slant wells could be greater than simulated. Without knowing the actual partitioning of extraction between the aquifers and the resulting effect on OWP, it cannot be concluded that the OWP predicted by the model is a conservative worst case.

- Weiss did not modify the NMGWM[2016] to address the complex heterogeneity of the aquifer system identified in recent geophysical studies completed by Stanford University (Gottschalk, et al. 2018). The Stanford studies describe the lithology of the subsurface as being very heterogeneous and determined that the aquitards within and between the DSA, 180-Foot Aquifer, and 400-Foot Aquifer are locally discontinuous. Heterogeneity in the aquifer system, especially in the FO-SVA, could affect the OWP. Weiss used the existing simplified hydrogeologic layers provided in the NMGWM[2016] model. The simplification of aquifer system heterogeneity in the model adds uncertainty to the OWP analysis, and this uncertainty could, as noted above, result in overestimation of the OWP. Weiss' modeling analysis attempted to evaluate the endpoints to this heterogeneity by conducting sensitivity analyses where the vertical hydraulic conductivity of certain layers was increased and the lateral extent of the FO-SVA was varied. However, heterogeneity remains an area of uncertainty, and it is unlikely that the sensitivity analyses conducted by Weiss explored the full range of reasonable outcomes.

2.2. *Implications*

The 2020 Weiss Report indicates the amount of fresh water captured by the proposed Project slant wells will be several times greater than was previously evaluated in the EIR. This new information indicates that several impacts will be more severe than indicated by the prior analysis and raises concerns about the following potential impacts that were not previously evaluated:

- Potential conflicts with the Basin Plan for this region through the increased and more rapid depletion of drinking water resources in the DSA and the 180-Foot Aquifer and the potential for increased seawater intrusion into the nearshore area;

- Potential conflicts with sustainable groundwater management mandated by the Sustainable Groundwater Management Act caused by the increased capture and depletion of freshwater resources;

- Increased groundwater impacts related to operation of the Project that were not considered or evaluated in the EIR (more freshwater capture and more drawdown at GDEs); and

- Project changes due to increased replacement water volumes required to be delivered to CCSD that may result in new impacts or increased impacts during Project construction and operation that were not evaluated in the EIR.

3. GROUNDWATER-DEPENDENT ECOSYSTEMS

3.1. Findings

There are several groundwater dependent ecosystems (GDEs) identified in the Coastal Zone near the City that are identified as "vernal ponds" and are afforded specific protection and management under several land use plans. These vernal ponds consist of wetlands, seasonal ponds and perennial ponds that are believed to be remnants of marshes that occurred within the Salinas River floodplain approximately 12,000 years ago, and were subsequently covered by encroaching coastal sand dunes (The Habitat Group 1994). They are described in the City's planning documents as water pools that expand during the wet season and support marshy wetlands that provide habitat for plants and animals for all or much of the year. They represent unique coastal ecosystems that are important stopover points for migratory waterfowl and provide habitat to a number of sensitive plant and animal species. The City's Local Coastal Plan, certified by the California Coastal Commission (CCC) on April 20, 1982, guides development within the coastal zone in Marina and recognizes the importance and unique nature of these vernal ponds, which are designated for protection as Environmentally Sensitive Habitat Areas (ESHAs) under the California Coastal Act. These veranal ponds are shown in Figure 2.

A request for development of a Comprehensive Management Plan (CMP) was initiated in 1990 by the Coastal Commission in response to development pressures around the City's vernal pond resources. The City engaged stakeholders in a collaborative effort to prepare the CMP. A Technical Advisory Committee comprised of representatives from the City, Monterey Peninsula Regional Park District (MPRPD), California Department of Fish and Game (CDFG, now CDFW), the Coastal Commission, Sierra Club, residents, and other interested stakeholders was also established to guide development of the plan. Four meetings were held with the Technical Advisory Committee. A public meeting was held on March 18, 1993, to present preliminary findings on the resources of the ponds and solicit comments from the public on management issues. A second public meeting was held on November 18, 1993, to present the draft plan and solicit comments on the proposed management plan recommendations.

The final CMP was adopted on February 15, 1994 (Coastal/Vernal Ponds Comprehensive Management Plan, The Habitat Restoration Group 1994). It identifies guidelines for the preservation, management and enhancement of these wetland resources, and identifies specific measures to be conducted at each

pond to preserve, protect, and enhance sensitive resources. This includes seven ponds, including two hypersaline vernal (i.e., seasonal) ponds, two freshwater perennial ponds, two freshwater vernal ponds, and one fresh to brackish pond that functions as a perennial pond in most years.

Weiss evaluated the predicted drawdown at the locations of seven vernal ponds/pond complexes identified as GDEs during prior studies (Formation 2020, WRA 2020). These vernal ponds are in the Coastal Zone and are considered Environmentally Sensitive Habitat Areas (ESHA) under the California Coastal Act (WRA 2020) and protected under the Public Trust Doctrine (FBM 2019).

Drawdowns induced by pumping of the proposed Project slant wells at the vernal ponds were predicted by Weiss to range from 0.79 to 4.05 feet, with the highest drawdown predicted to occur at the Armstrong Ranch ponds near MW-4S. Under a reduced demand scenario with slant well pumping decreased to about 50% of the amount of pumping proposed for the Project, predicted drawdowns range from 0.39 to 2.02 feet. The available data indicate the prediction presented by Weiss (2020) may underestimate the actual drawdown at the vernal ponds for the following reasons:

- The baseline case evaluated drawdown if the FO-SVA extends west of MW-7S. Under this scenario, perched groundwater flowing westward in the DSA above the FO-SVA would discharge to the aquifer system at its western terminus, creating a groundwater mound in the area near MW-4S. If the FO-SVA were to terminate further east, or be discontinuous and in local communication with the underlying 180-Foot Aquifer, as appears to be the case based on the available AEM data, this groundwater mound would not be created. Thus, under the baseline model scenario, groundwater inflow from the east may tend to maintain a constant head condition near the western boundary of the FO-SVA, and limit drawdown near the vernal ponds in the Coastal Zone. The baseline scenario is therefore not conservative – it may underestimate the amount of drawdown near the potentially affected vernal ponds, and thereby the potential impacts to the vernal ponds

- The NMGWM^{2016} was not modified to address the heterogeneity of the aquifer system identified in recent geophysical studies completed by Stanford University (Gottschalk et al. 2018). Heterogeneity in the aquifer system, especially in the shallow aquifer, could affect the amount of drawdown at the vernal ponds, and the actual drawdown could consequently be greater.

- The amount of groundwater that the test slant well extracted from the DSA versus from the 180-Foot Aquifer during the pump test was never confirmed by actual measurements and remains unknown. As such, the partitioning of groundwater extraction between the DSA and the 180-Foot Aquifer may not be accurately represented by the model. A shift in the extraction percentage could substantially change the amount of drawdown predicted in the DSA near the identified GDEs. For example, if a greater amount of groundwater is extracted from the DSA than assumed by the model, the amount of drawdown could be greater than simulated.

- The NMGWM^{2016} was implemented as a steady state model. The amount of groundwater needed to sustain the vernal ponds is likely to be greatest during dry periods. The cumulative

stress of climatic conditions and drawdown cannot be evaluated using a steady state model alone.

- A key consideration when developing models for the assessment of surface water-groundwater interaction at GDEs is the near surface layering scheme. The NMGWM[2016] includes a relatively coarse layering scheme with limited usefulness for evaluating impacts to GDEs.

3.2. Implications

The seven vernal ponds that could potentially be affected by drawdown induced by pumping of the proposed Project slant wells are described in the *Costal/Vernal Ponds Comprehensive Management Plan* (CMP) that was developed by the City (The Habitat Restoration Group, 1994).

The City of Marina recently commissioned a biological, soils and hydrologic investigation to assess the current conditions and groundwater dependence of six of the seven vernal ponds described above (WRA 2020). The current species composition and condition at each of these vernal ponds was documented. Shallow test pits were excavated at each pond and soil types and colors, rooting depths, and depths to saturated soil were noted. The wetlands were dominated by herbaceous wetland vegetation, which tend to have relatively shallow rooting depths and requires a relatively consistent groundwater depth. The study confirmed these wetland resources are dependent on groundwater and should be considered groundwater dependent ecosystems. Saturated conditions were observed at depths ranging from 5 to 11.5 inches, and rooting depths were observed to range from 5 to 14 inches. The deepest-rooted hydrophytic species identified during the study was Arroyo willow (*Salix lasiolepsis*), with a reported rooting depth up to approximately 26 inches (USDA, 2020). The vernal pond habitats were confirmed to contain sensitive biological communities and many protected animal and plant species that could be adversely affected by groundwater drawdown.

The vernal pond habitats were confirmed to contain sensitive biological communities that could be adversely affected by groundwater level drawdown (WRA 2020). The sensitive communities that have been identified are upland communities (i.e., coastal dune scrub, rose scrub, California blackberry scrub), and various types of aquatic habitats (e.g., coastal freshwater marsh, coastal saltwater marsh, willow riparian forest, freshwater seasonal wetland, and open water). These habitats are important for various species in singularity or combined as some species rely on (1) upland habitats for foraging, nesting, basking and burrowing; (2) aquatic habitats for foraging, breeding and fulfilling their lifecycle; and (3) some can only survive in aquatic environments.

The sensitive aquatic and upland communities, singularly or in combination, are key for (1) wading, foraging and nesting birds; (2) aquatic algae, invertebrates and plankton that support the food web; (3) amphibian and reptile species that may use aquatic and upland areas to complete their lifecycles, or seasonal / diurnal patterns; (4) mammals and insects that utilize the vegetation and aquatic environments for cover and forage; and (5) supporting the vegetative communities (which may include rare plant species) that support plankton, algae and higher species. There is also a high to moderate potential for vernal pond habitats to support 32 rare plant species, although only 5 to 6 are confirmed

present at this time. The special-status wildlife species that have potential to rely on the six ponds and Armstrong Ranch include four reptile, two amphibian, one insect, one mammal, and four bird species. These organisms, as well as other unprotected species, are likely to be adversely affected by groundwater drawdown; however, specific correlations between the amount of drawdown and species or ecosystem response have not yet been verified.

Drawdown in shallow groundwater systems may alter community composition by increasing (1) cover of non-native or upland species; or (2) soil salinity from evapotranspiration. Research has shown that root distribution tends to be related to groundwater history; therefore, a rapid decline in water table relative to the condition under which roots developed may strand plant roots so they cannot obtain sufficient moisture (Shafroth, Stromberg and Patten, 2000). Although roots do tend to redistribute with the water table, plants cannot proliferate new roots if the water table decline is too rapid or if groundwater levels fall below the maximum rooting depths of a particular species (Richards et al unpublished; Stella and Battles, 2010; Stella et al., 2010). Relatively modest groundwater level declines can also significantly decrease the recruitment of new seedlings even if more mature plants ultimately adapt, causing a long-term shift in habitat type, ecosystem function and species composition (TNC, 2018; Amlin and Rood, 2002).

A compilation of studies conducted by The Nature Conservancy (TNC) in the western United States that examined plant response for 17 herbaceous wetland indicator species (11 common and six rare) to groundwater drawdown indicated gradual loss of indicator species starting with as little as 0.66 feet of drawdown, with a median of 2.99 feet, and complete loss at 6.23 feet (Gerla et al. 2015). Rhode et al. (2017) reviewed policies adopted for management of GDEs in the United States and globally, and assessed that thresholds for GDE responses to groundwater level decline are often assumed to follow linear, curvilinear, or step-wise functions, but that in reality they are likely habitat specific. A study of the effects of regulatory drawdown thresholds on inundation area and plant community composition in southeast Australia suggested that drawdowns from 0.82 feet to 0.98 feet represent a threshold where community composition is likely to change (Deane et al. 2018). The study setting included a regional unconfined aquifer with shallow groundwater levels, wetlands dependent on groundwater discharge, and wetlands considered sensitive to even small declines in groundwater level. Thresholds were assigned based on ecological value, with higher functioning wetlands sensitive to changes assigned a threshold of up to 0.82 feet of acceptable drawdown over the course of five years; regional triggers were set at 1.64 feet over five years.

The Armstrong Ranch Pond Complex (Vernal Pond #6 in the CMP) is located approximately 300 to 1,000 feet east of the CEMEX plant site and includes a series of seasonal wetlands with ponded water in the winter and wet herbaceous meadows likely subsisting on shallow groundwater during the dry season (The Habitat Restoration Group 1994). Analysis of summer evapotranspiration discharge, which is a measure of vegetation health and stress, indicated that groundwater level declines on the order of 1 to 2 feet were sufficient to cause plant stress in this GDE (Formation 2020). The Weiss 2020 Report predicted a groundwater drawdown of 4.05 feet at the Armstrong Ranch Pond Complex if the project is implemented as proposed. If project pumping were to be reduced by half, the predicted drawdown

would still be 2.02 feet. These values may be underpredicted, as discussed in the previous section, and based on the available data are likely to cause significant adverse impacts to the GDEs at Armstrong Ranch, potentially resulting in complete loss of these protected habitat. Predicted drawdowns at the remaining ponds are also in the range where potentially significant impacts, such as diminished habitat area or quality, may occur. There would likely be a shift in species presence because the aquatic and herbaceous species would not be able to survive with drier soil conditions and some woody species would likely be stranded if drawdown is too rapid.

Based on the above information, we conclude the drawdowns predicted by Weiss would be sufficient to cause significant plant stress and habitat degradation at the vernal ponds in the Coastal Zone near Marina, or potentially, in the case of the Armstrong Ponds, habitat loss. These impacts were not evaluated, identified or considered in the EIR, which did not recognize the existence of the GDEs, assess the potential for them to be adversely affected, or use a groundwater model that could accurately predict water table drawdown in the DSA at the GDE locations. As such, the Weiss 2020 Report presents important and significant new information about potential impacts to these GDEs, which are a protected resource. As noted above, the NMGWM^{2016} has limited capability to predict actual groundwater interaction with GDEs, so the findings of the Weiss 2020 report confirm that significant impacts to GDEs are likely, but do not characterize those impacts. More detailed modeling and investigation would be required to assess the nature and extent of the potential impacts, assess the ecosystem response, and develop an appropriate mitigation and monitoring strategy.

In addition to the inadequacy of the analysis of potential adverse impacts to GDEs in the EIR and the identification of potential impacts that were not previously recognized , the drawdown effects predicted by Weiss at the vernal ponds have implications relative to several other regulatory programs and requirements that are relevant to the Coastal Commissions proceedings regarding the Project as listed below:

- Under SGMA, the predicted drawdowns indicate the potential for significant and unreasonable impacts to the beneficial uses of groundwater by GDEs and indicate the potential for undesirable results and unsustainable groundwater extraction as defined under the California Water Code.
- Under the California Coastal Act, operation of the proposed Project slant wells would result in potential adverse impacts to ESHA.
- Finally, the predicted drawdowns indicate a potential to harm public trust resources (FBM 2019), which must be considered and avoided, if possible.

4. ADEQUACY OF THE NMGWM^{2016}

The objectives of the evaluation discussed in the Weiss 2020 report included providing perspective on whether the existing NMGWM^{2016} is adequate to support the current CCC proceeding, or whether a refined, calibrated, transient version of the NMGWM^{2016} developed based on the results of additional

investigation is needed. To that end, the predicted Project OWP and potential drawdown effects on GDEs were assessed using the existing NMGWM^{2016} with targeted modifications to provide additional perspective on the potential impacts of the Project. The results of the modeling analysis were discussed, and the report repeated Weiss' November 1, 2019 recommendations for refined modeling and investigation if more certainty regarding the potential effects of the Project is desired.

As noted above, the additional modeling conducted by Weiss is sufficient to conclude the Project will result in potentially significant adverse impacts related to freshwater aquifer depletion, non-compliance with the RWQCB's Basin Plan, unsustainable groundwater extraction and degradation of GDEs. The results of the modeling are however insufficient to characterize the nature and extent of the impacts and support development of an appropriate monitoring and mitigation approach. Further investigation and refinement of the model, as recommended by Weiss, would be necessary to meet this objective.

Specific limitations and deficiencies of the existing NMGWM^{2016} include the following:

- The existing model is a steady state model that does not consider temporal variation in recharge and groundwater gradients that may affect capture zones and drawdown. A refined, calibrated, transient model is needed to better assess Project impacts and planning for appropriate monitoring and mitigation.

- The existing model does not consider the new scientific data and analyses developed by a Stanford research team based on its recent investigation utilizing airborne electromagnetic (AEM) technology. It should be noted that AEM is currently being employed by several Groundwater Sustainability Agencies and the California Department of Water Resources to characterize water quality, seawater intrusion and hydrostratigraphy in basins across the state and represents a proven, reliable and accepted technology for the characterization of groundwater resources. The Stanford investigation assessed the hydrostratigraphy and water quality distribution in the area and revealed (1) freshwater within the Dune Sand Aquifer extends westward beneath the older and recent dune deposits south and west of the Salinas River, which have been recognized as an area with high recharge rates; (2) the Dune Sand Aquifer lies on top of the FO-SVA, which thins and pinches out toward the west and is not as continuous as has been previously thought; 3) the Dune Sand Aquifer is in direct hydraulic communication with the underlying 180-Foot Aquifer where the FO-SVA is not present; and (4) deeper aquitards within and between the 180-Foot and 400-Foot Aquifers are not as continuous as was once thought. In general, the AEM investigations have confirmed that the aquifer system that will be affected by the MPSWP is much more heterogeneous than was recognized in the NMGWM^{2016}. (Gottschalk et al. 2018). Further investigation to assess the lateral extent and heterogeneity of the FO-SVA and other aquitards is needed.

- Modeling the western limit of the FO-SVA west of MW-7S is not conservative when considering potential impacts to GDEs. Extending the FO-SVA west of MW-7S may artificially limit the amount of predicted drawdown in the shallow aquifer in the area, and therefore underestimate adverse impacts to the GDEs, especially the Armstrong Ranch Pond Complex.

- The model layering limits its capacity to assess surface-groundwater interaction at the GDEs. Finer vertical discretization would be desirable and should be based on local investigation of the shallow hydrostratigraphy at the vernal ponds through the installation of nested piezometers.

- The amount of groundwater extraction from the DSA versus the 180-Foot Aquifer should be confirmed. We recommend the slant wells be simulated using the MODFLOW Multi-Node Well (MNW) package. If hydraulic profiling of production flows to the test slant wall cannot be conducted, a range of reasonable values should be evaluated in a sensitivity analysis.

- The effects of the inland shallow aquifer General Head Boundaries should be more closely examined. The Salinas River is groundwater connected and is a source of groundwater recharge. The amount and seasonal timing of the River recharge, and its effect on slant well capture in the DSA and 180-Foot Aquifer should be evaluated.

- To fully understand the potential of the Project to affect water quality, the effects of density-driven flow of saline groundwater will need to be considered.

- The amount of recharge considered in the model should be refined or a range of recharge values should be considered. Recharge estimates may be refined by assessing deep percolation from precipitation plus applied irrigation water, and subtracting actual ET derived from the Cal ETa dataset developed by Formation on behalf of DWR.

- The model should be calibrated by simulating the transient test slant well pumping test and history matching the results to recorded groundwater levels in the MPWSP monitoring wells.

5. CONCLUSIONS

In its 2019 review, Weiss concluded the NMGWM^{2016} is based on a flawed conceptual model that may underestimate the MPWSP's inland hydrologic impacts and extraction of inland aquifer water that is designated as a source of drinking water. Weiss recommended improving the model by refining, recalibrating and converting the existing version of the NMGWM^{2016} from a steady state into a transient groundwater flow model to support more reliable impact assessment, re-calibrating the model, and conducting investigations to help address several data gaps in the hydrogeologic understanding of the area. Because of time limitations, the Coastal Commission requested that Weiss instead use the existing steady-state version of NMGWM^{2016} with several targeted modifications to assess the range of potential impacts to OWP and GDEs from the Project.

The Weiss 2020 Report indicates that the long-term predicted Project OWP would be 72.4% compared with 93 to 96% in the EIR. For perspective, since the Project is planned to operate every day of the year, the Project would be expected to extract about 1.5 billion gallons of fresh water each year from the critically overdrafted 180/400 Foot Aquifer Subbasin of the Salinas Valley Groundwater Basin. This represents a 4-fold to 7-fold increase in the estimated volume of fresh water that would be extracted compared to what was evaluated in the EIR. Based on the limitations of the approach used to derive the OWP estimate, the actual OWP may be even lower. The evaluation conducted by Weiss indicates the

Project will result in potentially significant impacts to freshwater resources, water right holders and beneficial groundwater users and uses, and could interfere with sustainable groundwater management. These impacts were either not identified in the EIR, or to the extent they were, were significantly underestimated. In addition, Weiss' 2020 analysis suggests the amount of replacement water required to be provided to CCSD is greatly underestimated, and delivery of the additional water volumes may result in new or increased impacts that were not evaluated in the EIR.

The Weiss 2020 Report found that drawdown impacts to GDEs in the Coastal Zone near Marina will range from 0.79 to 4.05 feet. Similar to the OWP, the limitations of the approach used to forecast these impacts indicates they may be underestimated. The magnitude of the predicted drawdowns exceeds thresholds at which adverse effects have been documented in similar ecosystems and indicate the potential for significant impacts that were not evaluated or identified in the EIR. Even if the Project's makeup water demand were cut in half, the potential for significant impacts would still exist. The degradation, shrinkage or loss of these sensitive habitats would impact a number of protected animal and plant species. The GDEs in the Coastal Zone are considered ESHA and are protected under the Coastal Act. In addition, adverse impacts to GDEs would constitute "undesirable results" in violation of SGMA. Finally, adverse effects on public trust resources would need to be considered and avoided in the Coastal Commission's proceeding regarding the MPWSP.

The existing NMGWM^{2016} is a simplified, steady state model that entails inherent limitations in its predictive capability and, as applied, may lead to the underestimating of environmental impacts in some cases. The evaluation conducted by Weiss (2020) confirms the Project will likely result in significant environmental impacts that were not considered or identified in the EIR. While the existing NMGWM^{2016} is sufficient to make these conclusions, it is not adequate to develop an understanding of how these impacts can be monitored, decreased or mitigated. To achieve these objectives, additional investigations would need to be undertaken to address data gaps in the hydrogeologic understanding of the area, the potential response of GDEs to drawdown would need to be better understood, and a refined, transient version of the NMGWM^{2016} would need to be developed and calibrated.

Water Demand and Supply for Monterey Peninsula
Peer Review Report (April 2020)

Introduction and Summary

Energy and Water Consulting (EWC) has been asked by the City of Marina to provide a peer review of a report relating to water demand and supply for the Monterey Peninsula entitled "Supply and Demand for Water on the Monterey Peninsula", prepared by Monterey Peninsula Water Management District, September 2019, with December 2019 and March 6, 2020 updates (MPWMD Report). This peer review also includes a brief review of a peer review letter regarding the MPWMD Report, dated January 22, 2020, prepared by Hazen & Sawyer on behalf of California-American Water Company (CalAm).

EWC is familiar with these water demand/supply issues in connection with the Monterey Peninsula Water Supply Project (Project or MPWSP). Dr. Lon House submitted written expert testimony and testified in person at the evidentiary hearings of the California Public Utilities Commission (CPUC) in proceeding A.12-04-019 held in September/October 2017. Now that three more full years (2017-2019) of recorded water demand data is available, a more precise updated analysis of Monterey Peninsula water demand/supply is possible.

At the outset, it is important to recognize that the Monterey Peninsula Water Management District (MPWMD) is the agency charged by the California Legislature with making these water supply/demand determinations. MPWMD was formed in 1978 and, in its enabling legislation, it is tasked with filing an annual report which includes "an analysis of the present and future water requirements of the district, the water supply available to the district, and the requirements for future capital improvements, and the requirements for maintenance and operation." [Water Code Appendix § 118-350(b)]. Contrary to the statements by Hazen & Sawyer, MPWMD is the expert on these issues

and has no reason to defer to the CPUC or any other agency in these analyses, which it has been preparing for over 40 years.

Three more full years (2017-2019) of recorded water demand data is now available. This recent data makes the CPUC data set obsolete, reducing the existing customer 10-year average water demand available in the CPUC proceeding by 1,275 acre-feet per year (afy), a reduction of 10.7 percent.

The future demand for "new" water (lots of record, Pebble Beach, tourism rebound) estimates, based on the analysis contained in the MPWMD Report, also have dropped by 582-939 afy from earlier estimates made by CalAm.

Using different forecast assumptions (an instantaneous and permanent increase in demand of 881 afy as soon as new water supply is available in 2022 and thereafter an annual increase at the highest average system water increase growth rate in the history of the area) compared with water supply options results in similar results to the MPWMD Report conclusions - the expansion of the Pure Water Monterey project will meet area water demands through 2050.

In contrast, the Monterey Peninsula Water Supply Project is excessive to area water needs for the next several decades. Moreover, it is likely to have major disadvantageous rate impacts on customers because of the huge annual fixed cost of the desalination facilities (estimated at over $30 million annually), which could cause water from that project to go over $21,000 per acre foot if, as expected, it will be greatly underutilized. The low-income customers in the district will be especially hard hit by the necessary huge increases in water rates to pay for this expensive and unnecessary (by 2050) water facility.

In the sections below, EWC will address a series of questions relating to water demand/supply that are covered in the MPWMD Report. These questions include: (1) what is the updated demand for water on the Monterey Peninsula; (2) what are the relevant components of this new water demand; (3) what is the likely future total demand for water on the Monterey Peninsula; (4) when will this future water demand materialize; (5) what are important factors influencing future water demand; (6) what are available water supplies for the Monterey Peninsula; (7) when are new water supplies needed; and (8) what are the implications of building excess water supply. As set forth herein, the conclusions set forth in the MPWMD Report are fully supported by the available facts.

What is the Appropriate Water Demand Level to Assume for Existing Customers?

Based on water demand data only through December 31, 2016, the CPUC issued a decision in which it adopted CalAm's projections of existing and future demand for water in its Monterey District.[1] Specifically, for current demand, the CPUC adopts CalAm's 12,350 afy projection, stating "[w]hile the methodologies put forward by Cal-Am may not be perfect, that is not the standard they are required to meet. The methodologies are persuasive in providing a reasonable estimate of annual demand in the district going forward."[2] Similarly, the CPUC adopted CalAm's figure of 2,005 afy for future demand and its total current/future demand of 14,355 afy as a reasonable projection.[3]

Notably, the CPUC did not undertake its own expert analysis to determine what water demand is appropriate. Rather, it took the view that so long as it found CalAm's projection to be reasonable, it had met its obligations. As the MPWMD Report states in its March 6, 2020 analysis (note 9) "[i]t is important to reiterate that the CPUC did no original analysis, modeling or projection of demand on its own." In its peer review, Hazen & Sawyer misstates the nature of the CPUC determination on this point and appear to argue that the MPWMD has no right to make its own determination on this issue. However, the MPWMD has the legal responsibility for making water demand determinations for the district and, given the important and significant new demand data available for the last few years, the MPWMD's updated determinations of water demand and supply are critical.

The CPUC recognizes the importance of using the latest water demand data. In their decision in CalAm's last General Rate Case, the CPUC concluded "*Given the declining consumption pattern in the Monterey main district, the most recent data available is likely to be the most accurate*"[4]. What could substitution of a couple more years of recent water demand information make? It turns out – a lot.

We also note that the March 6, 2020 addition to the MPWMD Report (note 6) reflects that CalAm itself has retreated from its earlier demand estimates before the CPUC and, in its current General Rate

[1] D.18-09-017.
[2] Id. at p. 49.
[3] Id. at p. 51.
[4] D.18-12-021, Finding of Fact 13, pg. 272.

Case, adopted significantly lower projections in line with those of MPWMD. This is further evidence that the most recent data is the most predictive of current water demand needs in the district.

What is the Updated Demand for Water?

We now have complete water demand data through 2019. The water demand information used by the CPUC ended in 2016. Data from the 2017-2019 period demonstrate that demand has stayed at or below 10,000 afy for the last five years (2015-2019). Figure 1 shows what happens when updating the water demand to the most recent 10 years of data – replacing 2007-2009 data with 2017- 2019 information. Updating the water demand data to include the three most recent years reduces the 10-year average water demand by 1,275 afy[5], a reduction in 10-year average demand of 10.7 percent.

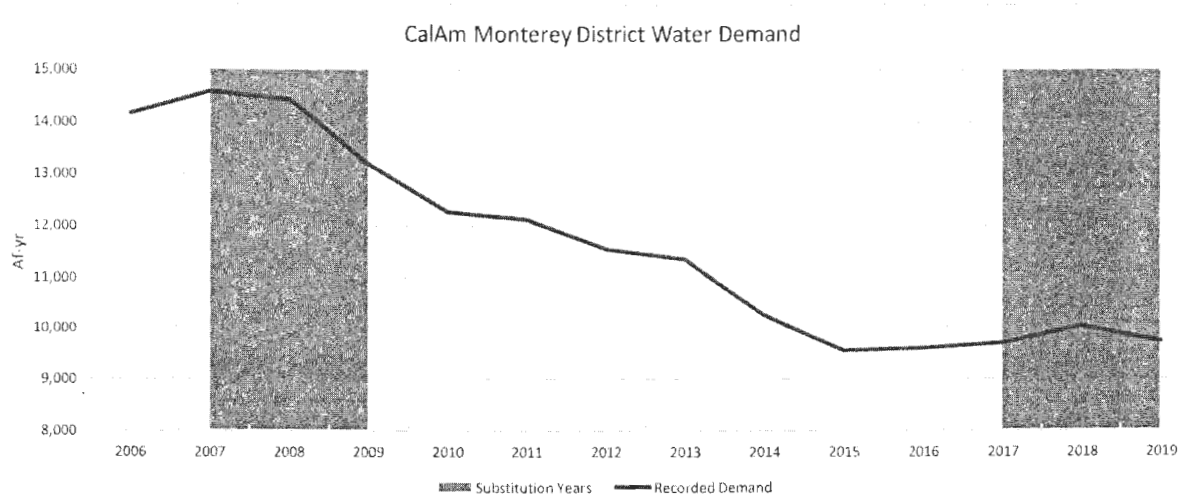

Figure 1. Recorded CalAm Customer Water Demand

Table 1 compares the various estimates of current customer CalAm water demand compared with recorded values. Estimates vary by 3,563 afy (over 25 percent) from recorded levels.

[5] Afy = acre feet per year (325,851 gallons).

Table 1. Comparison of Estimates of CalAm Customer Existing Water Demand

CalAm Application	CPUC Adopted	10-year average (2010-2019)	5-year average (2015-2019)
13,290 afy	12,350 afy	10,619 afy	9,727 afy

CalAm originally sized the Project on the basis of an assumed current water demand of 13,290 afy, to which it added about 2,000 afy for asserted growth in demand, for a total water demand of 15,296 afy. Although CalAm reduced its estimate somewhat later and the CPUC adopted these estimates, based on the data through 2016, an updated assumption based on 10-year and 5-year lookbacks reduce the current demand numbers to 10,619 afy (10-year average) and 9,727 afy (5-year average).

What Are Relevant Components of Future Monterey District Water Demand?

In addition to existing customer demand, there are various other anticipated future demands for water that must be assessed. These include assumptions about tourism rebound to levels experienced in the early years of this century and future buildout of legal lots in Pebble Beach. It should be emphasized that these are not current demands for water, but assumptions about new demands for water once an additional supply is established. In the MPWMD Report, MPWMD reviewed the latest information relating to the Monterey Peninsula future demand for water[6]. Table 2 is a modification of Table 8 in the MPWMD Report that focuses only on the future water demand factors. Based on the demand ranges for each of these elements based on the best current available data, MPWMD established high and low bounds for each type of potential future demand. As you can see, these future estimates for new water demand vary by almost 1,000 afy from CalAm's projections based on 2016 data.

[6] "Supply and Demand for Water on the Monterey Peninsula", prepared by Monterey Peninsula Water Management District, September 2019 with December 17, 2019 update: " Consider Adoption of Updated Water Demand Forecasts Related to Association of Monterey Bay Government 2018 Regional Growth Forecast and Regional Housing Needs Allocation Plan: 2014-2023, and Inclusion of 2019 Water Year".

Table 2. Comparison of Estimates of Monterey Peninsula "New" Water Demand

	Project Application	MPWMD High	MPWMD Low
Legal Lots of Record	1,181 afy	1,014 afy	864 afy
Tourism Bounce Back	500 afy	250 afy	100 afy
Pebble Beach Buildout	325 afy	160 afy	103
Total "New" Demand	**2,006 afy**	**1,424 afy**	**1,067 afy**

Source: "Supply and Demand for Water on the Monterey Peninsula", prepared by Monterey Peninsula Water Management District, September 2019, Table 8.

The analysis of future demand by MPWMD shows potential future water demand to be in the 1,067 to 1,424 afy range. In fact, as described below, the actual future demand is more likely to be at the lower end of this range. The MPWMD analysis of the significant new information regarding these water demand sources is sound. Hazen & Sawyer do not address or counter this new information other than to make an unsupported assertion that it "appears to be based on anecdotal data." To the contrary, the new information is based on updated lots of record, water use data, and hospitality industry occupancy rate data, which is the type of data that should be relied upon.

What is Eventual Total Demand for Water on the Monterey Peninsula?

The total eventual demand for water on the Monterey Peninsula is the combination of existing customer demand and new water demands. Table 3, prepared by MPWMD and enhanced to add in a column relating to 5-year average customer demand, provides a comparison of various estimates of eventual Monterey Peninsula water demand.

Table 3. Comparison of Estimates of Eventual Monterey Peninsula Water Demand

	MPWSP Application	CPUC Adopted	10-yr Average Customer Demand plus MPWMD New Demands	5-yr Average Customer Demand plus MPWMD New Demands
Existing Customer Demand	13,290 afy	12,000 afy	10,619 afy	9,727 afy
New Water Demand	2,006 afy	2,000 afy	1,067-1,424 afy	1,067-1,424 afy
Total Eventual Demand	**15,296 afy**	**14,000 afy**	**11,686-12,043 afy**	**10,794-11,151 afy**

When Will Total Eventual Demand Materialize?

A critical parameter in the discussion of MPWSP is when will the eventual total demand for water materialize? Tourists will not suddenly start flocking to Monterey when a new water supply becomes available, nor will existing lots or Pebble Beach be completely built out immediately. It will take years, or decades, for the eventual water demand to be realized.

We provide a reasonable assumption on future water demand trajectory in Figure 2. For this we assumed that in 2023, the earliest that the MPWSP could be available, there is an instantaneous and permanent water demand increase of about 881 afy (approximately 9 percent). This is equivalent to an increase in existing customer demand from current (2019) levels to the 10-year average customer demand (2010-2019). From 2023 on, we assume the highest average system water increase growth rate in history of the area, the average growth in water demand realized in the 1999-2008 years, before the water moratorium was instituted[7]. Water demands in the area have never increased faster,

[7] 16.4 afy, as found in: "Supply and Demand for Water on the Monterey Peninsula", prepared by Monterey Peninsula Water Management District, September 2019, pg. 11. As the report noted – this *"... was a period of relative economic stability, available property, no moratorium on new service connections, and lower water rates..."*

the use of this record growth in water demand is reasonable to ensure that the total water demand estimate is at the highest realistic level for planning purposes. The graph also shows what would happen if the 2023 demand rebounds to the 5-year average water demand.

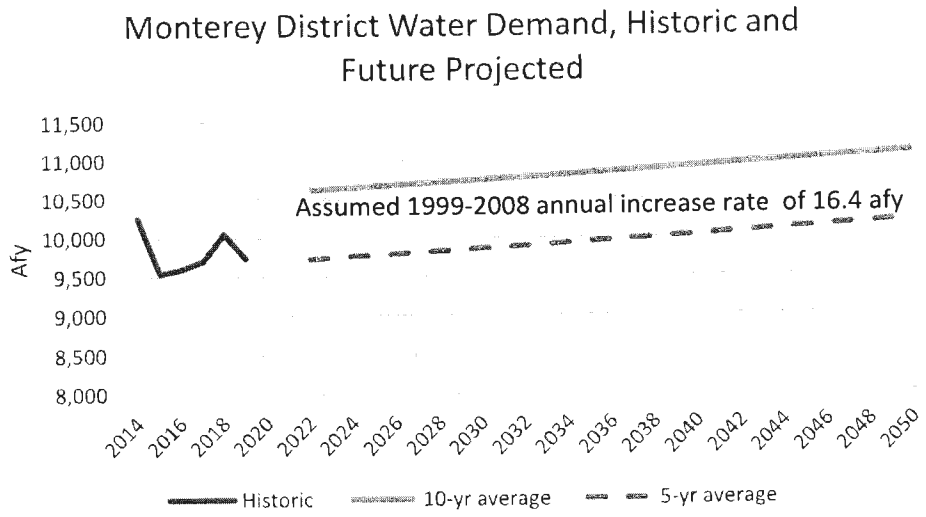

Figure 2. Historic and Project Monterey Peninsula Water Demand

This shows that, if water demand increases at the highest historic rate recorded for the area after new supplies become available, the 2050 demand for water will be between 11,078 afy and 10,186 afy.

What are Some Key Factors Influencing Future Water Demand?

There are regulatory and water conservation factors influencing water demand that will inevitably tend to dampen increases in water demand.

First, the California Legislature enacted, SB 606 and AB 1668, signed by the Governor in May 2018, that call for the creation of new urban efficiency standards for indoor use, outdoor use, and water lost to leaks in California. The indoor water use standard will be 55 gallons per person per day through 2025, then it will decrease to 50 gallons per person per day in 2030. As the MPWMD Report noted, current gallons per capita per day in the CalAm Monterey system is 57 gallons per person per day[8], so

[8] "Supply and Demand for Water on the Monterey Peninsula", prepared by Monterey Peninsula Water Management District, September 2019, pg. 15.

we cannot expect a huge increase in existing customer water demand. Rather, these mandatory water usage requirements for urban water supplies means that existing users are unlikely to increase their current water consumption when new water is made available.

Second, it is important to recognize California's new water resiliency policy as contained in the Governor's Executive Order N-10-19, signed on April 29, 2019. A key driver of the new policy is to build upon the "Sustainable Groundwater Management Act and new urban water efficiency standards" to meet the "evolving challenges" with water in the future. In addition to specifying an inventory of existing water supply and demand (which is exactly what the MPWMD has done in its report), the policy encourages "regional approaches" to water supply and mandates "extensive outreach" to stakeholders, including environmental justice organizations. These initiatives, which would include outreach to communities like Seaside and the City of Marina, likely will result in conserving water and keeping its cost affordable, which will likely exert constraints on water demand.

What are Available Supplies of Water for the Monterey Peninsula?

Available supplies of water for the Monterey Peninsula include the Carmel River, Seaside Basin, Aquifer Storage and Recovery, Sand City Desalination Plant, other available supplies, and Pure Water Monterey. There are two potential future supplies, the MPWSP Desalination facility and an expansion of the Pure Water Monterey (PWM) project[9]. These supplies are shown in Figure 3, along with the reference point of 2019 recorded water demands.

[9] As discussed in: "Supply and Demand for Water on the Monterey Peninsula", prepared by Monterey Peninsula Water Management District, September 2019.

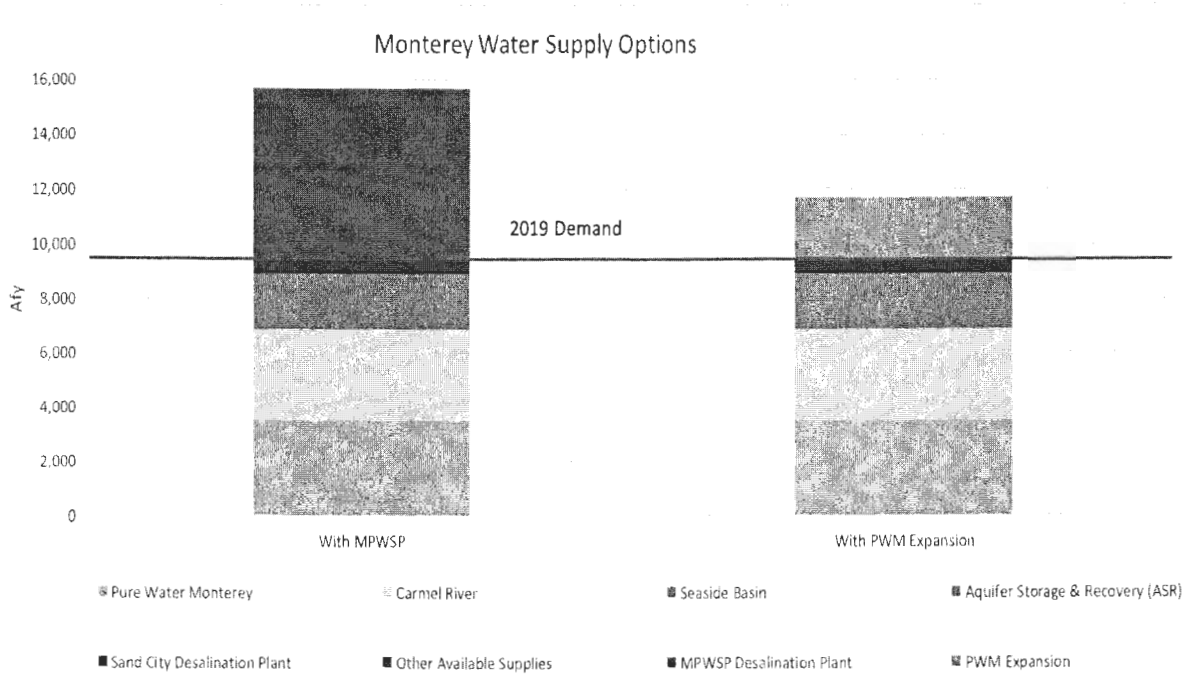

Figure 3. Available Water Supplies and 2019 Demand

Note that existing water supplies (absent MPWSP or expansion of the PWM) are inadequate to meet all of the future demand for water, so further new supplies will be needed.[10]

When Are New Supplies of Water Needed?

As Figure 3 showed, new water supplies (either MPWSP or additional PWM supply) are needed to meet water demands in the area. Figure 4 combines available water supplies with historic and future water demands (using the significantly higher rebound to 10-year average demand in 2023).

[10] We note that, under the State Water Board enforcement order relating to the Carmel River, CalAm has the interim right until December 31, 2021 (or longer if extended) to take large amounts (many thousands of acre-feet) of water from the river if necessary to meet demand.

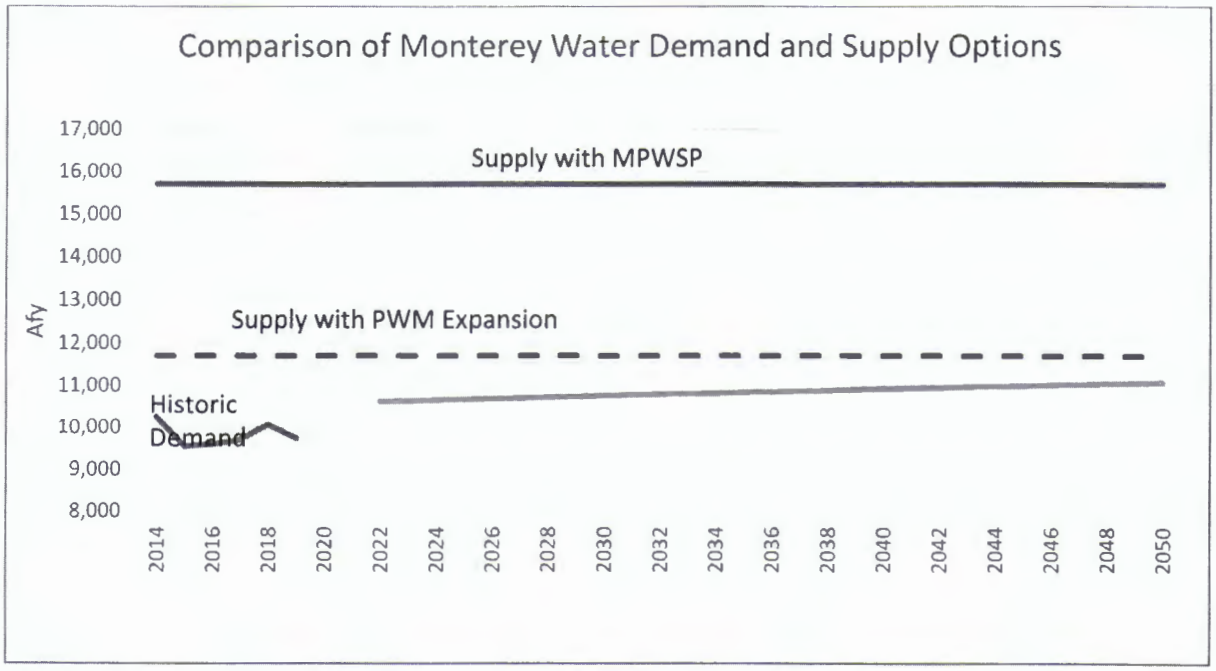

Figure 4. Available Water Supply Options and Historic and Future Water Demands

With the addition of the PWM expansion adequate water supplies are available through 2050. There will be 11,700 afy of water supply compared with a 2050 demand for water of 11,078 afy[11]. This is a similar conclusion to what was reached in the MPWMD Report.

What Are Implications of Building Excess Water Supply?

Having excess water supplies can be advantageous in the right circumstances – provided that the new water supplies do not impose an excessive financial burden on customers. Cost does matter.

There are two cost issues with MPWSP. The first is the MPWSP desal water is very expensive, running 22 times[12] as much as the most expensive current supply (Carmel River) and 3 times as much as PWM Expansion water. And it would make up 40 percent of the Cal Am water supply (assuming no PWM Expansion), which means it will drive water rates significantly higher. The second issue with MPWSP is that it is composed primarily of fixed costs (estimated at over $30 million per year) that will

[11] If the 2023 rebound is only to the 5-year average water demand, 2050 water demand will be 10,186 afy.
[12] Assuming 6,252 af of production from MPWSP (full production).

need to be recovered regardless of how much water it produces. As the MPWMD Report notes, water from MPWSP becomes increasingly expensive if the facility is not running at full production (assumed to be 6,252 af[13]). If the variable (operating) cost of water from MPWSP costs about $1,255 per af, then using MPWSP to provide the additional 1,500 af needed to meet 2023 demands means CalAm ratepayers will be paying the equivalent of an eye-popping amount of over $21,000 per af for the desal water[14].

There has been discussion regarding the economic impacts to the Monterey area of not having adequate water supplies. There has been extremely limited discussion on the other side of the equation – the economic shock to the area when the cost of MPWSP is recovered in water rates.

CalAm Monterey customers have the dubious distinction of having among the highest water bills in the country. The annual average water bill in the United States for a family of four using 50 gallons per person per day is about $35 per month[15]. The average CalAm family (assumed to be 2.4 people) currently (2019) pays over $93 per month[16]. When MPWSP becomes operational, average family bills are expected to jump to $134 per month. This means that average CalAm customers will have about $500 per year less in disposable income due to MPWSP.

The low-income customers in the area will be especially hard hit. Even though Cal Am has a Low-Income Ratepayer Assistance program (that reduces the water bill by about 30 percent), the advent of MPWSP jumps their bills from about $75 currently to $105 per month[17]. This means that low income customers will be paying almost 6 percent of their income for their water bills, having to work almost 10 hours per month at minimum wage to pay for water.

---

[13] "Supply and Demand for Water on the Monterey Peninsula", prepared by Monterey Peninsula Water Management District, September 2019, pg. 14.

[14] (1500 af * $1,255 + $30 M) / 1500 af. While desal water is always the most expensive option for California water systems, the impacts do not have to be overwhelming. For example, the Carlsbad, California, Desalination Plant in San Diego County is the largest desalination plant in the western Hemisphere, producing nearly 50 million gallons per day (56,000 acre-feet per year). The cost (and water provided) is allocated among a number of water systems, so no one system receives an excessive rate shock. For example, Valley Center Municipal Water District contracted for about 12 percent of their water supply at $2,800 per af from desal. The resultant rate increase was about 15 percent.

[15] https://www.statista.com/statistics/720418/average-monthly-cost-of-water-in-the-us/

[16] https://amwater.com/caaw/customer-service-billing/billing-payment-info/water-rates/monterey-district/rate-design.

[17] Using the CalAM rate calculator of Monterey, assuming 4,000 gallons per month usage.https://amwater.com/caaw/customer-service-billing-billing-payment-info-water-rates-bill-calc

Conclusion

Using a reasonable forecast for future water demand (an immediate and permanent increase in demand of 881 afy as soon as new water supply is available in 2023 and an annual increase at the highest average system water increase growth rate in the history of the area) compared with water supply options, the expansion of the Pure Water Monterey project will meet area water demands through 2050 and at lower water rate impacts than the MPWSP. This is a similar conclusion to that reached by the MPWMD Report but arrived at using different assumptions. The fact that both approaches produce comparable conclusions enhances the validity of the MPWMD Report.

The MPWSP is simply too expensive water. Adding a capital project that costs an additional $30M annually regardless of whether it operates or not and costs about $1,255 per af when it does operate presents an unacceptable burden on the area, particularly when there are less expensive options available that will meet area water demands.

MARINA EXHIBIT 6

TECHNICAL MEMORANDUM

FORMATION ENVIRONMENTAL

RESPONSE TO THE AUGUST 18, 2020 TECHNICAL MEMORANDUM PREPARED BY GEOSCIENCE SUPPORT SERVICES/AECOM REGARDING DRAWDOWN IMPACTS OF THE MONTEREY PENINSULA WATER SUPPLY PROJECT, ON SURFACE WATERS AND WETLANDS IN MARINA, CA

PREPARED FOR: Layne Long, City Manager, City of Marina

PREPARED BY: Mike Tietze, PG, CHG, CEG, Stephen Carlton, PG, CHG, and Emily Tozzi, CPSS and Certified Arborist, Formation Environmental, LLC

DATE: August 23, 2020

At your request, Formation Environmental, LLC (Formation) has reviewed the August 18, 2020 technical memorandum prepared by Geoscience Support Services (GSS) and AECOM titled " *Understanding the Influence of Subsurface Aquifer Drawdown Upon Surface Waters and Wetlands for the Proposed Monterey Peninsula Water Supply Project*" (the GSS Memorandum) The GSS Memorandum was prepared on behalf of California American Water Company (CalAm) and presents CalAm's comments on the technical memorandum prepared by Formation dated April 13, 2020 and titled "*Assessment and Protection of Groundwater Dependent Ecosystems near the Proposed Monterey Peninsula Water Supply Project Slant Wells, Marina, California*" (Formation 2020).

Our preliminary high-level responses to CalAm's comments are presented below. These responses are being prepared in an expedited manner to make them available to decision makers at the earliest opportunity. Additional comments/responses may be provided in the future. The locations of monitoring wells and vernal ponds discussed below are included as Figures 1 and 2, respectively.

1. INTRODUCTION AND BACKGROUND

Formation's April 13, 2020 Memorandum (Formation 2020) provided information regarding groundwater dependent ecosystems (GDEs) compiled to support preparation of the Groundwater Sustainability Plan (GSP) for the Marina Groundwater Sustainability Area (MGSA) Area of the 180/400 Foot Subbasin of the Salinas Valley Groundwater Basin. The Memorandum included an evaluation of existing data in accordance with guidelines developed by The Nature Conservancy (TNC) in collaboration with the California Department of Water Resources (DWR) to identify wetland and riparian resources that should be managed as GDEs (TNC 2018).

Formation's Memorandum also presented information from an additional evaluation of evapotranspiration (ET) and groundwater level trends to further assess the response of GDE vegetation to groundwater level declines. Additionally, the Memorandum presented information compiled from available planning documents, biological studies and public databases regarding the nature of GDE vegetation in the area that would potentially be affected by pumping of the slant wells for the proposed Monterey Peninsula Water Supply Project (MPWSP) and the general susceptibility of the existing vegetation to groundwater level declines. The Memorandum also identified data gaps and provided recommendations for further investigation, including installation of piezometers to assess the nature of the hydraulic interconnection between the Dune Sand Aquifer (DSA) and the identified GDEs, and biological assessment of the GDEs themselves to better understand their sensitivity to groundwater level declines and the nature of potential impacts that could result from groundwater extraction for the MPWSP.

The principal conclusions summarized in Formation's Memorandum are as follows:

- Evaluation of the existing data in accordance with available guidelines from TNC and DWR indicates that several vernal ponds in the Coastal Zone near the City of Marina should be considered and managed as GDEs.
- The available data indicate that pumping the proposed MPWSP slant wells can adversely affect these GDEs, potentially leading to vegetation stress, habitat degradation, and/or habitat loss. These effects would result in (1) potentially significant impacts to habitats and species in Environmentally Sensitive Habitat Areas (ESHA) protected under the Coastal Act; (2) potentially significant impacts under the California Environmental Quality Act (CEQA); (3) potential undesirable results under the Sustainable Groundwater Management Act (SGMA); and (4) potential adverse effects public trust resources (FBM 2019).
- Potential GDEs were not identified or evaluated in the Final Environmental Impact Report/ Environmental Impact Statement (Final EIR/EIS) prepared for the MPWSP, or in the supporting technical reports prepared by GSS and others (ESA 2018). As such, these GDE impacts represent new information that should be considered by the Coastal Commission in its consideration of the MPWSP.
- The Memorandum identified potential data gaps and the need for further investigation to support future management of the identified GDEs. Specifically, further investigation was recommended to assess the nature and degree of the hydraulic connection between the DSA and the identified GDEs, the extent of potential drawdown effects resulting from the MPWSP, and the nature of the GDE vegetation and habitat quality, and its susceptibility to groundwater drawdown.

After Formation's April 13, 2020 Memorandum was prepared, the City of Marina engaged WRA Environmental Consultants to investigate, collect data and assess the biological and hydrologic conditions at six of the seven vernal pond complexes discussed in the Formation Memorandum. WRA prepared a report titled "*Biological Resource and Groundwater Dependency Analysis of Marina Vernal*

Ponds" dated July 30, 2020 (WRA Report). WRA's analysis included biological surveys and documentation of vegetation and habitat types in the wetland, pond and upland areas around each vernal pond. WRA also evaluated the hydrology and water quality at each pond, and excavated test pits to assess shallow soil and groundwater conditions. Based on this assessment, WRA concluded that vegetation at the ponds is in fact utilizing and relying on shallow groundwater. Urban runoff also contributes to the water demand of some of the ponds. The vegetation documented at the ponds includes some plants that are typically reliant on shallow groundwater, and a number of protected species, or habitat that could support them, were documented This new information will be utilized, as appropriate, in responding to individual assertions made by the GSS Memorandum in the responses below.

2. COMMENTS

2.1. General Comments

The GSS Memorandum incorrectly claims that *"... pumping from CalAm's proposed slant wells is not anticipated to adversely affect the wetlands/ponds described by Formation. This conclusion is consistent with the findings of the California Public Utilities Commission (CPUC) MPWSP Final Environmental Impact Report/Environmental Impact Statement (Final EIR/EIS). The CPUC concluded that the proposed slant wells would not affect a GDE due to the lack of hydrologic connectivity between these resources and the Dune Sand Aquifer. This finding is supported by the information contained in the CPUC's MPWSP EIR/EIS ... ."*

To the contrary, the potential effects of the proposed project pumping on the identified ponds/wetlands were never evaluated in the Final EIR/EIS (ESA 2018). The concept of GDEs is not discussed, nor do the words "groundwater dependent ecosystem" even appear in the Final EIR/EIS for the MPWSP or the supporting reports. This is the first document we are aware of in which CalAm or its consultants have considered this potential impact.

The GSS Memorandum identifies several data gaps they perceive concerning the hydrology and hydrogeology of the identified GDEs, critiques the Formation Memorandum and offers supporting information. The primary data gap discussed by GSS is information to more precisely document the shallow hydrostratigraphy and groundwater conditions at the ponds. This data gap should have been addressed during preparation of the EIR/EIS for the MPWSP, but was not, and therefore some uncertainty remains regarding the extent of the ponds' reliance on groundwater and their potential sensitivity to drawdown.

This data gap was previously recognized and discussed in the Formation Memorandum and the MGSA GSP, and the available data supported the conclusion that the vernal pond habitats should be considered groundwater dependent and could be adversely impacted by groundwater level declines. The operative conclusion of the GSS Memorandum appears to be that since some uncertainty remains regarding the nature of the shallow hydrostratigraphy and groundwater conditions at the ponds, data from wells located at significant distances from the ponds can be extrapolated to apply to the ponds and

conclude they are not groundwater connected and impacts to the ponds from MPWSP slant well pumping will be less than significant.

As discussed further below, we believe that this conclusion is unfounded, ignores the process recommended to evaluate groundwater dependency in the available guidance regarding GDEs, and in conflict with the requirements of CEQA, SGMA, the Coastal Act and the public trust doctrine. In addition, the conclusion relies on speculative extrapolation of some data, while ignoring studies of the local hydrostratigraphy and water quality that currently represent the best available science for this purpose. Specifically, as is the case with other submittals from CalAm and its consultants, the GSS Memorandum improperly ignores the findings of key technical investigations by a team of geophysicists led by Stanford University who used Aerial Electromagnetics (AEM) to investigate the three dimensional hydrostratigraphic and water quality conditions in the area. AEM is a well-accepted research technique that is being widely applied throughout California by DWR, local groundwater sustainability agencies (GSAs) and the United States Geological Survey (USGS) for just this purpose (Gottschalk et al. 2018).

2.2. Specific Comments

Specific areas of comment discussed in the GSS Memorandum include the identification of GDEs, Dune Sand Aquifer hydrostratigraphy (e.g., perched aquifer, hydraulic communication), interpretation of groundwater levels, and pond surface hydrology (e.g., agricultural inflow and urban runoff). Each topic is discussed further below in Assertion/Response format.

Identification of GDEs.

GSS Assertion: The GSS Memorandum asserts that *"Formation speculates that the seven wetlands/ponds identified in the Coastal/Vernal Pond Comprehensive Management Plan prepared by the habitat restoration group Mitchell Swanson and Associates ("S&A") in 1994 could be groundwater dependent."*

Response: The Formation Memorandum does not "speculate" that the vernal ponds are groundwater dependent. The information presented in Formation's April 13 memorandum presents the results of a systematic evaluation that follows TNC and DWR-recommended procedures to determine if a potential GDE should be considered a GDE for groundwater management purposes. The fact that some data gaps may remain or even that future investigations may indicate more limited groundwater dependence is not relevant to this finding. The investigations to address these data gaps should have been performed during preparation of the Final EIR/EIS for the MPWSP but were not, and thus these questions must be addressed based on available data. Given the current scientific indications that the ponds are groundwater dependent, until/unless future investigations demonstrate that an identified resource is not groundwater dependent or will not be harmed by groundwater drawdown, the demonstrated potential for adverse impacts must be considered during impact analysis under CEQA and in making groundwater management decisions under SGMA.

This determination applies to each of the seven vernal ponds/pond complexes identified by the City and The Habitat Restoration Group. Formation conducted more detailed analysis of the Armstrong Ranch Pond Complex because it is closest to the MPWSP to provide more insight into the potential relationship between groundwater level decline and vegetation stress. This additional evaluation reinforced the determination made under the TNC/DWR guidance, but did not change that determination and was not required to determine which resources warrant management as GDEs. As such, the findings at Armstrong Ranch were not "extrapolated" to determine whether the other ponds should be managed as GDEs. That determination had already been made.

Hydrostratigraphy of the Dune Sand Aquifer.

GSS Assertion: The GSS Memorandum claims the Fort Ord-Salinas Valley Aquitard (FO-SVA) effectively separates an uppermost perched aquifer from the underlying Dune Sand Aquifer at each of the ponds.

Response: In making this determination, GSS uses a 2001 interpretation of the westward extent of the FO-SVA that contradicts data presented in its own reports prepared in 2016 in support of the MPWSP and summarized in a recent report prepared by Weiss Associates (Weiss 2020). Several cross sections and maps prepared by GSS in 2016 show the FO-SVA terminating significantly further east than shown in Figure 8 of the GSS Memorandum. These cross sections and maps show the FO-SVA either terminating, or with significant discontinuities, east of MW-7S and east of Del Monte Boulevard; whereas, the figure in the GSS Memorandum shows the FO-SVA extending over 2,000 feet further west. In addition, the outdated interpretation in the GSS Memorandum conflicts with the latest and most accurate scientific data generated by the AEM studies conducted by the Stanford geophysics team which demonstrate that the FO-SVA is discontinuous in this area (Gottschalk et al. 2019).

Instead, the GSS Memorandum cites data from several monitoring wells installed to investigate potential gasoline contamination at service stations in the City of Marina as supposedly conclusively demonstrating groundwater near the ponds in the City Limits is from the Perched "A" aquifer and not from the DSA, and that "*therefore MPWSP pumping will not have an impact on pond water levels.*" We disagree with this assessment because it conflicts with more recent and authoritative interpretations of the FO-SVA extent. In addition, definitive evaluation of GDE connection with shallow aquifers is typically accepted in the hydrogeologic community to require the installation of nested piezometers immediately adjacent to the resource, and the extrapolation of data gathered at greater distance for another purpose does not provide reliable data for decision making regarding these protected resources. We know of no monitoring wells or monitoring well clusters that have been installed close to any of the vernal ponds to investigate the local hydrostratigraphy and hydraulic connection between the ponds and underlying aquifers, so this information remains a data gap that should be addressed.

Extrapolation of data from monitoring wells constructed to assess the presence and migration of fuel contamination for distances up to 3,000 feet to infer conditions in a heterogenous environment is far from conclusive and is certainly of much less relevance than the AEM data regarding the three dimensional extent of the aquifers, aquitards and freshwater resources in the area, which represents the best available science for this purpose.

Interpretation of Groundwater Levels near the Armstrong Ponds.

GSS Assertion: The GSS Memorandum asserts that there are too few groundwater level control points to extrapolate water table elevations in the DSA near the Armstrong Pond Complex.

Response: This claim is perplexing because CalAm and GSS installed the existing monitoring well network near the MPWSP precisely for the purpose of assessing groundwater levels, flow directions and potential drawdown impacts and now appear to be undermining the use of the network they recommended for this purpose. Although we agree that evaluation of the GDEs in the Coastal Zone near Marina warrants a closer evaluation of the hydrostratigraphy, groundwater gradients and flow conditions near the ponds, such an evaluation does not, as yet, exist. We have therefore relied on the available data to assess, based on the available guidance and best available and accepted science, whether these ponds should be managed as GDEs.

Despite the claim that the available control points are insufficient for reliable water table extrapolation across the Armstrong Pond area, the GSS memorandum then goes on to extrapolate seasonal high groundwater level elevations in monitoring wells MW-4S and MW-7S across the pond area, and claim that analysis of three aerial images between 2016 and 2020 for evidence of surface water ponding proves that groundwater is not a source of water to the Armstrong Ponds. However, the use of this data is suspect and GSS's analysis does not seem to be on a firm scientific foundation, as they themselves point out that the extrapolation of groundwater levels between these relatively widely spaced points is uncertain. In addition, the aerial imagery data set used by GSS is limited to three images. Additional aerial images taken during different times of the year should be obtained and evaluated. Available satellite data could be used for this purpose. Finally, it is possible that an impeding layer could in fact be present that slows the discharge of groundwater.

A more robust site-specific analysis of hydrostratigraphy, groundwater levels and gradients, and the temporal changes in groundwater ponding and ET would be needed to draw more reliable conclusions. In the meantime the best-available data when applied in accordance with TNC and DWR guidance indicate the Armstrong Ponds should continue to be managed as a GDE. This was recently supported by the biological investigation performed by WRA Associates (WRA 2020), which found that the vegetation, soil conditions, hydrology and presence of shallow groundwater at the six ponds that were investigated was consistent with GDEs. Although the Armstrong ponds could not be accessed directly during that investigation, observations from the property line, aerial imagery and historical data from 1994 (The Habitat Group 1994) were consistent with this interpretation.

Pond Hydrology.

GSS Assertion: The GSS memorandum appears to broadly suppose that the availability of surface water to a wetland indicates it receives sufficient surface water supply to not be classified or managed as a GDE.

Response: Most GDEs are dependent on a combination of surface and groundwater. The surface water inflow component to the ponds in the City Limits that receive urban runoff and the agricultural runoff component of runoff to the Armstrong Pond complex has been previously acknowledged (e.g., The Habitat Group 1994, WRA 2020). The existence of these inflow components does not mean that groundwater does not provide a significant portion of the water used by these wetlands, and that these habitats would be harmed if that component were taken away. The ET analysis presented in Formation's 2019 memorandum examined summertime ET precisely for this reason, and indicates that ET discharge from the Armstrong Pond Complex during the dry season is most likely derived from groundwater.

The GSS Memorandum points to a lighter colored "halo" of hypothecated evaporite deposits at the Armstrong Ponds as evidence that surface water is ponding on a low permeability layer at the bottom of the pond and is therefore responsible for the water inflow. We note that the nature of these small reflectance contrasts in the aerial imagery has not been established and they could be derived from any number of causes, including the incident angle of the light on different surface materials, seasonal changes in vegetation life cycles, biological residues, etc. The presence of evaporite accumulations would be inconsistent with observations that the Armstrong Ponds are a seasonal freshwater wetland (The Habitat Group 1994, WRA 2020), which would typically be sensitive to elevated salinity. Nevertheless, even if the deposits were evaporites, such deposits are often associated with evaporative discharge of groundwater at the ground surface, which would support classifying the ponds as GDEs. As such the presence of evaporites, even if they exist, would be inconclusive.

3. CONCLUSIONS AND RECOMMENDATIONS

The GSS Memorandum is the first attempt by CalAm's consulting team at an evaluation of potential adverse impacts that could result to GDEs from operation of the proposed MPWSP slant wells. The analysis focuses on data gaps that should have been addressed during preparation of the EIR/EIS for the MPWSP, which did not include any efforts to identify GDEs or assess potential impacts to them. The information provided in the GSS Memorandum does not address these data gaps, and incorrectly dismisses the potential for adverse impacts to GDEs based on an incomplete understanding and inconclusive data . Further investigation should be required; however, performing such an investigation as an applicant-provided measure during implementation of the MPWSP would not satisfy the requirement of (1) CEQA to recognize and mitigate potentially significant impacts; (2) SGMA to prevent future undesirable results; (3) the Coastal Act to protect ESHA; or (4) the public trust doctrine to identify and avoid potential adverse impacts. To meet these objectives, the potential impacts of the MPWSP should be fully analyzed and addressed prior to project authorization.

FORMATION ENVIRONMENTAL

Mr. Layne Long, City Manager
City of Marina
211 Hillcrest Avenue
Marina, CA 93933

Subject: Review of August 17, 2020 Technical Memorandum by Montgomery & Associates Titled "Groundwater Dependent Ecosystems and Interconnected Surface Water" Prepared for Salinas Valley Basin Groundwater Sustainability Agency, Monterey County, California

Dear Mr. Long:

As requested, Formation Environmental LLC (Formation) has reviewed the technical memorandum prepared by Montgomery & Associates (Montgomery) on behalf of Salinas Valley Basin Groundwater Sustainability Agency (SVBGSA) titled "Groundwater Dependent Ecosystems and Interconnected Surface Water" and dated August 17, 2020.

This letter presents our preliminary comments on the Montgomery Memorandum and is focused on: (1) what we deem to be an incorrect recommendation by Montgomery not to designate the Dune Sand Aquifer (DSA) as a Principal Aquifer during implementation of the Groundwater Sustainability Plan for the 180/400 Foot Aquifer Subbasin prepared by SVBGSA; (2) the improper use of groundwater levels in the 180-Foot Aquifer to confirm which "indicators of groundwater dependent ecosystems" (iGDE) should be managed as groundwater dependent ecosystems (GDEs); and (3) the failure to recognize GDEs in the shoreward portion of the subbasin due to an incorrect interpretation of the extent of the Fort Ord-Salinas Valley Aquitard (FO-SVA) not supported by the available data. We may provide more detailed comments at a later date under separate cover.

Designation of the Dune Sand Aquifer as a Principal Aquifer

Montgomery concludes that only aquifers identified as Principal Aquifers in Department of Water Resources (DWR) Bulletin 118 should be identified and managed as Principal Aquifers. This conclusion is flawed for several reasons:

- The GSP regulations state that " *'Principal Aquifers' refer to aquifers or aquifer systems that store, transmit, and yield significant or economic quantities of groundwater to wells, springs, or surface water systems*" (23CCR § 351(aa)). GDEs include springs, seeps and surface water systems. Since the DSA yields water that maintains protected, environmentally sensitive GDEs and since it is capable of yielding significant quantities of groundwater designated as suitable for domestic and municipal use (Gottschalk et al. 2018), it should be considered a Principal Aquifer under this definition. This observation is consistent with comments the SVBGSA received from The Nature Conservancy (TNC) and the California Department of Fish and Wildlife. Furthermore, investigations of the distribution of freshwater in the shoreward portion of the aquifer system by a team of geophysicists from Stanford University (Gottschalk et al. 2018) have estimated that the DSA contains over 200,000 acre-feet of freshwater. The California Regional Water Quality Control Board, Central Coast Region, has commented to SVBGSA that such resources should be protected under SGMA.

FORMATION ENVIRONMENTAL, LLC
1631 Alhambra Boulevard, Suite 220
Sacramento, CA 95816

- DWR Bulletin 118 does not define Principal Aquifers. In fact, the term Principal Aquifer does not even appear in this document. By the definition that is being applied, any aquifer could be removed from consideration as a Principal Aquifer.

- Narrative guidance provided by TNC clearly indicates they recommend any aquifer that is hydraulically connected to GDEs and can be influenced by pumping is a Principal Aquifer that should be managed under SGMA (TNC 2018 and 2019). For example, in a discussion regarding Best Practices for Establishing a Connection to Groundwater, TNC states the following:

  > *"If pumping is concentrated in deeper aquifers, SGMA still requires GSAs to sustainably manage groundwater resources in shallow aquifers, such as perched aquifers, that support springs, surface water, domestic wells, and GDEs. ... The goal of SGMA is to sustainably manage groundwater resources for current and future social, economic, and environmental benefits. While groundwater pumping may not be currently occurring in a shallower aquifer, use of this water may become more appealing and economically viable in future years as pumping restrictions are placed on the deeper production aquifers in the basin to meet the sustainable yield and criteria. Thus, identifying GDEs in the basin should done irrespective to the amount of current pumping occurring in a particular aquifer, so that future impacts on GDEs due to new production can be avoided. A good rule of thumb to follow is: if groundwater can be pumped from a well - it's an aquifer."* (TNC 2019).

Thus, by adopting a definition for Principal Aquifers from an appendix checklist without considering the written intent of the guidance or the applicable regulatory standards that designate it as a potential source of domestic or municipal supply, and then ignoring multiple clarifications and reiterations in TNC's comments, the Montgomery memorandum adopts a definition for Principal Aquifers that is not supported by any guidance, regulations or the facts.

Improper Use of Groundwater Levels in the 180-Foot Aquifer

Contrary to the TNC and DWR guidance referenced above, the Montgomery memorandum relies on groundwater level measurements in the 180-Foot Aquifer, rather than the Dune Sand Aquifer, to assess whether iGDEs should be classified as GDEs. Instead, groundwater level data available for the DSA should be used for this purpose. Formation used this approach as summarized in our memorandum regarding GDEs in the Marina area (Formation 2020), and found that under TNC and DWR guidance (TNC 2018) there are several protected wetlands near the coast that should be managed as GDEs. This includes seven "vernal ponds" that are located in the Coastal Zone near the City and required to be managed as Environmentally Sensitive Habitat Areas (ESHA) under the California Coastal Act.

Incorrect Interpretation of the Extent of the Fort Ord-Salinas Valley Aquitard

The hydrogeologic conceptual model adopted in Montgomery's Memorandum is that the FO-SVA is a continuous and uninterrupted aquitard that extends to the shoreward edge of the subbasin. This oversimplified interpretation has been disproven by studies completed by the Monterey County Water Resources Agency (MCWRA 2017), published geophysical investigations (Gottschalk 2018) and

investigations performed for the Monterey Peninsula Water Supply Project (Weiss 2020). The Memorandum improperly applies this flawed hydrogeologic conceptual model to categorically rule out the designation of iGDEs in the shoreward portion of the subbasin as GDEs, leaving them unmanaged and subject to potential irreversible harm.

The net effect of applying this incorrect and disproven hydrogeologic assumption is that Montgomery supposedly determines the protected vernal ponds in the Coastal Zone do not qualify as GDEs under the Sustainable Groundwater Management Act and need not be managed or protected relative to their groundwater dependence. However, since the best available science and applicable GDE guidance indicates these ponds should be recognized and managed as GDEs (see Formation's April 13, 2020 memorandum), this analysis is incorrect and should be disregarded.

Thank you for considering these comments. If you have any questions or would like to discuss these matters further, please contact the undersigned at (916) 200-9038.

Sincerely,
Formation Environmental LLC

DENY Desal Plant Project

Jean Rasch <jean@jeanrasch.com>

Fri 9/11/2020 9:38 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

I support the staff recommendations to deny the De Novo permit and deny the coastal development permit, finding that Cal Am's desal plant project is inconsistent with relevant Coastal Act and LCP policies and that the Commission not approve the Project because the Pure Water Monterey Expansion is a feasible, less damaging alternative that will adequately provide water and protect the public welfare.

Please permanently deny Cal Am's oversized, overpriced desal plant project! We don't need a desal plant. It is not in the public interest because Cal Am's desal would double our water bills, which are already the highest priced water in America. Also, desal damages the environment by harming the coastal habitat and would draw groundwater from an overdrafted groundwater basin.

Pure Water Monterey Expansion is the feasible and environmentally preferable alternative. It will give us a new water supply much sooner than building a desal plant. Our current water supply from Pure Water Monterey ~ Phase 1 (3,500 acre-feet) ~ will allow us to stop illegal withdrawals from the Carmel River by December 2021 and will restore the Carmel River and protect the Steelhead. The environmental issues facing the Carmel River have been resolved by Pure Water Monterey without the need for Cal Am's desal plant. The Expansion of Pure Water Monterey will provide a long-term sustainable water supply for decades of growth.

Cal Am is the only obstacle to the expansion of Pure Water Monterey. Cal Am is blocking it because it will not be profitable for them. Decisions must be made based on what is good for the community and its residents, not what is good for corporations and their stockholders!

Thank you for your consideration,

Sincerely,

Jean Rasch

Deny DeSal project

Jennifer Colby <jennifercolbyphd@gmail.com>

Fri 9/11/2020 9:35 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear commission,

Cal Am Desal Project fails to qualify for special consideration.

Cal Am Desal Project fails the test as " the Pure Water Expansion project"

Project fails this test as denying it "would not adversely affect the public welfare. The Project would result in a number of adverse impacts, and there is also substantial uncertainty about the Project's long-term feasibility due to questions about return water obligations, groundwater rights, where future wells could be located once the initial ones need to be replaced, and costs, among other things. Denying the project is likely to lead to implementation of a project alternative that would benefit the public welfare."; Cal Am Desal Project fails the tests for special consideration as "the currently proposed mitigation does not yet meet the standard of impacts being mitigated to the maximum extent feasible." and it's adverse effects are not mitigated to the maximum extent feasible.

We do not need the Cal Am Desal Project and it is a highly flawed project. The Pure Water Project Expansion will meet our needs and is a wiser, sustainable, environmentally-sound, more cost-effective option.

RE: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 (Cal Am Desal)

Dear Chair Padilla and Commissioners,

We support your staff recommendation. Please deny the Coastal Development Permit for California American Water's proposed desalination facility.

Our community does not need this oversized, overpriced and environmentally damaging Project. It is not in the public interest. It would burden our community, especially our lower income households, with even higher water costs and perpetuate environmental injustice in Marina.

The expansion of Pure Water Monterey (PWM) is a feasible alternative sufficient to meet the Monterey Peninsula's future needs for the next 20 to 30 years. Pure Water Monterey – Phase 1 is already in operation. The Expansion could be constructed in approximately 20 months. Compared to Cal Am's desal project the PWM Expansion will save ratepayers approximately $1 billion over 30 years.

Cal Am claims that its desal project is the only way to stop the illegal withdrawals from the Carmel River. We want to make it clear that while a new water supply is needed for future growth, it is not needed to end the illegal withdrawals from the Carmel River. The 3,500 acre-feet from Pure Water Monterey – Phase 1 will allow us to meet the state's December 2021 deadline.

Our current 5-year average withdrawal from the Carmel River is 6,314 acre-feet. Our legally allowed withdrawal is 3,376 acre-feet. As you can see, adding the new 3,500 acre-feet from Pure Water Monterey will meet the state's CDO requirement with a 562 acre-foot surplus. No new water supply is needed to stop illegal withdrawals from the Carmel River.

The health of the Carmel River has long been a concern. Through the work of our public agencies in bringing Pure Water Monterey online over the last 6 years, and the conservation efforts of our community, we have solved the problem. The credit goes to Monterey One Water and the Monterey Peninsula Water Management District (MPWMD), not to Cal Am.

For decades it has been MPWMD's responsibility to monitor and restore the Carmel River and to oversee water supply and conservation. No other agency is in a better position to report on the state of the River and our current water demand.

MPWMD was created by the legislature to find new water supplies through integrated management of surface and groundwater, conservation, and water reuse and reclamation. Including Pure Water Monterey, it has given us over 7,000 acre-feet of new water in the past 20 years. It is a highly competent agency.

The Supply and Demand Report produced by MPWMD is accurate and current. It tracks our history of water use and has shown that the PWM Expansion is more than sufficient to lift the Cease and Desist Order (CDO). Based on the most recent pumping and demand history, less than 800 acre-feet per year of new supply is required to do so – at 2,250 acre-feet per year, the PWM expansion is more than sufficient.

We have complete confidence in MPWMD. It has demonstrated success in solving our water supply issues, while Cal Am has not. Cal Am made no financial contribution to PWM phase 1 and will earn no profit on this water. Nor would it profit on the PWM Expansion. It would earn a 9.2% return on its proposed desal project. Please consider Cal Am's motivation in arguing against the Expansion.

The Pure Water Monterey Expansion is essentially ready to go. It would simply take a political decision – there are no physical barriers to this Project. All it requires is a decision to certify the Final SEIR, approval of the final design and bidding, and most importantly, a Water Purchase Agreement from Cal Am. If Cal Am wanted to move forward on this, all opposition by its political allies would evaporate.

While Pure Water Monterey – Phase 1 has solved the long-standing Carmel River problem, we still need a new water supply to lift the CDO and to supply water for housing, economic recovery and growth. Even if it were approved, Cal Am's desal project faces years of litigation over water rights. We cannot afford to wait.

Thank you for taking the time to understand these complex issues. In the interest of our coastal environment and our community, please deny Cal Am's permit.

Appeal No. A-3-MRA-19-0034 - DENY CalAm Desalination Project Permit (Marina)

Carol Lauderdale <dancergirl1966@gmail.com>

Fri 9/11/2020 9:21 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

To California Coastal Commissioners, Executive Director John Ainsworth and staff:

I have been a resident of the City of Marina since January, 1994, when I purchased my home very close to our beautiful Marina coastline. Marina is a wholesome, friendly and safe community, with a well-run city government and the best mayor (Bruce Delgado) that any community could hope for. The people here in Marina really care about our quality of life and look out for one another. I am currently retired from working nearly 50 years in law firms from Monterey to Los Angeles and back home again to the Monterey Peninsula. When I purchased my home I was still working, but as of four years ago, I am now retired. I live on a fixed income and Marina is the only affordable area on the Monterey Peninsula I can own a home in a nice neighborhood and feel safe. I carefully watch my health and take my daily walks along our coast to be sure I stay well. I am a single senior citizen and now stay home to myself since we are in the middle of the deadly COVID-19 pandemic. What happens in my neighborhood matters to me.

I am opposed to CalAm building a desal plant and drilling slant wells on Marina's beach to extract our groundwater. CalAm has no right to do this. Not a drop of that water will benefit Marina, it will be sold to CalAm's customers on the Peninsula. This project will harm our water source and coast. CalAm's project is environmentally unjust. It will destroy our pristine dunes and harm the Snowy plover birds that enjoy living and feeding off our seashore.

There are other options for CalAm to supply water to the communities of the Monterey Peninsula other than stealing Marina's water and contaminating our water table. We Marina residents want our clean and safe drinking water left alone! Please follow staff's recommendation to DENY Cal Am's application to build a desal plant in Marina and drill slant wells on our shoreline. Please help the Marina Coast Water District to conserve our drinking water for its residents, and preserve our beautiful dunes and wildlife, and save our pristine California coastline from destruction and being defaced. I strongly oppose this project and suggest that CalAm explore its other options, and come up with another plan that does not involve drilling on our sand dunes and stealing Marina's water!

Respectfully submitted,

Carol B. Lauderdale

From: Gregory Furey <gefurey@aol.com>
Sent: Wed, Sep 9, 2020 2:38 pm
Subject: Appeal No. A-3-MRA-19-0034; Deny Cal Am Desalinization Project Permit

Dear California Coastal Commissioners; Executive Director John Ainsworth

My name is Greg Furey. I am a 21 year resident of Marina, I moved here from Southern California in 1998 when I accepted a promotional assignment from Cal Fire. I am retired now. The central focus of my life is currently the care and rehab of my stepdaughter, a UC Berkeley graduate who was raised in Marina but suffered a life-altering brain injury when she was a passenger in a vehicle accident in 2015.
We do not want Cal Am's DeSal project to be situated on our coastline. It is an insult to our community that Cal Am would choose to locate their ugly, unecessary slant well pumps along our beautiful coastline. Why did they not locate their wells along the coastline of a community they serve, instead of next to the beaches of Marina? The answer seems unpleasantly obvious.
There are a reported 71 different dialects spoken in Marina, largely due to the town's historical affiliation with Ft. Ord.
"Back in the day", when an enlisted soldier returned to the US/Ft. Ord with a foreign bride, he was directed to Marina as the "ideal place" to settle and raise a family. Keep in mind that even in the 1960's, there were deed restrictions buried in local land use ordinances of Monterey Peninsula jurisdictions that prohibited persons of color from owning property in thiose communities.
We are still an "enlisted", working class town. Many of our older residents are the widows of those career soldiers who spent careers.
in the US Army. Their widows live on fixed incomes and cannot afford to be forced into the Cal AM "family" if our fragile water supply is compromised by this unnecessary project. While there logically appears to be no existential need at this time for a project as expensive and intrusive as Cal Am's proposed DeSal project, we simply DO NOT WANT IT HERE for any reason. To me, it would simply represent an extension of the discriminatory socio-economic practices of the past and be a financial boondoggle imposed on its' customers and on our little community.
Thank you for your service to all of our coastal communities.
Please Deny this harmful project!

Sincerely.
Greg Furey

September 11, 2020

California Coastal Commission

455 MARKET STREET, SUITE 228

SAN FRANCISCO, CA 94105-2219

Dear California Coastal Commissioners:

re: DE NOVO APPEAL (A-3-MRA-19-0034) and

CONSOLIDATED COASTAL DEVELOPMENT PERMIT (9-19-0198)

I have read the CCC staff reports and I ask you to deny both the above Appeal and the Consolidated Coastal Development permit application. The staff reports gave numerous reasons for the denial and I do not need to repeat.

But I want to add additional comments on the Areas of Uncertainty for the Pure Water Expansion alternative as described in the staff report, starting on page 141.

The CCC staff report failed to discuss the infeasibility of conveying or carrying the additional 2,250 AFY from the existing treatment plant in Marina to the new injection wells in Seaside.

The existing conveying system that currently carries the advanced treated water was designed to carry only **5,127 AFY** which consists of 3,250 AFY for Monterey Peninsula Water Management District (to be sold to Cal Am) and 1,427 AFY for Marina Coast Water District.

This existing conveying pipeline was **NOT** designed to carry the additional 2,250 AFY for a total of **7,377 AFY**.

Marina Coast Water District did OWN this existing conveying pipeline. Neither Monterey One Water nor Monterey Peninsula Water Management District owns the existing conveyance pipeline.

The CCC staff report **failed** to discuss this issue. Additionally, the CCC staff report did **not** include any engineering calculations or hydraulic models that prove that the additional 2,250 AFY could be carried by the existing conveyance pipeline.

The above comments are my own and they do not represent the views or opinions of any other individuals or any private or public organizations including Marina Coast Water District and its Board of Directors.

Sincerely,

Peter Le

Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Irene Dorsey <idorsey11@gmail.com>

Fri 9/11/2020 9:11 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff,

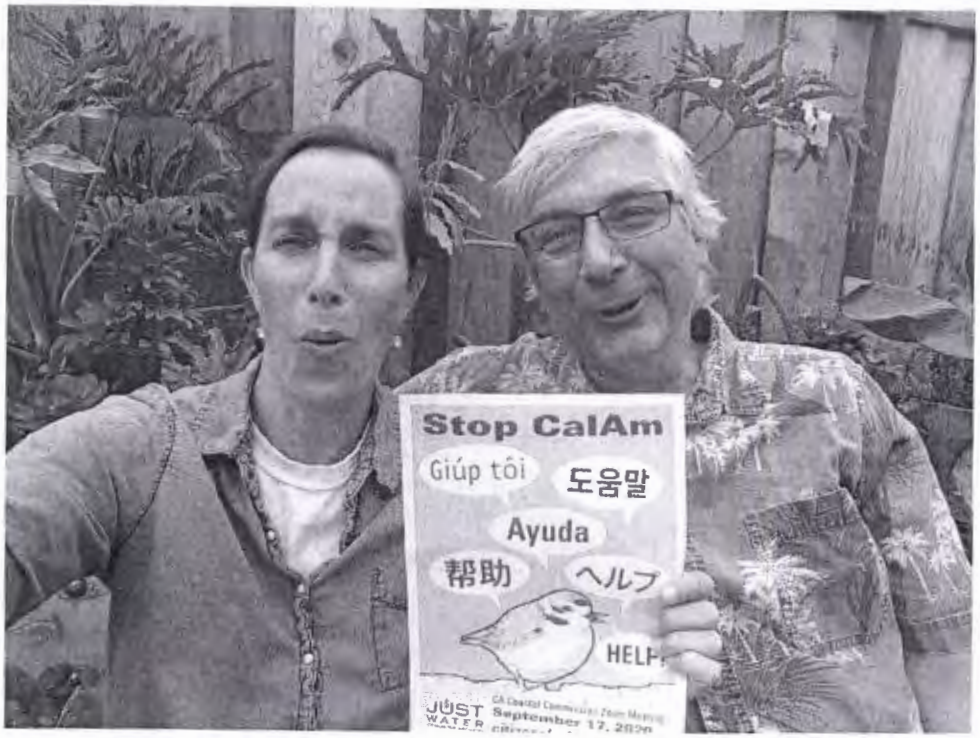
My name is Irene Dorsey. I am 70 years old, 37% Native American, and identify as Mexican. My husband, Jim, and I moved to Marina, from Los Angeles, just over two years ago.

My husband entered basic training at Ft. Ord almost 50-years to the day we bought our home in Marina. He never got to explore Monterey during his time here, but in our 49 years of marriage, he often reflected on the beauty and majesty of land, sea, and life he'd seen during his short stay here. When we retired and made our big move, we were beside ourselves that we were actually able to move to Monterey Bay. We'd worked hard all our lives, in pursuit of the old "American Dream," and were astonished, and grateful, to find that we could actually move here.

However, we started to hear, oftentimes, Marina referred to as a "disadvantaged" city, and we were puzzled. Then we came to realize that Marina lost so much of its population, business, etc. when Fort Old closed, and we are proud of Marina's efforts to revive itself and to be "disadvantaged" no more. But now, we are faced with the indignity of having to fight for rights to our own water supply. To allow CalAm to come to Marina will only harm our water, and our dunes, and it will disrespect this city's efforts to thrive once again.

Please deny the CalAm Slant Well project!

Respectfully,



Irene B. Dorsey

Appeal No. A-3-M RA-19-0034; Deny CalAm Desalination Project Permit

Rachel Christopherson <rachel.i.christo@gmail.com>

Fri 9/11/2020 9:10 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and Staff,

My name is Rachel Christopherson, and I live in Seaside, CA with my husband Casey and our animal family. We both earn modest incomes: I work part-time at the Center for the Blue Economy/Middlebury Institute of International Studies as an administrator, and Casey works full-time tracking ships on the SF bay at the Marine Exchange. We love Seaside and our Monterey Bay community so much, and really appreciate the work of the California Coastal Commission and their staff. We would have a very different coastline if it were not for the mission of the CCC and the activists and politicians who helped set up the CCC serving the public good.

This project is exactly the type that needs CCC oversight and consideration. After the amicable closure of the Cemex sand mine on the same location, the community celebrated that the site would finally become accessible to the public, and restored to a safe haven from the endangered snowy plover and blue butterfly. I fear that if this CalAm project is allowed, we will see continued inaccessibility for the public, and endangerment of the natural environment.

More importantly, this project threatens the aquifer that Marina citizens rely upon for 100% of their drinking water, yet they would see no benefit from the project either in terms of water or economic gain. This is a classic case of environmental injustice: put the project in the poor section of the Monterey Bay, grab water rights, and offer no benefit to the local residents, extend no regard to their rights or well-being. This is systemic racism in action.

Finally, there is a very real economic argument to be made for leaving the beauty of nature intact. In the Monterey Bay, tourism is the number one industry in the area, and the second largest industry in the county. A 2018 report from the Monterey County Convention and Visitors Bureau showed visitor spending in the Monterey Bay supported over 25,000 jobs and generated $135 million in local tax revenue. Although we are facing a downturn due to the pandemic, the long-term economic health and prosperity of our region depends upon the beauty of nature and the ability of people to access nature in a meaningful way. The beaches of Marina are among the least populous, most wild and beautiful in the area, and to place any industrial project on these dunes would be to endanger the economic future of Marina and the Monterey Bay area.

With the Pure Water, recycled alternative that provides plenty of water for the region both now and well into the future, we do not need this risky desal project. Additionally, with the passage

of Measure J and the feasibility study out soon, the community hopes to entirely take over the CalAm infrastructure, and free ourselves from the highest water rates in the U.S.

Please deny this harmful project! Thank you.

Deny Cal-Am's Desal Project - Items Th3a/Th4a

Amelia Murphy <afmurphy25@gmail.com>

Fri 9/11/2020 8:19 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>; Materials <materials@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff,

My name is Amelia Murphy and I have lived in Marina for many years. I am a college Biology and Chemistry Lab Coordinator, and my husband (Tim Thomas) teaches Biology and Environmental Science at CSUMB. We love our beautiful community and care deeply about protecting our local coastal habitats and the species that depend on them to stay alive.

As a concerned resident of Marina, I would like to express my strong support for the Coastal Commission Staff's recommendation to **deny** Cal Am's permit. Our pristine Marina beaches, with their many sensitive wildlife species such as the Western Snowy Plover (our official city shorebird), are no place for the harmful Cal-Am Slant Well Project. It is also very unjust that the Marina community would receive absolutely no water from this project, since all the desalinated water would be shipped to the Cal-Am Peninsula customers, at exorbitant prices.

The Pure Water Expansion is a feasible alternative to Cal-Am's Project, and is far more just and environmentally friendly. The Pure Water Expansion would avoid environmental burdens to the City of Marina, keep our precious wildlife safe, and also appears to have fewer significant hurdles to clear before it could be implemented.

Please deny Cal Am's very harmful project, protecting our water, our dunes and our wildlife. Although we have not requested to speak publicly, we will be attending the meeting on Sept.17 and look forward to seeing you there.

Sincerely,
Amelia Murphy and Tim Thomas

Opposed to CalAm's proposed desal project in Marina

Jeff Morton <jmorton@chartwell.org>

Fri 9/11/2020 8:17 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear California Coastal Commission,

I am writing to express my opposition to CalAm's proposed desal project. As a resident of Marina, I am gravely concerned about CalAm's plan to take water from Marina's groundwater basin. The possibility that the basin could be depleted and/or contaminated is troubling to say the least, and running the risk is unnecessary.

I support the expansion of the Pure Water Monterey Project to meet the water demand. This option is less expensive and could meet the Monterey Peninsula's water needs using existing infrastructure and without compromising coastal ecosystem health.

I hope you will seriously consider this input and think carefully about the City of Marina, it's inhabitants, and the overall ecological health of the coastline as you conduct your evaluation of CalAms desal proposal.

Decline Calam Desal Project Permit

Ken Robins <kenarobins@gmail.com>

Fri 9/11/2020 8:13 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

I am writing to say that I am completely unequivocal about my request that your Decline the Calam Desal Project permit - the majority of our voters are against it. Thank you kindly, Ken Robins Carmel Valley Ca. 93924.

Public Comment on September 2020 Agenda Item undefined 4a - Application No. 9-19-0918 (California American Water Co., Seaside, Monterey Co.)

Juli Hofmann <jhofmann@redshift.com>

Fri 9/11/2020 8:10 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Subject: Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit.

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

I have been a resident of Marina since 1995 and love this sleepy little coastal community. Several years ago I became aware that the California American Water Company had intentions to site a Desalination plant that was designed to utilize Marina's groundwater resources on the CEMEX property. I want to thank your staff for their careful work in exposing the lies that have allowed this project to proceed to benefit the few and not the many.

I participated in the CPUC hearing in November of 2017 which culminated in the approval of the Final Environmental Impact report for the CalAm experimental Slant Well project. It was appalling to witness the obvious bias that the Administrative Law Judges had for rubber stamping the project against numerous objections from multiple parties. A room full of special interests carved up our ancient dunes with no regard to our diverse community, water rights, city local coastal plan, the CEMEX agreement of coastal access for all, loss of habitat and threatened wildlife, or our future as the peninsula city with the largest projected growth for population. It cannot be denied that our community had little power to influence compared to a deep pocketed corporation that has had behind the scenes ear(s) of every relevant agency since the inception of the project. Our protests predictably fell on deaf ears.

So fast forward a few years; our citizen group has made many trips to all agencies, people of power and generally anyone who would listen. It was an uphill battle to make our position of Environmental Injustice known - even in our own community! When the 2019 Coastal Commission staff report so clearly articulated MANY of the problematic issues with this project, it gave gave great hope. We dared to believe justice would prevail and end this unnecessary self-serving water project. But, that did not happen in November. We went home without an answer—***would our community be forced to bear the brunt of a project that offered no benefits yet many risks?***

The new staff report is out, and I applaud the scrutiny given to this project that now requires a final decision. Coastal Commissioners: please look carefully at your staff findings. I believe that your staff has done a thorough review of the facts unlike the CPUC who based their decision solely on information promoted in the FEIR by CalAm. Please consider this project the Beta test for the CCC new Environmental Policy. Will you Walk the Talk and find this project and its damages unacceptable? I hope so. I hope science and reason finally prevail.

Large projects like this one will always have detractors, but the CalAm Slant Well project does not serve the best long term shared interests of the peninsula and greater region. If approved, the effects on all of our communities and environment will alter any future envisioned. The project impacts have parallels to the 1965 plans to build the Humble Oil Refinery in Moss Landing that was ardently opposed by local communities. Ansel Adams, the photographer commented that:

"It is not just the Humble Oil refinery we're fighting at Moss Landing. It is the whole industrial complex which will inevitably follow and change the whole complexion of (the region)."

This is the crux of the project before you—there will be far reaching consequences that will define the region for years to come. Do the benefits to ALL out weigh the losses? I think the evidence is clear, the losses are manifold and and cannot be simply mitigated away. Our shared water issues are regional and will not be served by this improvident project. Desalination should be a last resort when more nimble, cost effective solutions are available. The Pure Water Monterey Recycled Water expansion IS a cooperative solution for the region and should be promoted over CalAm's bloated, experimental, expensive boondoggle.

I urge you to deny the CalAm Application No.9-19-0918 for all of the thoroughly documented reasons your staff has presented. Also, don't forget to deny the Appeal No. A-3-MRA-19-0034 for unnecessary infrastructure no longer required.

Thank you for your service.

Deny Cal-Am's Desal Project - Items Th3a/Th4a

Gord <gordykfrog@comcast.net>

Fri 9/11/2020 7:55 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>; Materials <materials@coastal.ca.gov>

To Whom It May Concern:

We are writing you concerning the Coastal Commission's upcoming consideration of the approval/denial of the Cal-Am permit for its proposed desalination project. We strongly ask that the Commissions deny Cal-Am's permit as there is clearly a much more financially and environmentally superior proposal put forward by Pure Water Expansion.

As the Monterey Peninsula Water Management District has clearly demonstrated, a critical problem with the desalination facility is that it would generate much more water than is foreseeably demanded. This would raise water rates substantially because smaller delivered quantities of desalinated water would have to cover the same large, fixed costs. Even with the extremely optimistic demand at three times the historic absorption rate, the desalination plant will not run at capacity in this century. The Water Management District concluded that Pure Water Monterey expansion is sufficient until 2043 with demand at three times the historic absorption rate.

Additionally as the Coastal Commission staff report says, "after weighing the evidence in the record at this time, that the Pure Water Expansion is a feasible alternative to Cal-Am's Project, will allow Cal-Am to cease its illegal water withdrawals from the Carmel River and meet the region's water needs, and is the preferable, least environmentally damaging alternative. The Pure Water Expansion would also result in fewer environmental and economic burdens to the communities of concern within Cal-Am's service area, would avoid environmental burdens to the City of Marina, and appears to have fewer significant hurdles to clear before it could be implemented. "

We ask that you support your staff's recommendation to deny the Cal-Am's desalination project so that the Pure Water Monterey expansion can be brought online as soon as possible. Thank you for your attention to this matter.

Chair Steve Padilla and members of the California Coastal Commission;

I am a former Pacific Grove Council Member (until 2018) and former Board member of Monterey One Water (M1W). I was Board Chair of M1W for two years, during which time the Pure Water Monterey project was approved and construction started. It is now on-line and producing potable water and, once fully operational, is expected to supply the Monterey Peninsula cities with about 35% of our water. But it has not yet produced that amount of water, and likely will not in the near term.

The shallow wells Pure Water Monterey (PWM) is using are calculated to inject 500 gallons per minute into the aquifer but have actually been injecting much less (and one well has subsidence issues and needs to be stabilized). The two deep injection wells were expected to inject 1,000 gallons per minute but are only injecting 635 gallons and 775 gallons respectively.

As a result, the Agency is seeking to add another deep well (it should actually have two more). Even if the next well injects an average of the others, that will only be 705 GPM. That means the deep injection wells will probably inject only 2,115 GPM versus the hoped for 3,000 GPM. I have confidence that the agency will get to the 3,500 afy, but let's not count on an expansion until it does the primary job first.

Staff also makes misstatements or errors in logic as far as demand for water on the Monterey Peninsula (page 125-126). There is, indeed, and great deal of pent up demand. Speak to anyone on a city council, any mayor, or any City Manager on the Peninsula and you will find they all have issues around water. Many are advocating for the building of affordable housing, but we cannot build affordable housing if we cannot build even market rate housing because of a lack of water. And without more housing - and more affordable housing - we are going to continue to have major issues on the Monterey Peninsula with residents who have to share housing or who can't find housing locally.

This is not for growth in the sense of bringing in people from elsewhere (as some of the opponents believe) but is needed affordable housing for workers who are already here supporting the cities and their economies.

Cities all over the Peninsula are looking for ways to add workforce and affordable housing. Monterey, for instance, wants to build some affordable housing over on Garden Road. Seaside is trying to build the Campus Town development, much of which provides

affordable housing for people who live here right now. Water has been part of the struggle of getting all of these projects approved and built.

Right up the road we have Cal State University Monterey Bay, which is a growing university. Their students and professors need housing but are having a hard time finding it. The Monterey Herald reported on Thursday, September 10, 202o that the University is starting construction on a four story student housing project. Even so, the article explains that the university has 7,400 students but only housing for 3,600 of them. Though some students do live off campus, the Vice President of Student Affairs stated that "7-8% of students need more housing".

As a result, any excess of water will not last for 20 years as staff and local water project opponents claim, but more like 6-10 years. Staff demeans the claim of "pent up demand", but they are wrong and they don't live here.

If you look at NextDoor on the internet, you often see people who are begging to find a home – even for a short time - to do research at Hopkins or to teach at our schools. How do we expect to find good teachers for our kids if they can't find affordable housing?

Several years ago the Community Hospital of Monterey bought an apartment building at 230 Lighthouse from Carl Outzen for their employees only. Their doctors and nurses can't find housing and, after working for a short time, just quit and leave the area. How can we expect the excellent health care we benefit from to continue if nurses and doctors can't find housing?

We have doctors, nurses, teachers, police officers, and firefighters living in other communities because they can't find housing near their jobs here. These people end up having to live somewhere else and commute to their jobs – adding pollution to the environment in the process. The shortage of water is negatively affecting our public safety, our health, and our children's education.

While we still need to develop more water, this isn't just about water. It is about our quality of life and taking care of our residents.

Staff also speaks of "high water availability" locally over the last 20 years (page 125). This is absolutely false! The Monterey Peninsula has been under water restrictions for the last 25 years. In my city of Pacific Grove we have had people on the city's "Water Wait List" for up to ten years. We have two people I know of who have properties and building plans approved but cannot build because of a lack of water. We have hundreds of in-fill Lots of Record in our cities where people want to build. There will be building, but it will mostly be in-fill building.

We on the Monterey Peninsula need to have the ability – the option – to make sure we have the water we need both now and in the future. If you reject desal project totally, we may not have that option. You will have taken one leg from our multi legged stool and made our situation more unstable.

The opponents of desal present this as a choice between desal and Pure Water Monterey. I don't believe it is that simple.

Whether in the future we go through another draught, run into a problem with the Las Padres Dam, have problems with the wells in the aquifer, or some other kind of problem; we need to have the option to look at other projects – including desal.

I believe the Pure Water Monterey Plant is a great project which will produce what it is expected to **eventually**. But it has not yet produced 3,500 acre feet a year in the past as we need it to do.

Our Monterey Peninsula Water Management District (MPWMD) has also taken great strides in supplementing the areas water supply. It's Aquifer Storage and Recovery project has gotten much better over the years and now produces close to the 1,300 afy projected. Together these public agencies will be able to produce almost half the water the Peninsula currently needs from new projects.

Some of our traditional sources make up much of the rest. But, like most areas, there will be some natural growth in needs. We may not know what that will be, but are we actually going to argue about the very maximum amount of water we should have access to?

If we start the EIR process for another desal plant again in the future, it will take another 15 years and tens of millions of dollars to get to where we are right now. You may want to put some constraints on the plant, but please don't totally dismiss desal and take away the option of local water experts to take care of the Monterey Peninsula's water needs.

We may not need as large a plant, and the source water wells should certainly be located elsewhere (though I would point out it was your agency which insisted on slant wells), but let's not reject desal totally. Have them put the wells elsewhere, direct that it is smaller – or even publicly owned - but please don't totally dismiss desal and take away the option of local water experts to take care of the Monterey Peninsula's water needs.

Whether built by Cal Am or one of the public agencies (my preferred option) we need to have the ability to build a small (but expandable as the need arises) desal plant in the future.

If you have any questions or wish to discuss this or any other matter, please feel free to call me at (831) 236-3431 or e-mail me at rudyfischer@earthlink.net.

Regards,

Rudy Fischer

Pat Venza <patvenza@me.com>

Fri 9/11/2020 7:43 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Commissioners: As a Monterey Peninsula resident I have watched the developments for/against the CalAm desal plant for years now. With the Monterey One Water recycling in place, and ever more water available if the expansion is signed by CalAm, there is no need for this very costly, environmentally unsound desal plant.

As the commission that is in place to protect our coast I have not seen, or heard, any positive environmental reason for this hugely expensive project. The residents do not want it. It is not only environmentally terrible, but also pits one community against another. Marina should not be losing its water source in order to provide water to the Monterey Peninsula and Castroville. This is socially unsound.

I thank your staff for its great work on evaluating the desal plant. Two separate reviews came up with the same conclusion....this desal plant is not needed and will be environmentally a bad choice.

September 2020 agenda item 3a-Appeal No. A-3-MRA-19-0034 Deny Cal Am!

Karen <kla1105@earthlink.net>

Fri 9/11/2020 7:29 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

My name is Karen Andersen and I moved to Marina because I could afford to live here on a fixed income, I prefer to live in a diverse community, and I appreciate the many local environmentally-conscious organizations I could join.

I also knew my water company, MCWD, was publicly owned. I soon met the water conservationist on their staff, who helped me apply to the CA DWR program to convert my front lawn into local habitat typical of the Fort Ord National Monument. I also soon learned of the shareholder-owned water company trying to dip long straws into Marina's aquifers, and joined the resistance movement.

Please deny Cal Am's permit application.

I am looking forward to the removal of the hugely destructive Cemex sand mining facility, and rehabilitation of the coast. Please don't replace one industry with an even more destructive one. Please join me in looking forward to the day when families will visit the beach from this location, read the signs about the restoration process, and notice the seal of the California Coastal Commission among the others when they discover another gem along Marina's shores.

Thank you,
Karen Andersen

Attn: Tom Luster

Re: Application No. 9-19-0918, Appeal No. A-3-MRA-19-0034 (California American Water Co., Marina)

Dear Chair Padilla and Commissioners:

In the face of the raging fires and the devasating impact of COVID-19, your focus on the other critical issue facing Monterey County is so appreciated. We have many challenges in our state right now which makes the work you are doing even more important. And the outcome of your deliberations today will have as severe an impact on the residents of our county as these other incredible problems are having.

Access to safe and affordable water is the most important issue facing our community. New water supplies are needed if we want to be able to thrive. Workforce housing, economic development, business expansion and human commodity rely on a sustainable and affordable source of water.

The primary reason for this desalination project, however, is to end Cal-Am's illegal diversions on the Carmel River and to reduce pumping in the Seaside Groundwater Basin as mandated in its adjudication decision. I take the State Water Resources Control Board Cease and Desist Order very seriously, as it would have dramatic consequences for our residents and our economy. Without a replacement water supply, the health of the Carmel River and the species that depend on it will continue to be endangered, and the Seaside Groundwater Basin could be at risk of further seawater intrusion.

While the desalination project has been planned mostly for Cal-Am's service area, it would impact the neighboring Marina community. Implementation of a desalination project should not be done to their detriment. I appreciate the Coastal Commission's

environmental justice analysis and the consideration for communities of concern in Marina, Seaside and Castroville.

As the District 5 Monterey County Supervisor, residents in my district will carry most of the costly burden of this project, so I am especially vested in the outcome of your decision. The CCC staff's reasoning in recommending denial of the appeal and application reflects the concerns I have expressed about the project for quite some time.

The environmental justice analysis addresses one of my primary concerns about the project – the cost and its impact to Cal-Am's ratepayers. In addition to the communities of concern included in the staff report, within my supervisorial district, I am concerned about the cost to seniors and the many people on fixed incomes who would be greatly burdened by the increased cost of water as a result of the proposed project.

Monterey County, Marina Coast Water District and California American Water lost a true opportunity some years ago with the failed Regional Desal project. The public mistrust about this current project is an ongoing reminder of those unfortunate decisions. I firmly believe that desalination will be needed in our future, even with Pure Water Monterey expansion. A thoughtful regional approach, towards a project serving a larger area that includes the Monterey Peninsula and Seaside Basin, along with the City of Marina and other urbanized areas in the Salinas Valley Basin that face loss of their water supplies due to seawater intrusion, is needed for a prudent long range solution in Monterey County. Such a regional approach, led by public agencies, would also reduce the significant costs that Cal-Am's project would impose on the ratepayers in my district and throughout our county.

As recommended, the Pure Water Monterey Expansion can serve as a bridge to meet the near term requirements of the CDO until a regional desalination project can be developed, as opposed to this unbearably expensive Cal-Am project.

Thank you for your consideration of these comments and for the incredible amount of time, thought, and diligence you give all projects that come before you.

Sincerely,

Mary L. Adams
Board of Supervisors

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff,
Thank you so much for taking the time to listen to all the concerns of our local citizens I know you have given this issue substantial attention because you see how much we care about the

issue and I appreciate all your hard work and dedication.

My family and I have lived in Marina for almost a decade. We love our city and were so happy the Cementex Mine has been ordered to shut down so the land may be restored to natural

habitat.

We do not want Cal Am to place its slant wells in our city, especially when we have no guarantee our ground water will remain safe nor do we fully know the impact it could have on the endangered Snowy Plovers.

Please hear the voices of Marina and deny the Cal Am slant well project, at least until we can have a thorough guarantee our natural environment and our ground water basin will not be negatively impacted.

Thank you so much for your time and consideration,

Catrina Blair

September 11, 2020

Chair Steve Padilla & Commissioners
California Coastal Commission
455 Market St., Suite 300
San Francisco, CA 94105

Re: California American Coastal Permit

Dear Chair Padilla and Commissioners:

I am a resident of Seaside, Ca and a CalAm ratepayer. I am firmly opposed to CalAm's desalination project. it is an overly large and overly expensive boondoggle that will guarantee profits to an international corporation while exponentially increasing costs to CalAm's customers (especially those burdened with a 4 tier rate system). CalAm's desal plant has the potential to cause permanent harm to the water supply of the city of Marina.

This project will cause further harm to the California Coastal habitat, dunes habitat and vernal ponds. Thereby increasing the vulnerability of the Snowy Plover to extinction and harming all the other plants and animals of these habitats. This project is not a necessary component of the Carmel river and Seaside basin (both damaged by CalAm's illegal withdrawals of water) restorations as adequate water for these endeavors is available from an alternative project already adding water to the Seaside aquifer.

The more economical, environmentally sensitive and just alternative is the Pure Water Monterey Project that is now producing potable water and able to expand its production to meet the needs of the CalAm water area while restoring water to the Seaside basin and allowing the cessation of illegal water withdrawals from the Carmel River for the next 20 - 30 years.

As you know this application has drawn considerable attention to the concept of environmental justice. The Coastal commission has been enjoined to "consider Environmental Justice or the equitable distribution of environmental benefits throughout the state". Environmental justice depends on hearing the voices of those who will suffer the adverse impacts. I believe there is a loud and clear call for environmental justice to be a significant part of your decision. Denial of this application will demonstrate that California's environmental justice policy encoded

in the Coastal act is not just fine sounding words on paper but a very real objective of our society.

The Coastal Commission's staff report provides the detail you need to arrive at a just decision; please deny the application for this poorly conceived overly expensive and environmentally unjust project.

Respectfully yours,

Robert McGinley

Deny Cal-Am's Desal Project - Items Th3a/Th4a

Deanna Lynn <deamarily@gmail.com>

Fri 9/11/2020 6:51 PM

To: Materials <materials@coastal.ca.gov>; CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Coastal Commission Staff,

I am a Marina resident and I am very concerned about the potential impact to Marina's water from Cal-Am's Desalination plant.

I live near some of the wetlands that may be impacted by groundwater loss from the intake wells of the plant. I love to walk by these wetlands with my boyfriend and my dog multiple times per week, and I see a lot of different bird species. I think I saw a group of snowy plovers last time we went by one of them, we call the "little lake". One time we saw a blue heron. It would be very sad for us if our "little lake" were to never have water in it again, and no longer provide habitat for the many bird species we've seen out there.

Our part of Marina is already dealing with some unknown putrid smell from some undisclosed industrial or commercial activity. It would not be fair to us to also have to suffer the impacts of another industrial activity.

I am also very concerned about the impact of the greenhouse gas emissions produced by the plant on the climate. when the Pure Water Monterey project will operate on renewable energy. Like a lot of people these days, I find climate change a terrifying phenomenon. If we are experiencing temperatures and fires as extreme as we are experiencing now, what will California look like in 10 years? 20 years? We must make the most sustainable decisions now to protect a livable climate for humans.

Please support the Pure Water Monterey Project over the Cal-Am Project.

Thank you for your consideration,

Deanna Lynn

Christopher Long <bmwlaw@gmail.com>

Fri 9/11/2020 6:48 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>; Materials <materials@coastal.ca.gov>

To Whom It May Concern:

As a local resident and attorney at a law firm located in Monterey, I write in my individual capacity in support of Staff's recommendation and urge the Commission to **deny** California American Water Co.'s de novo and regular permits related to the Monterey Peninsula Water Supply Project.

As Staff notes in their August 25, 2020 report, "the primary questions for the Commission to consider are whether another project, the Pure Water Monterey water recycling and aquifer storage project "**Pure Water project,**" operated by Monterey One Water, can be expanded to provide a feasible and environmentally preferable alternative to the Cal-Am Project and whether the alternative can provide sufficient water to this region for current and future uses while allowing Cal-Am to end its overdraft of the Carmel River."

The report continues, noting that the CPUC "determined that the baseline Pure Water project would reliably provide water for Cal-Am so that Cal-Am's initially proposed desalination facility could be downsized from 10,700 acre-feet per year . . . to about 7,165 acre-feet per year. The baseline Pure Water project is expected to provide about 3,500 acre-feet per year, and the currently proposed Pure Water Expansion would be an extended version of that same project and provide an additional 2,250 acre-feet per year."

The Staff Report concludes, after weighing the evidence in the record, "that the Pure Water Expansion is a feasible alternative to Cal-Am's Project, will allow Cal-Am to cease its illegal water withdrawals from the Carmel River and meet the region's water needs, and is the preferable, least environmentally damaging alternative. The Pure Water Expansion would also result in fewer environmental and economic burdens to the communities of concern within Cal-Am's service area, would avoid environmental burdens to the City of Marina, and appears to have fewer significant hurdles to clear before it could be implemented."

After reading the conclusions summarized in the Staff Report, I agree with Staff's recommendations, and in particular their conclusions on page 6 of the report stating that "staff's analysis determined that either project would provide enough water for the area's expected demands and growth over the next twenty to thirty years, although Cal-Am's Project would provide far more water than needed, and at a much higher cost - about two to three times the cost of water from the Pure Water Expansion" and on page 9 of the report that the Pure water Expansion project "would benefit the communities of concern by not causing adverse environmental impacts to the City of Marina and by reducing the cost burdens to Seaside and other underserved Cal-Am ratepayers[.]"

Accordingly, I concur with Staff's recommendation to deny the proposed project.

Thank you for your careful consideration of this controversial project.

Sincerely,

Christopher M. Long, Esq.that any unauthorized review, use, disclosure, distribution, or copying of any information contained in this email or its attachments is strictly prohibited.

Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Velez, Damian S STU (MIL) <damian.velez@dliflc.edu>

Fri 9/11/2020 6:36 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

My name is Damian Velez. My wife and I are new permanent residents of Marina. I cannot speak at the meeting on September 17, so accept this email as my voice. News of the desalination project, and the threats that it poses became an immediate concern and priority of ours. As recommended by the Coastal Commission's Staff report, I urge you to vote against this project.
Please deny this wasteful unnecessary project, and instead support the expansion of the Pure Water Monterey project.
Thank you.

Very respectfully,
Damian Velez

Cal Am's Desalination

Suzie Gabri <suzie_gabri@yahoo.com>

Fri 9/11/2020 6:29 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Commissioners,
Thanks to you Cemex is getting out of the picture, but now Cal Am wants to take their place.
Please deny Cal Am's desalination plan for these reasons.
1- It needs to use tremendous amount of energy.
2- It is an experimental project at the ratepayers expense. (Slanted Wells are not done anywhere else in the world.)
3- they have no rights to that source of water.
4- It is Marina's source of water, but they won't get a drop of that and they have to deal with the salt water intrusion.
5-It is extremely expensive and we don't need it.
Expanding the Pure Water Monterey is the answer.
Thank you so much for all you have done so far.
Gratefully yours,
Suzie Gabri from Pacific Grove

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Commissioners,

The Portuguese Ledge is a State Marine Conservation Area (SMCA) which lies just four miles offshore of CalAms proposed desal project. It covers almost 11 sq.miles of offshore habitat.

If allowed this project will dispose brine waste almost 1 mile away from this (SMCA) protected area.

We have a Sanctuary to protect and our beautiful dunes.

Please deny this project.

Ray Santella

Fri 9/11/2020 6:14 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is David Bockian; My wife Jeri and I are residents of Marina, celebrating two years of home ownership here. I'm a retired marketing manager and Jeri is a project manager for a Bay Area county government. For over 40 years we've lived, worked, and raised our family in the greater Bay Area and we love the beautiful physical environment.

We are opposed to the CalAm desalination project for several reasons:

1. It is unnecessary: the Pure Water Monterey recycling project has been shown to meet the Monterey Peninsula's water needs for the next several decades
2. There is a clear risk to Marina's aquifer - our sole source of fresh water - and no "Plan B" if the project causes salt water infiltration into the aquifer
3. The economics of this project are ridiculously bad

Please deny this harmful project. Thank you.

Sincerely,

David and Jeri Bockian

Voices for Equity and Choice

September 10, 2020

California Coastal Commission
455 Market Street
San Francisco, CA 94105

Dear Chair Padilla and Commissioners:

As Democrats, we support sustainably planned communities. Our Party Platform promotes environmental justice. Monterey Peninsula residents need water that is more affordable – not more expensive. New affordable housing projects need water that is more affordable – not more expensive. Small business owners need water that is more affordable – not more expensive. The Monterey Peninsula needs water it can afford.

On September 17, you will decide whether to grant Cal Am a permit for a desalination plant in Marina – the only community on the Monterey Peninsula that will not get anything from this project and whose environment, as your staff has determined, would be damaged by it. Yet again, a diverse, working-class community is asked to bear the brunt of industrial development and environmental degradation. And in return, *Marina will not receive a single drop of desalinated water.*

Discriminatory land use policies have burdened marginalized communities along the California Coast for generations. We cannot let this happen to the City of Marina. There is an immediate solution to the Monterey Peninsula's water needs – an expansion of Pure Water Monterey.

Future water supply projects on the Monterey Peninsula must be designed with equity and justice for all!

Sincerely,

Kate Daniels Kurz

My Name is GroundWater,
You know me. I am a resident of
your world. So valuable and fragile that humans
fight over me. Yet they seek ways to pollute
me, drain me, divide me off, block, steal, stop, siphon,
pull me out, or dry me up.

Who remembers..... I Am Life?
Who stands up to protect me?
Who will disallow things that harm me?
Slant wells where they don't belong... harm me.
I'm tired.

DENY Cal Am's Desal Project

Alice Ann Glenn <aa1glenn9@aol.com>

Fri 9/11/2020 6:06 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Commissioners

I am a Cal Am rate payer and the Cal Am Desal Project is NOT in the public interest.

Pure Water Monterey Expansion is the feasible and environmentally preferable alternative.
With our new water supply from Pure Water Monterey--Phase 1 we restore the Carmel River and stop the illegal withdrawals by December 2021. We do NOT need Cal Am's Desal to resolve the Carmel River issues.

I also object to the Cal Am Desal on the grounds that it would double our water bills which is a burden that will price more people out of living within Cal Am's boundaries.

Expansion of Pure Water Monterey provides a long-term sustainable water source that is capable of protecting both the Carmel River and the Seaside basin. Pure Water Monterey expansion is also capable of supporting affordable housing and economic recovery.

There is no water supply crisis with Pure Water Monterey up and running so there is NO need for Cal Am's Desal.

I find it very difficult to trust anything Cal Am says as they have been the only obstacle to the Expansion of Pure Water Monterey that will give us adequate water, including development, for years.

Please DENY Cal Am's Desal Project.

Sincerely,
Rev. Alice Ann Glenn
Monterey, CA

DENY Cal Am's Desal Project!

To Whom it may concern:

My name is Deborah Miller, and I moved to the Monterey Peninsula 22 years ago and have become aware of the water scarcity and the controversy around possible solutions.

We do not need the Cal Am Desal Project and it is a highly flawed project. The Pure Water Project Expansion will meet our needs and is a wiser, sustainable, environmentally-sound, more cost-effective option.

I appreciate your consideration.

Thank you.

Deny Cal Am's Desal

Kristin Dotterrer <kristinmey@gmail.com>

Fri 9/11/2020 5:45 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commission:

I strongly urge you to deny the unnecessary and expensive Cal Am desal project as it is not in the public's best interest. Pure Water Monterey's Expansion is more feasible, more environmentally-friendly, and will give us water sooner. Our water bills have already increased at an unaffordable rate, adding to the housing affordability emergency in our area. It is unjust that Cal Am desal intends to pull water from Marina and harm its coastal dunes habitat. This massively expensive desal project is a terrible attempt to hinder public-ownership, adding to Cal Am's already misleading political record, and again, not in the interest of our community. The people of the Monterey area are absolutely done with Cal Am. Their last-ditch effort to squeeze out as much profit before an imminent public takeover is as clear as day.

Sincerely,

Kristin Dotterrer

Re: Monterey Peninsula Water Supply Project, CDP Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 –Source Water for Pure Water Monterey Expansion and Concerns About the Latham & Watkins Outfall Lining Proposal

Dear Commissioners and Staff,
I was an employee of the engineering consulting firm Montgomery-Watson for over 10 years prior to being hired by Monterey One Water (M1W). I retired from M1W in May 2020 as their Principal Engineer after working for them for over 30 years. I was involved in the Pure Water Monterey (PWM) project since it began and was involved in the previous Groundwater Replenishment Project from 2006. Most recently, I was the project manager for the planning, environmental review, and permitting of the approved PWM Project, and managed the design and construction of the Advanced Water Purification Facility (AWPF). I was also the project manager for the Monterey Peninsula Water Supply Project components involving M1W facilities, including the project's NPDES permitting process, brine mixing facility, outfall protection components, and return flow agreements. I was a coauthor of Appendix M (found at purewatermonterey.org/wp/wp-content/uploads/Final-SEIR-Proposed-Modifications-PWM-GWR-Project-April-2020.pdf), Source Water Operational Plan Technical Memorandum, for the Pure Water Monterey Expansion (PWME) Supplemental Environmental Impact Report (SEIR) along with Alison Imamura who remains an M1W employee. The Technical Memorandum was prepared in consultation with Denise Duffy & Associates, Schaaf & Wheeler, Perkins Coie, Monterey Peninsula Water Management District (MPWMD), who funded the majority of the SEIR, and Monterey County Water Resources Agency (MCWRA).

I wish to address two issues: 1) the analyses in Appendix I and M demonstrates that the PWME has sufficient source water to meet the 2,250 acre-feet per year yields requested by MPWMD), and 2) the liquid applied liner that CalAm proposed to protect M1W's Land Outfall is not viable based on information provided in the submittal to the Coastal Commission.

Pure Water Monterey Expansion Source Water
M1W met with MCWRA and discussed water rights and water availability for months during the SEIR preparation process for PWME. At one-point MCWRA said that they disagreed with the numbers but did not provide M1W with details. MCWRA indicated that they felt that M1W incorrectly interpreted the Amended and Restated Water Recycling Agreement (ARWRA). Perkins Coie, an outside land use, environmental and water rights law firm, reviewed M1W's source water rights as part of the SEIR. Those finding were presented to MCWRA prior to publishing them in the Draft SEIR in November 2019. MCWRA, in response, requested that M1W pay one-half the cost for an independent legal review of the water rights. M1W agreed. MCWRA has not pursued.

Appendix I of the SEIR (found at purewatermonterey.org/wp/wp-content/uploads/Appendices-to-M1W-Draft-Supplemental-EIR-11-7-2019.pdf) shows the source water availability. Appendix I was based on average flows for the years 2009 through 2013. Drought flows were based on 2013. These flows were from the same time period as the EIR for the original project. Appendix I showed there was sufficient source water for the PWME. Expansion would reduce additional water available for the Castroville Seawater Intrusion Project (CSIP) by 700-800 AFY but still provide thousands of acre-feet more for CSIP than before the Pure Water Monterey Project. Appendix M was written after reading the Draft SEIR comments and seeing the extent of misinformation about source waters. Since the SEIR was written as a supplement to the original project it was unclear to some where the water would come from for expansion versus the base project. The base project provided additional water for CSIP as well as for groundwater replenishment. Appendix M was intended to show how existing water rights could be used between the base Pure Water Monterey Project, Marina Coast Water District's (MCWD's) Regional Urban Water Augmentation Project (RUWAP), and the PWME. Appendix M used 2018 as a typical normal year reflecting reduced wastewater flow (and presumably drinking water demand) related to increased conservation. 2015 was chosen as a severe drought year. The purpose of using single years was to show how available water could be used in specific cases, namely a typical wet or normal year and a drought year. The drought year scenario could be repeated for multiple years without adversely affecting the project yield. The source water sources in order of priority are shown below:

1. Secondary Effluent to the Ocean Outfall. This is water that would otherwise be sent to the ocean.
2. Reclamation Ditch. The ARWRA allows M1W to use this water. At the time I helped write Appendix M, I believed this water was available for both the base project and expansion; however, I only used it for the base project due to comments from MCWRA.
3. Blanco Drain. Similar to the Reclamation Ditch, the ARWRA allows M1W to use this water. At the time I helped write Appendix M, I believed this water was available for both the base project and expansion; I only used it for the base project because of the feelings of MCWRA.
4. Agricultural Wash Water. This new source water is currently available for M1W to use for recycling by either the PWM AWPF or the Salinas Valley Reclamation Project (SVRP) according to the 2015 agreement between the City and M1W and the SWRCB Wastewater Change Petition (Order No. WW0089). The ARWRA states that M1W would be able to use the water for either purpose also, but if certain conditions in Section 16.15 are not satisfied it may be reserved for MCWRA. For Appendix M, it was assumed to be available only to meet approved PWM Project yield requirements and for recycling using SVRP for CSIP use.
5. Recycle Sump #1. This water contains sewage from the MRWMD facilities and from the west side of the Regional Treatment Plant (RTP). The ARWRA allocates one-half of this water to MCWRA and one-half to M1W because it originates from outside M1W's 2001 service area boundaries.
6. Recycle Sump #2. This water is from the east side of the RTP. The ARWRA allocates one-half of this water to MCWRA and one-half to M1W again because it originates from outside M1W's 2001 boundaries.
7. Approved Pure Water Monterey Project Advanced Water Purification Facilities Backwashes, including those from producing water for MCWD. This includes the ozone and the pre-membrane filtration screening wastes plus the membrane filtration backwashes. The ARWRA allocates one-half of this water from outside M1W's 2001 boundaries to MCWRA and one-half to M1W.
8. PWME Backwashes. This is the same as the previous water type except it is only for the proposed expansion and M1W's portion could only be used for the expansion.

9. Salinas Valley Reclamation Project Backwash. The ARWRA allocates one-half of this water from outside M1W's 2001 boundaries to MCWRA and one-half to M1W. Appendix M assumes increased use of recycled water by CSIP and an associated increase in backwash flows throughout the year.
10. Boronda. This sewage is captured and sent to the RTP by the City of Salinas. However, the sewage comes from outside M1W's 2001 boundaries and so, per the ARWRA, one-half of this water is allocated to MCWRA and one-half to M1W.
11. Farmworker Housing. Sewage from this new project is captured and sent to the RTP by the City of Salinas. However, the sewage comes from outside M1W's 2001 Boundaries and so, per the ARWRA, one-half of this water is allocated to MCWRA and one-half to M1W.
12. M1W's ARWRA Summer Water. Section IV 4.01 1 (d) of the ARWRA allocates 650 AFY to M1W during the months of May through August.
13. Salinas River Diversion Facility (SRDF) Screening. Screening from the SRDF returns to the RTP Headworks where it combines with other sewage and is treated through the RTP. Per the ARWRA, one-half of this water is allocated to MCWRA and one-half to M1W as it comes from outside M1W's 2001 boundaries. M1W has rights to one-half this water. This water was available in 2018, however, since this water is not available each year it was not used in the Appendix M calculations. If the ARWRA was not in effect, M1W would have rights to use this water if it is discharged into M1W's infrastructure.
14. Salinas Industrial Water Treatment Facility Pond System. Since this water is from outside M1W's 2001 boundaries, one-half may be considered to be allocated to M1W per the ARWRA, or use of this water would require execution of a separate agreement between parties for that water to be considered a New Source Water per ARWRA section 16.15(6). The facilities to send this water to the RTP are a joint project between M1W and the City of Salinas and are currently under construction. However, to be conservative, it was assumed to not be available in the Appendix M calculations.

MCWRA has been working to meet the six conditions in Section 16.15 of the ARWRA since November 2015. Should they meet those conditions, then Appendix M shows that M1W has sufficient water for wet, normal or drought conditions. Should MCWRA not meet those six conditions in Section 16.15 of the ARWRA, then Section 16.16 would apply and according to Appendix M, M1W would need to utilize part of the operation reserve (described in the Water Purchase Agreement) during drought years.

The conclusion from Appendix M is that M1W has more than enough source water for the PWM base project, for MCWD's RUWAP project, and for the PWME in all foreseeable situations.

The Liquid Applied Liner Proposed to Protect M1W's Land Outfall is Not Viable as Proposed

Latham & Watkins' August 17, 2020 email to Mr. Tom Luster suggests a liquid applied lining alternative to the Outfall Protection Project that is under design by Brown & Caldwell Consulting Engineers. California American Water has paid for and been involved in that design work for years. Several projects I worked on for M1W provided me with experience related to this proposal. The Cannery Row Sewer Maintenance Projects in which I needed to apply to the California Coastal Commission to allow for an over ground temporary pipeline from M1W's Reeside Pump Station to a sewer manhole in the beach. I managed two M1W Ocean Outfall repair projects using divers to install the WEKO seals whose replacement is part of the project you are reviewing. Those projects taught me about the difficulty of pulling hose and working just 2,000 feet from an entry point in 60-inch diameter reinforced concrete pipe (same size and manufacturer as the pipe in question). In those projects we used a 24-inch diameter pipe to discharge secondary effluent onto the beach from the Junction Structure. I was also project

manager for M1W's Ocean Outfall Inspection and Maintenance contracts. I learned of the difficulty of drilling into 60-inch reinforced concrete pipe (same size and manufacturer as the Land Outfall). I also was project manager on several liquid applied lining projects and for many of them, I was also the inspector. These taught me the importance of rigorous confined space safety requirements, of a dry and warm concrete surface to avoid blistering, and how hot the employees doing the spraying can become.

A few of the problems I see with the Latham & Watkins' proposal include:

1. The four-inch diameter bypass pipe is far too small, and even if four-inch diameter pipe could be large enough, it would not work within the outfall pipeline. A bypass pipe of 18 to 24 inches would be more appropriate depending on the size of the pumps and the pressure rating of the pipe. This bypass pipe would need to be buried under Del Monte Blvd. and Lapis Road and discharge into the Beach Junction Structure which would need to be open during the lining process (requiring excavation).
2. The Beach Junction Structure would also be needed to remain open as an alternate rescue point for the confined space entries and to provide air flow and potentially for material supply.
3. No mention is made of the proposed lining material. The only mention is repair using epoxy grout. My experience is that epoxy grout is not an appropriate material for this application. A liner material should be flexible to provide a similar longevity to a PVC liner.
4. A fan system would be needed to push air between the Beach Junction Structure and the Access Point to dry the pipeline, remove heat, and to provide a safer working environment.
5. More hoses are needed than the five (resin, resin hardener, hot water supply, hot water return, and airline) listed. A spare backup air hose for worker (plus two additional air lines each for additional workers and for an inspector), a separate life line for each person in the pipe, a communication line for each person in the pipe, pressurized water for the water blasting, and vacuum hose for removing water and debris. It is very unclear how the "electric carts" could maneuver through this maze of hoses nor through the bends in the outfall.
6. No mention is made of how to restore the access point and protect the pipe after the liner is spray applied.
7. The proposal does not seem to consider employee safety and that this is an extreme confined space situation.

My experience with EIRs is that at least a 10% design is required to adequately determine the environmental impacts of a proposed project. This proposed alternative for lining the final portion of M1W's Land Outfall is far short of a 10% design.

I would be happy to discuss any of these issues with you and provide additional information. I can be reached at 831-277-9044. Thank you for your consideration.

Sincerely,

Robert B Holden

Fri 9/11/2020 5:30 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Ladies and Gentlemen,

The CalAm Desal Project is environmentally damaging and is not right to go forward with. I want this project to be rejected.

My husband and I moved to Marina in large part because we believed that Monterey County was especially concerned about taking care of environmental issues.

This CalAm Desal Project is going in the wrong direction. We need you to protect our water source and beach. Marina is as important a community as any other community in this area.

Thank you,

Nancy Nishimura

NO CAL-AM DESAL

Steve Bean <knottman@gmail.com>

Fri 9/11/2020 5:27 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

I urge the Commission to DENY Cal-Am's desalination project. So many reasons.
City of Marina would have its aquifer imperiled, and would not receive ANY of the water!! This would be cruelly unjust! Hugely expensive product in perpetuity; adequate alternative exists; et cetera, et cetera.
Steve Bean

Please deny a coastal development permit to California American Water

Michael Morris <mmorris740@gmail.com>

Fri 9/11/2020 5:25 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Commissioners:
I urge you to stand by your staff's recommendation against the permit. Staff's report released August 25, 2020 reaffirms the position taken by the staff last year, arguing that the desal plant should be abandoned due to environmental concerns, especially considering that the less impactful expansion of Pure Water Monterey exists.

In the current era of heightened awareness about racial justice, a section of the report is particularly apropos to the Monterey Peninsula: "The community of Marina is already disproportionately burdened by many other industrial uses and would receive none of the project benefits. There is a long history of government institutions allowing unwanted industrial development to be concentrated in underserved communities of color without their consent."

CalAm will try to convince you that "a future without desal is, in essence, kicking the can down the road and increasing costs for customers in the long run" (Catherine Stedman, CalAm spokesperson).

The truth is that the Pure Water expansion will allow CalAm to cease its illegal water withdrawals from the Carmel River by December 2021.

Those of us CalAm ratepayers who live here do not need CalAm's oversized, over-priced, intrusive desal plant to solve our future water supply needs. We need to expand what is already built here and working just fine.

Thank you for supporting Staff's report.

Michael Morris and Gay (Hughes) Morris
Sand City, CA

DENY CAL AM'S DESAL PROJECT

Daniel Dotterrer <danieldotterrer@gmail.com>

Fri 9/11/2020 5:22 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Coastal Commission:

No Cal Am desal! I'll be succinct. The voter-approved feasibility study results are in. Big surprise! Publicly-owned and operated water is better and cheaper for our community than for-profit water. Who da thunk? So we the people WILL take over control of our water system. I don't know if desal is feasible for our community but I know absolutely we are not paying Cal Am's for-profit sticker price for such a facility.

Daniel Dotterrer

Fri 9/11/2020 4:51 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Ladies and Gentlemen of the Ca Coastal Comm. and for Greta

There should be no doubt that human driven climate change is upon us with record wild fires. Ecologic chickens have come home to roost. Desalination is an highly expensive to maintain, energy consuming process, with a toxic by-product-an obsolete idea. To best use our most precious public resource wisely the emphasis must be for increased storage, percolation methods and dispersed gray water facilities.

A scientist upon the Greenland ice sheet was "astonished" by the rate of melt. Sea levels will continue to rise. The very site of the proposed wells may in the not too distant future be washed away in a Pacific storm upon a king tide. It is along the most prone area of the California coast to erosion. A facility there will go the way of Stillwell Hall.

For what may be the future, look to the climate related human chaos in the middle east. Populations are being driven off the arid lands. Xenophobic England has withdrawn from the EU. "International" trade is nothing more than exploiting slave labor by the oligarchs and their corporations. Nearly every modern human activity is not sustainable. We must regain a harmonious aboriginal relation with our habitat. " Eighteen container cargo ships produce as much pollution as the entire world fleet of automobiles." Forthcoming, "A Guide to Save Civilization."

I would hope you find against the greed driven and ignorant proponents and with your staff.

Very truly yours,,
Mark Magruder Eckles, Pacific Grove Ca 93950

Deny Cal-Am's Desal Project - Items Th3a/Th4a

Jack Holmgren <jack.holmgren1@gmail.com>

Fri 9/11/2020 4:49 PM

Deny Cal-Am's Desal Project - Items Th3a/Th4a

Karen McPherson <karenmcpherson321@gmail.com>

Fri 9/11/2020 3:42 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>; Materials <materials@coastal.ca.gov>

Dear Coastal Commission Members,

I have lived on the Monterey Peninsula all my life. I have heard all the promises that Cal-Am has made to the public about giving us a new water source. From what I can tell all they have done is make money for their shareholders. We are no closer to a sustainable water source for the future. My monthly water bill has continued to rise and I use less water. I am now retired and can't afford to pay surcharges that will be never ending.

Please don't approve this plan. It's not cost effective and will be dangerous to our environment. We have no idea what will happen to the ocean and the coast. It's our job to protect the planet that we live on. Cal-Am doesn't care about the environment and or its customers. It's a business that wants find ways to make more money.

Sincerely,

Karen McPherson

Christopher Hart <chart@csumb.edu>

Fri 9/11/2020 3:03 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Christopher Hart; I live in Marina CA on 457 Gloria Circle. I have lived in the Monterey area for the last 8 years; first as a student and now as a plant biologist getting to conserve our open spaces. I recently moved to Marina this last year due its open spaces and undeveloped coastline. The commitment of Marina to protecting its coastline and groundwater supply is why I moved away from the city of Monterey which is much more developed. I have been following this project as both a cal-am subscriber in Monterey CA, and now a Marina Coast Water District subscriber. However, the one thing that has stood out to me is that the del sal plant is a classic case of environmental injustice, and will permanently harm Marina's coastline which is home to many endangered species such as the snowy plovers (I often visit the plover population on the beach, they're quite fun to watch and love to run around and chase each other on the coastline).

Please deny this harmful project! Thank you!

Christopher Hart

CAL-AM's Desal Project

hamann <hamann@beuth-hochschule.de>
Fri 9/11/2020 3:02 PM
To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

I AM OPPOSED TO THE CAL-AM-DESAL-PLANT !
CAL-AM's DESAL PROJECT IS NOT IN THE PUBLIC INTEREST.

PURE WATER MONTEREY EXPANSION (=PWE)
is a feasible and environmentally preferable alternative.
(1)
PWE will give us a new water supply much sooner.
(2)
PWE's new water supply will allow us to restore
the Carmel River and stop illegal withdrawals
by December 2021.
(3)
PWE's Expansion of Pure Water Monterey provides a
long-term sustainable water source that protects
the Carmel River and the Seaside basin.
(4)
Orange County has used this same system for
decades so it has been proven effective.
(5)
CAL-AM IS THE ONLY OBSTACLE
to the expansion of Pure Water Monterey.
(6)
CAL-AM CANNOT BE TRUSTED.
Passing Measure J was the community's statement
(7)
DESAL WILL DOUBLE OUR WATER BILLS
(8)
DESAL HARMS THE COASTEL HABITAT
and Marina's beautiful dunes
(9)
DESAL HAS NO LEGAL SOURCE WATER,
it would draw groundwater from an
overdrafted groundwater basin.
PWM's Expansion source water is primarily
the 8,000 acre-feet of excess wastewater
that is now discharged into the Bay.
It is contractually secure and drought proof.
(10)
CAL-AM has had 25 years to solve our

Pacific Grove, CA

DENY Cal Am's Desal Project

Gary Kreeger <kreegerg@gmail.com>

Fri 9/11/2020 2:38 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Commissioners,

My appeal to you is quite simple - it's time to do what's right and deny CalAm's petition for the desalination plant. It has unclear but potentially quite harmful environmental impacts. Impacts that CalAm shareholders who do not live on our beautiful Peninsula will never be affected by. It is a slap in the face to anyone concerned about social justice as the already most expensive water in the country will be significantly more expensive. CalAm shareholders will not pay these exorbitant rates though.

What's the theme in the short letter? It's that the primary beneficiary of this bloated, environmentally fraught project is the shareholders of CalAm - not the people living and working on the Monterey Peninsula. CalAm has created a project whose primary purpose is to be as expensive as possible so that profits are maximized.

Fortunately, a much preferred alternative exists in Pure Water Monterey, our world class water recycling project. The environmental impacts are significantly less as are the costs. The only reason CalAm is not pursuing what is right is that they are pursuing profits over the environment and peoples' well being. Desalination may very well be needed one day. But not now and definitely not this ill-conceived project.

So, it's up to you to do what is right. Up to now CalAm has steamrolled every approval organization in the process with big money. That is another problem for another day. Today though, you can stop this injustice.

Thank you,

Gary Kreeger

Cal-Am Project

Sam T.Minorini <bereebear@outlook.com>

Fri 9/11/2020 2:03 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

I am a concerned citizen of Monterey . Water on the Monterey Peninsula is too expensive . I do not see a desal plant making the water less expensive . I agree with the Democratic Women of Monterey County on this matter . Expand Pure Water Monterey instead of this costly desal plant that Cal Am wants . Also, this solution does not do irreparable damage to the city of Marina's environment .

Retired public works employee.

Sam Minorini.

I support the Coastal Commission's staff recommendation to deny California-American Water's Desalination Plant Coastal Development Permit

Tammy Jennings <4tlj1959@att.net>

Fri 9/11/2020 9:45 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Commissioners,

I completely support your Staff's recommendation to deny California-American Water's Desalination Plant Coastal Development Permit. There are many reasons why denial is appropriate, for example, we can't have affordable housing without affordable water and Cal-Am's desalination plant would double our water bills and we're already paying the for the most expensive water in the country. But the most important reason to me is that there is an economically feasible and environmentally preferable alternative…Pure Water Monterey Expansion. Cal-Am is the only obstacle to the expansion of Pure Water Monterey. Please DENY Cal-Am's request.

Thank you.

Sincerely,

Tammy L. Jennings

Vote No on Desal

Tricia Roden <tricia@coastviews.com>

Fri 9/11/2020 6:57 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

California Coastal Commission Staff,

I applaud the staff recommendations to deny the De Novo permit and deny the coastal development permit, finding that Cal Am's desal plant project is inconsistent with relevant Coastal Act and LCP policies and that the Commission not approve the Project because the Pure Water Monterey Expansion is a feasible choice that will adequately provide water and protect the public welfare.

Please permanently deny Cal Am's oversized, overpriced desal plant project. Our community passed Measure J to get rid of Cal Am and have public water in 2018. Cal Am has had 25 years to solve our water supply problem and they have failed. We don't need a desal plant. It is not in the public interest. Cal Am's desal plant project would double our water bills, which are already the highest priced water in our state. Desal damages the environment by harming the coastal habitat. The proposed desal project would draw groundwater from an overdrafted groundwater basin NOT under the ocean using slant wells.

Pure Water Monterey Expansion is the feasible and environmentally preferable alternative. It will give us a new water supply much sooner than building a desal plant. Our current water supply from Pure Water Monterey ~ Phase 1 (3,500 acre-feet) ~ will allow us to stop illegal withdrawals from the Carmel River by December 2021 and will restore the Carmel River and protect the Steelhead.

The environmental issues facing the Carmel River have been resolved by Pure Water Monterey without the need for Cal Am's desal plant. The Expansion of Pure Water Monterey will provide a long-term sustainable water supply for decades of growth. It will support affordable housing and economic recovery and avoid environmental damage and environmental injustice to Marina. The governor has declared a housing shortage in

California and there will be no affordable housing without affordable water. Orange County has used this same system for decades.

Cal Am is the only obstacle to the expansion of Pure Water Monterey. Cal Am is blocking it because it will not be as profitable for them. Decisions must be made based on what is good for the community and its residents, not what is good for big corporations and profits to their stockholders. Not long ago my water bill was $67 and now it is well over $200. Let's stop the endless Cal Am increases and protect our environment and our local community. Thank you for your time and consideration of this important issue.

Sincerely,
Patricia Roden

Citizens for Just Water would like to submit a list of 52 small business owners from Marina who oppose the CalAm desalination project. Our local businesses aptly reflect the census demographics by our highly diverse owners of restaurants, stores, and services.

Please review the names/signatures and our photos of the various businesses that line our downtown and transition streets to downtown. You will see the great diversity that represents so many different ethnicities, many of whom are first generation Americans hailing from countries around the world including Mexico, Vietnam, India, Italy, Korea, Lebanon, China, Syria, Japan, the Philippines, and Fiji Islands. We truly exemplify the highly diverse, disadvantaged community that was so correctly identified in the Staff Report recommending denial of CalAm's Coastal Development Permit.

California Coastal Commission

Dear Commissioners and Chair,

The undersigned small business owners of Marina urge you to deny the Coastal Development Permit for California American Water's proposed desalination project. Your staff report cited that CalAm's project would create substantial hardships for several communities of concern "**by its potential indirect impacts to other area water supplies, or due to to the presence of CalAm's well field on a site that otherwise would provide priority coastal resource benefits such as habitat restoration, public access to the shoreline, and recreational opportunities.**"

Further, Marina has one census tract designated as an SB 535 Disadvantaged Community, has a higher level of poverty, linguistic isolation, unemployment and housing burden compared to the rest of CA. The top 3 non-English languages spoken incl. Spanish, Vietnamese, and Korean. Marina also has a pollution burden higher than 71% of other census tracts in the state.

Our local businesses are a direct reflection of these demographics. Marina has a few large employers but we have primarily small ethnic "mom and pop" restaurants and businesses, often owned by and operating with extended families. Our businesses generate small profit margins but it keeps food on our tables for our families and guarantees a livelihood to our immigrants, many of whom do not speak English as their primary language. This project will create significant road work on our main Marina streets and will likely create issues for our customers to access our businesses and deter tourists from exploring our city and patronizing our businesses.

Further, the business owners of Marina and the Ord communities currently pay one of the lowest rates of water under the publicly elected Marina Coast Water District, its water supply now being threatened by the CalAm Desalination project's illegal take of groundwater from other than its own jurisdiction. The seawater intrusion and over draft from the Salinas Valley Groundwater Basin will place the future of potable water and MCWD water rates in major jeopardy and untenable for small businesses in a disadvantaged community that currently receive water from MCWD.

This project is not in the public interest. It benefits Cal Am shareholders, while creating environmental damage and unnecessary financial burden for our community. We ask you to deny this permit.

Further, the business owners of Marina and the Ord communities currently pay one of the lowest rates of water under the publicly elected Marina Coast Water District, its water supply now being threatened by the CalAm Desalination project's illegal take of groundwater from other than its own jurisdiction. The seawater intrusion and over draft from the Salinas Valley Groundwater Basin will place the future of potable water and MCWD water rates in major jeopardy and untenable for small businesses in a disadvantaged community that currently receive water from MCWD.

This project is not in the public interest. It benefits Cal Am shareholders, while creating environmental damage and unnecessary financial burden for our community. We ask you to deny this permit.

California Coastal Commission

Dear Commissioners and Chair,

The undersigned small business owners of Marina urge you to deny the Coastal Development Permit for California American Water's proposed desalination project. Your staff report cited that CalAm's project would create substantial hardships for several communities of concern "**by its potential indirect impacts to other area water supplies, or due to to the presence of CalAm's well field on a site that otherwise would provide priority coastal resource benefits such as habitat restoration, public access to the shoreline, and recreational opportunities.**"

Further, Marina has one census tract designated as an SB 535 Disadvantaged Community, has a higher level of poverty, linguistic isolation, unemployment and housing burden compared to the rest of CA. The top 3 non-English languages spoken incl. Spanish, Vietnamese, and Korean. Marina also has a pollution burden higher than 71% of other census tracts in the state.

Our local businesses are a direct reflection of these demographics. Marina has a few large employers but we have primarily small ethnic "mom and pop" restaurants and businesses, often owned by and operating with extended families. Our businesses generate small profit margins but it keeps food on our tables for our families and guarantees a livelihood to our immigrants, many of whom do not speak English as their primary language. This project will create significant road work on our main Marina streets and will likely create issues for our customers to access our businesses and deter tourists from exploring our city and patronizing our businesses

Further, the business owners of Marina and the Ord communities currently pay one of the lowest rates of water under the publicly elected Marina Coast Water District, its water supply now being threatened by the CalAm Desalination project's illegal take of groundwater from other than its own jurisdiction. The seawater intrusion and over draft from the Salinas Valley Groundwater Basin will place the future of potable water and MCWD water rates in major jeopardy and untenable for small businesses in a disadvantaged community that currently receive water from MCWD.

This project is not in the public interest. It benefits Cal Am shareholders, while creating environmental damage and unnecessary financial burden for our community. We ask you to deny this permit.

California Coastal Commission

Dear Chair Padilla and Commissioners,

I own a a small business in Marina and I am very concerned that our current water bills would increase if CalAm began to pump huge amounts of our groundwater without any legal rights to do this. Under our own public water district, the Marina Coast Water District, we businesses and residents have enjoyed the *lowest* rates of water in the region. I join the other 33 small businesses that signed a letter last November in opposition to the CalAm Slant Well Desalination project to be built in Marina.

CalAm charges its own ratepayers on the Monterey Peninsula the *highest* rates of water in the *nation*. Why would they be allowed to interfere with another water district's supply of water? Our bills would go up if CalAm takes water from our critically overdrafted basin that will further ***harm our sole source of water*** by pulling in more seawater into our basin!

Our businesses in Marina also depend on people stopping by to walk our beautiful beaches. When the Cemex sandmining plant closes in three years, we do not want another industrial operation in its place at that same site that would ***create permanent damage to our beach and dunes!***

As you pointed out in the Nov. 2019 staff report, Marina is a disadvantaged community and this is ***a clear example of environmental injustice***. Marina has a 64% non-white population, a higher level of poverty and unemployment compared to the rest of CA. The top 3 non-English languages spoken are Spanish, Vietnamese, and Korean. We deserve to have our natural resources protected just as any other coastal city.

Please deny the CalAm Desalination project!

Thank you,

DENY Cal Am's Desal Plant Project

Jeannie Ferrara <jeannieferrara@gmail.com>

Fri 9/11/2020 5:44 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear California Coastal Commission,

I applaud the staff recommendations to deny the De Novo permit and deny the coastal development permit, finding that Cal Am's desal plant project is inconsistent with relevant Coastal Act and LCP policies and that the Commission not approve the Project because the Pure Water Monterey Expansion is a feasible, less damaging alternative that will adequately provide water and protect the public welfare.

Please permanently deny Cal Am's oversized, overpriced desal plant project! Our community passed Measure J to get rid of Cal Am and have public water. Cal Am has had 25 years to solve our water supply problem and they have failed. We don't need a desal plant. It is not in the public interest. Cal Am's desal would double our water bills, which are already the highest priced water in America. Desal damages the environment by harming the coastal habitat and would draw groundwater from an overdrafted groundwater basin NOT under the ocean using slant wells.

Pure Water Monterey Expansion is the feasible and environmentally preferable alternative. It will give us a new water supply much sooner than building a desal plant. Our current water supply from Pure Water Monterey ~ Phase 1 (3,500 acre-feet) ~ will allow us to stop illegal withdrawals from the Carmel River by December 2021 and will restore the Carmel River and protect the Steelhead. The environmental issues facing the Carmel River have been resolved by Pure Water Monterey without the need for Cal Am's desal plant. The Expansion of Pure Water Monterey will provide a long-term sustainable water supply for decades of growth. It will support affordable housing and economic recovery and avoid environmental damage and environmental injustice to Marina. The governor has declared a housing shortage in California and there will be no affordable housing without affordable water. Orange County has used this same system for decades.

Cal Am is the only obstacle to the expansion of Pure Water Monterey. Cal Am is blocking it because it will not be profitable for them. Decisions must be made based on what is good for the community and its residents, not what is good for corporations and their stockholders!

Thank you for your consideration,

No Desal Project for Monterey

Lisa Haas <paintqueen@gmail.com>

Fri 9/11/2020 4:53 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear California Coastal Commission,

I am writing you today, as a concerned citizen and local of 30 years, to ask you to please to deny Cal Am from moving forward with the Desal project in the Marina/ Monterey area.

First off I have read the studies and am concerned about the environmental impact and damage to our coast. Secondly, I also understand the Marina is not happy with the intrusion as it is not legal and they would be drawing water from an over wrought ground water system ..Not the ocean! Thirdly, The projected costs will be enormous and trickle down to us ratepayers even though we have one of the highest water rates in the country already.

We currently have a fantastic solution in place with the expansion of Pure Water Monterey! Pure Water Monterey will provide a long term and sustainable water supply for our future without Cal Ams expensive desal plant and ultimate environmental and economic damage and injustices!

Our community strongly voted to get Cal Am out and work on a public takeover in 2016 and won…however Cal Am has been standing in the way of what the people want for for 4 years now. It is time for you to vote for people you are supposed to serve over profit, greed and corruption! This is in our best interest!

I have watched my water bills quadruple over the last decade with all the conservation efforts and using 1/2 the water I previously used while raising my family! I am older now and struggle with the increase in the water bill!

Affordable Water should be a basic human right… but apparently it is not when run by a corporation that is all about profit and greed… It should be publicly run!

Thank you for listening, Lisa Haas

Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit.

Patty Grogan <pgrogan754@gmail.com>

Fri 9/11/2020 4:44 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Patty Grogan; I am sixty seven years old, and a long time resident of Marina. My parents arrived here with the military in 1951, and decided to stay after my father was discharged. They lived here when I was born in 1953, and I have lived most of my life in Marina. My parents were working class civil servants, not wealthy in the least, and I followed in their footsteps as a member of the working class. I am now retired from the Salinas Union High School District, living on a small pension and social security, and renting a subsidized studio apartment from Chispa housing on Sunset Avenue. I am low-income, as my monthly income from both sources is only $1,397.00. I have recently had my rent increased by Chispa and it's now at a level that is more difficult for me to meet. If the CalAm desal project is allowed to proceed, and Marina is forced to buy back its own water at increased rates (comparable to the high levels experienced by the Monterey Peninsula) I have no doubt that agencies like Chispa will have to increase rents in order to meet new additional water expenses. This would create a further hardship for me, and many others, if that were to occur.

Being a long time resident, I have seen environmental degradation here in Marina throughout my life: dune buggies destroying the sand dunes, which are now part of Marina State Beach, two operating sand plants carrying away our beautiful dunes, wide-spread and irresponsible development which has destroyed habitat over the years, and multiple sources of pollution on the former Fort Ord lands which now lay within Marina's city boundaries. I have also personally experienced salt water intrusion at my and my parent's former home on Beach Road. We had a well which had been in place since the early 1950's, which we used for our primary water source. We eventually had to close the well off because of salt intrusion, and switch to city water.

Fortunately Marina has seen many advances since those days; dune buggies no longer recklessly destroy the dunes, one sand plant closed and another is due to do so, and environmental remediation on the former Fort Ord is helping to restore Marina to health and a more natural state. I know that we cannot turn back the clock to the Marina of my childhood and youth. We are in need of housing, and businesses to support resident's needs. However, if the CalAm desal plant is allowed to proceed it will further damage the natural beauty and habitat of Marina that still remains, and it will drain our already stressed aquifer. Please do not allow this to happen. Marina already shoulders regional waste and sewage treatment facilities; please don't let CalAm deface our beautiful sand dunes with its desal facility, and take our water for regional distribution.

Please deny this harmful project. Thank you.

Respectfully,

Patty Grogan

RE: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 (Cal Am CDP)

Dear Chair Padilla and Commissioners:

It's been a long and hair-raising process, and now, finally, you have the authority to DO THE RIGHT THING, and deny the permit for Cal-Am's (CAW) dishonest and totally illogical desal plant. From the beginning, CAW has applied a false premise, and false promise, regarding this desal proposal. And that is, the simple fact that the source water is not coming from beneath the ocean, (as CAW declared) but in reality the water is coming from freshwater aquifers beneath inland surfaces - namely, the Dune Sands Aquifers. This is not supposition, this is factual, and everyone, including the CCC, knows it. Therefore, all data, and all modeling, and all the claims CAW has made - are FALSE and irrelevant and inaccurate. For this fact alone, not to mention a dozen or more other reasons, the project should be denied. DO THE RIGHT THING ! DENIAL.

The Commission report claims that there is no proven environmental harm to come from the proposed desal. I beg to differ. First of all, from the beginning, CAW has asserted that as they pump more and more water from the slant well (s), the salinity of the pumped water will increase. This is their claim, this is the truth. That simply means that those freshwater aquifers will become more saltier and seawater intrusion into those aquifers will increase. That's damage enough. Secondly, since there is also no proof that environmental damage will NOT occur, does this mean that the Commission's policy is to allow irreversible environmental damage to perhaps occur, then after the damage is done, to then somehow mitigate, or reverse, the irreversible damage? Once those aquifers are ruined, they're ruined, probably for a very long time. How can that possibly be your position? If one hasn't proven that damage will occur (in your opinion), how can you say, without proof, that it won't occur? That's a gamble the CCC shouldn't be taking.

Finally, I believe there are many overwhelming reasons to deny this project on numerous grounds, and if you have read all the information

available, you should reach a similar conclusion.
PLEASE, DO THE RIGHT THING & DENY THIS PROJECT.

Thank you for your consideration,
Larry Parrish

Dear CA Coastal Commissioners, Executive Director John Ainsworth and Staff:

My name is Grace Silva-Santella. In 1958 I was born on the Monterey Peninsula. My husband and I purchased a home in Marina 31 years ago. I have been an active participant in Marina government having served ten years on the Marina Planning Commission. Recently I served on the Downtown Vitalization Specific Plan Committee.

In 2000, when I chaired the Marina Planning Commission General Plan Update meetings, the Planning Commission inserted language relative to Dunes Dr to prevent the road from extending North to the Cemex property. We did that in 2000 knowing we, as a city, would want to prevent any development of the Cemex property once the sand plant activity was shut down.

That day is now. The sand mining will soon end. Marina will return this stretch of dunes land back to its natural habitat. CalAm DOES NOT have the right to convert this property to a desal project. CalAm does not have the right to install seven (!!!) 5,000 to 7,000 sq ft concrete slabs to accommodate the slant wells.

Please, deny this harmful project.

Thank you,

NASUSNINE@hotmail.com <NASUSNINE@hotmail.com>
Fri 9/11/2020 3:31 AM
To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Esteemed Members of the California Coastal Commission,

The Coastal Commission's Staff Report got things right. Cal Am's desal project is not in the public's interest. Pure Water Monterey's Expansion is the feasible and environmentally preferable alternative. It will give us a new water supply much sooner than desal. Our current water supply from Pure Water Monterey – Phase 1 (3,500 acre-feet) will allow us to stop illegal withdrawals from the Carmel River by December 2021. It will restore the Carmel River and protect the Steelhead. The environmental issues facing the Carmel River have been resolved by Pure Water Monterey without the need for Cal Am's desal or the PWM Expansion.

We don't need Cal Am's oversized, over-priced desal project to solve our problem. The expansion of Pure Water Monterey will provide a long-term sustainable water supply for decades of growth. It will support affordable housing and economic recovery and avoid environmental damage and environmental injustice to Marina. No housing is affordable without affordable water. Cal Am's desal would double our water bills, already the highest in the nation. Cal Am is the only obstacle to the expansion of Pure Water Monterey. Passing Measure J was the community's statement. Desal damages the environment, costs too much and creates environmental injustice. Desal harms the coastal habitat and Marina's beautiful dunes. Desal has no legal source water as it would draw groundwater from an over drafted groundwater basin.

Pure Water Monterey's expansion source water is primarily the 8,000 acre-feet of excess wastewater that is now discharged into the Bay. It is contractually secure and drought proof. It is environmentally sustainable. Cal Am has had 25 years to solve or water supply problem without success. Our public agencies have solved it in the last 6 years. Now all the water we need for decades is available, but Cal Am is blocking it. Cal Am has one and only one purpose in mind. Increasing profits for its shareholders. Those aligned with desal are special interest groups that will profit from having unlimited water credits to develop the heck out of our beautiful and sensitive coastal areas for personal gain whatever the cost to the environment and the average resident. We already are reeling from shocking water bills. The more we conserve the more expensive our water becomes. It's a catch 22 situation.

Please do not vote to approve this horrible desal alternative when a much better, quicker, cheaper and more environmentally friendly alternative exists using cutting edge recycling techniques. We are putting our trust and faith in you to do the right thing for the environment and the public.

Deny Cal-Am's Desal Project - Items Th3a/Th4a

Veronica San Chirico Miller <tovernwithlove@yahoo.com>

Fri 9/11/2020 3:16 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

I'm writing in opposition to the desal project for multiple reasons. The Monterey Peninsula is an incredibly difficult place to survive financially. Parts of our community with the financial resources to support a project like this (Pacific Grove or Carmel) are not a part of the equation. However, lower income cities (Seaside and Marina) are expected to foot the bill and bear the environmental costs. This is wrong. I am a resident of Seaside. I do not want the people in Seaside having to subsidize the city of Castroville's water. This is an unfair burden to put a on a city who is in need of its own support. Also, I am not supportive of a plan that will face difficulties in 25 years with regard to problems with underground pipes or salt water intrusion. Lastly, and most importantly, this project is unnecessary. There are other, less expensive and more sustainable ways to meet our water needs. Thank you for your consideration.

Veronica Miller

CSMC

To meet the challenges of declining resources and climate change by helping our communities transition to sustainable practices.

September 10, 2020

Dear California Coastal Commissioners,

Communities for Sustainable Monterey County (CSMC) is an alliance of concerned citizens working through eight local chapters locally to meet the challenges of declining resources and climate change. We share a common goal of advocating for the changes needed to safeguard the long-term health of our environment and the resources needed to sustain current and future generations.

We urge the Coastal Commission to deny the Cal Am Desalination Project Coastal Development Permit. CSMC declares its support for the City of Marina and Marina Coast Water District at this latest California Coastal Commission hearing to consider an alternative to the Cal Am Slant Well Desalination, i.e. the Pure Water Monterey (PWM) Expansion Project proposed by Monterey One Water as a feasible and affordable alternative to the Cal Am Slant Well Desalination project.

Of the many valid reasons in support of this alternative, CSMC's focus is from the perspective of greenhouse gas emissions.

It is CSMC's position that in terms of greenhouse gas (GHG) emissions, the Pure Water Monterey (PWM) Expansion Project is the only acceptable alternative. It is clearly and scientifically established that GHG emissions cause climate change. In evaluating the merits of projects, their respective impact on climate change must be seriously considered. According to the CCC staff report prepared for this Sept. 17th meeting, Cal-Am's proposed desal plant would generate over 2.5 times the CO2 GHG emissions compared to Pure Water Monterey Expansion, with the desal plant using twice as much electricity as the PWM Expansion Project.

The existential threat to our civilization posed by climate change makes mitigation imperative, hence our strong support for the alternative with the lower carbon footprint, i.e. the Pure Water Monterey Expansion Project. Our position is consistent with our mission to "help our communities transition to sustainable practices as we face climate change and the depletion of our natural resources".

Sincerely,

Cathy Rivera

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Coastal Commission:

Please deny Cal-Am's current desal project request. As has been determined by your staff, this particular project is, at best, quite ill-conceived and short-lived, and hence short-sighted. At worst, it actually helps destroy the Marina Aquifer over time; does this make any sense at all? Of course not! Even if some sort of desal ends up being used in the future in this part of the Central Coast, this project should not be considered as viable.

Thank you for your time.

Steve Padilla, Chair
California Coastal Commission
45 Fremont Street, Suite 2000
San Francisco, CA 94105

Dear Chair Padilla and Coastal Commissioners:

I have lived in Del Rey Oaks, California, for over 30 years, and I am sick of the mis-management and price gouging that California American Water Co. (Cal-Am) has inflicted on me. And now they want to build a very expensive desalination plant in nearby Marina because in the past quarter century they have done nothing about their unlawful diversions of water from the Carmel River. Of course, this for-profit company will force all of us local residents to pay for this terrible idea.

The proposed Cal-Am de-sal plant is terrible for several reasons. The biggest reason is that we do not need it! Pure Water Monterey is providing water in an economical and environmentally sensible way; their current capacity is sufficient to reduce Carmel River diversion to legal levels. Both the Monterey Peninsula Water Management District (MPWMD) and the Marina Coast Water District recommend expanding Pure Water Monterey (PWM) to meet our future needs, rather than de-sal.

Another reason the proposed Cal-Am de-sal plant is terrible is environmental degradation from increased salt-water intrusion and concentrated brine effluent in the Marina area. Moreover, Marina residents will get NO benefit, they will not use that desalinated water.

The proposed de-sal plant seems like the most expensive approach imaginable. Their proposed capacity would far exceed needs, so running the plant under capacity makes the cost of the water that much worse. We already pay the highest water rates in the country!

You may hear from the hospitality industry and developers that we need a lot more water. No, they may want more water, to profit from this wonderful location, but if so, they should pay for it, and not punish the people who live here!

So please, support your staff's recommendation to allow the Pure Water Monterey expansion, and reject this terrible Cal-Am de-sal swindle!

Sincerely,

David Canright

Cc: SHIVANI108 <shivani108@comcast.net>

Dear Coastal Commission:

I am a property owner in Pacific Grove, California and have been for thirty years. I am against Cal Am's development of a desalination plant as the solution to the provision of an adequate water supply to the Monterey Peninsula. The Cal Am desalination plant will unnecessarily affect the cost of water for everyone on the Peninsula for decades to come. We have other water solutions that are less costly, Pure Water Monterey. I have personally visited the plant as a concerned citizen to review its operation. Cal Am's desalination plant would harm the environment with 8,000 metric tons of CO2 and perpetuate environmental injustice in Marina where it would be sited. Pure Water Monterey will provide affordable water without a large, negative environmental impact.

Cal Am will profit from this desalination plant and we will pay with huge raises in our water bills when we already have one of the highest costs in the nation. This is not the new water supply we need. There is a far better alternative. Expanding the Pure Water Monterey project is the cost-effective, environmentally sound solution.

I ask you to deny this Cal Am desalination proposal as your commission staff have recommended. Your staff are trained scientists and experienced staff who evaluate and analyze these types of projects. Their own independent evaluation and hydrology report confirm Pure Water Monterey can provide sufficient water to meet the cease and desist order for the Carmel River, provide sufficient water for current demand as well as allow for development, including low-income housing.

Sincerely,
Jeanne Herrick

Photo from CCC meeting on March 12, 2020 in Scott's Valley.

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Kathy Biala, a resident of Marina (first row, second from the right). At the last Coastal Commission meeting to be held in-person before the Shelter-in-Place ordinance became effective, this group of Just Water residents of Marina, pictured above, traveled to Scotts Valley to speak before you. Our Marina community has been doing this for several years now and we thank your staff for twice recommending denial of the CalAm CDP.

We anxiously await your final decision as Marina's future is truly in your hands. The devastation in the short term and in the long term future will unfold into a most sad and irreversible series of assaults to our humble community if you vote against Marina on Sept. 17.

Please be a sign of hope to every community of color in California and in every state in the U.S. that the historic trend of domination and abuse of disadvantaged communities will be effectively stopped by your strong example, set by your vote here and now. This will be an amazing precedent for so many small cities like Marina that we were able to prevail over a mega corporation with its intent to exploit communities of color.

Please deny the CalAm CDP and support your excellent staff's recommendations!

Cordially,

Kathy Biala,
Resident of Marina

Steve Padilla, Chair

California Coastal Commission

45 Fremont Street, Suite 2000

San Francisco, CA 94105

Dear Chair Padilla and Coastal Commissioners:

I am a resident of Del Rey Oaks, California, and a captive customer of California American Water Co. (Cal-Am). I am strongly opposed to Cal-Am's proposal to build a desalination plant in my neighboring community of Marina. In this opposition I join the majority of elected officials on the Monterey Peninsula, the Monterey Peninsula Water Management District (MPWMD), Citizens for Just Water, Public Water Now, and pretty much all of the local residents I have spoken with, who already put up (perforce) with the highest water rates in the nation.

Rather, I support your staff's recommendation to allow the Pure Water Now expansion, as a feasible and significantly less environmentally damaging alternative to Cal-Am's project, one that analysis has shown will meet the Peninsula's water needs.

My primary concern with the desal project, as the MPWMD has clearly demonstrated, is that the desal facility will potentially generate much more water than is foreseeably demanded (perhaps for the rest of the century). Yet production at reduced capacity costs significantly more than production at full capacity. As a result, our water rates would rise substantially, doubling, tripling or more—from what are already the highest rates in the nation. Why should we ratepayers, not Cal-Am (or its shareholders), pay for this very expensive, and unwanted, project?

A secondary concern is one of environmental justice: the city of Marina does not benefit from Cal-Am; it receives its water from a different entity. Yet it will bear the physical brunt of the desal plant being located within its city limits, with seawater intrusion into its own groundwater a sure result. This would *not* happen in affluent Carmel or Pebble Beach, you can bet on that.

Cal-Am has had twenty-five years to address the state order to terminate unlawful diversions from the Carmel River. A quarter-century—and *now* it proposes this boondoggle, the most expensive, most *profit*-generating option possible. That is wrong and should not be rewarded.

I urge the Commission to vote down the desal proposal and instead allow Pure Water Now to expand to meet the water needs of our Peninsula, sustainably and progressively.

Sincerely yours,

Anne Canright

Deny Cal-Am's Desal Project - Items Th3a/Th4a

Shelby Fredrick <sfredrick@csumb.edu>

Fri 9/11/2020 1:18 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>; Materials <materials@coastal.ca.gov>

My name is Shelby Fredrick, and I am a student at CSU Monterey Bay. I am writing to express my concerns about the proposed California American Water (Cal-Am) desalination (desal) project in the city of Marina. I stand in agreement with the report released by Coastal Commission staff recommending that the Coastal Commission deny approval of the proposed desal project. Cal-Am's proposed desal project presents great local ecological and environmental injustices, is an inefficient use of resources, and is a less viable water source alternative than the Pure Water Expansion wastewater recycling project.

As mentioned in the staff Coastal Commission report, the desal plant presents numerous environmental issues that make the project non-compliant with the Coastal Act and the Local Coastal Program. Such issues include destruction to the local coastal dune ecosystem which is a terrestrial environmentally sensitive habitat area (ESHA), potential groundwater drawdown that could adversely impact nearby wetlands, and changes to the ocean's water chemistry from the plant's discharge brine.

The desal project is estimated to cost 2 billion dollars to construct, which would be absorbed by Cal-Am's ratepayers who already pay some of the highest water rates in the country. The Pure Water expansion project is only estimated to cost 90 million dollars. And while the desal project would only provide potable water for areas on the Monterey peninsula and Castroville, the Pure Water project would provide water for a greater region of Monterey County, including Seaside and Marina. This brings up another crucial argument against the desal project, which is the serious environmental justice issues the desal plant poses for the city of Marina.

The desal plant would be located in the city of Marina, which is not even in Cal-Am's service area, but would receive a disproportionate environmental burden than cities within Cal-Am's service area. The city of Marina already holds multiple industrial facilities and is a historically underserved community compared to more affluent cities on the Peninsula, such as Pacific Grove and Carmel. The argument that communities with existing industrial facilities should not be concerned with the addition of one more industrial facility is plagued with privilege and insensitivity. To proponents of the desal project, I ask: Would you still support this project if it were to be located on Windows on the Bay or along 17-mile drive?

Sincerely,

Shelby Fredrick

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

As a resident of Carmel for 13 years and a concerned and engaged citizen who also runs a local business located in Marina on the old Fort Ord base, I am opposed to the CalAm desalinization project until such time as alternative sources of water, specifically recycling and conservation, are fully engaged and on-line. We need to prioritize conservation and re-use over expensive capital projects that do not appear at all competitive with well understood and proven methods for increasing supply.

Cal Am has been pillaging our community water for way too long. We need to take local control of our water and care for it and manage it. Desalinization may be a necessary element in future water supply but the CAL Am Proposal is not the deal we should invest in.

DENY CalAm's Desal Proposal

Craig Scott <craigscottuu@gmail.com>

Fri 9/11/2020 1:11 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear commissioners -- The voters have spoken and they do not trust CalAm, which already charges us the highest water rates in the country. Please follow your staff report and deny a permit for a Desalination plant in Marina.

Desal may be appropriate at some point, but right now CalAm's slant well technology is unproven, and the project will be incredibly expensive. Of course CalAm will then charge water users for the cost of the plant. Meanwhile, Pure Water Monterey provides a much more cost-effective approach. Moreover CalAm's right to the groundwater it would be drawing is unclear at best.

There are no good reasons to grant this permit, and many reasons to oppose it.

Please DENY this proposal.

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff,

I moved to Marina in 2016 to be closer to my children and grandchildren. While I am retired, I volunteer locally when I am not taking care of those cute grandkids. I read the recent staff report on Cal Am's proposed Slant Well project, and could not agree more with the staff recommendation to deny the permit.

Marina bears too big a burden for the region's industrial needs. Our city already hosts a regional landfill, a regional composting site and a regional sewage plant. But at least Marina benefits from those industrial sites. Our city would derive NO benefit from CalAm's Slant Well project. And our aquifers that supply our city's water will be endangered.

I don't want to reiterate all the points of the staff report, except for this one. You adopted an Environmental Justice Policy last year to promote equitable distribution of environmental benefits throughout the state. Marina has historically been marginalized and discriminated against in land use decisions. Don't blow your first chance to uphold the Environmental Justice Policy.

I urge you to deny the CalAm Slant Well Project.

Sincerely,
Suzanne Thomas Odell

Cal Am's Desal Project

Nancy <ncshaw@mind.net>

Thu 9/10/2020 11:32 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

I am opposed to the Cal Am Desal Plant.

Cal Am's Desal project is not in the public interest. Pure Water Monterey Expansion is a feasible and environmentally preferable alternative.

– It will give us a new water supply much sooner.

– This new water supply will allow us to restore the Carmel River and stop illegal withdrawals by December 2021.

– Expansion of Pure Water Monterey provides a long-term sustainable water source that protects the Carmel River and the Seaside basin.

– Orange County has used this same system for decades so it has been proven effective.

– Cal Am is the only obstacle to the expansion of Pure Water Monterey.

– Cal Am cannot be trusted. Passing Measure J was the community's statement

– Desal will double our water bills.

– Desal harms the coastal habitat and Marina's beautiful dunes

– Desal has no legal source water, it would draw groundwater from an overdrafted groundwater basin. PWM Expansion source water is primarily the 8,000 acre-feet of excess wastewater that is now discharged into the Bay. It is contractually secure and drought proof.

– Cal Am has had 25 years to solve or water supply problem and has failed to do so.

Please do not allow this project to proceed.

PUBLIC TRUST ALLIANCE
A Project of the Resource Renewal Institute
187 East Blithedale Avenue
Mill Valley, CA 94941
Tel.: (510) 610-0868

September 10, 2020

Dear California Coastal Commission,

What compels you to convene this "hearing" in the midst of the most dangerous pandemic and confluence of environmental crises that California has ever faced? Is it just the current opinions of a few "legal professionals" or have these opinions somehow become misleadingly conflated with the "force of Law" more generally? Do these project proponents require a formal "denial" to stop a possibly unreasonable "project?" Or have circumstances changed so profoundly since it was proposed a decade ago that it can now be easily seen that the initial burden to demonstrate project reasonableness has not been met?

Many Californians take it for granted that the CPUC can only certify reasonable projects and that the initial burden of demonstrating reasonableness lies on the utility applicant. This requirement is usually met with evidence rather than assumption. In this case, more than a decade of complex litigation has yet to be formally "closed." Do you even know whether the "CPUC process" has already alienated the California Public's trust interest in its coastal resources or whether you are being told to do this separately?

Of course you can give Cal Am their "Denial" if they insist upon it, but perhaps this time could be more beneficially used by everybody by having Cal Am demonstrate how they could be a constructive "team player" in implementing the much less expensive and environmentally friendly alternative water supply infrastructure which other parts of the community have been working on for years. If the California Coastal Commission is to say "yes," it certainly helps to have the "right" project under consideration.

Thank you for taking this concern into consideration.

Michael Warburton
Executive Director

LandWatch monterey county

September 10, 2020

Steve Padilla, Chair
California Coastal Commission
45 Fremont Street,
Suite 2000
San Francisco, CA 94105
Email to EORFC@coastal.ca.gov, CalAmMonterey@coastal.ca.gov

Subject: September 17, 2020 Agenda Item TH3a & 4a - Appeal No. A-3-MRA-19-0034 (California American Water Company, et al., Monterey Co.); Agenda Item Thursday 9a - Application No. 9-19-0918 (California American Water Co., Seaside, Monterey Co.)

Dear Chair Padilla and Coastal Commissioners:

LandWatch joins the majority of elected officials on the Monterey Peninsula, the Monterey Peninsula Water Management District, Citizens for Just Water, Public Water Now, and tens of thousands of angry California American ratepayers in strongly supporting your staff's recommendation that:

1. "... the Pure Water Expansion is a feasible alternative to Cal-Am's Project, will allow Cal-Am to cease its illegal water withdrawals from the Carmel River and meet the region's water needs, and is the preferable, least environmentally damaging alternative."
2. "The Pure Water Expansion would also result in fewer environmental and economic burdens to the communities of concern within Cal-Am's service area, would avoid environmental burdens to the City of Marina, and appears to have fewer significant hurdles to clear before it could be implemented."
3. "... the [Cal-Am] Project is inconsistent with relevant Coastal Act and LCP policies and the Commission may not approve the Project despite those inconsistencies because the PWM Expansion is a feasible, less damaging alternative that will adequately provide water and protect the public welfare."

Please refer to our September 17, 2020 PowerPoint presentation that summarizes LandWatch's support for denying Cal-Am application.

As we noted in LandWatch's November 11, 2019 letter, the staff report concludes, the project:

- Is inconsistent with the City of Marina's Local Coastal Plan policies and the Coastal Act regarding Environmentally Sensitive Habitat Areas (ESHA), coastal hazards, and placement of fill in coastal waters.
- Does not qualify for the Coastal Act Section 30260 exception to permit a coastal-dependent industrial facility that is inconsistent with these policies:

- the project cannot meet the first element of the Section 30260 test because there is a feasible alternative in a different location that is less environmentally damaging;
- the project cannot meet the second element of the Section 30260 test because denial of the permit will not adversely affect public welfare, but will in fact promote public welfare; and
- the project cannot meet the third element of the Section 30260 test because it has not been mitigated to the maximum extent feasible.

As the Monterey Peninsula Water Management District has clearly demonstrated, a critical problem with the desalination facility is that it would generate much more water than is foreseeably demanded. This would raise water rates substantially because smaller delivered quantities of desalinated water would have to cover the same large, fixed costs. Table 8 of the staff report shows that the cost per acre foot of water with the desalination plant running at 4,300 AFY instead of full capacity would be $8,294/AF. This compares with $6,094/AF with the plant running at full capacity, a level that would not be reached for many years, if ever (Staff Report, pp. 128-129). By contrast, water from the Pure Water Monterey expansion would cost $2,340/AF (Staff Report, p. 128).

Even with the extremely optimistic demand at **three times the historic absorption rate**, the desalination plant will not run at capacity in this century. The Water Management District concludes that Pure Water Monterey expansion is sufficient until 2043 with demand at three times the historic absorption rate (Staff Report, p. 128). With water rates certain to rise, it is equally certain that demand will not reach three times the historic absorption rate -- unless the basic economic law of supply and demand miraculously doesn't apply to desalinated water. In relationship to absorption rates, consider that there are more than 9,000 houses with water entitlements that have been approved, but not built throughout Monterey County, including more than 700 within the Monterey Peninsula Water Management District.

LandWatch has long advocated for timely and affordable solutions to sustainable water on the Monterey Peninsula. **We ask that you support your staff's recommendation** so Cal-Am's desalination project can be put to bed and Pure Water Monterey expansion can be brought online as soon as possible.

Sincerely,

Michael DeLapa
Executive Director

Re: DENY Cal Am's Desal Project

I have been a Monterey resident for 40 years and I recommend that you deny the Cal Am Desal Project.

Cal Am's Desal project is not in the public interest.

Pure Water Monterey Expansion is the feasible and environmentally preferable alternative. It will give us a new water supply much sooner than desal. Our current water supply from Pure Water Monterey - Phase 1 (3,500 acre-feet) will allow us to stop illegal withdrawals from the Carmel River by December 2021.

Our current water supply will restore the Carmel River and protect the Steelhead. The environmental issues facing the Carmel River have been resolved by Pure Water Monterey without the need for Cal Am's desal or the Pure Water Monterey expansion.

There is no Carmel River crisis. We don't need Cal Am's oversized, over priced desal project to solve our problems.

The expansion of Pure Water Monterey will provide a long term sustainable water supply for decades of growth. It will support affordable housing and economic recovery and avoid environmental damage and environmental injustice to Marina.

There won't be affordable housing without affordable water. Cal Am's desal would double our water bills. Cal Am is the only obstacle to the expansion of Pure Water Monterey.

Cal Am cannot be trusted. Passing Measure J was the community's statement.

Desal damages the environment, costs too much and creates environmental injustice. Desal harms the coastal habitat and Marina's beautiful dunes.

Desal has no legal source water, it would draw groundwater from an overdrafted groundwater basin not under the ocean.

The Pure Water Monterey Expansion source water is primarily the 8,000 acre-feet of excess wastewater that is now discharged into the Bay. It is contractually secure and drought proof.

Cal Am has had 25 years to solve our water supply problem. Our public agencies have solved it in the last 6 years. Now all the water we need for decades is available, but Cal Am is blocking it.

Respectfully submitted,
Carol Jones
Monterey

CalAM Desal proposal

Soham Adair <adair.john1@gmail.com>

Thu 9/10/2020 10:53 PM

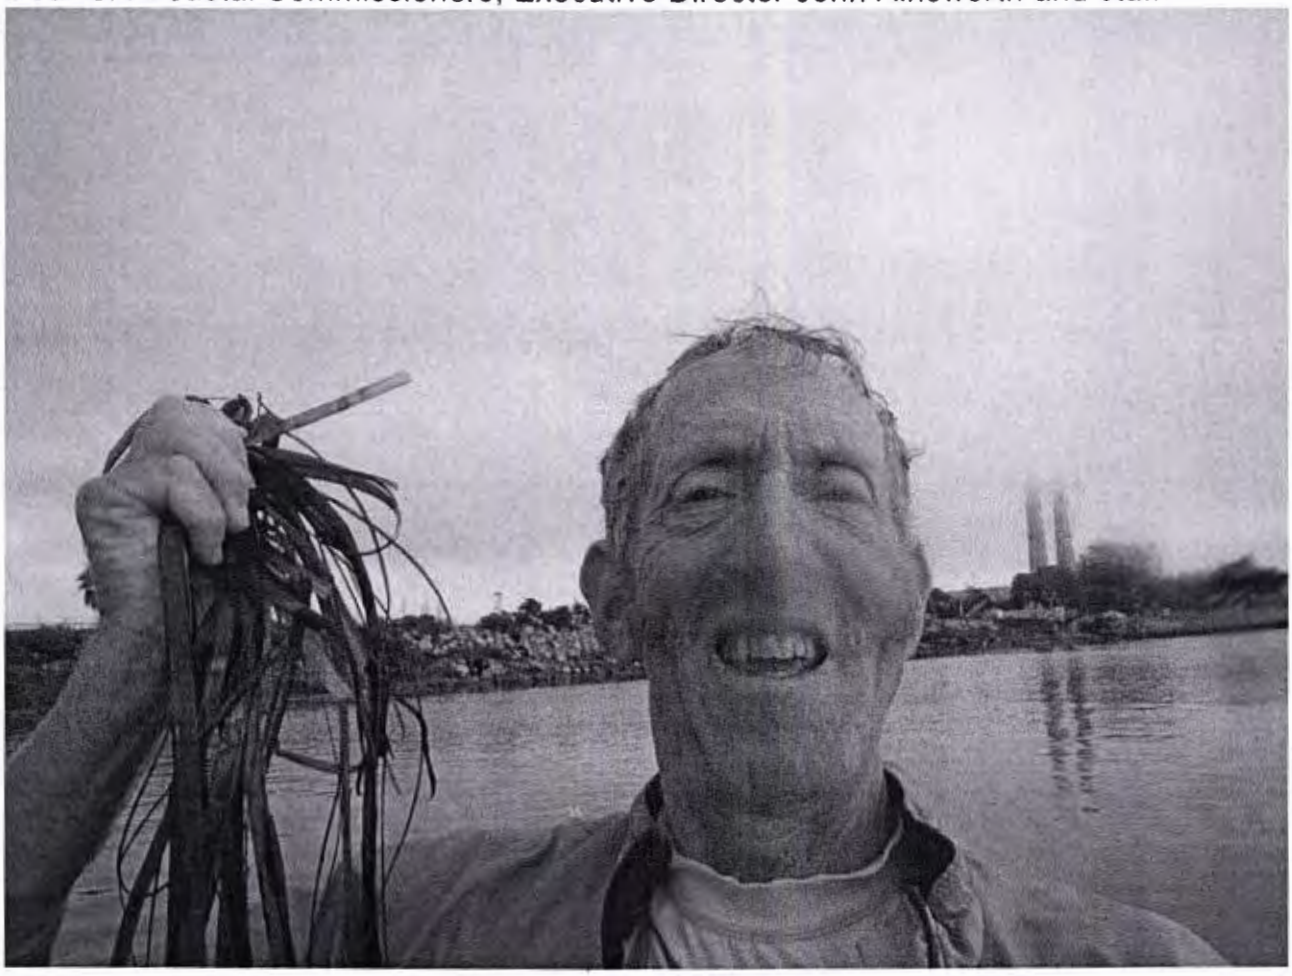
To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

We do not need desal.

The expansion of Pure Water Monterey will provide a long term environment friendly solution for decades of growth. It will support growth in affordable housing and economic recovery.

Orange County has relied on this pure water system for many years.

In appreciation for your service,
John C.Adair, M.D.



Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Joel Leker <jmleker@gmail.com>

Thu 9/10/2020 10:24 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

I have lived in Marina for 25 years and love it here. I work as a kayak tour guide in the outdoor recreation industry. We serve the many visitors that come to the peninsula to enjoy our beaches and beautiful coastline. I can't believe that the best use for the soon-to-close CEMEX site is being co-opted for industrial use after so many worked to close this coastline damaging sand-mining plant.

As I understand it there were agreements made for future coastal access and recreation for all between CEMEX, the Coastal Commission and the City of Marina. It is inconceivable that 7 industrial pumps, sited in the dunes on several 5,000 square foot concrete pads with service roads, lights and chain link fences will have little impact on the animals, plants and our collective access to the beach.

I enjoy walking Marina Beach but it is disheartening to think that a private company can reach outside of its own service area to steal our beach all because it wants to make a gross profit on its captive peninsula rate-payers. CalAm won't even support expanding the water recycling project that is now providing enough water for CalAm to stop taking water from the Carmel River. This greed must be stopped.

I hope to take my grand children down to the beach to see the snowy plovers and other wonderful wildlife (like the dolphins and whales) and tell them - that a lot of people fought for this beach so that we could be here today. Thank you and deny this project. It makes no sense to locate such a facility here.

Please deny this harmful project. Thank you

Joel Leker
Marina resident

Deny Cal Am's Desal Project

Thu 9/10/2020 10:21 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Commission Members and Staff:

I am a homeowner in Monterey, and Cal Am provides my water. I strongly oppose its proposed desal plant. For many reasons, only some of which I will include here, I urge you to deny Cal Am's permit request. Your staff has prepared an excellent report, and its recommendation to deny the permit is well-founded.

Cal Am's desal project is not needed, is far too expensive, and will harm our coastal environment. Several reputable studies show the expansion of Pure Water Monterey will provide a sustainable water supply to meet the reasonable needs of the Monterey Peninsula for decades--and at about 1/6 the cost of Cal Am's proposed project. Cal Am clearly knows this and has refused to enter into a contract to buy this water because Cal Am has no incentive to keep costs down. It passes everything on to we ratepayers.

Although it is clearly not true, Cal Am argues its desal plant is the only way to resolve the cease and desist orders facing Cal Am for taking water from the Carmel River and the Seaside Basin that it should not have taken. By December of 2021, Pure Water Monterey will provide enough water so that Cal Am will not need to take excess water from the Carmel River and Seaside Basin. All Cal Am needs to do is to agree to purchase the water.

Cal Am's pretense that it cares about conservation and affordable housing is ludicrous. Its conduct shows it does not care about either, and neither does it care about its residential customers. When we ratepayers heeded calls from then Governor Brown to conserve water, Cal Am's response was to increase our bills so it wouldn't lose money because we had used less water. Its claims are the height of hypocrisy.

Please do not saddle Monterey Peninsula rate payers with a desal plant that is not needed and will double our water bills. We already pay the highest costs for water in the country. Please vote against Cal Am's request.

Sincerely,

Barbara Moore

RE: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 (Cal Am CDP)

Chair Padilla and Commissioners,

Public Water Now supports your staff's recommendation. Please deny Cal Am's Desal permit. It is quite clear that this Project is not in the public interest. The alternative Pure Water Monterey Expansion is a project of our wastewater district – Monterey One Water. It is a state of the art groundwater replenishment project that will improve our environment by recycling more of the wastewater that flows into the Monterey Bay.

Does the Monterey Peninsula need this desal plant?

The Supply and Demand Report produced by the Monterey Peninsula Water Management District (MPWMD) is accurate and current. It can be accessed here: https://www.mpwmd.net/wp-content/uploads/Supply-and-Demand-Analysis-Adopted-5-18-20.pdf

The report looks at the history of water use and has shown that the 2,250 AF from the PWM Expansion will provide water for decades of growth. But Cal Am continues to argue against this using the outdated demand numbers in its EIR and claiming that its oversized desal Project is the only solution.

It's important to understand motive here. Cal Am is an investor-owned utility, and it earns a 9.2% return on its capital investments. It does not earn profit on water. For example, in the first year alone, it would earn over $9 million on this desal plant for its investors. Over 30 years, its estimated profit would be $123 million. In comparison, it earns nothing by selling the water from Pure Water Monterey or its Expansion.

Cal Am is notorious for its disinformation campaigns. We experienced this in our community's successful fight to pass Measure J, which requires MPWMD to buyout Cal Am's Monterey Peninsula system.

This time Cal Am's disinformation campaign focuses on discrediting the Pure Water Monterey Expansion. Its claim that the Expansion cannot provide enough water is false. MPWMD's supply and demand report, and two other reports from authorities on water management, have all shown that it will provide more than enough water for decades of growth.

Cal Am claims this water is not drought-proof, but the State considers recycled water to be a drought-proof source since wastewater is not impacted by drought. Note that conservation does affect wastewater and that Pure Water Monterey was designed with the Peninsula's radical conservation (57 gallons per person per day) already in place.

Cal Am claims that Monterey One does not have legal rights to the Expansion's source water. This is false. Attached is a chart showing Monterey One's rights to the source water for the PWM Expansion. It's ironic to note that it's Cal Am that has no legal source water for its desal project.

Your staff has seen through all these false claims in its report. But Cal Am and its supporters continue in their lie repeated a thousand times campaign.

Is Cal Am's desal needed to stop illegal withdrawals from the Carmel River?

For 25 years Cal Am has been overdrafting the Carmel River. It has failed to solve this problem. Over the past six years, our public water agencies, Monterey One Water and the Monterey Peninsula Water Management District have solved the problem with a new water supply from Pure Water Monterey. Through these public agencies' efforts in bringing Pure Water Monterey online and the conservation efforts of our community, we will meet the State's Cease and Desist Order (CDO) on the Carmel River by December 2021 without Cal Am's desal.

From Cal Am's records, its current 5-year average withdrawal from the Carmel River is 6,314 AF. Its legal withdrawal is 3,376 AF. The new 3,500 AF from Pure Water Monterey that Cal Am can now draw on will allow it to meet the CDO deadline with a surplus.

MPWMD was created to find a new water supply, and in the past 20 years, it has given us 7,300 AF of new water. It is a highly competent agency. It would be reasonable to have far more confidence in MPWMD, who has developed new water supplies over the past 20 years, than in Cal Am who has developed none.

For decades MPWMD's responsibility has been to monitor and restore the Carmel River and to oversee conservation. No other agency is in a better position to report on the State of the Carmel River. In August, Secretary Blumenfeld gave you an accurate history of the Carmel River CDO, but he did not update you on the progress or the fact that a new water supply is not needed to stop the illegal withdrawals from the Carmel River.

The credit for solving this long-standing problem goes to Monterey One Water and the Monterey Peninsula Water Management District, not to Cal Am.

The politics of our County, like our Country, are divided. Three members of our Board of Supervisors represent Salinas Valley Agricultural interests and often vote against the Peninsula's interests. This has certainly been the case with Cal Am's desal project. It's the reason for the split vote on the Monterey One Water Board. Half are in support and

half against expanding their own successful Pure Water Monterey project because the Expansion would make Cal Am's desal unnecessary.

Why do Salinas Valley agricultural interests want a desal plant on the Monterey Peninsula?

This is where Castroville comes into the picture. Cal Am has literally bribed half of the Monterey One Board with the promise of almost free desalinated water for Castroville. Cal Am's return water agreement gives Castroville 700 AF of very expensive desalinated water for $110 per AF. But it forces Cal Am's Peninsula customers to subsidize this water at the cost of $6000 to $8000 per AF. No one asked the Peninsula if they were willing to pay millions of dollars a year to subsidize Castroville's water on top of their already outrageous water costs.

Our community does not need this desal plant, and we can't afford it. This would add $1.2 billion to our water costs over the next 30 years. The Pure Water Monterey Expansion would cost $190 million and meet our water demand for decades.

Environmentally, we can't afford this either. We are a coastal community. The threat of global warming is very real to us. Cal Am's Project would be the largest GHG emitter in our region, emitting 8,000 MT of CO2 annually. The Pure Water Monterey Expansion would emit only 34 MT of CO2 annually because it is powered almost entirely by biogas from the nearby landfill. Cal Am's desal would also damage Marina's coastal dunes, threaten its groundwater and perpetuate environmental injustice.

Cal Am's desal project is not the right solution for the Peninsula. Please vote as if you live here and deny Cal Am's Coastal Development Permit.

Respectfully,

Comparison of Pure Water Monterey Expansion & Cal Am Desal

COST & DEMAND ISSUES

PURE WATER MONTEREY EXPANSION	CAL AM DESAL
Current annual demand for Monterey Peninsula: 5-Year average is 9,825 AFY.	
Adds 2,250 acre-feet per year (AFY) to water supply. Total available water supply 11,700 AFY.	Adds 6,252 acre-feet per year (AFY) to water supply. Total available water supply 15,702 AFY.
Estimated cost per acre-foot $2,700.	Cost per acre-foot is $6,094 (at 86% capacity). If capacity drops, cost rises $7,300-$8,300 per AF.
Cost with O&M over 30 years is $190 million. Lower cost from non-profit public agency.	Cost with O&M over 30 years is $1.2 Billion. Substantially raises ratepayer costs.
Produces enough water for 30 years of growth. Historic demand for new development is 16.4 AFY.	Oversized for current need of 9,825 AFY (5 yr. avg.) Exaggerates future demand.
Meets peak demand.	Meets peak demand.
	Cost of replacing fresh water drawn from Salinas Valley Groundwater Basin to meet Agency Act.

ENVIRONMENTAL ISSUES

PURE WATER MONTEREY EXPANSION	CAL AM DESAL
Expands existing approved project. No coastal impact.	Destroys 7 acres of coastal dunes and habitat. New construction in coastal and inland areas.
Energy consumption is 23,000 megawatt hours per year. (45 MWh - PG&E / remainder from landfill biogas.)	Energy consumption is 52,000 megawatt hours per year (PG&E).
Produces 34 metric tons of CO2 per year.	Produces 8,000 metric tons of CO2 per year.
Protects against seawater intrusion.	Project must create seawater intrusion to work.
Captures and purifies existing wastewater for indirect potable use and stores it in Seaside Groundwater Basin. Improves water quality in Basin. Provides drought reserve. Reduces current discharge to Bay.	Draws 17,300 AFY of groundwater from Salinas Valley Groundwater Basin with experimental slant wells. Adds brine discharge to Bay.

Compiled by Public Water Now / September 2020 / PublicWaterNow.org

LEGAL & POLICY ISSUES

PURE WATER MONTEREY EXPANSION	CAL AM DESAL*
No issues with water rights.	Cal Am has no water rights to the groundwater it wants to use. It cannot meet the criteria laid out by the SWRCB to gain appropriative water rights.
CPUC has approved the Pure Water Monterey project for 3,500 AFY. CPUC did not complete its review of the PWM Expansion and has never considered it as a feasible alternative.	CPUC has approved the desal, subject to the independent judgment of other key permitting agencies (CCC and Central Coast RWQCB). New information was not included in original EIR that was approved.
Same permitting as approved PWM project for 3,500 AFY. No surprises.	Permitting faces obstacles and litigation over groundwater. No slant wells in use for desal anywhere in the world.
No litigation.	Current litigation expected to continue. High risk of litigation delay.
Consistent with SWRCB Dec.12, 2018 notice emphasizing recycling of water as preferred policy.	SWRCB policy requires that feasibility of slant wells must be determined before proceeding.
	Needs Marina Coast Water District pipeline (not available)

COASTAL ZONE ISSUES

PURE WATER MONTEREY EXPANSION	CAL AM DESAL
Best environmental alternative in the public interest.	Not in the public interest.
No coastal impact.	Violates LCP. 7 slant wells, transmission pipelines, construction disturbances. Western Snowy Plover nesting area. Destroys ESHA.
Existing wastewater is purified and recycled for indirect potable use. Reduces discharge to Bay.	Adds new brine discharge to Marine Sanctuary (8 million gallons per day). Potential Dead Zone.
Protects against seawater intrusion.	Induces seawater intrusion into groundwater basin.
No Environmental Justice issues.	Inflicts Environmental Injustice on Marina.

OTHER ISSUES

PURE WATER MONTEREY EXPANSION	CAL AM DESAL
Lifts CDO and moratorium sooner than desal. Project can be completed in 20 months.	May take years to lift CDO and moratorium due to litigation or permit delays.
Needs Water Purchase Agreement from Cal Am.	More profitable for Cal Am. $123 million profit (30 yrs.)
Cooperative public partnership serves agriculture and urban needs.	Threatens Marina's water supplies to meet the Peninsula's needs.

Monterey One Water
Providing Cooperative Water Solutions

Source Water for Pure Water Monterey and PWM Expansion – 2018

The 9-year average (2010 – 2019) for Ocean Discharge (excess wastewater) is 7,634 acre-feet

This chart reflects the wastewater sources to which Monterey One Water has contractual rights. It is the worst case scenario and does not include roughly 2,000 acre-feet of agricultural wash water which is not being utilized in the Base PWM project or the proposed expanded PWM project.

	OCEAN DISCHARGE	RECLAMATION DITCH	BLANCO DRAIN	OUTSIDE BOUNDARIES	RIGHTS FROM AFWRA	TOTAL
TOTAL RIGHTS	6,294	1,014	2,620	1,363	308	11,599 AFY

George Riley <georgetriley@gmail.com>

Thu 9/10/2020 9:24 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Cal Am's desal is not ready for prime time.

As much as state, through policy and encouragement, wants a successful slant well desal, this is not the right one. It has an excessive degree of shortcomings, risks, and negative impacts to be approved. And it is not needed by the community Cal Am serves.

Cal Am has deficiencies that are astounding for a large asset-rich corporation. Its slant well data are not conclusive. Its engineering leaves gaps in analysis. Cal Am has changed its demand data.

It has tried to serve a low income community outside its service area - Castroville - at an even greater expense on an even greater number of low income in its own service area.

Cal Am's competence is questionable. It's simply not ready for prime time.

If you like desal, wait a few years. The US Dept of Energy has recognized the need for more research on desal technology and engineering. In late 2018, the DOE approved a $100,000,000 grant for this purpose. The lead agency for this national research grant is Berkeley Livermore Labs. Reports are due in 2025 and 2030.

Wait a few years before you entertain any new ocean desal proposals. Everyone would benefit from new research – the industry, policy and regulatory agencies like this Commission, as well as customers, communities with water needs and providers.

Desal continues to be the supply of last resort. We are not there, since we have an alternative.

One needs to deny reality if one accepts Cal Am's desal and its gargantuan cost, its enormous environmental footprint, the risky legal uncertainties, and using other people's money (ratepayers) to carry this burden.

Please deny the CDP for Cal Am.

George T. Riley

From: Johanna Pooler

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Johanna Pooler: I am a resident of Marina for 54 years. I am from Germany where I met my husband, an American soldier and consequently, have lived in many areas of this country. We decided to settle in Marina where we raised out son. I am against a big company like CalAm coming into our small, economically diverse town of Marina, to build slant wells and a recycling plant. Our water has been of good quality and I do not want them to jeopardize it by the possibility of salt water intrusion. I also fear that they will eventually take over our small water district and charge us unaffordable water rates.

Please deny this harmful project.
Signed,
Johanna Pooler

URGENT! please DENY the CalAm Desalinization Plant

Rosemary Wells <rosemaryw@vlastudio.com>

Thu 9/10/2020 9:11 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

I have been a resident of Pacific Grove for the past seventeen years. I am a landscape architect, member of the PG Architectural Review board, and former member and chair (in an earlier residence) of the Mountain View Environmental Planning Commission.
I have followed the debate concerning the future of the Carmel River with great interest and concern. I am writing today to voice my support for the CCC staff's recommendations.
Water for the Monterey Peninsula is too important to be left to the vagaries of the utility market.
Please **DENY** CalAm's Desalinization project. It *will not*, ultimately, solve our problems: it will cause environmental harm through a rise in salt in coastal waters, it dis-enfranchises the Marina community, and, down the road, leaves the community without agency or options twenty years from now.

Sincerely,
Rosemary Wells

CalAm Desal Project Proposal

Charlotte Otto <charotto2@gmail.com>

Thu 9/10/2020 8:32 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

As a homeowner in East Garrison serviced by Marina Water, I object to the subject proposal by CalAm on the following grounds:

1. My drinking water comes from Marina's groundwater basin.
2. The project would take up to 15 million gallons of water per day from Marina's overdrafted groundwater basin to supply CalAm's Monterey Peninsula customers but would supply none to Marina.
3. Stanford University and other studies show that CalAm's desal project may deplete or contaminate Marina's groundwater.
4. If the groundwater is contaminated, Marina may be forced to purchase water from CalAm at the highest water costs in the Nation.
5. The desal project threatens Marina's beautiful coastal dunes, wildlife habitat, and planned beachfront recreation area.

I respectfully request the Coastal Commission consider all of these reasons and reject the proposed project.

Sincerely,
Charlotte Robinson

CalAm's Desal Permit Request

John Ponta <johnscoms@aol.com>

Thu 9/10/2020 8:12 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Greetings,

This is just a quick note to express my opposition to the desalination permit requested by CalAm water company.

Frankly, my wife and I are fairly new homeowners in Marina. When we moved to Monterey County we were quite surprised to learn that most of our friends in neighboring communities buy their water from CalAm - a private company; and I have not spoken to anyone that is happy about it. On the contrary, those folks invariably tell us how lucky we are to live in Marina which has it's own municipal water source.

Moreover, as a matter of policy, I am opposed to private companies providing utilities, including water, to households. Look at PG & E verses SMUD - I'll take SMUD any day. I have lived and worked all over California, and to my knowledge, have never lived in a place where the drinking water is provided by a for-profit company. The fact that CalAm's customers pay more than just about anyone else in the country speaks for itself.

I empathize with CalAm's customers but it is flat-out wrong to ameliorate their problems by taking our water and constructing some new facility on our beautiful shoreline.

John Ponta, MA

Licensed Private Investigator
Special Agent, California Dept of Justice (Ret)

Marina, CA

September 10, 2020

Chairman Steve Padilla & Commissioners
California Coastal Commission
455 Market Street, Suite 300
San Francisco, California 94105.

In re: Cal Am Monterey Coastal Permit

Dear Chair Padilla and Commissioners:

Please deny the California American Coastal Permit. Please do not sacrifice my community, Seaside, and the City of Marina for this ill-conceived, environmentally damaging, extremely costly project which is no longer necessary. Should this project be approved, leave no doubt in your minds that it will cause severe hardship for ratepayers, especially those who are lower income and unnecessary severe environmental damage.

My letter addresses three issues: The egregious **environmental justice** issues in this permit presents, **the health of Carmel River and steelhead trout;** and the availability of a **viable alternative project** with no coastal footprint.

First: Environmental Justice: If the Coastal Commission really means to fulfill its policy enactment for environmental justice, this project *must* be denied.

As succinctly analyzed by your staff, the industrial/environmental burden for this project would be borne by the small diverse disadvantaged community of Marina which already has at least 4 industrial facilities located there, as well as an EPA superfund site from past Army activity. There is no question of the egregious harm that would be done to its sensitive snowy plover and finally secured coastal area from the CEMEX sand mining interests, only to have it turned into yet another industrial plant. Most insulting in this corporate colonization would be the fact that it will harm Marina's groundwater supply, which it depends upon for drinking water, and they would get no benefit and would lose much. The California Coast which you are dedicated to protecting would be harmed severely. What then? Would Cal Am then pressure Marina to accepts its own water as a customer after aquifer depletion and saltwater intrusion?

As a resident of Seaside, which has a 43% disadvantaged population, water costs are already burdensome. **In Cal Am's June response letter to the commission, on page 92, they assert that the usage for the average residential monthly water bill is about $78** (or$936 annually) for a family of three.

This directly contradicts Cal Am's own rate announcement in 2019 which launched the latest rate increase from their approved CPUC rate request **where they estimated the average residential bill to start being $90.78 in May 2019** as shown in the copied text below sent to customers by email. (I was unable to find it again on their website and have a copy on my desktop from their site. It may have been taken down.)

file:///C:/Users/Susan%20Schiavone/Desktop/Water%20Rates%20%20Monterey%20District%20_%20Rate%20Design.html

What will be the average rate impact due to these changes?
The average, monthly total bills are estimated to be as follows:

	Consumption **100 gallon units (CGL)**	***New Rates***
Single Family	***38***	***$93.07***
Multi-Family	***24***	***$67.38***
Low Income	***38***	***$72.64***
Non-Residential*	***50***	***$183.59***

**Assume Division 1 customer*

When will these changes go into effect?
The new rates will be reflected in customers' May 2019 bills.

On page 94 of Cal Am's June letter, in response to Commissioner Groom's question, Cal Am provides a chart of the water charges. **The chart does not include meter charges, or the WRAM surcharges that will be included, along with other fees that customers pay**. (See LIRA below). While the CPUC approved a motion to end the surcharge, this will not be effective until AFTER **the current rate case which will again raise our rates at least another 17% along with additional surcharges before it takes effect, thus the rate floor for this desal project will be even higher.**

I recently asked several Seaside neighbors (9 people) about their bill. For those who live alone it has been averaging about $60, for those with two people it is $100 or above. These are all senior citizens. It is not easy to stay in tier 1. I can also attest to this rate hike as my average bill has been $90 in the spring and now in the summer has reached $143 for two people and two dogs. My husband and I are seniors on a fixed income, we conserve indoor use with less flushing, less showers, buckets for any excess water, and collect rain water in multiple barrels as well.

Seaside has a per capita income of $24,726. Per capita income serves as a measurement of the stability and wealth within a particular region. With a poverty rate of 14.9%, nearly 5,000 Seaside residents live below the federal poverty level, 11% higher than statewide. We have a 43% low income population. We pay the same high 4-tiered rates as high-income residents. In contrast, the hospitality industry pays a fixed tier-two rate for all water which they were gifted when they agreed to support the Cal Am desal project in 2012. **Therefore, Seaside Cal Am ratepayers bear a much higher cost per income level for water, subsidize the hospitality industry lower rates, and bear disruptions for infrastructure construction for pipelines, road stress from construction vehicles, and emissions. Now Cal Am wants us to subsidize Castroville as well.** Given the ensuing economic downturn, this situation will only worsen. Seaside unemployment shot up to 19.4% in April.

If this project is approved, many poor and lower middle-income residents may have to make the painful choice as to whether they can live like this or what they cannot purchase, including seniors who are 10.5% of the population. This will result in less expendable income for necessities, hardships of relocation, denial of access to coastal living and increased income inequality. This will also likely result in extreme water conserving with possible ill health effects. People need water to live and it must be affordable for all, not just the wealthy or businesses who can write off expenses.

LIRA: Staff also pointed out the Cal Am low income assistance program, LIRA, has many **obstacles for someone to actually qualify**: The bill must be in your name, you must have the meter in your name, you must qualify for the low income amount which is much lower than other programs; forcing many renters, mobile home owners and those who are in income distress but do not qualify, to be excluded.

We pay for LIRA! According to the staff report, 6% of Cal Am's customers actually get LIRA help, 18% in Seaside. The Commission should be aware that the LIRA program itself is "partially" funded by a monthly fee of $1.81 on ALL customer bills, including lower income customers.

While this is a small amount, multiplied by the customer base of 33,312 (not counting Carmel Valley) that comes to $60,294.72 per month, or $723,336.64 per year collected. If 6% of its customers are receiving benefits at 30% of $90/month average 1,998 customers for about $30 a month, then $59,940 or $719,280 per year is given out. **This means that the customers are NOT partially funding this program but entirely funding this program as it stands (not counting customers paying this fee in Carmel Valley!)**

As a final assault on my community, Cal Am is attempting to force ratepayers on the peninsula to subsidize water for Castroville at 8% of the cost they will have to pay if this project is approved. Castroville residents currently pay about $20 per month for water and would continue to do so under this project, receiving desalinated potable water at $580 AF, and possibly more for the CSIP project at $110 AF, while Seaside residents may face minimum rates of $180+ a month at $6-8,000 AF (if the groundwater return rates increases, as staff predicts, costs will rise). **This is an absolutely unjust proposal and unfairly puts the burden of the project on lower income residents in the Cal Am district, especially in the city of Seaside which has a higher proportion of lower income residents and senior citizens on fixed incomes.** This is an existential threat that may price out many low -income people from the ability to live here. This project will severely and unfairly impact lower income peninsula ratepayers who should not be used as exploited subsidy sources to legitimize illegally taken water for the project.

Second: Carmel River and the Carmel River Steelhead Trout: The environmental issues facing the Carmel River are being resolved without Cal Am's desal project.
Numerous efforts are being made to make this very goal achievable and some of those intermediate goals are being met. This includes the removal of the San Clement dam (paid for by ratepayers), several programs and agencies which have donated and purchased surrounding lands to rewild them for optimum river health and the fish, volunteer efforts are

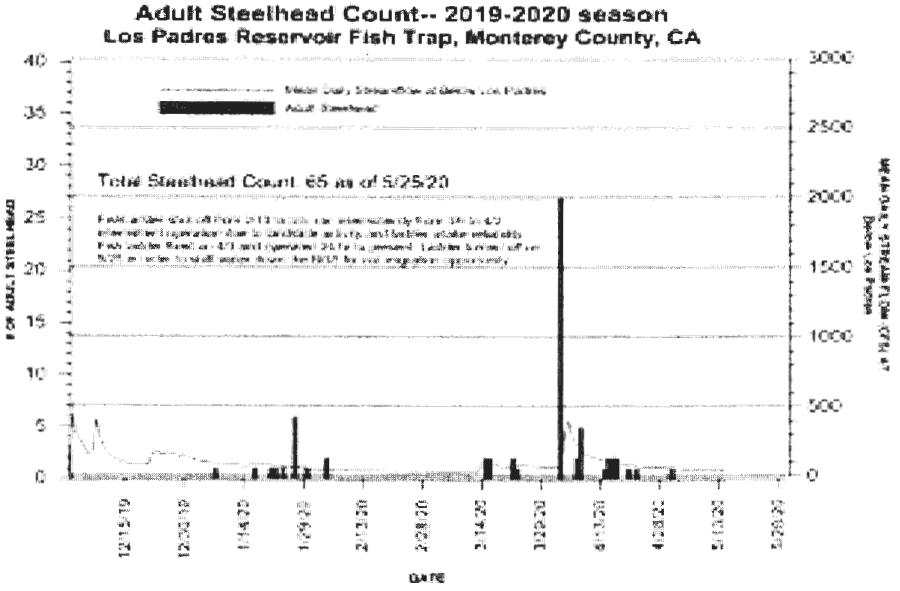
done and an ongoing rescue and release, as well as annual counts and monitoring by the Monterey Peninsula Water Management District.

This is no secret for the agencies involved. It seems those who are presenting another reality are mistake. For example, In **May 2019, TROUT Magazine**, reported an important land deal that was made to benefit Carmel River Steelhead (Sam Davidson, May 7, 2019)

> *"Trout Unlimited has worked since 2006 to advance steelhead recovery in this priority watershed.* ***Over the past year, this work has helped produce two major outcomes that will help Carmel River steelhead****.*
>
> *First, a long campaign to remove the lower of two dams on the Carmel—the century-old San Clemente Dam, at risk of catastrophic failure in a major earthquake—came to fruition* ***as the San Clemente Dam Removal and River Re-route project was completed in*** *the fall of 2015. (note: paid for by Cal Am Ratepayers)*
>
> *This* ***project re-opened some 25 miles of historic spawning and rearing habitat*** *to steelhead. This winter, scientists observed dozens of steelhead redds in the new habitat.*
>
> *...an opportunistic partnership involving the Trust for Public Land, Monterey Peninsula Regional Parks District, Santa Lucia Conservancy and the Steinbeck Country Chapter of Trout Unlimited has led to a remarkable land deal which will* ***convert 140 acres of a golf course to park land and re-dedicate some 300 acre-feet of water back to the lower river.***
>
> *The conservation partners announced the deal yesterday after a lengthy series of complicated negotiations with multiple landowners and the local water utility, California American Water Company..."*

The **Carmel River Watershed Conservancy** has spoken for the desal related to the steelhead. It should be noted that **Catherine Stedman, Cal Am Manager of External Affairs,** sits on the board of directors as well as **Paul Bruno,** an outspoken pro-Cal Am professional contractor with pipe installation contracts for Cal Am who stands to profit from the desal project.

Please note that in the organization's **2020 newsletter** they state this optimistic report. https://www.carmelriverwatershed.org/latest-news--



> *Fish Rescue at Finch Creek Ranch, 2019*
>
> *"This year 129 steelhead trout made it back from the ocean into the River and 126 made it over the Los Padres Dam.* ***This is a dramatic increase over 2018 and a good sign for both the species and the health of the river.*** *Just two years ago, only 29 steelhead made it over the Los Padres Dam. Steelhead are a hardy*

species, and with a little help from the CRWC, the Carmel River Steelhead Association and other local conservation groups, ***they are making a comeback.***

This year we also had more than 18,000 trout rescued*. 58 people assisted with rescues during the season, many of which were new volunteers...The return of steelhead indicates a significant ecological impact.* ***Returning steelhead are a sign that water quality and riverbed quality are good enough to house both spawning fish and juveniles. This development signifies a positive shift in the overall health of the river.*** *As Brian LeNeve (Carmel Steelhead Assn) says,* ***"We've turned a river around from one of the 10 most threatened in California to one with hope."***

Every organization likes to take the credit for good outcome, and rightly so. They often shine a brighter light on their organization and partners, but may forget the local public or government agencies that have also contributed to the efforts.

In this case, it is very important to see what part the local Monterey Peninsula Water Management District has done to augment and assist in this effort at river restoration.
Here is the fish count in early 2020 at the Los Padres Dam. This shows a definite increase, and the effect of the drought on the river must be factored into the equation.
See https://www.mpwmd.net/environmental-stewardship/carmel-river-steelhead-resources/los-padres-dam-fish-counts/current-year/

Monterey Peninsula Water Management District in partnership with Cal Am operates a Carmel River restoration and management program, including repair work that will enhance the areas suitable for trout. This is a long program dating back to the 1990s. They perform fish counts at Los Padres dam. They also rescue young fish, help rear and release them, as well as work

on habitat restoration. Their website notes that this year the trout 'superhighway' was in full swing with the abundant rainfall we received.

They are currently working on new ways to count the fish more accurately since the **invasion of striped bass into the river and effects of the drought** has also complicated this recovery process but progress IS being made and the alternative project Pure Water Monterey, if expanded, can meet all requirements for the SWRCB.

Third: There is an environmentally superior and sustainable alternative that has NO coastal footprint. There is a completely viable alternative in the Pure Water Monterey recycled water project, a cooperative project with Monterey One, the Monterey Water Management District, and Cal Am, if expanded.

Pure Water Monterey, now in phase one operation, will give us the additional water we need to stop illegal diversions from the Carmel River by the December 2021 deadline. And it would lift the moratorium much sooner than Cal Am's desal.
After December 2021, only 3,376 acre-feet (AF) of water can be legally taken from the river. But because of the 3,500 AF of new water available from Pure Water Monterey, we can meet that deadline with a surplus. **This will stop the illegal withdrawals and protect the River**. But to meet the requirements of the Cease and Desist Order (CDO) and the CPUC imposed moratorium, we would need the additional water supply of the **expansion of Pure Water Monterey**. With expansion, we will have sufficient water to lift the moratorium and address low income housing needs.

The supply and demand report from the MPWMD has been professionally certified by three separate nationally recognized water use hydrologist consulting firms, and Cal Am used the lower usage amount (9,825) in its latest CPUC rate case. The desal plant is not needed to meet this supply and demand. The impact of project approval, however, would be even higher rates if the desal plant proves to be under used and therefore the price per AF will become even higher than the current $6000-8,000. Cal Am hired one firm to echo its opinion related to higher supply numbers in the original EIR. With less demand than projected, the expanded PWM will give us enough water for a minimum of 20 to 30 years--enough time to allow further analysis of the effects of desal on ocean health and better technologies to ensure better environmental outcomes with desal options.

The Marina Coast Water District (MCWD) received a report in July 2020 from water management expert Peter Mayer of WaterDM, confirming that with careful management, Cal Am can comply with the SWRCB CDO and reduce Carmel River diversions as required by 2022 **without additional supply sources.** The report further concluded that in the near term, Cal Am can build up its storage reserves in the Seaside Basin increasing the amount of banked water. The report also found use of proven demand management tools, such as a water budget and adjusted irrigation schedules, will allow better management of peaks in demand. (as reported in Cedar Street Times, 7/10/20, p. 3, and MCWD www.mcwd.org)

***Expanding* Pure Water Monterey would provide adequate water needed for growth**. If the Pure Water Monterey Expansion of 2,250 AF were added to the current 3,500 AF from

Pure Water Monterey (Phase 1), along with legal River withdrawal of 3,376 AF and other ASR sources, the total available would be 11,700 AF. We only use 9,825 AF annually. That would lift the CDO and provide 1,875 AF of surplus water for growth.

PWM Expansion source water is primarily the 8,000 acre-feet of excess wastewater that is now discharged into the Bay. Another plus for this project. It is contractually secure and drought proof. And the plant is sustainably run with a low carbon footprint, and will be utilizing methane gas from the waste facility for fuel.

Cal Am's Desal project has no legal source water and will primarily illegally pump groundwater, damage Marina's water supply, destroy vernal pond environments and coastal habitat, and produce a large amount of carbon emissions and outflow, among so many other problems.

Commissioners, please see this project in the light of the latest information which has been provided at great cost to local communities who fully realize the damage and environmental and economic injustice that would occur should it be approved. Please deny this project.

Sincerely,

Susan L. Schiavone

Deny Cal Am's Desalinization Project

Tony Vastola <tvastola@gmail.com>

Thu 9/10/2020 7:42 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

I am a 17 year resident of Pacific Grove and a member of various local conservation groups: Big Sur Land Trust, Elkhorn Slough Foundation, and the Carmel River Steelhead Association. Over the past 6 months I have tried to educate myself on this complicated issue - what is the best solution to the Monterey Peninsula's water supply problems, including how to end the overdraft of the Carmel River.

After researching the various aspects of this issue and reading the arguments on both sides I have come to the conclusion that the CalAm proposed Desalinization Plant is not the correct solution and that the Pure Water Monterey (PWM) projects (phase 1 and the expansion), as compared to the desal project:

- can provide more than adequate water for Monterey Peninsula for at least the next 20-30 years
- will end the over drafting of the Carmel River long before the desal plan can come on line
- are much less expensive - both in capital and operating costs
- will release far less green house gases
- will have less negative impacts on the local environment
- have less technical and legal/permitting/approval risks
- do not take advantage of Marina and jeopardize their water supply

I believe that the California Coastal Commission's (CCC) staff report of Aug 25, 2020 thoroughly covers the environmental, economic, supply vs demand, and social justice issues. The CCC staff's conclusions are excellently summarized in the last paragraph of page 3 of the report:

'Staff believes, after weighing the evidence in the record at this time, that the Pure Water Expansion is a feasible alternative to Cal-Am's Project, will allow Cal-Am to cease its illegal water withdrawals from the Carmel River and meet the region's water needs, and is the preferable, least environmentally damaging alternative. The Pure Water Expansion would also result in fewer environmental and economic burdens to the communities of concern within Cal-Am's service area, would avoid environmental burdens to the City of Marina, and appears to have fewer significant hurdles to clear before it could be implemented…'

Please follow the recommendations of the CCC staff report and **DENY** CalAm's Desalinization project. Thank your for your consideration.

Denial of Cal-Am desalination project

mjdelpiero@aol.com <mjdelpiero@aol.com>

Thu 9/10/2020 7:36 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>
Cc: richardwnutter@gmail.com <richardwnutter@gmail.com>; mdptrustee@gmail.com <mdptrustee@gmail.com>

ATTN: Tom Luster and Members of the CA. Coastal Commission

On behalf of the Ag Land Trust of Monterey County Board of Directors, we strongly support the CA. Coastal Commission staff's recommendation for DENIAL of the proposed California American Water Company's desalination plant and their proposed massively damaging groundwater wells. This project must be denied because of its' massive and unmitigated adverse environmental impacts on protected Coastal Zone resources and its illegal reliance upon the pollution (induced saltwater intrusion) of potable groundwater resources in the Salinas Valley groundwater basin.

Our Trust currently owns over 45,000 acres (in fee or as permanent conservation easements) of prime and productive farmlands in Monterey County. We are the fee owners of over 150 acres of prime, cultivated Coastal Zone farmlands that are immediately adjacent to the CEMEX site wherein Cal Am intends to wrongfully exploit the groundwater resources to which CalAm has no water rights.

Cal Am's proposed project will have massive adverse effects upon our protected coastal farmlands, on our statutorily protected groundwater resources, and upon the long-term employment of hundreds of our farmworkers who work on our ranch. Polluting our groundwater compromises our ability to continue to farm/irrigate our protected coastal farmlands that were acquired with both federal and state farmland preservation program grant funds.

We first publicly objected to the proposed CalAm project before the CCC in November of 2014. We noted at the time that Cal Am had no groundwater rights in the over-drafted, non-adjudicated Salinas Valley, and that both existing California statutes and over 100 years of California groundwater rights law (as articulated by the California Supreme Court in numerous reported cases) prohibit CalAm from ever securing groundwater rights in the basin, and prohibit Cal Am from illegally exporting any groundwater from that overdrafted basin. The pumping of the Cal Am test wells has already wrongfully induced seawater pollution/intrusion into our protected Coastal Zone aquifers and exploited the groundwater aquifers that we have paid (and continue to pay) to preserve and recharge with fresh water (Cal Am has never paid a dime for these supplemental water resources and is in violation of long-term, existing, and comprehensive governmental aquifer recharge assessment districts rules).

We hereby reiterate and incorporate by reference each and every letter of objection, document, and e-mail correspondence in opposition to this project (and all contents thereof) that the Ag Land Trust has sent to the Coastal Commission and its staff since November of 2014 into this, our current objection and request for denial of the Cal am project.

We request the denial of the subject proposed project based upon all of the arguments and submissions that we have provided to you over the past six years, and based upon your staff's comprehensive recommendation for denial of this Cal Am desalination project.

Most Respectfully,

Marc Del Piero for the Ag Land Trust of Monterey County

Please expand the Pure Water Monterey project!

Helen Rudnick <irenehill520@gmail.com>

Thu 9/10/2020 7:20 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Please deny CalAm's desal permit. The plant would harm the environment and perpetuate environmental injustice in the city of Marina.

Pure Water Monterey is the cost-effective and environmentally sound solution to our affordable water needs. Please expand this project!

Thank you,
Helen Rudnick

Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Jessica Scrimshaw <scrimshawjessica@gmail.com>

Thu 9/10/2020 6:38 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, John Ainsworth, and staff:

My name is Jessica Scrimshaw, and I'm a current resident of Marina. I was originally a CSUMB student who moved here back in 2011, and fell in love with the town of Marina. It's a relatively small town with a lot of local business and great food! Yet it's also close to the larger towns, and less than 2 hours from the rest of my family.

I'm currently 27 and managed to purchase a home here in Marina 2 years ago. I'm living the best life here with my long term girlfriend and our two wonderful cats. I work as a data analyst with the DMDC, and my girlfriend manages for KF Construction. Marina is very special to us and we have planned to stay here and continue to expand our family.

We do not support CalAm's desal project as it will not only be costly and cumbersome, it will be detrimental to the environment we desperately need to protect. Our beaches here in Marina have many spots to protect our ecosystem, and this will only harm all of that.

Are we in a housing crisis? Yes, but the solution isn't this. Before we even think of increasing the supply of water to build more houses, we need to build the infrastructure to support the planned increased population.

Please deny this project. We want to see our community flourish and the land and water here stay safe for future generations of both people and animals.

Thank you,
Jessica Scrimshaw

No on Desal Plant

Elsa Weber <elsaweber4@yahoo.com>

Thu 9/10/2020 6:18 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Coastal Commission,

Please do not approve Cal Am's proposed Desal Plant. This project has been fraught with problems suggested by a company that is doing a terrible job. Cal Am has lost any trust or goodwill from the community. It's time to return water management to local government. That's what government is for!

Thank you for protecting our coast and particularly our vulnerable citizens in Marina. Building a Desal Plant in Marina is not Environmental Justice—it's exploitation.

Respectfully Yours,
Elizabeth Weber

6 September 2020

Dear California Coastal Commissioners:

I am a third year environmental studies major at CSUMB, born and raised in Santa Cruz, with a deep interest in ecological preservation, conservation of resources, and equal access of those resources to all people. After thoroughly reading the *Summary of Staff Recommendation* of the *Staff Report: De Novo Appeal and Consolidated Coastal Development Permit*, as well as sections A-F of the report, and hearing from local experts Amy Anderson, PhD Marine Biology, and Gary Hoffman, MPWMD representative and licensed civil engineer, on both sides of the issue, I strongly agree with the Report's recommendation not to approve the CalAm Desalination Project. The furthering of this desalination project would be economically expensive, have a multitude of negative environmental effects, and impose an unjust distribution of these financial and environmental burdens on the people of Monterey County.

Desalination of seawater for potable use is an overly expensive endeavor. The cost of this process, paid by CalAm customers via inevitable rise in water utility rates funnels money directly from local residents and businesses to the pockets of a private water company. As a private utility company, CalAm does not guarantee reduced rates for low income households, which compounds the inequity of financial burdens imposed by the desalination Project. In contrast, supporting the Pure Water Expansion Project, which, as stated in the Report, would cost two to three times less, would invest into a publicly owned utility that does offer tiered rates.

Furthermore, the desalination Project would lead to irreversible environmental impacts, both known and unknown, on the delicate ecosystem of Monterey Bay. Brine discharge, at a rate of 10 million gallons per day, would cause direct, ongoing harm to sea life. Additionally, the

construction site and infrastructure would lead to additional short term and permanent harm to sensitive dune habitats. The Monterey Bay National Marine Sanctuary and the protected dune habitats exemplify the value this community places on environmental preservation; this desalination Project directly contradicts these core values. Due to its location at the mouth of the Monterey Submarine Canyon, the Bay is home to a diverse community of studied and yet to be studied species. Scientists cannot know the extent of how the brine discharge and dune disturbance could affect life in the Bay, but operation of a desalination plant would terminate the possibility of finding out until after it is too late to resolve related issues.

Lastly, due to the location of the site, this proposed desalination plant would inequitably affect the already overburdened residents of Marina, a city that is not a customer of CalAm but would shoulder environmental degradation caused by the project, without the potential compensation of reduced water bills. Though the production of this desalination plant would provide water at a discounted rate to residents of Castroville, this benefit does not outweigh the harm it would cause the Marina community. Instead, a different solution to support Castroville residents that would not directly harm inhabitants of other areas must be sought out.

Exorbitant costs, environmental risk, and inequitable distribution of these burdens make this desalination project unjustifiable. While desalination may prove to be a viable option in the future, current technologies constrain this method to be expensive, both in terms of economic and environmental resources. I urge you to stand strong in this decision to deny the existence of a desalination plant at this time and in the foreseeable future.

Sincerely,

Kailee Huebner

Don't go rogue! Support the Coastal Commision staff report!!! Back Science not political influence! Deny Cal Am boondoggle desalination project location.

Tammie Timmion <adagio3737@aol.com>

Thu 9/10/2020 5:15 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

I hope and pray our government agencies will protect us from predatory water companies that hold monopoly powers fixated on pursuing THEIR AGENDA at any means necessary to advance THEIR bottom line. Cal Am sees an opportunity for a land grab. They know it's not an ideal location, it's only a convenient location opening up to pursue THEIR agenda to profit from a desal plant. It will never be built even if they corrupted our Coastal Commission! It makes no sense for the community. The extremely profitable New Jersey corporation AWK parent to Cal Am has nothing to loose promoting and trying ever trick in the book to get this concept accepted by the Coastal Commision. Please stop this madness dismiss Cal Am. We who live in the Monterey Bay know we deserve better than to have our water tied to a New Jersey Water Corporation (AWK - American Water Works) whose facade Is "California American Water" or Cal Am. Dismiss the project at this location now and forever! PLEASE! Thank you for doing your job to protect us.

Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Mark Kintz <Mark@fc-cpa.com>

Thu 9/10/2020 5:09 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Mark Kintz, and this is my family. We bought our first home in Marina in 1999, homeschooled all four of our children here (now adults in professional jobs) and plan to retire in this same house someday. My wife was a stay-at-home mom, and I am a CPA in public practice in Monterey. We've worked with many non-profits as a family, but the one we're most proud of is being on the founding board of https://www.norcalmtb.org/ (which became NICA https://www.nationalmtb.org/) and expanded across the country, coast to coast, and whose mission is to introduce youth to a healthy and active outdoor lifestyle and stewardship of our public lands and trails. The nearby Fort Ord National monument was/is an amazing place for these NICA kids, and we coached high-school teams from our house in Marina from 2002 to 2015 when we passed the torch. The team is still going strong. https://bikemonterey.org/monterey-bay-lightfighters-mountain-bike-team-2018.html

My concerns with the CalAm project are many, but the most pressing and concerning aspect to me is the uncertainty about how much water supply (Marina's sole aquifer) really exists, and the very real possibility that the CalAm project will have the undesired effect of exacerbating the existing sea-water intrusion into this already stressed aquifer. Add to this that Marina takes all of this risk, without benefitting by receiving a single-drop of this water, and the whole idea is unacceptable.

I'm not opposed to desalinization in principal, but according to my read of CC staff's report there are less costly alternatives, and if a desalinization plant needs to be built, in the interest of fairness it ought to be built within a jurisdiction who will receive the water. (There is an existing small desal plant already in Sand City on Bay Ave I beleive)

Please deny the Cal Am project.

Respectfully,

Mark Kintz CPA (and family)

Environmental Justice on desalination project

Araceli suarez-padilla <asuarez-padilla@csumb.edu>
Thu 9/10/2020 5:04 PM
To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear California Coastal Commission,

Marina, Seaside, and Sand City are all cities with notable low-income communities that are within the scope of this proposed project who would be greatly affected if these plans should come into fruition.

These cities have vulnerable, low-income populations that cannot handle another adversity to overcome in their lives being the addition of higher water costs, especially considering water is essential to life. Marina is a city that is already disproportionately home to multiple industrial development projects such as the mining facility, regional landfill, composting facility, and sewage plant which are services that are all outsourced by other cities(pg.89). In Seaside more than a third of its residents have an income below 200% of the federal poverty level. This city is also home to the largest population of African Americans (7%) in the affected area and to various other ethnicities making up the majority of the population at 69% being non-white(pg.90). The risk of displacing these communities is high due to the delicate nature of a low-income person's finances especially with the soaring cost of housing already present. Many residents have described the frugal measures they have implemented into their daily lives such as " ...using their dishwashers only to dry dishes, flushing toilets only once a day, taking showers at municipal facilities instead of at home, not washing clothes as often, removing gardens, or using greywater for irrigation" but to no avail, as water prices continue to rise(pg.95).

Cal-Am has tried to address this problem by implementing a discount on their water called Low Income Ratepayer Assistance ("LIRA") where disadvantaged residents can apply for a monthly discount of up to 30%. This program has many very specific requirements such as, "having an individually metered or flat-rate residential meter, having the water or sewer bill held in the name of program participants, and having household income" below the set poverty level(pg.94). These barriers make it

hard for all people in need to access this discount because of different living situations. the inability to have ownership of the water bill in their name due to renting, or not qualifying due to their income not meeting an unrealistically set low number. In addition to it being inaccessible, "Residents participating in the LIRA program who were interviewed also stated the discount does not offset the impacts of increasing rates still."[1](pg.95).

Through all this struggle, this desalination project is not intended to service them in the first place, but it is harming them the most in the long run. Marina's locals will have to deal with constant construction disturbing the ocean which many are concerned about due to the potential effects their cherished home may feel. On top of the high cost of living, and COVID-19's impact on the economy, these rising water rates may be enough to drive many natives out of their homes due to insufficient funds. This issue is exorbitantly affecting them as there are "seven times as many individuals in Marina and in Cal-Am's service area that would be burdened by the desalination facility as those in Castroville that would benefit (based on a federal low-income threshold)(pg.95).

This could all be avoided if the Pure Water Expansion project is put into action as an alternative. The projected cost of water is "one-third to one-half of Cal-Am's proposed Project", making it a far more economically friendly option(pg.9). As well as being low cost, this project is less intrusive, allows for the cities to avoid unnecessary damage to its beauty, and it would mean the world to the citizens that would otherwise be pushed out of their homes.

Source

Cal Am

Roland Martin <rolhmar95@yahoo.com>

Thu 9/10/2020 5:02 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

For the past twenty five years the CPUC has allowed Cal Am to grow both volume and profit at the expense of its ratepayers, primarily residential. This practice has, today, saddled those residential ratepayers with the highest cost water for comparable utilities in the United States. Its projected desal project will drive the price of water higher by a magnitude, with two profit centers rather than one. This
unnecessary burden must be stopped. It is your duty to represent the people on this peninsula, not Cal Am. Adequate less new water is availble now, not at some future date, by Pure Water Monterey.
Please deny Cal Am its desal authorization.
Respectfully,
Roland Martin, resident, Carmel Valley.

Desal Plant

Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Patricia Wagy <patti@wagy.net>

Thu 9/10/2020 4:48 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear CA Coastal Commissioners
Executive Director John Ainsworth and staff:

My name is Patricia Wagy; I am a resident of Marina, California since 1995. I have seen Marina undergo many changes and challenges in the last 25 years. Our small community shares the burden of an abandoned army base with its toxic remnants, a regional waste management dump with its impact seen on our freeways and frequent stench in our neighborhoods, and a sand plant which blights our coastline.

I am a retired registered nurse, living on a fixed income. I take pride in our small community and I am seen frequently with my husband of 50 years picking up trash in our neighborhood with our pogey sticks. Marina should not have to bear another burden of a harmful project by a greedy corporation that threatens our ground water and the beauty of our coastline.

Please deny this harmful project. Thank you.

Sincerely,

Patrica Wagy
Concerned Marina Resident

DENY NO Cal Am Desal Project

Judi Lehman <jlehman@redshift.com>

Thu 9/10/2020 4:46 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear Coastal Commissioner and Staff:

Please, Please DENY the Cal Am Desal Project.

The local leaders and the community all know the **Expansion of Pure Water Monterey** will provide a long-term sustainable water supply for decades of growth. It will support affordable housing and economic recovery and avoid environmental damage and environmental injustice to Marina.

The good work and fine deeds of the Pure Water Monterey supports the Expansion with source water, primarily the 8,000 acre-feet of excess wastewater, that is now discharged into the Bay. This is a WIN for the Ag (they don't have to pay more to treat it before they flush or use it again), a WIN for the Ratepayers (Affordable), a WIN for the environment AND it's contractually secure and drought proof !!

And the community did it - now Cal Am is trying to block and destroy it.

Please, Please DENY the Cal Am Desal Project.

Sincerely,
Judith Lehman
186 Hacienda Carmel, CA 93923

Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Gaely Jablonski and I am a 32 year resident of Marina, CA. My husband, David, and I have lived on the Monterey Peninsula since the early 1970's and found that Marina was not only an affordable community in which to raise our children, it is a community we love because it's filled with a rich ethnically diverse populace of very hard working families. We raised our 2 children here and spent time on our beach as often as time allowed.

When we purchased our home David was a Commercial Fisherman which was difficult as he was gone 80 percent of the year. The children and I were very involved in our community; Marina City Tree Committee, Marina Larger Library, Marina's soccer and baseball/softball, Boy Scouts, and many school activities. David and I began a stainless and aluminum fabrication shop in 2002 so that he could be home with the family.

I would be repeating what has been said time and again by so many others about why this project is terrible for our beloved community of hard working individuals but I implore you to Please deny the, very harmful, CalAm Project. Listen to your staff, they did get it right the first time and have continued to prove this again in their current report.

Thank you for your time.

Very Sincerely,

Gaely Jablonski

Letter to Coastal Commission.pdf;

Hello,

I have attached a letter to the California Coastal Commission that is written from the point of view of one of the potentially threatened species regarding the proposed desalination plant in Marina. I hope this offers a new perspective to the Coastal Commission.

--

Hailey Rizzo
Environmental Studies Major
Pre Law Minor
CSU Monterey Bay

To the California Coastal Commission

I am a Western Snowy Plover, one of the few that are left on the Pacific Coast. I was born and raised on the dunes in Marina and I will live my entire life here. I spend my days foraging for food down by the water and making a nest for my young in the dunes where I was born.

One day, as I am collecting shell and vegetation fragments for my nest, many people arrive in large trucks and construction equipment. They are planning to put wells near my home as I am getting ready to mate. I try to build my nest regardless of the noise and machinery, but I am forced further and further away from my home and there is less land for other birds like me. I am unable to find a nesting site that is protected from predators and far enough away from other nests. I do not mate this year.

I spend the next year adapting to the machinery and people encroaching on my home. They have taken up 6 acres of land and many birds like me could not mate last year. This year, we are determined. I begin making my nest early this year in hopes of finding adequate space to raise my young, but sadly I am unable to find the necessary vegetation for building my nest. I make do with pebbles and fish bones, but I can not find a mate. Many birds like me have left their home to find more space.

A few months later, the trucks and machines are gone. There's fewer people in my home, but they left behind wells. Over the next five years life begins to go back to normal. The vegetation grows back, some birds return home, and I am able to mate. I have two broods a year and produce many offspring before the people return.

The people came back to my home with their trucks and machinery. They are working again. I watch as my offspring fail to find space to mate and raise their young. This happens every five

years for the next 20 years. Eventually, there are no birds like me left on the dune I used to call home.

I am not sad that I had difficulties mating or that my young could not raise their own. I am not sad that I watched so many birds like me leave their home or that there are no birds like me in Marina anymore. I am sad that I was not protected. The few other Western Snowy Plovers and I that once called Marina home could have been protected by the California Coastal Commission when they voted against the Desalination Plant in Marina. The construction during my breeding season, the loss of my home, and the continual disturbance of my home could have been prevented. I was born and raised on the dunes in Marina, but I did not get to live my whole life there.

Signed 

One of the last Western Snowy Plovers in Marina

Matthew Zefferman
3114 Bayer Street

San Francisco, CA 94105-2219

Re: Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Dear Chair Padilla and Commissioners

I am writing to urge you to adopt your staff's recommendation and ***deny*** the permit for CalAm's desal project and uphold the City of Marina's denial of the permit. I am an elected board member of the Marina Coast Water District, but am writing this letter in my personal capacity. I also regularity enjoy access to our amazing beach, one of the few accessible beaches on the central coast in a disadvantaged community.

As a small water district that primarily serves the disadvantaged community of Marina, we have a hard time getting our voices heard in the face of CalAm's money and political connections. I commend your staff for evaluating the arguments and evidence presented by all of the stake-holders in this proposed desal project and coming to a decision on the merits.

This project is not needed and will not serve a purpose, other than padding CalAm's profit margin. The Pure Water Monterey expansion will give the peninsula enough water for decades at lower cost and without the environmental harm. I especially appreciate their care in examining the project's harms to residents of Marina and Seaside, two communities that will unfairly bear the burden of this unnecessary project.

The Coastal Commission staff did an outstanding job reviewing the evidence and came to the right decision.

Sincerely,

//signed//

Matt Zefferman

Tiffany Buraglio <Buraglios@outlook.com>

Thu 9/10/2020 3:16 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

CalAm has been fleecing the residents of the Monterey Peninsula for their water for years. The icing on the cake was CalAm asking users to conserve water and when they did, they jacked the rates up because they didn't have enough revenue coming in. What???

The Desal project has been an overpriced ridiculous solution proposed by CalAm for a long while. The peninsula needs to reject this project and find another manager for the peninsula's water.

Dear Commissioners,
Please DENY Cal Am's Desal Project on September 17, 2020.
As a 15 year-long Seaside resident and Cal Am ratepayer, I can say with knowledge and conviction that the Desal Project is NOT in the public interest. It is economically and environmentally unjust. We cannot afford to pay $6000 - $8000 per acre per foot for water! Water is a treasure of the environment and its necessity for life makes it a basic human right.
The Pure Water Monterey Expansion is the feasible, environmentally and economically just alternative. It provides a long-term, sustainable water source capable of supporting affordable housing, economic recovery, protection for the Carmel River and the steelhead trout, and protection for the Seaside basin.
Cal Am has created lies in letters and postcards to ratepayers and the general public, and presented lies to you.
The California Coastal Commission has worked very hard and diligently doing its own research and homework and proven that it is a full and competent match for Cal Am in trying to secure economic and environmental justice for the people of the Monterey Peninsula, especially for our sister town, Marina. I sincerely thank you for doing this work and helping the environment and the people.
I sincerely ask that you continue to do this fine work in denying the Cal Am Desal Project.
I request that you support the Pure Water Monterey Expansion.

Thank you for all your hard work, time and consideration.

Respectfully yours,

Patricia Fay-Magiera

Seaside, CA 93955-5554

September 9, 2020

Attn: Thomas Luster

California Coastal Commission

Dear Commissioner Luster:

As a resident of Seaside, I have been active door to door in Seaside with Public Water Now, in order to find a sustainable and affordable water supply and delivery system. Today, I write to you as a Seaside homeowner and senior.

On 9/17/2020 the final decision will be up to you and your Commissioners. Your rejection of Cal Am's proposed desal plant is vital to me and my fellow residents of Seaside. Many here are living below the poverty line, many are average citizens just doing their best working and living here with family and friends, or by themselves. Others are seniors struggling on a fixed income to hold onto their apartments, homes, neighborhoods and health. We simply cannot afford to pay $6000 to $8000 per acre foot for water, which is a human right and necessity.

There is no affordable living without affordable water.

The Pure Water Monterey Expansion is the feasible, economically and environmentally just alternative to Cal Am's desal project. It provides a long-term, sustainable water source capable of supporting affordable housing, economic recovery, and protection for the Carmel River and the Seaside basin.

Please follow your Staff's recommendation to **deny** the proposed Cal Am desal project.

Thank you for your time, consideration and hard work!

Respectfully yours,

Patricia Fay-Magiera

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Dear California Coastal Commissioners, Ex. Dir. Jack Ainsworth, and staff:

I am writing to you in support of Pure Water Monterey Expansion project. The CCC staff "Got it Right, Again!" I have read the 154-page report from cover-to-cover. The PWM Expansion is a far superior alternative to Cal-Am's desalination project and here are my top 10 reasons why!

1) PWM Expansion will come on line faster.

2) Cost less money!

3) Exceeding less environmentally damaging!

4) Is already pumping recycled water (the preference by your commission) into the Seaside Basin.

5) Does no harm to the Salinas Valley Groundwater Basin.

6) Will provide plenty of water for everyone in our water district for decades to come and allows for conscientious development, growth, and lots on record.

7) Will help restore the steelhead population in the Carmel River.

8) There will no longer be over-pumping of water from the Carmel River, removing the state's 1995 cease and desist order.

9) Does not burden low-income ratepayers in the Monterey Cal-Am district over another low-income group outside of the district. This is NOT Environmental Justice.

10) Has the potential to be the pioneer in recycled water, successfully championing environmental challenges in a climate changing world.

Deny Desal!

Respectfully,
Troy Ishikawa

Cal Am Desal Permit Denial

ouchie contributor <contributor@ouchie.us>

Wed 9/9/2020 12:26 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Hello California Coastal Commissioners,

I have been a Monterey County resident for three years. I was astonished to learn that a publicly traded corporation owns our regional water rights and infrastructure. Although I am strongly in support of private business and particularly value the model of public contracts which support independently owned and operated family and other corporate businesses, I believe that water systems should not be involved in business structures like publicly traded commodities. Water and the ability to utilize that water at a zero to extremely low cost is a basic human right. I believe that the stock market incentives of essential shared resources, such as water, elicit a monetary focus that un-justifiably uses a public resource as a methodology of commerce.

As a resident, I have personally experienced how Cal Am has leveraged our essential public resource for their corporate and shareholder objectives. My Cal Am water rate was burdensome to my budget.

Additionally, I received marketing materials from a Cal Am contracted marketing firm that contained mis-leading and inaccurate statements. They have clearly shown an interest in leveraging Federal and State funds to enrich their economic objectives. They have increased rates dramatically over my Brief residence in the county and show no intent to lower rates.

I have been aware their actions to side step environmental protections and to challenge the city of Marina on water rights. I do not believe that Cal Am is correctly managing the water system and respecting the water basin beyond their immediate region.

I strongly advocate that you deny Cal Am's permit application.

Thank you for your consideration,

Dustin Faddis

LETTERS MUST BE IN BY FRIDAY. They can be short, just ask them to DENY Cal Am's Desal Project.
Cal Am and its supporters are asking people to send letters to the Coastal Commission.
Please take a few minutes to counter Cal Am's effort with your own letter.

Email your letter to CalAmMonterey@coastal.ca.gov
Subject: DENY Cal Am's Desal Project

Support the Coastal Commission staff report in your letters. I recommend reading the summary. It's just the first 11 pages here: https://documents.coastal.ca.gov/reports/2020/9/Th3a&4a/Th3a&4a%20Staff%20Report.pdf

Melodie

Updated Key points to draw from:
– Cal Am's Desal project is not in the public interest
– Pure Water Monterey Expansion is the feasible and environmentally preferable alternative
– It will give us a new water supply much sooner than desal
– Our current water supply from Pure Water Monterey – Phase 1 (3,500 acre-feet) will allow us to stop illegal withdrawals from the Carmel River by December 2021.
– Our current water supply will restore the Carmel River and protect the Steelhead. The environmental issues facing the Carmel River have been resolved by Pure Water Monterey without the need for Cal Am's desal or the PWM Expansion.
– There is no Carmel River crisis
– We don't need Cal Am's oversized, over priced desal project to solve our problems
– The Expansion of Pure Water Monterey will provide a long-term sustainable water supply for decades of growth. It will support affordable housing and economic recovery and avoid environmental damage and environmental injustice to Marina.
– No Affordable housing without affordable water. Cal Am's desal would double our water bills.
– Cal Am is the only obstacle to the expansion of Pure Water Monterey.
– Cal Am cannot be trusted. Passing Measure J was the community's statement
– Desal damages the environment, costs too much and creates environmental injustice
– Desal harms the coastal habitat and Marina's beautiful dunes
– Desal has no legal source water, it would draw groundwater from an overdrafted groundwater basin NOT under the ocean
– PWM Expansion source water is primarily the 8,000 acre-feet of excess wastewater that is now discharged into the Bay. It is contractually secure and drought proof
– Orange County has used this same system for decades
– Cal Am has had 25 years to solve or water supply

problem
– Our public agencies have solved it in the last 6 years. Now all the water we need for decades is available, but Cal Am is blocking it

Subject: Cal Am's Desal Project

Dear Commissioners,

I am writing in support of the findings of your staff for Cal Am's Desal project. The Desal project is not in the public interest. There will be damages to the coastal habitat and Marina's sand dunes as well as creating an environmental injustice. There is no water supply crisis and we don't need Cal Am's oversized, overpriced desal project to provide our future water supply.
Pure Water Monterey Expansion is the feasible and environmentally preferable alternative that in Phase 1 (3,500 acre-feet) will allow us to restore the Carmel River and stop illegal withdrawals by December 2021. It will give us a new water supply much sooner than desal without Cal Am's proposed doubling of our water bills.

Desal has no legal source water. It would draw groundwater from an over drafted groundwater basin NOT under the ocean.

Expansion of Pure Water Monterey provides a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and protecting the Carmel River and the Seaside basin.

PWM Expansion source water is primarily the 8,000 acre-feet of excess wastewater that is now discharged into the Bay. It is contractually secure and drought proof. Orange County has used this same system for decades.

Cal Am is the only obstacle to the expansion of Pure Water Monterey.

Cal Am cannot be trusted. Passing Measure J was the community's statement.

Thank you for your consideration of this matter.

Sincerely,

Dustin Cook, Cal Am customer, resident of Carmel Valley

Subject: Comment re Sept. 17th CCC meeting

Please deny Cal Am permission to build its troubled slant well desalination project. The majority of our community and elected leaders do NOT support this project. We have a less expensive, less invasive solution in the Pure Water Monterey expansion.

Our region should not be forced into Cal Am's expensive desal, especially not while a pandemic is clobbering our economy. Building it would double our ratepayer's water bills at a time we can least afford it, as well as slowing our economic recovery.

We know Cal Am promotes its desal because it **earns a 9.2% rate of return on its capital investments.** If Cal Am buys water from the recycling project, the cost is passed through to customers with no profit going to Cal Am's corporate parent and shareholders.

Recycled water from the Pure Water Monterey Expansion can supply sufficient fresh water to our region for a generation. In the long term, we may need desal, but let's use the best design available then. Today's desals are expensive because pressures of more than 1,000 pounds per square inch must be generated to push the salty water through filters.

Livermore Lab researchers have recently developed a technique that lowers the cost of desalinating seawater. https://www.llnl.gov/news/new-desalination-technique-uses-flow-through-electrodes-faster-desalination-and-lower-cost

It uses new porous carbon materials, allowing saltwater to flow easily through electrodes, making it much more energy-efficient. Let's wait!

Not using Pure Water Monterey, the affordable solution the Monterey One Water Board has given us, would be just another Cal-Amity! Let's ditch divisive Cal Am, and our best regional water decisions will literally bubble up.

Subject: DENY Cal Am and the Desal Project

Hello,

I am a lifelong Monterey resident, and have been following our water issues in the area for over 25 years.

I would like to make one thing clear. No one that I have talked to here wants this overpriced, environmentally damaging Desal plant proposed by Cal Am.

In fact, people are very passionate about blocking it from ever getting built.

Cal Am has been trying to mislead the public with false information, so please consider that if you receive ANY letters from the public on Cal Ams behalf. They have been asking people to write letters based on their deceptive propaganda. I will get back to this.

No citizen hearing actual facts would ever choose this Desal Plant over the Pure One Monterey project. Unless, of course they had a financial interest.

This community is very proud of the Pure One Monterey project, and we are looking forward to our future with them. They are doing a fantastic job, and Pure One Monterey brings a sense of pride to our community.

Cal Am has worked very hard to block Pure One Monterey and it's expansion at every step. The SOLE PURPOSE of Cal Am blocking it is so they can profit from this expensive Desal build, and charge ratepayers outrageous amounts of money for water.

Cal Am has been working diligently against concerned citizens, ratepayers and even our own Water District that they are supposed to be supporting.

This Desal Plant will be litigated heavily. They want to build it right in the middle of a sensitive coastal habitat. It also may very well affect the water quality in Marina as well.

Even without litigation, this proposed Desal Plant is well out of reach of the goal to satisfy the Carmel River Desist Order. It's way too late for the Desal Plant to be operational by the end of 2021.

This Desal Plant is also EXPERIMENTAL, it's never been done with slant wells in this manner, anywhere, ever. It is possible it may not even operate as planned.

There is no doubt that it will draw more salt water toward the basin, as that would be the goal.

That could possibly contaminate the Marina water supply further, and draw their cleaner water toward the coast. I am no scientist, but I believe science and logic when I hear it. Logically, it only makes sense to me.

Regardless, Cal Am has no right to take water from the Marina Basin, or draw water anywhere near it. It is not something that we need to experiment with. The City of Marina is fully prepared to litigate this with hard science.

Marina is miles away from Monterey, and there has not been much talk or consideration about the additional environmental damage done from digging more trenches for more piping. Especially near the coast and the proposed site.

There is so much wrong with this Desal project, I can't even cover everything here.

Through news and social media, Cal Am has been spreading lies/ deception about the need for a Desal Plant. As a lifelong citizen of this county, it is has been frustrating to see Cal Am mislead fellow citizens like that.

I would be happy to forward you some of their overtly misleading messages at your request, so you can make your own judgement. It should be illegal for a company to lie to the public like that.

We, the people are tired of Cal Am working against our better interests for profit. That is why the majority of ratepayers voted to buy out/ get rid of Cal Am.

Dave Stoldt, General Manager of the Monterey Water District thoroughly crunched our water numbers. Mr. Stoldt says Pure One Monterey can easily relieve our reliance of the Carmel River. I believe that to be accurate, as Mr. Stoldt has our best interest in mind.

The better plan is to expand Pure One Monterey, which will supply us with enough water for at least another 25 years.

In the future, Desal technology will inevitably improve, and become more affordable. There is also new technology coming forward that could potentially replace Desal. Choosing Pure One Monterey will leave us with better options for the future.

If Cal Am had our best interest in mind, they themselves would have been pursuing other options to relieve our reliance from the Carmel River. Doing things like blocking the Pure One Monterey Water expansion shows you their true colors.

It makes no sense, unless you have ulterior motives like profit in mind.

Without Pure One Monterey, there would be no backup plan. Cal Am has no other plan. It seems Pure One and the Monterey Water District may have "saved the day" for us. Kudos to them.

Please vote to DENY this unwanted Desal Plant. Our water district has a plan, and our best interest in mind. I am confident we are in good hands.

Thank you for your time!
Wayne Kelly

Subject: Cal Am's Desal Project

Dear Coastal Commissioners,
I am a resident of Seaside, CA. My work and passion are in conservation and wise and equitable community stewardship of our collective natural resources. I am writing in support of the findings of the Staff Report referenced here: https://documents.coastal.ca.gov/reports/2020/9/Th3a&4a/Th3a&4a%20Staff%20Report.pdf

My intention in writing today is to assert my strong sentiment that the referenced California American (Cal Am) Water Desalination project is not at all in the public interest. The dogged insistence of Cal Am to press forward with the Desalination Project reflects, I believe, the company's utter disregard for the will and needs of the community in and around the Monterey Peninsula, and its interest rather in serving its own profit motive.
I do believe that the Pure Water Monterey Expansion is the most desirable alternative, allowing for a resolution of environmental issues related to withdrawal from the Camel River as well as future development.

I sincerely appreciate your consideration.

To: Coastal Commission Members and Staff

Re: Cal Am desal proposal – please oppose

Cal Am's proposal to build a behemoth of a desalinization plant is worse than a boondoggle. Cal Am states that it is a sustainable project and that it is the only adequate source of water for the Monterey Peninsula. In fact, it is neither. The Pure Water Monterey project, which uses reclaimed water, treats it by four separate, state of the art filtration systems – and then injects it in the ground water supply – is the sustainable, adequate, and affordable way to address the Monterey Peninsula's water needs. What does Cal Am do about Pure Water Monterey? It refuses to enter into a contract to buy this water – water which is ever so much cheaper than what Cal Am would produce if the desalinization plant were built. Fact is, Cal Am makes money on the development of a desal plant. It makes more money the bigger and more expensive that plant is. They have designed a plant that is not needed. For reasons both of cost and the environment, the desal plant should not go forward.

For many years I worked at the chief staff for a California Assembly Committee where, among other things, it was my job to evaluate the proposals and positions various groups took on legislation. I checked everything and everyone. I soon learned who could be trusted with not bending the truth or providing self-serving arguments while omitting the facts that countered their positions. It is partly for this reason that I am amazed that Cal Am has any credibility with public agencies. Cal Am continues to present arguments that have been shown to be untrue. They make claims they cannot back up. They are under a cease and desist order that they ignore and get delays for compliance, time after time. They cannot be trusted.

In their most recent letter to rate-payers, asking them to support Cal Am's position on the desal plant, Cal Am argues that the desal plant is the only viable option to supply the Peninsula with water. It has been proven over and over again that this is not true. Various studies have shown that the Pure Water Monterey expansion program will provide adequate water to the Peninsula to meet its needs long into the future.

In the same letter, Cal Am lauds the rate payers for being a leader in conservation – conservation that Cal Am chose to punish us for by asking for increases in water bills to compensate them for our lower water usage.

Basically, Cal Am's desal proposal is in the interest of Cal Am – not in the public interest. The Pure Water Monterey project will deliver adequate water to the Peninsula at 1/6 the cost of the desal plant. But Cal Am will not make money on this project as it would on the $1.2 estimated desal plant!

I spent most of my career working on affordable housing. I know how hard it is to get affordable housing accepted in communities and built. Cal Am's argument that it favors affordable housing, and that the desal plant is the way to achieve affordable housing is so far off the mark it is laughable.

- Cal Am would have you believe that there is a water crisis on the Peninsula. There is not. The Pure Water Monterey expansion project is the only viable and affordable proposal for the rate payers of the Peninsula.

- Cal Am would have you believe that the desal plant is the only way to resolve the cease and desist orders facing Cal Am for taking water from the Carmel River and the Seaside Basin that it should not have taken. It is not. Pure Water Monterey will, by December of 2021, provide enough water so that Cal Am will not need to take excess water from the Carmel River and Seaside Basin. All Cal Am needs to do is to agree to purchase the water. The desal plant, if approved, would not be on line for years, delaying Cal Am's ability to meet the terms of the cease and desist order – yet again.

Please do not saddle Monterey Peninsula rate payers with a desal plant that is not needed and will double our water bills. We already pay the highest costs for water in the country. Your staff has analyzed the situation well. I support that analysis. Please put an end to this desal proposal once and for all.

Thank you very much for your consideration.

Sincerely,

Renee Franken

Subject: Supporting Local Management of Water Resources

To whom It May Concern.
These are my thoughts relative to your supporting our local (Monterey area) management of our water resources.
1. I don't think that Cal Am's Desal project is in the public interest
2. Pure Water Monterey Expansion is the feasible and environmentally preferable alternative.
3. Our new water supply from Pure Water Monterey – Phase 1 (3,500 acre-feet) will allow us to restore the Carmel River and stop illegal withdrawals by December 2021. The environmental issues facing the Carmel River are resolved without Cal Am's desalination project.
4. There is no water supply crisis
5. There cannot be affordable housing without affordable water. Cal-Am's desal would double our water bills.
6. We don't need Cal Am's oversized, overpriced desal project to solve our future water supply needs.
7. The expansion of Pure Water Monterey provides a long-term sustainable water source that is capable of supporting affordable housing, economic recovery, and protecting the Carmel River and the Seaside Basin.
8. Cal-Am is the only obstacle to the expansion of Pure Water Monterey.
9. Finally, in the efforts over past years on this topic, I am convinced that Cal-Am management cannot be trusted as theirs is a profit versus service motive.

Subject: Cal Am Desal Plant Marina

Dear Coastal Commissioners and Staff,

I am writing to express my concern about the upcoming Coastal Commission review of the California-American (Cal Am) slant well desalination plant in Marina. I strongly urge you to deny this request.

Firstly, the City of Marina and its citizens will not reap any benefits from this project, but in fact, they will suffer significant harm as Cal Am removes ground water from the city's sole source of potable water. This is clearly an environment injustice to the citizens of Marina, who already shoulder a disproportionate share of the regional environmental burden, as both the regional wastewater treatment facility and the regional waste management facility are located in or nearby Marina.

Secondly, I have reviewed both the EIR and the studies supporting it. They are fundamentally flawed, and even though these flaws were noted in the peer review, no action was taken to address the flaws. Specifically, Lawrence Livermore National Laboratory peer reviewers questioned both the number and the duration of the sample wells as input to their groundwater modeling. All models are biased, and this one was purposefully designed to bias it towards showing no impact to sea water intrusion.

Lastly, one must ask the question: why Marina? Clearly, if desalination was truly the goal of the project, other locations could easily suit this purpose. But other communities - communities where the residents are more affluent and more likely to be able to defend themselves against a multinational corporation, they knew they could not get public support. Furthermore, I do not believe that Cal Am even has the support of their rate payers on this project.

In fact, Monterey One Water is a much better option for both the Peninsula rate payers, for the environment and for social and environmental justice.

I strongly urge you to head the citizens of Marina, Cal Am rate payers, and your own staff report and reject this appeal.

Subject: Appeal No. A-3 MRA-19-0034; Deny CalAm Desalination Project Permit
Attachments: anna b.jfif; buckwheat.jfif; dune veg.jfif; pelicans.jfif; smith's blue.jfif; marina dunes.jfif

I was born and raised in the Central Coast area and I am lucky enough to have retired in Marina, CA. I live in Marina because it is affordable, but also because it is a nature lover's paradise. I live a mile or so from Fort Ord Dunes State Park, Fort Ord Natural Reserve, Marina State Beach and the Monterey Bay Coastal Recreation trail. I frequent these places on a daily basis. There is no better feeling than breathing in the ocean air; watching the dunes change from their drab winter coloration to the bright blooms of spring and summer; or catching a glimpse of the rare but beautiful Smith's blue butterfly or of the delicate and threatened Snowy plover.

I love the dunes so much and they are so important to me, that I volunteer my time with the State Parks Foundation to remove invasive plant species. I also volunteer with other organizations in the area that feed the homeless, protect ocean wildlife and assist local students. I don't point this out to pat myself on the back but to explain that this is the norm here. Everyone who is able to, gives back to the community—protecting nature and its citizens. It is this strong sense of community that makes this area home, both to people and to wildlife. Because for those of us that are so lucky to live in such a blessed area, the homeless are not invisible but individuals. The animals also are not invisible, but individuals that are recognized by their specific traits or the little nooks and crannies of the area that they call home. Here, we live in concert with nature.

That is why I am opposed to the proposed CalAm desal project. The desal plant is not compatible with the culture of this area. It is a selfish endeavor in an area with an overabundance of selflessness. It harms rather than enhances the natural environment. It pollutes rather than restores water and habitat to pristine condition.

The desal plant is also NOT a logical choice:

1. It is too expensive and its slant-well technology is unproven and known to be environmentally harmful.
2. Rather than providing fresh water, it may actually endanger Marina's aquifer of fresh water which has taken nature 20,000 years to create and which should be a treasure that is protected rather than exploited.
3. It would be a slap in the face to residents who have worked so hard over the years to conserve water and to find solutions, like Pure Water Monterey, that ARE compatible with our culture.
4. It makes no sense to expect Marina to risk it's water, lose a big part of its beautiful shoreline, further stress threatened plant and animal life—and get absolutely nothing in return.

I respect a company's need to be profitable. But there are honorable and reasonable profits and there is that which is unethical. For the reasons noted above, I feel moving forward with the CalAm desal plant would be highly unethical. The choices that CalAm has made in the past (overdrafting the Carmel River, overcharging for dismantling of the San

Clemente dam, etc) are the reasons that this community has no faith in this multi-national company which so obviously does not care about Marina and the Peninsula, but only cares for its shareholders.

Please deny CalAm's Desal permit so that Marina residents can get back to our important business of taking care of our community--especially in this time of pandemic and extreme economic hardship--and so we can quit wasting our time, money and energy defending ourselves against this ridiculous and irresponsible project. We are not asking for anything—except to be left alone.

Subject: Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit

Hello, California Coastal Commissioners:

My name is Leslie Asher. I am a retired teacher and Marina resident. I know our city and others need more fresh water. Though desalination could help, California American Water's plant would:
-- be partly built at a beach site where a sand mining plant will be removed
-- not draw water directly from the ocean
-- instead draw water from aquifers beneath Marina that are currently our only source
-- not return to Marina any improved water, or payment
-- incur a cost your staff estimates to be 2 to 3 times greater than that of an alternative project
-- and increase water costs to customers in nearby cities who already pay among the highest rates

So please deny a permit for CalAm's plant.

Sincerely,

(Mr.) **Leslie Asher**

TO: California Coastal Commission

RE: Th3a & 4a - Appeal No. A-3-MRA-19-0034

First, desal is an environmental disaster in the making. Desal requires huge amounts of energy which requires burning fossil fuels that contribute to the on-going climate change, which in turn contributes to seal level rise that will reduce the lifespan of the proposed supposedly wonderful slant wells, a technology not used anywhere else in the U.S.

Second the test slant well has proved that it does not draw pure seawater. Rather slant wells will draw water from multiple jurisdictions most of whom Cal Am does not serve. Just as Cal Am is over drafting the Carmel River, the slant wells will be drawing water from sources Cal Am does not have rights to.

The energy efficient (they use land fill gas to generate electricity), resource sustainable, Pure Water Monterey's expansion has been shown that it will provide both enough potable water, so that Cal Am can stop over drafting the Carmel River and PWM will provide water for anticipated growth.

We urge that you deny both the De Novo Permit and the Regular Permit. It is time for Cal Am concentrate its efforts on system maintenance.

Thank you!

Subject: Comment re Sept. 17th CCC meeting

Please deny Cal Am permission to build its troubled slant well desalination project. The majority of our community and elected leaders do NOT support this project. We have a less expensive, less invasive solution in the Pure Water Monterey expansion.

Our region should not be forced into Cal Am's expensive desal, especially not while a pandemic is clobbering our economy. Building it would double our ratepayer's water bills at a time we can least afford it, as well as slowing our economic recovery.

We know Cal Am promotes its desal because it **earns a 9.2% rate of return on its capital investments.** If Cal Am buys water from the recycling project, the cost is passed through to customers with no profit going to Cal Am's corporate parent and shareholders.

Recycled water from the Pure Water Monterey Expansion can supply sufficient fresh water to our region for a generation. In the long term, we may need desal, but let's use the best design available then. Today's desals are expensive because pressures of more than 1,000 pounds per square inch must be generated to push the salty water through filters.

Livermore Lab researchers have recently developed a technique that lowers the cost of desalinating seawater. https://www.llnl.gov/news/new-desalination-technique-uses-flow-through-electrodes-faster-desalination-and-lower-cost

It uses new porous carbon materials, allowing saltwater to flow easily through electrodes, making it much more energy-efficient. Let's wait!

Not using Pure Water Monterey, the affordable solution the Monterey One Water Board has given us, would be just another Cal-Amity! Let's ditch divisive Cal Am, and our best regional water decisions will literally bubble up.

--
For every vision, there is an equal and opposite revision.

Subject: Stop the CalAm desalination plant

CalAm is Still pushing their costly desalination plant on us, the customers, and it would be grossly at our expense in even more expensive water and probable environmental risk.
The Pure Water Monterey PWM system has now been proven to be a safe, economical, ready to run system that can meet our water needs NOW and into the future with out a risky and long wait for a desalination plant that will only benefit the goals of corporate profits. We cannot wait for a in proven, costly desalination plant and we don't need to, we have PWM in operation right now and it can be expanded in the future to meet our needs in a safe, economical way.
I urge you to reject their fear tactics and proven false claims.
Sincerely,
Doane Hoag in Carmel

Subject: DENY Cal Am and the Desal Project

Hello,

I am a lifelong Monterey resident, and have been following our water issues in the area for over 25 years.

I would like to make one thing clear. No one that I have talked to here wants this overpriced, environmentally damaging Desal plant proposed by Cal Am.

In fact, people are very passionate about blocking it from ever getting built.

Cal Am has been trying to mislead the public with false information, so please consider that if you receive ANY letters from the public on Cal Ams behalf. They have been asking people to write letters based on their deceptive propaganda. I will get back to this.

No citizen hearing actual facts would ever choose this Desal Plant over the Pure One Monterey project. Unless, of course they had a financial interest.

This community is very proud of the Pure One Monterey project, and we are looking forward to our future with them. They are doing a fantastic job, and Pure One Monterey brings a sense of pride to our community.

Cal Am has worked very hard to block Pure One Monterey and it's expansion at every step. The SOLE PURPOSE of Cal Am blocking it is so they can profit from this expensive Desal build, and charge ratepayers outrageous amounts of money for water.

Cal Am has been working diligently against concerned citizens, ratepayers and even our own Water District that they are supposed to be supporting.

This Desal Plant will be litigated heavily. They want to build it right in the middle of a sensitive coastal habitat. It also may very well affect the water quality in Marina as well.

Even without litigation, this proposed Desal Plant is well out of reach of the goal to satisfy the Carmel River Desist Order. It's way too late for the Desal Plant to be operational by the end of 2021.

This Desal Plant is also EXPERIMENTAL, it's never been done with slant wells in this manner, anywhere, ever. It is possible it may not even operate as planned.

There is no doubt that it will draw more salt water toward the basin, as that would be the goal.

That could possibly contaminate the Marina water supply further, and draw their cleaner water toward the coast. I am no scientist, but I believe science and logic when I hear it. Logically, it only makes sense to me.

Regardless, Cal Am has no right to take water from the Marina Basin, or draw water anywhere near it. It is not something that we need to experiment with. The City of Marina is fully prepared to litigate this with hard science.

Marina is miles away from Monterey, and there has not been much talk or consideration about the additional environmental damage done from digging more trenches for more piping. Especially near the coast and the proposed site.

There is so much wrong with this Desal project, I can't even cover everything here.

Through news and social media, Cal Am has been spreading lies/ deception about the need for a Desal Plant. As a lifelong citizen of this county, it is has been frustrating to see Cal Am mislead fellow citizens like that.

I would be happy to forward you some of their overtly misleading messages at your request, so you can make your own judgement. It should be illegal for a company to lie to the public like that.

We, the people are tired of Cal Am working against our better interests for profit. That is why the majority of ratepayers voted to buy out/ get rid of Cal Am.

Dave Stoldt, General Manager of the Monterey Water District thoroughly crunched our water numbers. Mr. Stoldt says Pure One Monterey can easily relieve our reliance of the Carmel River. I believe that to be accurate, as Mr. Stoldt has our best interest in mind.

The better plan is to expand Pure One Monterey, which will supply us with enough water for at least another 25 years.

In the future, Desal technology will inevitably improve, and become more affordable. There is also new technology coming forward that could potentially replace Desal. Choosing Pure One Monterey will leave us with better options for the future.

If Cal Am had our best interest in mind, they themselves would have been pursuing other options to relieve our reliance from the Carmel River. Doing things like blocking the Pure One Monterey Water expansion shows you their true colors.

It makes no sense, unless you have ulterior motives like profit in mind.

Without Pure One Monterey, there would be no backup plan. Cal Am has no other plan. It seems Pure One and the Monterey Water District may have "saved the day" for us. Kudos to them.

Please vote to DENY this unwanted Desal Plant. Our water district has a plan, and our best interest in mind. I am confident we are in good hands.

Thank you for your time!
Wayne Kelly

Subject: Appeal No. A-3-MRA-19-0034; Deny CalAm Desalination Project Permit.

From: Nancy Fortman
Dear CA Coastal Commissioners, Executive Director John Ainsworth and staff:

My name is Nancy Fortman; I am a resident of Marina, CA. I have lived in Marina for 31 years. I am a retired school teacher. I taught in San Francisco and Menlo Park, but was not able to purchase a home on a private school teacher's salary in those areas. I was grateful to find an affordable home in Marina and more grateful once I retired and the commute was over! Marina qualifies as a disadvantaged community from the perspective of diverse census population, poverty levels, overburdening of regional projects of landfill and sewage plant and high regional affordable housing requirements. Permitting CalAm's projects once again subjects the citizens of Marina to yet more harmful projects of an illegal water grab that will negatively impact the sole source of water for Marina. This is a clear example of Environmental Injustice.

I ask that you consider Environmental Justice and the fact that there is a much better solution offered by the PWM Expansion Project when making permit decisions and deny CalAm permits to their proposed slant wells and desalination plant in Marina.

Signed,
Nancy Fortman

Subject: denial of the expansion of pure water Monterey

Please deny the expansion of Pure Water and the cancellation of the CalAm desal project.

Not only the Monterey Peninsula but the whole of Monterey County needs a new supply of fresh water.

The source for Pure Water is waste water the majority of which has its origins as water pumped from the 400 ft aquifer of the Salinas Valley. (Ag drainage from tile and vegetable processing) I know, I was responsible for installing many of these systems.

Reliance on this source will contribute to the ongoing degradation of the Salinas aquifer from salt water pollution. At minimum any use of recycled water on this scale should be used to mitigate further pumping in the Salinas Valley. Once Monterey becomes reliant on this source Pure Water will go to any lengths to maintain it. CSIP was designed with well located in the intruded zone, why wouldn't Pure Water do the same? Would they have a choice in a drought year.

Salt water intrusion is literally at the city limits of Salinas.

Currently the solution for land owners south of Cooper Rd, (the boarder of CSIP) is to drill into the 800 ft aquifer. Without any other alternative, the City of Salinas is next in line for multiple 800 ft wells. The 800 ft aquifer is not well understood and may not present any long term solution for what is a major shortage of fresh usable water.

Desalination is the only really new water source. While it may not be economically feasible to use it for growing, it represents a much needed alternative for municipal use. Salinas, the city proper and all the surrounding developed area as well as the Monterey Peninsula will need an alternative to water pumped from the 400 ft aquifer. Public health issues will demand it in Salinas and Monterey is not assured that ag pumping hence drainage will not be restricted by the State Department of Water Resources due to the advancement of intrusion.

You should approve the desal project and start building the pipeline towards Castroville and Salinas, Pronto.

Subject: Cal Am Desal Scam (1 Sept 2020)

Dear Coastal Commission Board ...

This letter is drawn from a Memorandum from Public Water Now. Since it covers all the vital points of the latest Cal Am's latest desal scam, I am sending it to you to state that I am in complete agreement with the PWN position:

• Cal Am's Desal project is not in the public interest

• No Affordable housing without affordable water. Cal Am's desal would double our water bills.

• We don't need Cal Am's oversized, over priced desal project to solve our future water supply needs.

• Expansion of Pure Water Monterey provides a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and protecting the Carmel River and the Seaside basin.

• Cal Am is the only obstacle to the expansion of Pure Water Monterey.

• Cal Am cannot be trusted.

• Pure Water Monterey Expansion is the feasible and environmentally preferable alternative

• Our new water supply from Pure Water Monterey – Phase 1 (3,500 acre-feet) will allow us to restore the Carmel River and stop illegal withdrawals by December 2021. The environmental issues facing the Carmel River are resolved without Cal Am's desal.

• There is no water supply crisis.

Thank you for your time and consideration.

Subject: Please deny a coastal development permit to California American Water

Dear Commissioners:
I urge you to stand by your staff's recommendation against the permit. Staff's report released August 25, 2020 reaffirms the position taken by the staff last year, arguing that the desal plant should be abandoned due to environmental concerns, especially considering that the less impactful expansion of Pure Water Monterey exists.

In the current era of heightened awareness about racial justice, a section of the report is particularly apropos to the Monterey Peninsula: "The community of Marina is already disproportionately burdened by many other industrial uses and would receive none of the project benefits. There is a long history of government institutions allowing unwanted industrial development to be concentrated in underserved communities of color without their consent."

CalAm will try to convince you that "a future without desal is, in essence, kicking the can down the road and increasing costs for customers in the long run" (Catherine Stedman, CalAm spokesperson).

The truth is that the Pure Water expansion will allow CalAm to cease its illegal water withdrawals from the Carmel River by December 2021.

Those of us CalAm ratepayers who live here do not need CalAm's oversized, over-priced, intrusive desal plant to solve our future water supply needs. We need to expand what is already built here and working just fine.

Thank you for supporting Staff's report.
Respectfully yours,

Subject: Deny Cal Am

Dear Commissioners,

Our future on the Monterey Peninsula desperately needs you to turn down Cal Am's proposed desal plant in favor of recycled water. Cal Am is similarly desperate to keep us under their giant thumb. We are their Cash Cow…their means of making stockholders happy.

If Cal Am is allowed to force their desal on our community, we will have:
- a bloated, hugely expensive and unnecessary desal plant;
- Marina suffering from the illegal drawing of their groundwater for desalination intake;
- degradation of the coastal environment and high energy expenditures.

We do NOT need their desal plant; desalination of seawater (not groundwater) will be needed some time in the future. It should be a public, regional effort. Enough drinking water is available to us for at least two decades by just expanding the currently operating recycling plant—Pure Water Monterey, a publicly-run facility—with no coastal impact, far less financial impact and nothing illegal.

But Cal Am will stop at nothing. Please help us.

To: Coastal Commission Members and Staff

Re: Cal Am desal proposal – please oppose

Cal Am's proposal to build a behemoth of a desalinization plant is worse than a boondoggle. Cal Am states that it is a sustainable project and that it is the only adequate source of water for the Monterey Peninsula. In fact, it is neither. The Pure Water Monterey project, which uses reclaimed water, treats it by four separate, state of the art filtration systems – and then injects it in the ground water supply – is the sustainable, adequate, and affordable way to address the Monterey Peninsula's water needs. What does Cal Am do about Pure Water Monterey? It refuses to enter into a contract to buy this water – water which is ever so much cheaper than what Cal Am would produce if the desalinization plant were built. Fact is, Cal Am makes money on the development of a desal plant. It makes more money the bigger and more expensive that plant is. They have designed a plant that is not needed. For reasons both of cost and the environment, the desal plant should not go forward.

For many years I worked at the chief staff for a California Assembly Committee where, among other things, it was my job to evaluate the proposals and positions various groups took on legislation. I checked everything and everyone. I soon learned who could be trusted with not bending the truth or providing self-serving arguments while omitting the facts that countered their positions. It is partly for this reason that I am amazed that Cal Am has any credibility with public agencies. Cal Am continues to present arguments that have been shown to be untrue. They make claims they cannot back up. They are under a cease and desist order that they ignore and get delays for compliance, time after time. They cannot be trusted.

In their most recent letter to rate-payers, asking them to support Cal Am's position on the desal plant, Cal Am argues that the desal plant is the only viable option to supply the Peninsula with water. It has been proven over and over again that this is not true. Various studies have shown that the Pure Water Monterey expansion program will provide adequate water to the Peninsula to meet its needs long into the future.

In the same letter, Cal Am lauds the rate payers for being a leader in conservation – conservation that Cal Am chose to punish us for by asking for increases in water bills to compensate them for our lower water usage.

Basically, Cal Am's desal proposal is in the interest of Cal Am – not in the public interest. The Pure Water Monterey project will deliver adequate water to the Peninsula at 1/6 the cost of the desal plant. But Cal Am will not make money on this project as it would on the $1.2 estimated desal plant!

I spent most of my career working on affordable housing. I know how hard it is to get affordable housing accepted in communities and built. Cal Am's argument that it favors affordable housing, and that the desal plant is the way to achieve affordable housing is so far off the mark it is laughable.

- Cal Am would have you believe that there is a water crisis on the Peninsula. There is not. The Pure Water Monterey expansion project is the only viable and affordable proposal for the rate payers of the Peninsula.

- Cal Am would have you believe that the desal plant is the only way to resolve the cease and desist orders facing Cal Am for taking water from the Carmel River and the Seaside Basin that it should not have taken. It is not. Pure Water Monterey will, by December of 2021, provide enough water so that Cal Am will not need to take excess water from the Carmel River and Seaside Basin. All Cal Am needs to do is to agree to purchase the water. The desal plant, if approved, would not be on line for years, delaying Cal Am's ability to meet the terms of the cease and desist order – yet again.

Please do not saddle Monterey Peninsula rate payers with a desal plant that is not needed and will double our water bills. We already pay the highest costs for water in the country. Your staff has analyzed the situation well. I support that analysis. Please put an end to this desal proposal once and for all.

Thank you very much for your consideration.

Sincerely,

Renee Franken

Re: Appeal no. A-3-MRA-19-0034
Hearing: September 17, 2020

September 1, 2020

Dear Coastal Commissioners,

I am writing in support of staff's recommendation for denial of a permit for Cal Am's slant well because Pure Water Monterey Expansion is a feasible alternative that would avoid harming Environmentally Sensitive Habitat Area (ESHA).

Because I live in the coastal zone in Pacific Grove, I'm aware of the importance of protecting ESHA, whether located in Marina or in Pacific Grove. Pages 35 and 36 of the staff report explain that the site of Cal Am's well, at the CEMEX site, contains the federally-threatened Monterey spineflower, the federally-endangered Smith's blue butterfly, and the threatened Snowy Plover.

Please enforce Coastal Act policy to protect ESHA by denying Cal Am's application and support instead the Pure Water Monterey Expansion.

Respectfully,

Jane Haines

Re: Special Meeting Notice: September 17, 2020

Mr. Chairman and Members of the California Coastal Commission,

If it is your plan to delay any sort of decision with respect to CalAm's Slant Well boondoggle, then it appears you are succeeding! If, sometime in the future, you folks decide to solve this Desal issue – why not seriously consider and help the two DeSal operations in Moss Landing: Deep Water DeSal and/or The Peoples' Desal Project who offer water at rates well below CalAm's proposal.

Problems with the Slant Well technique:

1. ***Riparian Rights:*** The natural flow of affected water aquifers are not within the boundaries of Cal Am's legal access. Subsequent attempts by Cal Am to access this water will lead to litigation, more delays, and massive legal expenses.
2. ***Salt Water Intrusion:*** Cal Am performed a modest test with a single slant well and located several monitoring wells to determine if their technique would draw water from existing aquifers – the result was that some of the monitoring wells did experience a drop in the water level.
3. ***Cost of Cal Am's Slant Well project is excessive!*** In 2011 the Ratepayer Advocates (a subsidiary of the CPUC) had estimated the cost of this Slant Well technique at between $7,000 and $7,900 per acre foot.
4. ***Conflict of Interest . . .*** A Public Utility, like California-American Water Co (Cal-Am), is a legal monopoly created, supposedly, for the public benefit. California, in an effort to restrict a public utility from excessive fees, rate increases or other potential abuses to their customer base, created the CPUC as an advocate for the rate payer.

   I have to ask: "Since the CPUC is the "Lead Agent" for this EIR, ***Who remainsto speak for the rate payer here?*** & ***Why is this not a conflict of interest?!"***
5. ***Possible Conflict of Interest:*** To Mr. Paul E. Michel I confess I did not know that NEPA (Monterey Bay National Marine Sanctuary) was acting as a lead agent – silly me. I congratulate Cal-Am. If I wanted to insure my EIR passed with flying colors, I would procure you as one of my lead agents.

For your perusal (if you are interested) – I am enclosing two letters sent on earlier dates – one to CPUC Rate Payers Advocates (May 18, 2015) and one to CA Coastal Commission (Santa Cruz June 2, 2019)

Sincerely,

Virgil M. Piper

Re: Monterey Peninsula Water Supply Project, CDP Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 –Source Water for Pure Water Monterey Expansion and Concerns About the Latham & Watkins Outfall Lining Proposal

Dear Commissioners and Staff,
I was an employee of the engineering consulting firm Montgomery-Watson for over 10 years prior to being hired by Monterey One Water (M1W). I retired from M1W in May 2020 as their Principal Engineer after working for them for over 30 years. I was involved in the Pure Water Monterey (PWM) project since it began and was involved in the previous Groundwater Replenishment Project from 2006. Most recently, I was the project manager for the planning, environmental review, and permitting of the approved PWM Project, and managed the design and construction of the Advanced Water Purification Facility (AWPF). I was also the project manager for the Monterey Peninsula Water Supply Project components involving M1W facilities, including the project's NPDES permitting process, brine mixing facility, outfall protection components, and return flow agreements. I was a coauthor of Appendix M (found at purewatermonterey.org/wp/wp-content/uploads/Final-SEIR-Proposed-Modifications-PWM-GWR-Project-April-2020.pdf), Source Water Operational Plan Technical Memorandum, for the Pure Water Monterey Expansion (PWME) Supplemental Environmental Impact Report (SEIR) along with Alison Imamura who remains an M1W employee. The Technical Memorandum was prepared in consultation with Denise Duffy & Associates, Schaaf & Wheeler, Perkins Coie, Monterey Peninsula Water Management District (MPWMD), who funded the majority of the SEIR, and Monterey County Water Resources Agency (MCWRA).

I wish to address two issues: 1) the analyses in Appendix I and M demonstrates that the PWME has sufficient source water to meet the 2,250 acre-feet per year yields requested by MPWMD), and 2) the liquid applied liner that CalAm proposed to protect M1W's Land Outfall is not viable based on information provided in the submittal to the Coastal Commission.

Pure Water Monterey Expansion Source Water

M1W met with MCWRA and discussed water rights and water availability for months during the SEIR preparation process for PWME. At one-point MCWRA said that they disagreed with the numbers but did not provide M1W with details. MCWRA indicated that they felt that M1W incorrectly interpreted the Amended and Restated Water Recycling Agreement (ARWRA). Perkins Coie, an outside land use, environmental and water rights law firm, reviewed M1W's source water rights as part of the SEIR. Those finding were presented to MCWRA prior to publishing them in the Draft SEIR in November 2019. MCWRA, in response, requested that M1W pay one-half the cost for an independent legal review of the water rights. M1W agreed. MCWRA has not pursued.

Appendix I of the SEIR (found at purewatermonterey.org/wp/wp-content/uploads/Appendices-to-M1W-Draft-Supplemental-EIR-11-7-2019.pdf) shows the source water availability. Appendix I was based on average flows for the years 2009 through 2013. Drought flows were based on 2013. These flows were from the same time period as the EIR for the original project. Appendix I showed there was sufficient source water for the PWME. Expansion would reduce additional water available for the Castroville Seawater Intrusion Project (CSIP) by 700-800 AFY but still provide thousands of acre-feet more for CSIP than before the Pure Water Monterey Project. Appendix M was written after reading the Draft SEIR comments and seeing the extent of misinformation about source waters. Since the SEIR was written as a supplement to the original project it was unclear to some where the water would come from for expansion versus the base project. The base project provided additional water for CSIP as well as for groundwater replenishment. Appendix M was intended to show how existing water rights could be used between the base Pure Water Monterey Project, Marina Coast Water District's (MCWD's) Regional Urban Water Augmentation Project (RUWAP), and the PWME. Appendix M used 2018 as a typical normal year reflecting reduced wastewater flow (and presumably drinking water demand) related to increased conservation. 2015 was chosen as a severe drought year. The purpose of using single years was to show how available water could be used in specific cases, namely a typical wet or normal year and a drought year. The drought year scenario could be repeated for multiple years without adversely affecting the project yield. The source water sources in order of priority are shown below:

1. Secondary Effluent to the Ocean Outfall. This is water that would otherwise be sent to the ocean.
2. Reclamation Ditch. The ARWRA allows M1W to use this water. At the time I helped write Appendix M, I believed this water was available for both the base project and expansion; however, I only used it for the base project due to comments from MCWRA.
3. Blanco Drain. Similar to the Reclamation Ditch, the ARWRA allows M1W to use this water. At the time I helped write Appendix M, I believed this water was available for both the base project and expansion; I only used it for the base project because of the feelings of MCWRA.
4. Agricultural Wash Water. This new source water is currently available for M1W to use for recycling by either the PWM AWPF or the Salinas Valley Reclamation Project (SVRP) according to the 2015 agreement between the City and M1W and the SWRCB Wastewater Change Petition (Order No. WW0089). The ARWRA states that M1W would be able to use the water for either purpose also, but if certain conditions in Section 16.15 are not satisfied it may be reserved for MCWRA. For Appendix M, it was assumed to be available only to meet approved PWM Project yield requirements and for recycling using SVRP for CSIP use.
5. Recycle Sump #1. This water contains sewage from the MRWMD facilities and from the west side of the Regional Treatment Plant (RTP). The ARWRA allocates one-half of this water to MCWRA and one-half to M1W because it originates from outside M1W's 2001 service area boundaries.
6. Recycle Sump #2. This water is from the east side of the RTP. The ARWRA allocates one-half of this water to MCWRA and one-half to M1W again because it originates from outside M1W's 2001 boundaries.
7. Approved Pure Water Monterey Project Advanced Water Purification Facilities Backwashes, including those from producing water for MCWD. This includes the ozone and the pre-membrane filtration screening wastes plus the membrane filtration backwashes. The ARWRA allocates one-half of this water from outside M1W's 2001 boundaries to MCWRA and one-half to M1W.
8. PWME Backwashes. This is the same as the previous water type except it is only for the proposed expansion and M1W's portion could only be used for the expansion.

9. Salinas Valley Reclamation Project Backwash. The ARWRA allocates one-half of this water from outside M1W's 2001 boundaries to MCWRA and one-half to M1W. Appendix M assumes increased use of recycled water by CSIP and an associated increase in backwash flows throughout the year.
10. Boronda. This sewage is captured and sent to the RTP by the City of Salinas. However, the sewage comes from outside M1W's 2001 boundaries and so, per the ARWRA, one-half of this water is allocated to MCWRA and one-half to M1W.
11. Farmworker Housing. Sewage from this new project is captured and sent to the RTP by the City of Salinas. However, the sewage comes from outside M1W's 2001 Boundaries and so, per the ARWRA, one-half of this water is allocated to MCWRA and one-half to M1W.
12. M1W's ARWRA Summer Water. Section IV 4.01 1 (d) of the ARWRA allocates 650 AFY to M1W during the months of May through August.
13. Salinas River Diversion Facility (SRDF) Screening. Screening from the SRDF returns to the RTP Headworks where it combines with other sewage and is treated through the RTP. Per the ARWRA, one-half of this water is allocated to MCWRA and one-half to M1W as it comes from outside M1W's 2001 boundaries. M1W has rights to one-half this water. This water was available in 2018, however, since this water is not available each year it was not used in the Appendix M calculations. If the ARWRA was not in effect, M1W would have rights to use this water if it is discharged into M1W's infrastructure.
14. Salinas Industrial Water Treatment Facility Pond System. Since this water is from outside M1W's 2001 boundaries, one-half may be considered to be allocated to M1W per the ARWRA, or use of this water would require execution of a separate agreement between parties for that water to be considered a New Source Water per ARWRA section 16.15(6). The facilities to send this water to the RTP are a joint project between M1W and the City of Salinas and are currently under construction. However, to be conservative, it was assumed to not be available in the Appendix M calculations.

MCWRA has been working to meet the six conditions in Section 16.15 of the ARWRA since November 2015. Should they meet those conditions, then Appendix M shows that M1W has sufficient water for wet, normal or drought conditions. Should MCWRA not meet those six conditions in Section 16.15 of the ARWRA, then Section 16.16 would apply and according to Appendix M, M1W would need to utilize part of the operation reserve (described in the Water Purchase Agreement) during drought years.

The conclusion from Appendix M is that M1W has more than enough source water for the PWM base project, for MCWD's RUWAP project, and for the PWME in all foreseeable situations.

The Liquid Applied Liner Proposed to Protect M1W's Land Outfall is Not Viable as Proposed

Latham & Watkins' August 17, 2020 email to Mr. Tom Luster suggests a liquid applied lining alternative to the Outfall Protection Project that is under design by Brown & Caldwell Consulting Engineers. California American Water has paid for and been involved in that design work for years. Several projects I worked on for M1W provided me with experience related to this proposal. The Cannery Row Sewer Maintenance Projects in which I needed to apply to the California Coastal Commission to allow for an over ground temporary pipeline from M1W's Reeside Pump Station to a sewer manhole in the beach. I managed two M1W Ocean Outfall repair projects using divers to install the WEKO seals whose replacement is part of the project you are reviewing. Those projects taught me about the difficulty of pulling hose and working just 2,000 feet from an entry point in 60-inch diameter reinforced concrete pipe (same size and manufacturer as the pipe in question). In those projects we used a 24-inch diameter pipe to discharge secondary effluent onto the beach from the Junction Structure. I was also project

manager for M1W's Ocean Outfall Inspection and Maintenance contracts. I learned of the difficulty of drilling into 60-inch reinforced concrete pipe (same size and manufacturer as the Land Outfall). I also was project manager on several liquid applied lining projects and for many of them, I was also the inspector. These taught me the importance of rigorous confined space safety requirements, of a dry and warm concrete surface to avoid blistering, and how hot the employees doing the spraying can become.

A few of the problems I see with the Latham & Watkins' proposal include:

1. The four-inch diameter bypass pipe is far too small, and even if four-inch diameter pipe could be large enough, it would not work within the outfall pipeline. A bypass pipe of 18 to 24 inches would be more appropriate depending on the size of the pumps and the pressure rating of the pipe. This bypass pipe would need to be buried under Del Monte Blvd. and Lapis Road and discharge into the Beach Junction Structure which would need to be open during the lining process (requiring excavation).
2. The Beach Junction Structure would also be needed to remain open as an alternate rescue point for the confined space entries and to provide air flow and potentially for material supply.
3. No mention is made of the proposed lining material. The only mention is repair using epoxy grout. My experience is that epoxy grout is not an appropriate material for this application. A liner material should be flexible to provide a similar longevity to a PVC liner.
4. A fan system would be needed to push air between the Beach Junction Structure and the Access Point to dry the pipeline, remove heat, and to provide a safer working environment.
5. More hoses are needed than the five (resin, resin hardener, hot water supply, hot water return, and airline) listed. A spare backup air hose for worker (plus two additional air lines each for additional workers and for an inspector), a separate life line for each person in the pipe, a communication line for each person in the pipe, pressurized water for the water blasting, and vacuum hose for removing water and debris. It is very unclear how the "electric carts" could maneuver through this maze of hoses nor through the bends in the outfall.
6. No mention is made of how to restore the access point and protect the pipe after the liner is spray applied.
7. The proposal does not seem to consider employee safety and that this is an extreme confined space situation.

My experience with EIRs is that at least a 10% design is required to adequately determine the environmental impacts of a proposed project. This proposed alternative for lining the final portion of M1W's Land Outfall is far short of a 10% design.

I would be happy to discuss any of these issues with you and provide additional information. I can be reached at 831-277-9044. Thank you for your consideration.

Sincerely,

Robert B. Holden

MEMORANDUM

September 9, 2020

To: Keith Van Der Maaten, General Manager, Marina Coast Water District

Response to question from Secretary Jared Blumenfeld regarding Cal-Am resiliency to 5-year drought

Secretary Jared Blumenfeld asked on the call today: ***If the California-American Water Company ("Cal-Am") is confronted with a five-year regional drought impacting the Monterey Main System, how could they manage to comply with the cease and desist order without the proposed desalination plant?***

As result of my review of the items listed in the report WaterDM submitted to the Marina Coast Water District on April 21, 2020 and supplemental report WaterDM submitted on July 1 and other related and relevant documents and reports, my own independent analysis, and my expertise in municipal and industrial water use, water management, and engineering, I offer the following responses to Secretary Blumenfeld.

1. **Cal-Am can and must comply the Cease and Desist Order (CDO) in 2022.**
   The analysis conducted by WaterDM shows that Cal-Am's demands have reduced greatly and it has sufficient supplies to comply with the CDO, even under drought conditions.

2. **Secretary Blumenfeld is correct, desalination will not be available anytime soon to meet normal year or drought demands.** Under the most optimistic scenario, Cal-Am's proposed desalination plant could be brought on-line nearly three years after final approvals are received, but it will likely take considerably longer. The hypothetical five-year drought could have started in 2020**.** <u>The fastest (and least environmentally damaging) way to bring a new water supply to the Monterey Peninsula is the Pure Water Monterey Expansion, which could make water available in less than 24 months</u>.

3. **Even without the proposed desalination facility or the Expansion, Cal-Am has a relatively drought resilient, diversified annual water supply of 10,100 AF.**
   WaterDM's analysis of Cal-Am's water sources included the historic impacts of the most recent drought periods (2007 – 2011 and 2014 – 2017) and represent a firm yield estimate of available supply. Under drought conditions Cal-Am's legal supplies include the Carmel River, from which Cal-Am will still be entitled to 3,376 acre-feet (AF) in 2022 and beyond plus an additional 300 AF from Carmel River – Permit 21330. Cal-Am also has other sources that are largely not drought impacted including: Seaside Basin Native Groundwater, ASR recovered water, the Sand City Desalination plant, and the Pure Water Monterey recycling facility. Cal Am also has banked carryover water in storage in the Seaside Basin. As shown in Figure 1 from WaterDM's July

supplemental expert report, by the end of 2020 Cal-Am will have more than 3,394 AF banked in groundwater storage and this will grow to 7,144 AF in 2022. This storage reserve is available to help Cal-Am manage through a period of drought.

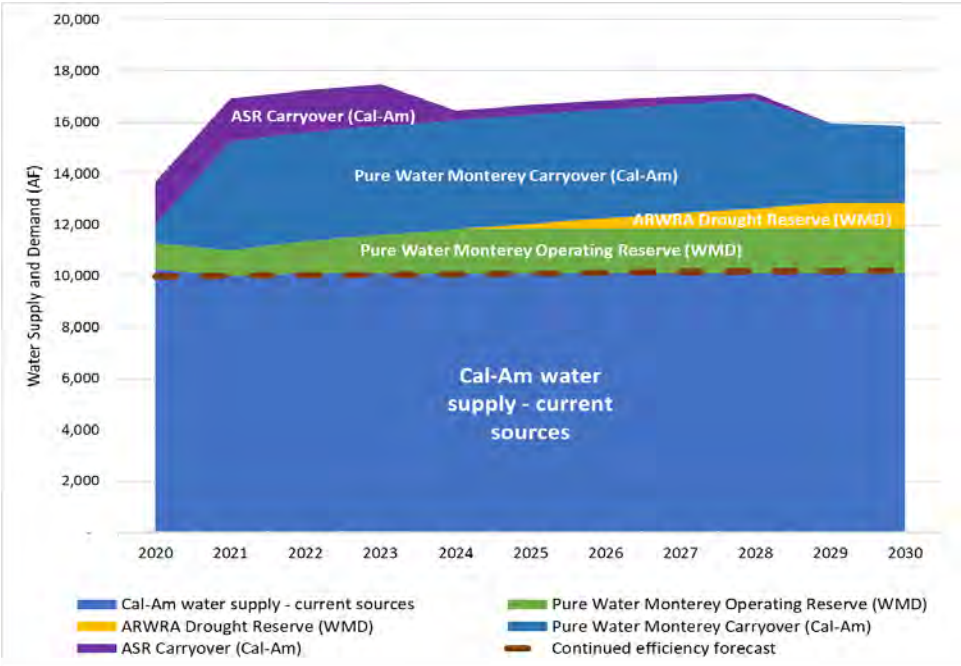

Figure 1: Cal-Am Monterey Main System current supply sources, forecast demand, and potential buildup of Seaside Basin groundwater reserve, 2020-2030

4. **Under a 5-year regional drought, mandatory restrictions are put in place that are not reflected in any demand forecasts.**
It is a certainty that under a severe drought, mandatory irrigation restrictions and other demand management measures will be put in place to reduce outdoor and other non-essential uses, over and above what Cal-Am already implements. Restrictions would not be limited to Cal-Am but will be mandated for all water providers in the drought-stricken region. These demand reductions are not reflected in any forecast or supply analysis and would certainly contribute to Cal-Am's ability to manage demand through the drought while complying with the CDO. As noted in WaterDM's April expert report the Monterey region has been regarded as a model for water conservation programs for many years. There are extensive on-going water conservation programs currently implemented across the Monterey Peninsula and California and these effective measures will reduce per capita demand into the future.

   The State of California has implemented a series of laws and directives to ensure future water efficiency across the state including Assembly Bill 1668 and Senate Bill 60. These laws and directives effectively mandate an ongoing reduction in per capita use. Cal-Am's continued compliance with these regulations and its active efforts to reduce customer water demand in the future are likely to gradually further decrease per capita water use across the service area.

Summary

In the dire event of a regional five-year drought that starts in 2020, Cal-Am's current sources of supply for the Monterey System, without desalination or the Expansion, are diversified and relatively drought

resilient. Mandatory demand restrictions beyond what Cal-Am implements ordinarily are not reflected in current forecasts and would further reduce demand and help extend Cal-Am's groundwater reserve supplies.

Analysis of supply deliveries through recent drought conditions shows that Cal-Am can comply with the CDO in 2022 without the desal plant or the expansion.

The fastest and least environmentally damaging way to bring a new water supply to the Monterey Peninsula is the Pure Water Monterey Expansion.

Sincerely,

Peter Mayer, P.E.
Principal

Figure 3: Cal-Am's available supply in 2022 9

SCOPE OF INVESTIGATION

This report is intended as an second supplement to the report WaterDM submitted to the Marina Coast Water District on April 21, 2020 and supplemental report WaterDM submitted on July 1, 2020 that expanded on the research, analysis, and forecasts prepared for the original report.

For this second supplement, I was specifically asked to respond to recent statements, opinions, and presentations offered by the California-American Water Company ("Cal-Am"), its consultants, and surrogates as they relate to future water supply and water demand of the Cal-Am Monterey Main system.

My opinions are based on my understanding of the information available as of the date of this report and my experience evaluating municipal and industrial water supplies and demands and conservation measures. In forming my opinions, I also considered the documents, testimony, and other materials listed in Appendix A. Should additional information become available to me, I reserve the right to supplement this report based on any additional work that I may conduct based on my review of such materials.

FINDINGS

As result of my review of the items listed in Appendix A and other related and relevant documents and reports, my own independent analysis, and my expertise in municipal and industrial water use, water management, and engineering, I offer the following responses to recent statements and opinions from Cal-Am:

1. **Cal-Am and its surrogates have offered numerous misleading statements and opinions when discussing supply and demand in the Monterey Main System. All of Cal-Am's apocalyptic claims are founded upon its inflated, unrealistic, and contradictory demand forecast.**

The strong recommendation from the staff of the California Coastal Commission to reject Cal-Am's proposed groundwater desalination project has pushed Cal-Am to double down on fictious and ominous claims of "water rationing" in 2022[1,2], economic doom and gloom[3], and threats to affordable housing and to any additional housing.[4] None of these claims are rooted in reality because the entire justification for the desalination project is predicated upon Cal-Am's inflated future demand forecast (Figure 1). Cal-Am and its surrogates are offering misleading statements rather than facts.

Neither the desalination plant nor the proposed Pure Water Monterey Expansion will be online and able to produce water by 2022. Thus, Cal-Am must comply with the cease-and-desist order (CDO) in 2022 without either project. Analysis completed by WaterDM shows this is possible in 2022 with existing, available supply sources.

Analysis conducted by WaterDM[5,6] shows that Cal-Am's demands have reduced greatly over the past 20 years, as shown in Figure 1. As a result of these reductions, with careful management Cal-Am has sufficient supplies to comply with the CDO, even under drought conditions. Cal-Am's claims of dire supply conditions in 2022 are not supported by the facts because all of their dire predictions are based on the unrealistic demand forecast shown in red in Figure 1, which is not a reasonable or accurate representation of current or future demand. In fact, Cal-Am's July 2019 CPUC filing projected demand for 2022 at 9,789 AF, not 12,350 AF.

[5] WaterDM. April 2020. Expert Report and Recommendations of Peter Mayer, P.E. Regarding Water Supply and Demand in the California American Water Company's Monterey Main System.

[6] WaterDM. July 2020. Supplemental Expert Report and Recommendations of Peter Mayer, P.E. Regarding Water Supply and Demand in the California American Water Company's Monterey Main System.

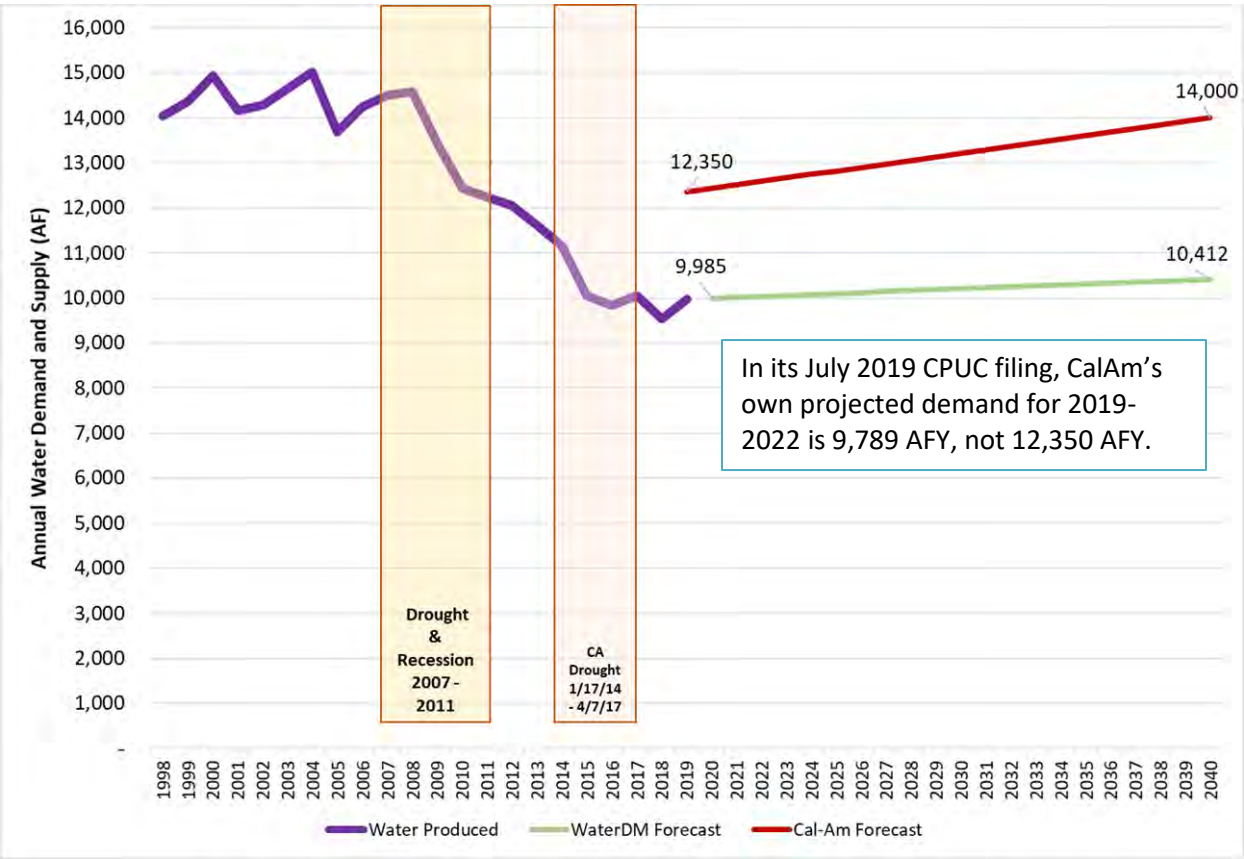

Figure 1: WaterDM and Cal-Am forecasts of future average annual production

Housing construction and affordable housing in particular will not be impacted if the desalination plant is not approved. Cal-Am's statements are misleading on the issue of housing as well. Most of the new housing, and in particular the new affordable housing, that will be constructed in the region in the near future will be built in the City of Marina, outside of the Cal-Am service area, not in Monterey or Carmel.

WaterDM's demand forecast shown in Figure 1 is based on the Associated Monterey Bay Area Governments (AMBAG) 2018 forecast of future population growth for the Cal-Am service area, and it includes all forecasts for future development across all sectors.

WaterDM also conducted an analysis to determine the reliable water sources available to Cal-Am for the Monterey Main system over the next five to ten years that will allow Cal-Am to eliminate its unlawful water diversions from the Carmel River in accordance with provisions of the CDO from the State Water Resources Control Board.

As shown in WaterDM's July supplemental report, in 2022 and going forward under the assumption of full compliance with reduction of Carmel River diversions under the CDO, Cal-Am will have 10,100 AF per year of water supply plus the buffer of banked storage in the Seaside

Basin. Figure 2 shows the combination of the available annual water supply and buildup of banked storage reserve along with the continued efficiency forecast and the impact of two hypothetical droughts in 2024 and 2029. This analysis illustrates how the buildup of storage provides a reserve for Cal-Am to draw upon if necessary.

WaterDM's analysis of Cal-Am's water sources included the historic impacts of the most recent drought periods (2007 – 2011 and 2014 – 2017) and represent a firm yield estimate of available supply. Under drought conditions Cal-Am's legal supplies include the Carmel River, from which Cal-Am will still be entitled to 3,376 acre-feet (AF) in 2022 and beyond plus an additional 300 AF from Carmel River – Permit 21330. Cal-Am also has other sources that are largely not drought impacted including: Seaside Basin Native Groundwater, ASR recovered water, the Sand City Desalination plant, and the Pure Water Monterey recycling facility. Cal Am also has banked carryover water in storage in the Seaside Basin.

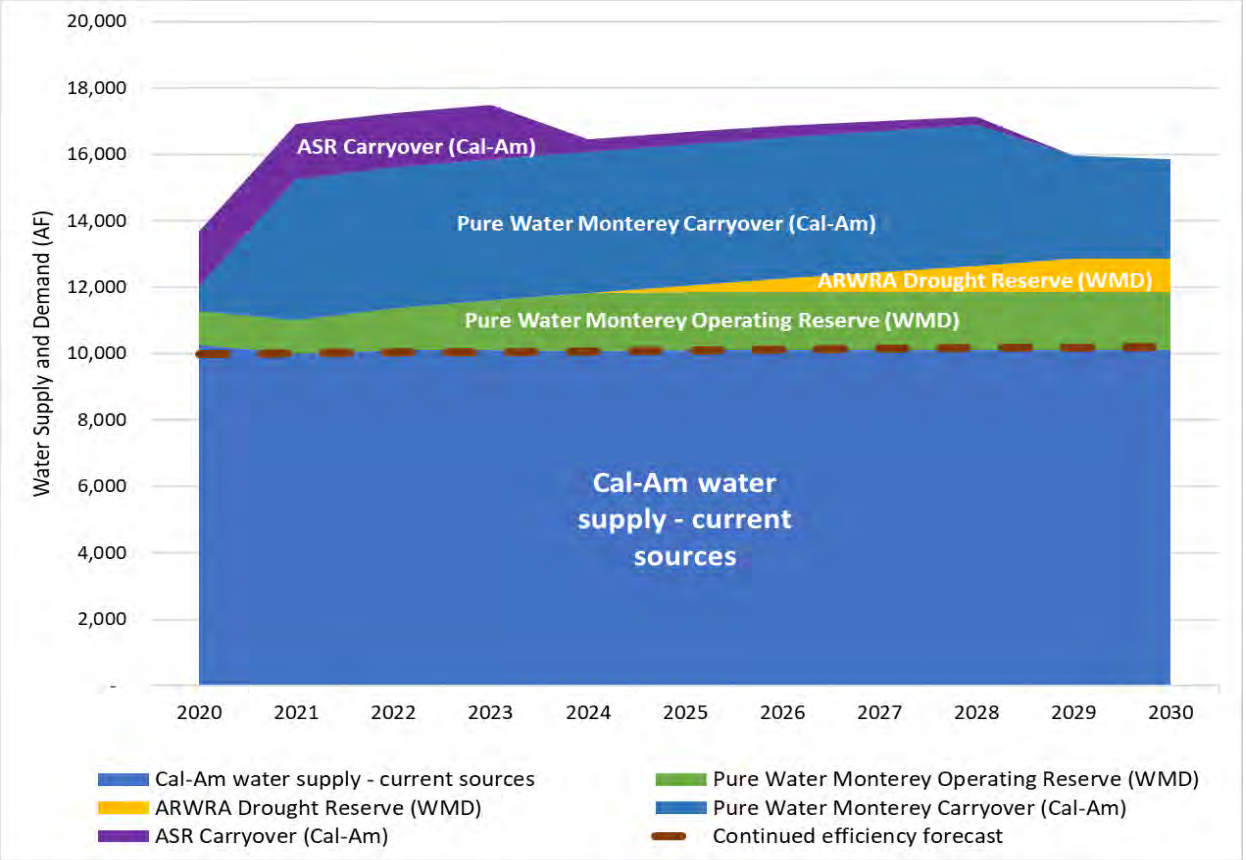

Figure 2: Cal-Am Monterey Main System current supply sources, forecast demand, and potential buildup of Seaside Basin groundwater reserve, 2020-2030

Neither the groundwater desalination project nor the Expansion will be online in 2022 when full compliance with the CDO is mandatory. Figure 2, which closely matches Cal-Am's July 2019 forecast, represents the most-likely future water supply scenario for Cal-Am. With careful

management, Cal-Am can enter 2022 with more than 6,800 AF of banked water in the Seaside Basin.

Cal-Am's misleading claims of supply shortage and rationing are predicated on a level of demand which simply does not exist today as shown in Figure 1. Cal-Am's reported demand in 2020 is trending lower than other recent years. Cal-Am's own July 2019 forecast projects a 2022 level of demand (9,789 AF) that can be met with existing supplies even as Cal-Am eliminates its illegal withdrawals from the Carmel River and complies with the CDO.

2. Cal-Am incorrectly discounts the capacity of its own Aquifer Storage and Recovery (ASR) system during normal and drought years.

Cal-Am participates in an aquifer storage and recovery (ASR) project that allows for the capture of excess Carmel River winter flows through wells along the river. This project operates with four ASR well sites capable of both injection and extraction. Ownership and operation of this source water project has various components split between Cal-Am and the Monterey Peninsula Water Management District.[7]

In its increasingly desperate attempt to bolster support for its groundwater desalination project, Cal-Am has provided incorrect and misleading information about the performance and capacity of its own ASR system.[8] In fact, WaterDM's estimate of 1,300 AF of annual ASR is conservative and it could be considerably higher.

At the outset Cal-Am neglects to mention in its review of historical ASR production that while the first ASR injection/extraction well was in commercial operation in 2005, the fourth ASR well, ASR-4, was not in commercial operation until Water Year 2017. Water Year 2017 was the first year that all four ASR wells were fully utilized. Furthermore, the Hilby Pump Station and Monterey Pipeline (critical components for maximizing ASR recovery) were placed into service in January 2019. Thus the full capacity of the ASR system cannot be adequately estimated from an analysis of prior years and Cal-Am is intentionally misleading on this point.

There are two water rights that support the ASR system: Permit 20808A which allows maximum diversion of 2,426 AF and Permit 20808C which allows up to 2,900 AF for a total potential maximum annual diversion of 5,326 AF.[9] But in reality Cal-Am will only be able to divert, inject, and store the maximum permitted volume in the wettest of years.

---

[7] California-American Water Company. 2019. (U-210-W) Update to General Rate Case Application, A.19-07-004. Direct Testimony of Christopher Cook. (p.7)

[8] California American Water Coastal Presentation to Coast Commission Hearing 9.17.20, slide #7; California American Water Peer Review of Supply and Demand for Water on the Monterey Peninsula, Hazen and Sawyer, August 11, 2020.

[9] Monterey Peninsula Water Management District. 2020. Supply and Demand for Water on the Monterey Peninsula prepared by David Stoldt. (3-13-2020, 12-3-2019, and 9-16-2019)

Based on long-term historical precipitation and streamflow data, which includes drought hydrology, the ASR system is designed to allow an average of 1,920 AF per year to be recovered. In Figure 2,WaterDM assumes a far more conservative 1,300 AF of ASR production per year for 2020 – 2030. With the addition of the Pure Water Expansion, Cal-Am will have additional opportunity to inject and store water in the Seaside Groundwater Basin which would allow for increased annual recovery over time.

Cal-Am is allocated 28,777 AF of total storage in the Seaside Groundwater Basin.[10] Careful management of the Seaside Groundwater Basin and optimizing the storage opportunities it provides will help ensure a long-term reliable supply for the Cal-Am Monterey service area. In the future, Cal-Am could withdraw 1,920 AF (or more) of banked ASR storage on a regular basis.

3. Cal-Am has a reliable and diverse water supply and can comply with the CDO in 2022.

The analysis conducted by WaterDM shows that Cal-Am's demands have reduced greatly over the past 20 years and as a result, Cal-Am has sufficient supplies to comply with the CDO, even under drought conditions. In 2022, when Cal-Am must reduce diversions from the Carmel River in compliance with provisions of the cease-and-desist order from the State Water Resources Control Board[11] the combination of available, reliable water supplies for the Monterey Main system totals 10,100 AF. In WaterDM's April 21, 2020 report demand was forecast to be 10,098 AF in 2025 under the most likely scenario and Cal-Am's own forecast put 2022 demand at 9,879 AF.

Cal-Am can build up reserve storage in the Seaside Basin which provides banked water to draw on if it becomes necessary. This storage will help balance supply to meet variable demands in the coming years, but Cal-Am must also carefully manage demand in the Monterey Main system to ensure that it balances with available supply through all months of the year. Proven demand management tools should also be implemented as quickly as possible.

As shown in Figure 2, by the end of 2020 Cal-Am will have more than 3,394 AF banked in groundwater storage and this will grow to 7,144 AF in 2022. This storage reserve is available to help Cal-Am manage through a period of drought.

Suggestions by Cal-Am that groundwater desalination is necessary to increase the diversity of its water supply[12] are puzzling because Cal-Am's supply sources are already diverse – without

[10] Seaside Basin Watermaster Annual Report – 2019, December 5, 2019

[11] The original order, issued in 1995, determined that Cal-Am was extracting over 14,000 acre-feet per year from the river when it had a legal right to 3,376 acre-feet. The Board determined that these excess diversions were adversely affecting the river's population of federally-threatened Central Coast steelhead. The Board ordered Cal-Am to develop or purchase alternative water supplies so it could end its excess diversions. Subsequent orders issued by the Board have included additional requirements, with Cal-Am currently required to end its excess diversions and be able to rely on other sources of water by December 2021.

[12] California American Water Presentation to Coastal Commission Hearing 9.17.20, slide #15.

desalination. Figure 3 shows Cal-Am's available supplies in 2022 from all sources which include surface water (36%), native ground water (15%), recycled water (35%), banked ASR (13%), and desalination (1%). This analysis shows Cal-Am already possess a distinctly diverse water supply without desalination.

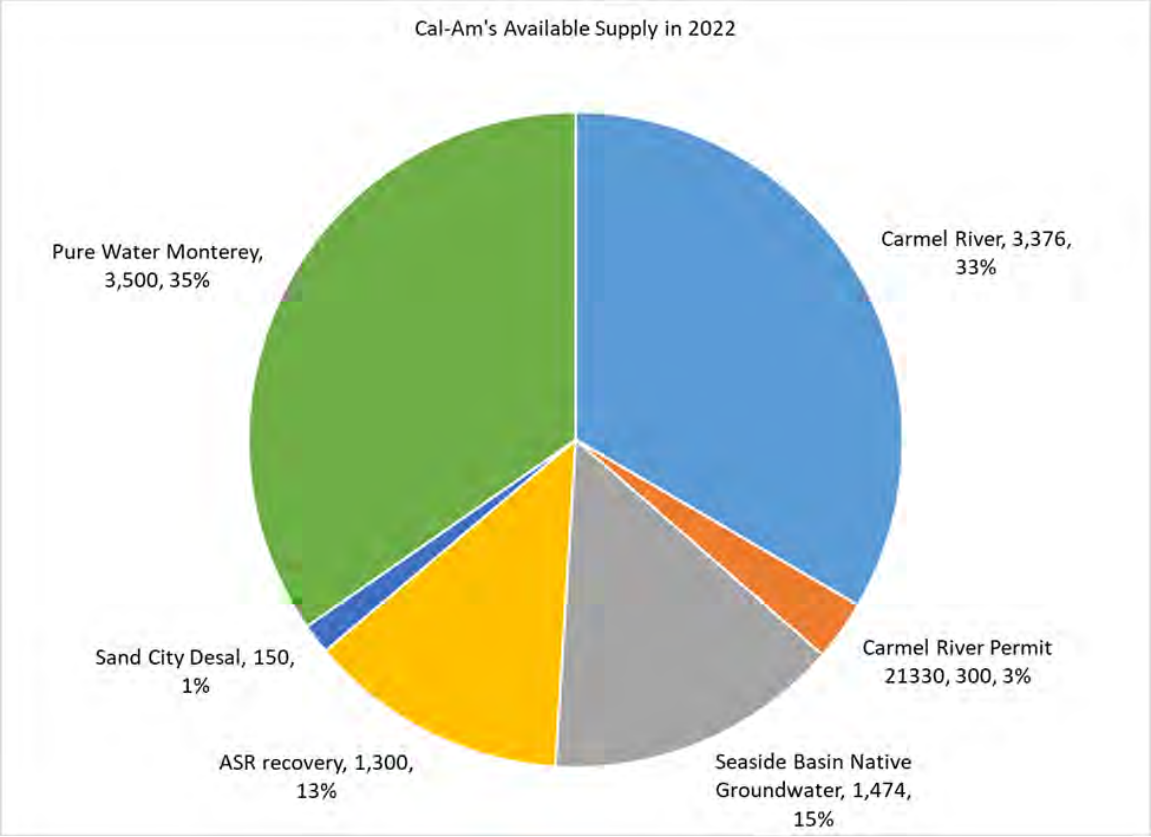

Figure 3: Cal-Am's available supply in 2022

4. **Cal-Am repeatedly confuses and conflates peak demand and annual demand planning requirements and has offered numerous misleading statements about California codes and standards and AWWA water planning guidance.**

Cal-Am continues to confuse and conflate requirements for meeting the peak demand and annual demand planning practices in their statements and communications. Planning the infrastructure and treatment capacity requirements for a community to meet the peak day and peak hours of demand is distinctly different from planning for an adequate long-term water supply for the same community. Cal-Am's faulty premises and errors are addressed in detail in WaterDM's April expert report (pp. 37 – 41). WaterDM's analysis adhered to all applicable codes and industry standards and practices. With or without desalination or the Expansion, Cal-Am is currently complying and can continue to comply with California Waterworks Standards and CPUC General Order 103-A.

SUMMARY

Cal-Am has put forward many misleading statements and opinions when discussing supply and demand in the Monterey Main System. Cal-Am's claims of dire supply conditions in 2022 are not supported by the facts because all of their dire predictions are based on the unrealistic demand forecast, which is not a reasonable or accurate representation of current or future demand. In fact, Cal-Am's July 2019 CPUC filing projected demand for 2022 at 9,789 AF, not 12,350 AF.

Cal-Am incorrectly discounts the capacity of its own Aquifer Storage and Recovery (ASR) system during normal and drought years. Based on long-term historical precipitation and streamflow data, the ASR system is designed to allow an average of 1,920 AF per year to be recovered. Cal-Am neglects to mention in its review of historical ASR production that while the first ASR injection/extraction well was in commercial operation in 2005, the fourth ASR well, ASR-4, was not in commercial operation until WY 2017. WY 2017 was the first year that all four ASR wells were fully utilized, thus the full capacity of the ASR system cannot be adequately estimated from an analysis of prior years.

The analysis conducted by WaterDM shows that Cal-Am's demands have reduced greatly over the past 20 years and as a result, Cal-Am has sufficient supplies to comply with the CDO, even under drought conditions. In 2022, when Cal-Am must reduce diversions from the Carmel River in compliance with provisions of the CDO, the combination of available, reliable water supplies for the Monterey Main system totals 10,100 AF. In WaterDM's April 21, 2020 report demand was forecast to be 10,098 AF in 2025 under the most likely scenario and Cal-Am's own forecast put 2022 demand at 9,879 AF.

Suggestions by Cal-Am that groundwater desalination is necessary to increase the diversity of its water supply are puzzling because Cal-Am's supply sources are already diverse – without desalination.

Cal-Am continues to confuse and conflate requirements for meeting the peak demand and annual demand planning practices in their statements and communications. Cal-Am's faulty premises and errors are addressed in detail in WaterDM's April expert report. WaterDM's analysis adhered to all applicable codes and industry standards and practices. With or without desalination or the Expansion, Cal-Am is currently complying and can continue to comply with California Waterworks Standards and CPUC General Order 103-A.

Cal-Am has a reliable and diverse water supply and can comply with the CDO in 2022.

Comment in Support of the Monterey Peninsula Water Supply Project
Case Number: 9-19-0918

Dear Commissioners,

I support the Monterey Water Supply Project to create a desalination plant as a clean, sustainable solution to the water supply crisis in the Monterey Peninsula.

This desalination project is the only viable option to supply our community with a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and restoring the Carmel River and the Seaside basin.

The Monterey Peninsula is a leader in conservation, and for 25 years has been working with federal, state and local agencies to develop an alternate water supply for our community. It is imperative that the water supply needs of the Monterey Peninsula and the environmental issues facing the Carmel River are resolved as quickly as possible.

Please support this desalination project to ensure our water future. Thank you for your consideration.

Sincerely,

Alex Seid

Subject: Re: Castroville for social Justice

Good Afternoon Eric and Coastal Commissioners,

I am very concerned about the impact and limits of the Castroville's water source and the continued high density development, over development, and high concentration of low income housing in spite of our lack of much needed infrastructure and traffic mitigation issues.

As I shared previously with Eric, I believe there are many inequities in policies that have and continue to impact Castroville such as being designated as a high density area which allows for development of high density apartments and concentrates low income housing in Castroville (like the East side of Salinas), regardless of the lack of safe water, high traffic/congestion, lack of infrastructure to support existing development, lack of sidewalks in many areas, lack of parking, lack of open recreational space for our children/families, lack of safe bike/walk trails to connect us to the nearby sloughs and beaches, and deteriorating buildings and streets to name just of few issues impacting our disenfranchised town.

I don't understand why we are not under the protection of the Coastal Commission to protect/prevent Castroville from being designated as a high density area considering we are only 3 miles from the ocean, while other communities that are further from the ocean are protected by the Coastal Commission from high density development. The end result has been a concentration of low income, high density apartments built or being built in our small town that add to the existing equities, lack of infrastructure and lack of resources, which also keep our home values down in comparison to surrounding communities where property values are almost twice (and much more depending on the area) the value of Castroville property/homes.

I will review and share the information provided by Eric with other Castroville residents and the NMC LULAC Council. We plan to prepare and submit a letter with our concerns related to; high density housing /development in Castroville, need to have a long term water supply plan due to over pumping of our under ground water source that has lead to sea water intrusion and shutting down of some of our water wells, and the need for Castroville to be protected under the Coastal Commission's rules and regulations due to Castroville being only 3 miles from the ocean.

Thanking you in advance for the opportunity to submit these comments.

Diana Jimenez
Castroville Resident
NMC LULAC President

Good to hear from you Noaki,

Hope you are well and happy and sorry for the delay.

I've reached out to several folks and am waiting to hear back from the ones that don't have a phone # attached to their name

- Adriana Melgoza- Social Activist, Legal Aid, member of Water Center, CCSD Board President and Active in Social Justice issues in our Community- **831.214.5053**
- Cosme Padilla- Former Planning Commissioner and CCSD Director and former president, LULAC and social justice Advocate- **831.905.3540**
- Ron Stefani- SVGWB Chair, M1W Chair, Artichoke Festival President, CCSD Director and former fire fighter- **831.595.1431**
- Diane Jimenez- Former LULAC President, and very active Social Activist for equidible Justice
- Pastor Rich- Food Bank, Chair Neighborhood watch and pastor at local house of worship
- M.C. Supervisor John Phillips- Founder of Rancho Cielo (second chance for at risk youth), County Supervisor, M.C. Superior Judge and M1W Director

Thanks for reaching out, I/WE really appreciate it

I'm also working on the number and percentage of Affordable/low income housing in my District for Tom

So far I have 333 confirmed units just from Moro Cojo CHISPA ,the MC Housing Authority & Midpen housing projects. This does not count the 50+ unpermitted garages turned into living quarters.

And there are currently low income and senior housing projects underway that will provide 90 homes and 126 apartments at CHISPA's Castroville Oaks and another 63 units at the Driscoll's Farm worker housing project

In addition, we have 100 single wide trailers in Moss Landing ,of primarily low income Field workers, 311 trailers at the Monte Del Lago Trailer park and 10 more shabby trailer single wide units at the north end of Castroville. Our total residential housing units is 1738

All told, I'm guessing we have **at least 60%** very low income housing (but probably much higher) .

In addition, we had RCAC do a Median Household Income study (MHI)and despite a low response from Field workers, due the current political climate, Castroville was still rated at a Severely Disadvantage Community (SDAC) with an MHI of only $35,000.

I'm willing to bet that tiny ol' Castroville has more permitted Low Income Housing than the entire peninsula.

Because of Landwatch, Public Water Now and others that continue denying any water solution on the peninsula to keep low income folks like the ones from Castroville living in their community. One example is the Father Serra school that is closing after 80 years because of a lack of student, low numbers caused by keeping affordable housing for young families with children unreachable

Finally, while the MPWSP offers some hope and equitable justice to Castroville and North County, PWMx does nothing but take water from a seriously over-drafted basin and send it to solve water problems on the peninsula that no-growth groups have blocked for decades.

Sorry for the long message, we have a lot to cover.

I look forward to your next trip down, I'll try to line up some of our famous Artichoke

All the best and please stay well

Eric

Re: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034(Monterey Peninsula Water Supply Project - MPWSP)

Dear Messrs. Ainsworth and Luster:

The Coalition of Peninsula Businesses submits this letter and additional information as a follow-up to our letter you of June 17, 2020. Our June 17th letter detailed 1) the inadequacy of the Monterey Peninsula water supply figures in the Monterey Peninsula Water Management District *Demand and Supply of Water for the Monterey Peninsula* report and 2) the Coastal Commission staffs' incorrect characterization of the Pure Water Monterey Expansion as a 'fully developed, viable' alternative to the desal portion of the Monterey Peninsula Water Supply Project.

The proposed Pure Water Monterey Expansion project was never intended to be a substitute or alternative for the desal plant. We attach Monterey One Water Resolution 2019-19 that addresses this point directly and unequivocally.

The Pure Water Monterey Expansion project Supplemental Environmental Impact Report was not certified by Monterey One Water because a number of deficiencies were identified. No further work to correct deficiencies in the SEIR is contemplated and no further work on the proposed project is planned. We attach the May 21st M1W General Manager-prepared staff report to the M1W Board that confirms these facts and outlines these conclusions.

As you saw in the chart accompanying our June 17th letter (which we include again with this letter), even if the Pure Water Monterey Expansion project were to be built, the resulting supply of water would not meet the Peninsula's water needs now or in the future.

As you can see, the Pure Water Monterey Expansion is neither 'fully developed' or 'viable.' It would be highly detrimental to solving the Peninsula's water supply needs for the Commission to tie the Peninsula's water future to this project.

The only way for the Peninsula to meet its water needs is with the desal project portion of the portfolio of projects you are asked to approve in Application No. 9-19-0918.

Please help the Peninsula solve its critical water supply shortage by approving Monterey Peninsula Water Supply Project. After over 40 years, it is time to help us achieve a sustainable and sufficient water supply that offers the added benefit of letting us stop, forever, illegal diversions from the Carmel River.

Please recommend and approve Application No. 9-19-0918.

Sincerely,

Jeff Davi, Co-chair

John Tilley, Co-chair

RESOLUTION NO. 2019-19

A RESOLUTION OF THE BOARD OF DIRECTORS OF MONTEREY ONE WATER STATING THAT ITS PRIOR APPROVAL TO PROCEED WITH THE POTENTIAL EXPANSION OF THE PURE WATER MONTEREY PROJECT WAS DONE ONLY AS A BACK-UP PLAN FOR, AND NOT AS AN ALTERNATIVE TO, CAL-AM'S DESALINATION PROJECT

WHEREAS, on March 25, 2019, at a regular M1W board meeting, this Board considered an agenda item of proceeding with the approval of the funding of preparation for environmental, permitting and detailed design work for the potential expansion of the Pure Water Monterey (PWM) Project, and pursuant to agreement M1W was and is to be reimbursed by the MPWMD and Cal-Am for their apportioned shares associated with all the potential expansion environmental, permitting and design costs; and

WHEREAS, the staff report on this matter, and the discussion of the Board Members regarding it, made it clear that the proposed PWM Expansion was to be "only a backup water supply to the Cal Am desalination plant . . . In the event that the Cal Am plant becomes delayed" with regard to meeting the Cease and Desist Order deadline of December 31, 2021, and not as a replacement to Cal-Am's desalination project; and

WHEREAS, contrary to the purpose and intent of this Board in proceeding with working on the potential expansion of the PWM Project, as stated above, there is currently substantial confusion in the community about this Board's intent; and

WHEREAS, at all times herein M1W remains in a contractual and working relationship with Cal-Am to sell 3500 acre feet of recycled/purified water to Cal-Am when the PWM Project begins production, to modify the M1W outfall, to construct a brine mixing structure, etc.; and

WHEREAS, the purpose and intent of this Resolution, therefore, is to clarify and restate, for the record, the understanding and basis upon which this Board has proceeded with looking into and working on the expansion of the PWM Project.

NOW, THEREFORE, BE IT RESOLVED by the Board of Directors of Monterey One Water that it hereby restates and reiterates that its prior approval

of proceeding with the initial environmental, permitting and design work for the potential expansion of the Pure Water Monterey Project was done specifically as a backup plan to, and not as an option in the place of, the Cal Am desalination project, and only to have a ready-to-go alternative plan in place in the event that the Cal Am desalination project is delayed beyond the Cease and Desist Order deadline of December 31, 2019.

PASSED, APPROVED AND ADOPTED by the Board of Directors of the Monterey One Water at a regular meeting duly held on October 28, 2019 by the following vote:

Board of Directors Meeting
Staff Report

TO: Board of Directors

FROM: Paul A. Sciuto, General Manager

MEETING DATE: May 21, 2020

AGENDA ITEM NO: 7 - B

SUBJECT: **Discuss and Consider Issues and any Options Relative to the PWM Expansion Project and the SEIR (not certified)**

BACKGROUND

On April 27, 2020, the M1W Board did not act to certify the Supplemental Environmental Impact Report (SEIR) for the Pure Water Monterey Expansion (Back-up) Project. Staff has received inquiries from Board Members about whether it might be appropriate for the Board to consider and discuss further any actions that might be suitable or opportune regarding the SEIR and the project. Also, on May 1, 2020 the M1W Board of Directors received the attached letter from the Monterey Peninsula Water Management District (MPWMD) requesting identification of specific deficiencies found in the SEIR. These matters were discussed in some detail by the Recycled Water Committee at its meeting on May 14th, 2020.

DISCUSSION

There are a number of options the Board may consider and discuss in regard to further action on the not certified SEIR and the PWM Expansion Project.

Staff has noted that the Agency does not have additional budget funds at this time for dealing with any additional deficiencies that have been identified by some Board Members or could be identified in the future. The Agency has suspended all of the remaining contracts on these matters to prevent further consultant expenditures. This includes related work that was being done specifically for Cal Am. At least one Board Member expressed at April's Board meeting an interest in seeing further work to address the questions and comments that were provided to the Board. It might be appropriate for the Board to consider providing further guidance in that regard.

At its meeting the Recycled Water Committee discussed whether, in light of other critical M1W priorities and the uncertain financial environment due to COVID 19 impacts to the economy, it might not be prudent to move forward with any work regarding PWM Expansion at this time.

Some of the other critical priorities include:

- Meeting PWM injection volumes as required by the Water Purchase Agreement with Cal Am and the Monterey Peninsula Water Management District (MPWMD).
- Deferred maintenance at the Agency's Regional Treatment plant, pump stations, and field facilities.

- Increasing rehabilitation and replacement of infrastructure assets.
- Increasing financial reserves to be more fiscally stable

Furthermore, the current financial situation will require a contraction of expenditures and potentially a decrease to levels of service provided by the Agency. The reduction of financial capacity may result in:

- Not filling needed vacant positions.
- Drastic budget cuts (about 12.5% to 15%) for 2020/2021 fiscal year.
- Furloughs and layoffs of employees.
- Opening and renegotiating of labor agreements.

In the Board's discussion, it could determine that it is appropriate for it to also consider in connection with this matter the draft list staff was directed to compile of deficiencies identified regarding the SEIR based on the statements made by Board members during the April 27, 2020 Board meeting. This list was directed to be prepared as a potential response to the letter received from the MPWMD, which requested that this Agency "identify specific deficiencies found in the SEIR," and is as follows:

1. Source Water. The SEIR does not adequately address the number of comments and concerns expressed that it cannot document the quantity and reliability of the source water available to the Expansion Project.

2. Water Supply and Demand. The SEIR fails to support its conclusion about long-term water supply and demand, and that conclusion is contrary to the CPUC demand determination and the estimates from the individual cities involved.

3. Agricultural Water Supplies. It fails to properly evaluate potential impacts to agricultural water supplies due to a significant reduction in available agricultural irrigation water because of the Expansion.

4. Cumulative Impact. The SEIR fails to evaluate the Expansion either as an alternative to or a cumulative project with the MPWSP desalination facility.

FISCAL IMPACT

None identified at this time.

RECOMMENDED ACTION:

That the Board of Directors consider and discuss these matters and make such decisions regarding same as it deems appropriate.

Pure Water Monterey, PWM (ground water recharge)	3,500	3,500	3,500	3,500	3,500	3,500	3,500	3,500	3,500
PWM Expansion, PWME [1]				2,250	2,250	2,250			
Carmel River	3,376	3,376	3,376	3,376	3,376	3,376	3,376	3,376	3,376
Seaside Basin	774	774	774	774	774	774	774	774	774
Aquifer Storage & Recovery, ASR	1,300	650	0	1,300	650	0	1,300	650	0
Sand City Desal	94	94	94	94	94	94	94	94	94
Totals	15,296	14,646	13,996	11,294	10,644	9,994	9,044	8,394	7,744

Water Demand Estimates		% Scenarios Above Are Able to Meet Different Water Demand Projections								
CPUC Original Estimate (AFA) [2346]	15,296	100%	96%	92%	74%	70%	65%	59%	55%	51%
MPWMD - Revised HIGH Estimate (AFA) [2456]	12,287	124%	119%	114%	92%	87%	81%	74%	68%	63%
MPWMD - Revised LOW Estimate (AFA) [2456]	10,884	141%	135%	129%	104%	98%	92%	83%	77%	71%

Major Observations:

I. Even under the best MPWMD water source assumption without desal (Scenario 4), all water sources cannot meet the MPWMD high estimate of water demand, and continues to be the case even if the additional 406 AFA of "Other Available Supplies" is accessed as noted on MPWMD's document *Supply and Demand for Water on the Monterey Peninsula* dated Dec. 3, 2019.

II. Only one water source scenario without desal, Scenario 4, can meet projected water demand and only if the MPWMD's revised low water demand assumption consistently occurs, and assuming none of the footnotes below are taken into consideration.

III. Scenario 7 is most reflective of current state -- no desal, no PWM Expansion or likely to occur given decision by M1W board, and ASR 5-year historical average injection amount of 1,164 AF for water years 2016-2020. Note: ASR production can be adversely affected by low rainfall and drought years.

IV. Only with desal can CPUC's original or revised demand estimates, or MPWMD's revised high estimate, be satisfied.

---

[1] M1W Board already voted that PWM Expansion is only to be a back-up if Desal doesn't proceed, and also recently declined to certify the SEIR or pursue PWM Expansion further.

[2] CPUC estimate includes water allocations for legal lots of record of 1,181 AFA, tourism bounce-back of 500 AFA, and Pebble Beach buildout of 325 AFA, whereas MPWMD's estimates reflect lower amounts for its revised high and low projections of: 1,014 and 864 for legal lots of record; 250 and 100 for tourism bounce-back; and 160 and 103 for the Pebble Beach buildout.

[3] In Sept. 2018, the CPUC determined that CalAm's overall future water demand will be approximately 14,000 AFA, but for this comparative exercise, the original estimate is used as 14,000 AFA has no impact on the four Major Observations above.

[4] CPUC estimates predated recent State mandatory new housing requirements, while MPWMD included some minimal discussion and considerations for new housing needs as part of its revised high and low estimates for legal lots of record. The importance of ensuring an adequate housing supply warrants continued assessment and refinement of related water needs.

[5] Some of the parties originally agreeing to the CPUC demand estimate are not in agreement with the lower revised high and low MPWMD-determined estimates.

[6] None of the water demand estimates take into account the future water needs of the various Monterey Peninsula federal and military installations, a key potential factor in the next round of closures and realignments.

Re: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034(Monterey Peninsula Water Supply Project - MPWSP)

Dear Messrs. Ainsworth and Luster:

Coastal Commission staff recommended denial of the above captioned application and appeal based in part on two erroneous assumptions.

The first assumption is that the desalination portion of the Monterey Peninsula Water Supply Project portfolio could be replaced by expansion of another portion of the project's portfolio, Pure Water Monterey, because that is a 'viable alternative.'

Another assumption is that the Supply and Demand for Water on the Monterey Peninsula report provided to staff, which purports to show that either desal or expanded Pure Water Monterey is sufficient to satisfy the Peninsulas water supply needs, is reflective of Peninsula water reality.

To deal with the second assumption, we enclose our recently created chart that shows that the assumed water supply available to the Peninsula satisfies all water demand for the next 20 years or more is seriously flawed and clearly shows that even if the production figures are met, and the Pure Water Monterey Expansion were to be achieved, the supply is not adequate to current needs.

Importantly, there is nothing in the 20-year history of the Peninsula's Aquifer Storage and Recovery project that indicates the project would yield anything approaching the assumed 1,300 afa.

You should also note that Pure Water Monterey is not yet operational and is in at least double-

default of the production guaranteed by the Water Purchase Agreement, so to assume it will produce the required 3,500 afa is not warranted without several years of operational experience to base that projection on.

As you can see on the chart, no water supply option except the option that includes the desal plant is adequate to the Peninsula's current or long-term water needs.

The first assumption is that the Pure Water Monterey Expansion is a "viable" alternative to the desal portion of the water supply portfolio. This is erroneous for at least two reasons: the Pure Water Expansion Project Supplemental Environmental Impact Report is not certified and, inexplicably, the necessary federal environmental work has not yet been started (a point shockingly dismissed by Monterey One Water staff and environmental consultants); even if the expansion were to be accomplished and perform to its standard, the amount of water supply available would not be sufficient to the Peninsula's water needs.

The theory of a portfolio approach to solving our decades-old water supply crisis is sound and was supported by almost all interested parties for years. That theory is that through a project portfolio approach, if a production glitch occurs in one part of the portfolio the other two could make up for a temporary lack of production by the affected part.

In addition to solving the decades-old water supply problem for those of us who live and work on the Peninsula, you have been reminded, recently and strongly, by the National Marine Fisheries Service and the State Water Resources Control Board, of the critical environmental need to solve the water supply problem and eliminate the illegal diversions of water from the Carmel River.

Please reconsider your recommendation and instead recommend approval of the Monterey Peninsula Water Supply Project.

Subject: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

To: Honorable Chair Padilla & Commissioners

Two fish (steelhead) swim into a concrete wall. One turns to the other and says... Dam!

It has been a great step forward to remove the San Clemente dam and provide miles of new spawning river environment. But, to carry on watershed repair we need multiple sources of new non-Carmel River water so there is water available for habitat restoration and improvement.

As a board member of CRSA I highly recommend the Coastal Commission board approve the proposed desalination project for the Monterey Peninsula even though the staff report recommends against it. We live next to the Pacific Ocean. There is no other sustainable water source for us. We're just moving the chairs around on the Titanic with the other alternatives.

We seriously doubt that Pure Water Monterey Phase II will provide enough water for the Monterey Peninsula once the development/growth flood gates are opened. The economic/political pressures are just too great and as usual there will be lots of money made at the cost of further environmental destruction. And, if we are to believe science, we are in megadrought cycle that is worsened by human activities. (https://fishbio.com/field-notes/the-fish-report/tales-dry-times-human-effects-historic-drought-cycles August 31, 2020 www.fishbio.com)

So, I plead that you ask all those really smart people who wrote 154 page report denying
a desalination project make some helpful positive suggestions how to modify the plan so that it can be approved and implemented. We need some alternatives fast. How about some smaller modular less problematic city desal units locally located such as the old Monterey sewage treatment plant, the proposed but potentially rejected site but with different water sources, fix and use Marina desal unit...

Please give us and the Carmel River steelhead this desalination plan or a modification that will work for the Coastal Commission, the Monterey Peninsula and the Carmel River watershed and steelhead.

RE: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Honorable Chair Padilla and Commissioners:

My Name is Brian LeNeve and I was one of the parties who appealed the Marina Planning Commissions denial of the Coastal Development Permit to Cal Am for the slant wells in Marina. I have attended every meeting where this subject has come up including the hearing in Half Moon Bay where I sat with 4 friends all day hoping to get a chance to speak. When in the late afternoon the commission decided to give a bus load of speakers preference so they could get home in time, it made it impossible for the five of us to speak as we also had other commitments that required us to leave before 5:00. It was very unfortunate you allowed some speakers favorable time slots to the disadvantage of all others and I hope you will take that into consideration when arranging speakers this time.

I was very disappointed in reading your staff report where they recommend denial of the permit. I find it hard to believe your staff recommends that the peninsula rely on a project (Pure Water Monterey Phase II) that:

1: Does not have a certified EIR.
2: Whose Board of Directors twice voted not to certify the EIR.
3: Whose Board of Directors has repeatedly stated the project was designed as a backup to the proposed desal project.
4: Whose Board of Directors has stated several times the permit for the waste water is not secured.
5: That leaves the peninsula without a backup water source when something fails.
6: That has not yet produced a drop of water and cannot guarantee it will produce as promised. Phase I has not so far.
7: That takes water from sources that would eventually end up in the Salinas River Lagoon providing water for that eco-system, and not evaluate the impacts to that environment.
8: That is not expandable making another project in the near future a necessity.
9: That leaves the Peninsula without a drought-proof water supply.
10: That takes water from the Salinas Valley that could be used to solve its critically over-drafted basin.

11: That wastes the $100,000,000.00 already spent on the proposed desal plant.
12: That will require another $100,000,000.00 to be spent in the near future to get us to where we are now.
13: That will require more money to build the actual desal plant in the future than it would cost now.
14: That assumes an average of 1,300-acre feet of water from ASR when it has never averaged that amount. The average has been less than half of the 1,300-acre feet projected by your staff and in the drought years it produces no water at all. Many scientists believe we are starting a mega-drought now.
15: That could cause further environmental damage to the Carmel River and its steelhead if and when the recycle project fails to produce the amount of water promised or ASR does not produce as staff projects, and not evaluate that damage with other environmental damages.
16: **That just does not actually solve the water shortage on the Monterey Peninsula.**

I find it hard to believe your staff ignored the State Water Resources Control Board when they told you the desal is needed.

I find it hard to believe your staff ignored the CPUC when they told you the desal plant is needed.

I find it hard to believe your staff ignored the EPA when they say the steelhead are in real danger.

I find it hard to believe the Coastal Commission required Cal Am to develop a desal plant supplied by slant wells and then state that the slant wells are not the way to go.

In my opinion there are a lot of people advocating for the second phase of Pure Water Monterey whose main objective is the take over of Cal Am. I believe you have been given information that paints Pure Water Monterey in a favorable light and misrepresents the water supply and demands of the peninsula. I believe those people think a take-over of Cal Am will be financially feasible if Cal Am is not permitted to build the desal plant, but will not be feasible if the people on the peninsula also have to finance the amount of a desal plant. My worst nightmare is in three years Monterey Peninsula Water Management District (the agency that would take over Cal Am) comes to the people on the peninsula and says: I am sorry we were wrong on the amount of water we can produce and we were wrong on the amount of water needed and we now must build a desal plant to meet demand.

I strongly request you approve the Coastal Development Permit for Cal Am and let the peninsula breath a collective sigh of relief knowing that we now have water and have water for the future.

Sincerely,

Brian LeNeve

RE: DE NOVO APPEAL and CONSOLIDATED COASTAL DEVELOPMENT PERMIT
Appeal No. A-3-MRA-19-0034 (California American Water Company, et. al., Monterey Co.)
Application No. 9-19-0918 (California American Water Co., Seaside, Monterey Co.)

LETTER OF SUPPORT FOR APPROVAL OF APPEAL AND ISSUANCE OF A CONSOLIDATED PERMIT FOR CAL-AM DESAL PROJECT

Dear Chair Padilla and Commissioners:

For over 40 years, the Monterey Peninsula has had insufficient water capability/supply to appropriately and adequately serve immediate and long-term needs for a reliable and sustainable water supply to protect the Carmel River, area residents, the local economy, and the general Peninsula environment.

The desalination project has been thoroughly studied and determined reliable and sustainable. In contrast, the Pure Water Monterey (PWM) project has been partially studied and has already been shown unreliable and highly questionable with respect to sustainability. At best, and even with expansion, PWN may be able to function as originally intended ---- solely as a component of the desal project.

Given the unknowns and complexities of climate change, COVID-19, and other potential unforeseen or unknown issues in the future, we do not need additional delays or another 40 years of politics, inadequate water supply, and continued damage to the Peninsula's environmental and economic resources.

Please approve the appeal and approve and issue the permits required for the desal project.

Thank you.

Hon. Steve Padilla and Commissioners
California Coastal Commission
Att: Tom Luster
455 Market Street, Suite 300
San Francisco, CA 95105

Honorable Chair Padilla and Commissioners:

I am writing in support of the desalination project in Monterey County. I appreciate the challenge you have to navigate a contentious decision such as this. My personal support for this project is grounded in my service to Castroville as Pastor of North County Christian Center for the past eleven years, and as a community advocate. I have personally witnessed the struggles many families in Castroville have to survive economically. They often are employed in low-wage jobs and live in residences that house more than one family due to high rent and lack of affordable housing in our region. Many of these struggling individuals and families are constituents of my church.

You have opportunity with this decision to offer some real relief to a significantly disadvantaged population that resides in the largest unincorportated commercial center in the County. While other communities are well-represented by well-financed governmental agencies and leaders, Castroville's official advocates are few. Because of this, frequently throughout the years the community's infrastructural needs have been minimized or insufficiently addressed. Perhaps the most critical infrastructural need is our water supply due in large part to salt water intrusion that has compromised most of the water wells in the community. Please understand, the situation is not some potential future crisis, but an actual immediate problem that requires intervention. The consequences of an inadequate and delayed response will be quite severe for some of the most vulnerable.

In light of this real-time crisis, I urge you to approve the desal project which will provide a long-term sustainable resource to an historically significant and long under-valued community.

Sincerely,

Rev. Richard Coffelt, D.Min.

September 9, 2020

Subject: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Honorable Padilla, Chair and Commissioners. California Coastal Commission:

I speak to you as one who has been involved in the water issue since 1995—12 years of which were as Mayor of Carmel-by-the-Sea. Due to pending surgery, I am unable to be present but did wish to bring forth a developing issue with major impact on the decision before you today.

This new issue was brought about in large part by the impact of Covid 19. The front page of the Wall Street Journal, Section B of August 15-16 has the banner headline of "The Silicon Valley Exodus". More dramatic was the termination by Pinterest of their 88 Bluxome Project , south of Market St. in San Francisco, for which they had to pay a termination fee of $89.5 million.

As the article expanded on this development, it noted that even though rents have dropped in many of the most expensive parts of the Bay Area, Menlo Park (home to Facebook), Cupertino (home to Apple) and Mountain View (home to Google), there is a changing work quotient that one can work from home resulting in a tech worker exodus to work remotely. Our Monterey County area is already seeing this growth.

Carmel's real estate market has been hit by a shortage of builders causing a dramatic impact on new construction and remodels in both the commercial and residential districts. The point of this turn of events is that all projections for new water have been overtaken by these events and are fast becoming history as they are too low. Water projections need to be increased in light of the amount of water required for the homes being built. Existing homes are being sold even during remodeling for double the original sale price. How long this will be sustained is anyone's guess, but the point is that circumstances have changed dramatically and thereby accelerated projected water needs. How this impacts the whole water district is probably not yet known, but what is known are the projections that are underway to start to develop the former Fort Ord.

In conclusion, it appears that the underlying projects in the larger Monterey Peninsula/County are being accelerated and increased in a scope that will exceed projected water availability! In sum, the ability to protect the Carmel River, to protect

residents as climate change and drought scenarios become more prevalent, and to meet unforeseen and evolving water needs (to include fire-fighting) for the Monterey Peninsula and surrounding area cannot be met without a desal project.

California Coastal Commission
Honorable Chair Padilla and Commissioners

Dear Mr. Padilla and Commissioners

As a proud member of the Carmel River Steelhead Association I'd greatly appreciate your vote to proceed with construction and operation of a full scale desalinization plant in Monterey County. CRSA lists a dozen good reasons why the county should proceed with this project, but I'll not repeat these here as I'm sure you've seen them in multiple letters already. Instead I'd like to offer you my perspective from a life time of work as an biologist and environmental scientist.

I worked in Hawaii for 42 years ('75 - '17) and retired to Pacific Grove - as this is where I first learned to explore tide pools and scuba dive. Hawaii has fresh water supply problems also. And, like Monterey, made investigations into the feasibility of desalination in the 1990's, without ever making the final decision to construct a plant. While efficiency of desal plants have increased by about 50% since the '90's, the cost of construction in Hawaii is now almost 10 times higher. It doesn't look like they will implement this elegant solution in the near future. Moving forward NOW to construct this important infrastructure will be much less expensive than waiting another decade. Timing of construction with likely upcoming Federal support for infrastructure improvement projects could result in significant fiscal savings for our citizens.

The need for desalinization is inevitable. Water conservation initiatives, recycling water, and recapturing runoff, are also necessary but these actions are all based upon a fixed (or more likely dwindling with climate change) supply. Desalinization is the only alternative that actually increases the supply of fresh water over the long term. Please consider a long term solution for our urban drinking water needs.

Aloha

Honorable Chair Padilla and Commissioners:

Respectfully, I urge approval of the CalAm Desalination Project, despite staff's recommendation. I have been working as an unpaid volunteer for over 30 years to save the Carmel River Steelhead. Though speaking for myself I can say our group has devoted thousands of hours rescuing stranded juvenile steelhead, 12,000 this year alone. Hundreds of thousands over the years. We are a grassroots effort, we advocate and raise money to save the Carmel River and the Watershed itself. Our Steelhead are a Federally ESA listed species that are endangered because of illegal dewatering of the river. This decade-long problem results in total drying of the main channel and spawning tributaries, poor rearing conditions in the Carmel Lagoon and chronic groundwater overdraft. For decades our coastal community has used our limited aquifer and river as the sole source of freshwater. By all measures this has failed to be sustainable, not only regards extreme environmental degradation to our watersheds, but indeed as a reliable water supply.

As a member of the angling community with many connections within recreational angling I can tell you the loss of the fishery is not minor. Not to the store owners, tackle manufacturers, hotels, restaurants and anglers who benefit from the resource. Nor to our Tribal Communities who have lost a cultural, economic and spiritual connection to their fishery and land that sustained them for centuries. A central activity of the Esselen, and other coastal tribes, was the annual fishery. As an advisor to the Tribe on Steelhead issues I cannot speak for them but can tell you the lost fishery is a major issue for their members. California anglers also have been very disappointed by the inability of the community to come together and solve the water supply problems and restore the Carmel River Fishery. The Endangered Species Act requires recovery of Carmel River Steelhead. Anglers have public trust resource rights and an expectation that the State will ensure this fishery is here for our community and future anglers.

Opponents are now trying to once again stop the new water supply. Monterey Desal is a truly alternate water source that is not dependent on fickle winter rains, direct diversions from the Carmel River and chronically over drafted aquifers. Only the drought proof source can return enough flow to our beautiful river to restore the habitat of wildlife and fish. The claim by opponents that reclaimed waste and more diversions from the Carmel River, at any time of the year, can replace Desal is a false promise. It is unreliable, untested and insufficient to solve the problem of chronic groundwater overdraft that has plagued the entire watershed. Long term residents who grew up here are weary of the empty promises and failure of local agencies. I am writing to urge you to support and approve the required Coastal Development Permit for California American Water's Monterey Peninsula Water Supply Project.

This project has been designed in an environmentally-responsible manner. It is in fact a major improvement over outdated water policies in California that continue chronic overdraft of our watersheds and aquifers at great cost to local rivers and wildlife. It utilizes a state-of-the-art subsurface intake well system and a commingled brine/wastewater discharge, a desalination technology that minimizes marine impacts and is preferred by the State Water Board, Monterey Bay National Marine Sanctuary and many ENGO's.

Pure Water Monterey was determined by the CPUC in its decision to approve the Monterey Peninsula Water Supply Project to be of inadequate size to meet the terms of the Cease and Desist Order and the long-term water demands of the Monterey Peninsula.

The construction schedule for the project requires work begin as soon as possible in order to meet the Cease and Desist Order deadlines. Your review of this important project cannot be delayed. The solution is long, long overdue and the opponents that would have you continue to delay will perpetuate loss of listed species and jeopardize recovery that is required under the ESA.

Conservation alone cannot replace the shortfall between Cal Am's water supplies and anticipated future demands. Nor will the untested scheme proposed by opponents.

I respectfully ask that the Commission approve Cal Am's application for a Coastal Development Permit at the earliest opportunity.

Sincerely,

Frank Emerson

Attention: California Coastal Commission/Honorable Chair Padilla and Commissioners,

We believe the best solution for providing an alternate water source for the Monterey Bay area is a new desalination plant currently awaiting a permit from the California Coastal Commission.

A desalination plant is the only viable source of water that can be expanded to meet the needs of the area. The Pure Water project of recycling waste water is not expandable and should only serve as a backup to the a desalination plant.

We would like to strongly encourage the California Coastal commission to issue a Coastal Development Permit to California American Water so that slant wells can be installed from the land to under the ocean as required to support the desalination project.

We appreciate your immediate attention in this matter.

Sincerely,

Andrew and Rebecca Walker

To:
California Coastal Commission
Honorable Chair Padilla and Commissioners

Dear Honorable Chair Padilla and Commissioners,

I am writing to ask you to issue a Coastal Development Permit to California American Water to build the desalination plant.

I welcome the Pure Water Monterey recycling projects.
It is unclear if their projects provide enough to reduce the pumping of the Carmel River to legal limits.
If we have only Pure Water Monterey, we have no back-up.

It is my understanding your staff concluded there would be less overall environmental damage from Pure Water Monterey.
It is also my understanding that in their assessment, they:
1) did not consider the environmental damage to the Salinas River Lagoon
2) did not consider the harm to the Carmel River if Pure Water Monterey cannot produce enough.

I urge you to permit both projects.
Having **both the desalinization plant and Pure Water** recycling should provide enough water in our area for decades, and through droughts.

It is important for the California Coastal Commission to ensure we **prepare for the worst and hope for the best.**

Thank you,
Donna Singmaster
Pebble Beach, CA
Donna@Singmaster.com

Unrelated to the above:
1) Thank you for closing the beaches this past weekend.

2) Congratulation to Honorable Chair Padilla for surviving COVID-19

Worst Drought in 1,000 Years Predicted for American West
Global warming to cause historic "megadrought" by century's end.

3 MINUTE READ

BY BRIAN CLARK HOWARD, NATIONAL GEOGRAPHIC

PUBLISHED FEBRUARY 12, 2015

LARGE PARTS OF the U.S. are in for a drought of epic proportions in the second half of this century, scientists warn in a new study that provides the highest degree of certainty yet on the impact of global warming on water supplies in the region.

The chances of a 35-year or longer "megadrought" striking the Southwest and central Great Plains by 2100 are above 80 percent if the world stays on its current trajectory of greenhouse gas emissions, scientists from NASA, Columbia University, and Cornell University report in a study published Thursday in the new open-access journal *Science Advances.*

If countries reduce their emissions to current "middle of the road" targets, the chances of a megadrought hitting the Great Plains drop to between 60 and 70 percent. But they remain nearly 80 percent for the Southwest.

That's because rising temperatures spurred by the greenhouse effect result in more evaporation and less precipitation for the region, which is already relatively dry. "Even at the middle-of-the-road scenario, we see enough warming and drying to push us past the worst droughts experienced in the region since the medieval era," said Benjamin Cook, the study's lead author and a scientist at NASA's Goddard Institute for Space Studies in New York.

Why It Matters

Drought often has significant impacts on agriculture, ecosystems, and city water supplies. "We see some of those impacts going on now in California," said Cook, referring to the ongoing drought that is the worst in that state's recorded history.

In fact, 11 of the past 14 years have seen drought in much of the American West, from California across to Texas and Oklahoma, according to the U.S. Drought Monitor.

In their study, Cook's team used 17 computer models of droughts and three models of soil moisture to predict the likelihood of dryness over the next century. After they found a high degree of agreement among the models, they applied them to data gathered from tree rings going back to about the year 1000.

They found that the megadrought that struck the region in the 1100s and 1200s—which has been tied to the decline of the ancient Pueblo peoples, or Anasazi, of the Colorado Plateau—was likely not as severe as the one expected in the near future.

"Even when selecting for the worst megadrought-dominated period, the 21st-century projections make the megadroughts seem like quaint walks through the Garden of Eden," study co-author Jason E. Smerdon of Columbia University's Lamont-Doherty Earth Observatory said in a statement.

The Big Picture

The megadrought predicted for the U.S. seems to be part of a "northward creeping of desert bands" in other subtropical regions, especially in the Mediterranean and southern Africa, said Tom Painter, a snow and drought scientist with NASA's Jet Propulsion Laboratory in Pasadena, California, who was not involved with the study. That shift is clearly related to changes in air circulation caused by global warming, but the precise mechanics are "fuzzy," Painter said.

The new study is the latest in a series over the past decade highlighting the challenge facing people in the American West, where strategies for coping with drought, such as irrigation and water conservation, have a long history. "The real challenge is whether we can take strategies we have now and apply them to the more severe droughts that are likely in the future," Cook said.

"Over the past year, water managers and the public have started paying more attention to the possibility of a megadrought," said Painter. "Water demand has

passed supply in some areas. Throwing 30 years of drought on top of that means we're going to have to change the way we live out here."

Help Needed

Our best chance to save the Carmel River Steelhead

The Carmel River Steelhead Association (CRSA) is asking all members to write the State Coastal Commission and demand the commission issue a Coastal Development Permit to California American Water (Cal Am). That permit would allow Cal Am to install slant wells from land to under the ocean and provide water for a new and needed desal plant.

Everything CRSA does to help steelhead, from habitat improvements, to barrier removal, to river clean up, to fish rescues are only a way to maintain a viable population of steelhead until water is restored to the river. Without adequate water we will never recover steelhead and as long as we have illegal pumping, we will never have adequate water.

In 1994 CRSA filed a complaint with the State Water Resources Control Board (SWRCB) about Cal Am pumping water without a legal permit and damaging the steelhead population. That action ultimately led to the SWRCB issuing Water Order 1995-0010 telling Cal Am to diligently implement a new water source. In the following 25 years many attempts have been made to secure a new water source but none have been found or developed that eliminates Cal Am over-pumping the Carmel River. Most of the projects failed because of the involvement of people with different agendas, not the lack of technology. The result is that for 25 years the steelhead of the Carmel River have declined and been a pawn in all of the bickering.

Water One (the sewerage processing plant near the Material Recovery Facility) and Monterey Peninsula Water Management District (MPWMD) are in the process of completing a project to take waste water and turn it into drinking water. This project is called Pure Water Monterey but, as of this date, houses on the peninsula have not received any of that water and it is not positive how much water the project will actually produce. At best it will still leave us over 2,000-acre feet

short of what is needed to reduce pumping on the Carmel River to legal limits and help to recover steelhead.

Once again, there are people with different agendas and opinions fighting over different proposals. Not only are there different proposals, this time MPWMD and other groups are working to force Cal Am to sell its company on the Monterey Peninsula to MPWMD. It is this added dimension that is causing more problems and, in my opinion, affecting the thought process.

Cal Am is trying to build a desal plant near the Material Recovery Facility near Marina, and Water One with MPWMD are proposing a second phase of Pure Water Monterey. In all fairness there are arguments to be made for both proposals, but CRSA supports the desal plant because we believe it is the only project that will continually provide enough water into the next decades and through droughts. Some people believe we are starting a mega-drought now, and desal is the only project that is expandable.

The only argument for the recycled water project in lieu of desal is that recycled water will cost less now. However, if it cannot produce what it has promised (and so far, phase I has not) it will cost a lot more by delaying a desal plant that actually can produce what is needed.

Arguments for desal and against only recycled water

1. The Board of Directors of Water One have stated many times that Pure Water Monterey Phase II was designed and should be considered as a backup to the desal plant.
2. If the desal plant is built, Pure Water Monterey would be a backup should something go wrong.
3. If we only have Pure Water Monterey Phase II there will be no backup when something goes wrong and people will demand to start over-pumping the Carmel River again.
4. The Water One Board of Directors have voted twice not to approve the EIR for Phase II.
5. The Water One Board of Directors have stated the permit for the water to be used in Phase II has not been secured.
6. Any waste water taken from the lower Salinas Valley for Pure Water Monterey Phase II would end up in the Salinas River Lagoon providing non-salt water for that environment and benefit any steelhead still in the Salinas River.
7. The Salinas Valley is a critically over-drafted basin and any water taken for Pure Water Monterey could be used to reduce the overdraft of the Salinas Valley Ground Water Basin.

8. The proposed desal plant is expandable. Pure Water Monterey is not expandable and the volume is not guaranteed.
9. Pure Water Monterey **may** provide enough water to replace illegal water diversions from the Carmel River now, but at some time "now or in the near future" we will again need more water and as Pure Water Monterey is not expandable we would still have to build a desal plant at a lot more cost because of inflation.
10. There has been $100-million spent on this proposed desal plant that will be wasted if it is not completed and a desal plant in built in the future will have to spend another $100-million to get us to where we are now and then more to actually complete the plant than it would cost now.
11. One of the criticisms of the proposed desal plant is that due to climate change there will be coastal erosion making the proposed slant wells eroded into the ocean in 20 years and the wells will have to be relocated with no place identified. Yet the proponents of Pure Water Monterey Phase II say at best in 20 years we will need a new water source and nothing is identified.
12. The staff report to the Coastal Commission concluded there would be less overall environmental damage from the recycled water project than the desal plant but they did not consider environmental harm to the Salinas River Lagoon in their analysis and they also did not consider any harm to the Carmel River if the recycled water project cannot produce what is necessary.

For all of the above reasons we are asking all members to write to:

California Coastal Commission
Honorable Chair Padilla and Commissioners

I support this letter as it is written. I am a member of CRSA and the current president of CRSA. I completely support recycling of anything and I encourage innovative technology especially in the West where the future of water is in the crisis stage. However, I simply cannot watch human kind wipe out another animal species in this case the Carmel River Steelhead. This is a magnificent California coastal sea run rainbow trout who is hardy and determined to survive. The continued pumping of the Carmel River will, in the end, take this species from threatened to extinct.

Sincerely,
Steve Park
President

Honorable members of the California Coastal Commission,

We write this letter to you in support of the desalination operations and ask that you continue progress to get this done without further delay.

The waste treatment plant alone is not enough of a **long-term** backstop to keep from drawing upon the Carmel River, its tributaries, and ground water resources.

This project is too politicized - only when the facts and truth and science is adhered to can you get this done. HELP US! Our tributaries are bone dry! Come and see for yourselves! We will show you how bad it is in person if you want a guide. We need to stop pulling from the watershed in the valley! The waste water conversation is terrific and we applaud it - but is not enough.

Data will support your decision to approve the desalination and we residents of Carmel Valley and generations to come will benefit from your decisiveness.

Don't delay approving the desalination project any longer. This has gone on long enough.

Loren & Erica Walden

Re: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Honorable Chair Padilla and Commissioners:

I am writing to urge you to support and approve the required Coastal Development Permit for California American Water's Monterey Peninsula Water Supply Project.

The Monterey Peninsula Water Supply Project is California American Water's answer to the State Water Resources Control Board's 2009 Cease and Desist Order, which limits pumping from the Monterey Peninsula's primary water source, the Carmel River, and requires a replacement water source be on-line by December 31, 2021.

Approval of this project will protect the Carmel River and its threatened species; and by providing a sustainable long-term water supply and alternative source to the river, will allow the Monterey Peninsula community to comply with state regulations.

The project has been the subject of an extensive, six-year environmental review by state and federal agencies and was unanimously approved by the California Public Utilities Commission (CPUC) in 2018.

The project utilizes a subsurface intake well system and a commingled brine/wastewater discharge, a desalination technology that minimizes marine impacts and is preferred by the State Water Board, Monterey Bay National Marine Sanctuary and your agency. The project's subsurface intake wells will also be located on a disturbed former industrial site, reducing impacts to biological resources.

Under the State Water Board's order to cease diversions from the Carmel River, Cal Am must ramp down its withdrawals from the river, which would result in severe water restrictions, including possible water rationing, unless a long-term permanent replacement source is put in place. The expansion of Pure Water Monterey does not have a clear path to being developed anytime soon and was determined by the CPUC in its decision to approve the Monterey Peninsula Water Supply Project to be of inadequate size to meet the terms of the Cease and Desist Order and the long-term water demands of the Monterey Peninsula.

Failure to complete the project in a timely manner would be harmful for the Monterey Peninsula community.

The construction schedule for the project requires work begin as soon as possible in order to meet the Cease and Desist Order deadlines. Your final decision on this important project cannot be delayed without implications.

For years, our community has faced stringent water supply restrictions that have necessitated drastic water conservation measures, prohibited new service connections and increases in existing water use, limited economic growth and severely limited opportunities for affordable housing in the region. Faced with these constraints, local businesses and residents have become leaders in the state in water conservation. However, given the already low water usage rate, conservation alone cannot replace the shortfall between Cal Am's water supplies and anticipated future demands.

The benefits of the Project are clear. We ask that the Commission approve Cal Am's application for a Coastal Development Permit..

Sincerely,

Steven Packer, MD
President / CEO
Montage Health

Comment in Support of the Monterey Peninsula Water Supply Project
Case Number: 9-19-0918

Dear Commissioners,

I support the Monterey Water Supply Project to create a desalination plant as a clean, sustainable solution to the water supply crisis in the Monterey Peninsula.

This desalination project is the only viable option to supply our community with a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and restoring the Carmel River and the Seaside basin.

The Monterey Peninsula is a leader in conservation, and for 25 years has been working with federal, state and local agencies to develop an alternate water supply for our community. It is imperative that the water supply needs of the Monterey Peninsula and the environmental issues facing the Carmel River are resolved as quickly as possible.

Please support this desalination project to ensure our water future. Thank you for your consideration.

Sincerely,

Gordon Mortensen

RE: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Honorable Chair Padilla and Commissioners:

Monterey County Farm Bureau represents family farmers and ranchers in the interest of protecting and promoting agriculture throughout our County. Since 1917, Farm Bureau strives to improve the ability of those engaged in production agriculture to provide a reliable supply of food and fiber through responsible stewardship of our local resources.

Our organization was an intervening party in the California Public Utilities Commission proceeding for the approval of the Monterey Peninsula Water Supply Project (Project) Certificate of Public Convenience & Necessity issued by the commission in October 2018. From the beginning of this regulatory approval process, our organization and others expressed numerous concerns over the source water intake facility to be located at the CEMEX property just north of the City of Marina, and the potential impacts of the Project on the groundwater aquifers upon which our members rely for their livelihoods. Our organization and others actively engaged with California American Water (Cal Am) and other stakeholders to scientifically determine whether and how the Project may affect the groundwater basin and our members' water rights. We formed the Hydrogeologic Working Group to model the groundwater basin and the Project, and pressed Cal Am to make project design and operational modifications to minimize and eliminate impacts to groundwater. We also negotiated agreements to ensure that third party groundwater rights would not be impacted and that the Project would be operated consistent with the Monterey County Water Resources Agency Act.

With this letter, we continue to express our support for the Cal Am desalination facility, and expressly, the issuance of the Coastal Development Permit for the source water intake facility. Monterey County Farm Bureau has a vested interest in the Project and its potential impacts to the groundwater basin, and we are convinced that the scientific record supporting this Project, developed over a seven year period and involving literally dozens of the State's leading hydrogeologists and modelers (independent from Cal Am) undeniably supports approval of the Project.

Background and History

Monterey County Farm Bureau (MCFB) represents 375 family farms and has constituent members that own or manage over 250,000 acres of farm and ranch lands in our County; this represents a substantial portion of the irrigated farmland of the Salinas River watershed area of the Salinas Valley, also known as the 'Salad Bowl of the World.' Producing over

150 different food products and crops annually, the economic value of these agricultural products exceeded $4.4 billion[1] in 2019, outdistancing all other economic sectors of Monterey County.

Moreover, economic impacts of agricultural activities in Monterey County were updated to $11.7 billion, demonstrating the dependence that the region has on the success of local Agriculture.[2] With this comes the reliance on groundwater for irrigation of the crops that are produced; thus, our organization's keen interest in anything that may impact or harm the Salinas Valley Groundwater Basin and its resources.

It was this concern about groundwater resources that caused MCFB to enter into the California Public Utilities Commission (CPUC) proceeding as an intervener in Spring 2012, shortly after Cal Am filed their petition for a Certificate of Public Convenience and Necessity (CPCN). MCFB's main concern was the intended placement the source water wells facility directly over the 180-foot aquifer of the Salinas Valley Groundwater Basin where it extends out under the Monterey Bay; the protection of water rights, exportation of fresh water from the Salinas Valley aquifer, and seawater intrusion impacts were of paramount concern to our organization and, particularly, to our members who are overlying water rights holders and users in the coastal zone area.

To protect our interests, as part of an initial settlement agreement,[3] MCFB, along with Salinas Valley Water Coalition (SVWC), supported the creation of the Hydrogeologic Working Group (HWG), to work independently on potential impacts the source water wells could have on the Salinas Valley aquifer. An invitation to participate was extended to all interveners of record at the time of the formation of the HWG; only SVWC along with Cal Am participated materially and financially, with support from MCFB.[4] The results of the HWG review process and work was presented in a findings document to the CPUC in 2017.

To address the issue of any freshwater extractions that may come from the source water well facility, MCFB and SVWC initiated discussions with Cal Am and other interveners to develop a return water flow settlement that would satisfy the water rights issue and the Monterey County Water Resource Agency Act (Agency Act) regulatory provisions (i.e. no exportation of groundwater from the Salinas Valley Groundwater Basin outside of the basin). This led to a mutually beneficial settlement agreement[5] (Return Water Flow Settlement) where all parties were satisfied with the outcome, including a number of water rights attorneys who crafted the language.

Water Rights & Source Water

Much has been made of the water rights issues associated with the desalination source water well facility; many community members and activist organizations maintain that any extraction from the Salinas Valley Groundwater Basin is a violation of water rights law. This is, in fact, not correct; the Agency Act, while strictly prohibiting the exportation of groundwater extracted from the basin to any other use outside of the basin area itself, does allow for beneficial uses of all extracted water *within* the basin area.

Cal Am admits that there is a reasonable expectation that a small amount of source water extracted for the desalination process will be of a content somewhat less in salinity than normal seawater; this is to be expected because the area of the proposed source water wells is substantially seawater intruded and has been for many decades. Subsurface water in the area north of Marina has been shown on maps of the Monterey County Water Resource Agency as showing higher levels of salinity, and has been confirmed by the number of irrigation wells in the area that are showing elevated salinity levels.[6]

This indicates, as supported in the Environmental Impact Report (FEIR/FEIS) for the CPUC decision, that seawater intruded areas of the subsurface (Dune Sand aquifer) have variable water conditions and quality. In no way is there indication that freshwater from inland areas of the Salinas Valley Groundwater Basin will be 'sucked into' the source water cone of impact; contrarily, the hydrologic studies in the FEIR/FEIS indicate that the source water wells, through continuous extractions, may actually improve seawater intrusion by holding this higher salinity water closer to the coast rather than allowing further advancement inland.

As one of the major concerns during the initial stages of this proceeding, MCFB sought to protect the water rights of overlying land owners adjacent to the proposed source water facility. Because of the potential to create a cone of depression in that area, impacts to water rights holders of the Salinas Valley Groundwater Basin could create undesirable consequences due to the subsurface extractions. Ultimately, this is not an identified impact to the groundwater basin found in the FEIR/FEIS, and certainly does not impact the City of Marina's water supply wells as those are of some distance away from the source water well facility *and in deeper levels of the aquifer.*

Working with Cal Am in the early stages of the CPUC proceeding, the proposed Project was modified to include multiple monitoring wells to determine groundwater levels in the immediate area of the source water well facility, with information supplied to the Monterey County Water Resources Agency for verification. In addition, mitigation measures to ensure that any impacts occurring in future years of operation of the source water wells facility are in place to protect water right holders; this applies to any overlying landowner or municipal water purveyor with water rights that shows the source water intake extractions are causing or inflicting harm. Thus, the City of Marina's water supply is similarly protected by these monitoring and mitigation measures.

Further, there is no credible evidence that can be supplied to show that either water rights or drinking water supplies of local water users will be impacted by the source water intake wells. The policy discussion of this CCC coastal permit should focus on the facts of this application, not the emotional and political rhetoric that many of the activist organizations use as a tactic to dissuade the issuance of the final permit for this Project. The CCC staff report repeats

[6] Monterey County Water Resources Agency, Seawater Intrusion Monitoring Program webpage with maps: https://www.co.monterey.ca.us/government/government-links/water-resources-agency/programs/seawater-intrusion-monitoring

FARM BUREAU

many of these unsubstantiated arguments and contends that these are indeed fact when they are clearly not facts as supported by the extensive documentation of this Project. The FEIR/FEIS prepared for the CPUC process is one of the most heavily researched and exhaustive impact reports prepared for any Project of this type, considering many of the issues that all interveners brought before the CPUC in testimony and briefings on the environmental concerns; the Large Settlement Agreement issues were all resolved through this extensive environmental review to the satisfaction of participating intervener organizations.

The monitoring and mitigation measures satisfied the question surrounding groundwater impacts to water rights holders in the coastal zone area of the Salinas Valley Groundwater Basin; the Return Water Flow Settlement addresses the remaining water rights issue of exportation of freshwater, as discussed in this next section of this letter.

Return Water Flow Settlement

MCFB entered into negotiations with several interveners (and their attorneys) to create language for the return water flow of fresh water extracted during the source water extraction process for desalination. Cal Am has characterized this fresh water component as approximately 7% or less of the seawater extracted from the Dune Sands aquifer on any given day,[7] and the EIR modeling shows it could be in the range of 1% to 12% with the higher range expected at pumping start up and then lowering overtime.

MCFB's primary concern was with fresh water extraction (really, brackish water due to seawater intrusion) related to the Agency Act which protects the groundwater basin *legislatively* from any water exports. The Agency Act's requirement that all fresh water extracted from the basin must remain in the basin mandates that extracted fresh water must be returned for beneficial use in the basin; the settlement constrains this return flow to be *in-lieu* of other groundwater pumping within the basin. This indicates that the return water flow must supplement (and replace) other supplies within the basin that are sourced from the groundwater itself.

MCFB asserts that the best choices for this return water flow are the Castroville Community Services District (CCSD) that is challenged with degrading groundwater quality, and the Castroville Seawater Intrusion Project (CSIP) that provides irrigation water to 12,000 acres of farmland in the coastal zone where seawater intrusion has made groundwater unusable for crop production. Both of these beneficial uses of return flow water would reduce reliance on marginal quality coastal groundwater and minimize extractions in these areas (*in-lieu* concept in place). In addition, the return flow water would curtail the need for very deep aquifer wells (for both municipal and irrigation uses) in the Salinas Valley Groundwater Basin in the coastal zone area, protecting this valuable resource in perpetuity.

Under the Return Water Flow Settlement, water would be delivered to CCSD and CSIP prior to any desalinated water delivered to the Monterey Peninsula; this indicates that Cal Am's source water intake extractions will have a net-zero impact on Salinas Valley Basin Groundwater extractions, and makes the basin whole and the Project legally feasible by avoiding any potential conflicts with the Agency Act. By delivering return water flows to these groundwater basin users prior to the Monterey Peninsula, there is a starting point of 'surplus or credit' avoiding net basin exportation.

The Return Water Flow Settlement contemplates a win-win-win solution for this difficult legal constraint for Cal Am, tangentially benefiting CCSD, CSIP, and the Salinas Valley aquifer. Many in the community have characterized this

[7] Results of the test well and the amount of fresh water extracted are available on the project's website: https://www.watersupplyproject.org/test-well

FARM BUREAU
MONTEREY

1140 Abbott Street, Suite C, Salinas, CA 93901 • PO BOX 1449, Salinas, CA 93902
office (831) 751-3100 • www.montereycfb.com

settlement action as a subsidizing of drinking water for the CCSD and irrigation water for CSIP, when in fact the *in-lieu* clause of this settlement agreement is simply exchanging one set of extraction circumstances that yields a better quality of water, and maintains the same amount of groundwater extractions overall (an overall goal of the Sustainable Groundwater Management Act of 2015). Because of the Agency Act, this assures that the small portions of Salinas Valley Groundwater Basin extractions of brackish water, unusable at that quality for any beneficial use, become a valuable and useable resource of higher quality for the benefit of groundwater basin users currently impacted by seawater intrusion.

The CPUC decision to award the CPCN to Cal Am included the Return Water Flow provisions, which fully satisfies the Agency Act requirements, recognizing that there are multiple wins in this elegant solution. CCC staff fails to recognize the advantages of this multi-benefit solution in their Project analysis.

Hydrogeologic Working Group Findings

At the outset of the HWG meetings, there was skepticism that the source water well facility could be configured in such a way as to avoid severe impacts to the Salinas Valley Groundwater Basin. Concerns focused on exasperating seawater intrusion in the north Marina coast area by establishing a large cone of depression, triggering in-land underground water flows from further distances within the basin, thereby violating both overlying landowner water rights and the Agency Act.

The intent was to find the best science, through an independent review by experts in their field of hydrology with specific experience and knowledge of the Salinas Valley Groundwater Basin, to determine the potential impacts of the source water well production. Collaborating with Cal Am's experts allowed for frank and honest discussion of the issues and review of available data, and the result was a report to the CPUC that indicated that brackish water will be removed from the shallow aquifer through the source water extraction process, improving seawater intrusion in the area of the source wells. The FEIR/FEIS supports these findings of the HWG and corroborates the positive impacts that the source water extraction process could have on the Salinas Valley Groundwater Basin and seawater intrusion.

Detractors of the desalination process would place harm on any water resources used for this Project, including extractions from the historically contaminated Dune Sand aquifer; the CPUC findings do not support this hyperbole. In fact, both the State Water Resources Control Board and the CCC recommended the subsurface well intakes as the optimal process for extracting source waters for desalination, noting that this virtually eliminated the entrainment issue associated with open ocean water intakes. After eight years of data collection, including numerous years of test well operation, the directives put forward by these two State agencies were upheld demonstrating that source waters could be extracted with minimal impacts to surrounding groundwater and other environmental concerns.

It seems incongruent that the CCC staff, as one of the agencies with a sub-surface intake policy for desalination extraction wells, would then confuse issues by recommending a denial of the permit that utilizes the very extraction process the policy recommends. The environmental issues listed in the staff report are, at best, minimal in impact and do not adequately reflect the policy of the CCC.

After careful review of the test well data, and the findings of the HWG, MCFB moved to a conclusion that the desalination source water wells facility portion of the Monterey Peninsula Water Supply Project can be operated with

FARM BUREAU
MONTEREY

1140 Abbott Street, Suite C, Salinas, CA 93901 • PO BOX 1449, Salinas, CA 93902
office (831) 751-3100 • www.montereycfb.com

no impact or less than significant impact to the Salinas Valley basin's groundwater, as supported in the FEIR/FEIS.[8] The evidence is clear.

Portfolio Project Approach of Monterey Peninsula Water Supply Project

When initially entering into the CPUC proceeding as an intervener, MCFB understood the Project description to include a portfolio of projects, to ensure not only adequate supply but redundant operational protections for service disruptions. This portfolio included desalination, aquifer storage and recovery (ASR), and reclaimed water from the Monterey One Water purification project (Pure Water Monterey). MCFB is on record as supporting this portfolio approach at a number of occasions throughout the CPUC proceeding.

Several intervener and community organizations, and now CCC staff, are now calling for reliance on a single water source for the majority of the Monterey Peninsula's water supply through expansion of the Pure Monterey Water project. CCC staff fails to recognize that the original portion of this project is over a year behind schedule, over budget, and has yet to deliver any potable water supply to the Monterey Peninsula (and only recently completed the reserve portion of the water supply to be stored in the Monterey sub-basin). Due to these key points, the expansion of the Pure Water Monterey project was effectively put on hold by the Monterey One Water Board of Directors earlier this year. There is no physical demonstration yet that the Pure Water Monterey project can deliver on the production numbers promised.

Moreover, two State agencies have formalized their support of the desalination Project (State Water Resources Control Board and CPUC) through extensive review of all issues and environmental concerns over the past eight years. This stands in stark contrast to the CCC staff recommendation that now goes against those two State agencies' support position when the policies for desalination are aligned and the applicant has complied with those same policies, at considerable expense.

Regardless of claims to the amounts of water the Pure Water Monterey project or its expansion could ultimately supply, the key point for MCFB is that the Monterey Peninsula would be solely dependent on a single water project to provide potable water for the majority of its demand. It remains our contention that Pure Water Monterey source waters are interruptible due to a number of considerations, and any one of these interruptions could impact the ability of the project to delivery on its promise.

Thus, reliance on a single water supply project is a short-sighted approach to solving a long-term water supply for a region that has been challenged to find adequate water supplies for decades.

By relying on a portfolio approach, redundancy of projects would ensure that any one project that fails to meet its supply demands could be supplied by another project of the portfolio; if any of these projects needs to contemplate a longer service interruption, other projects of the portfolio could plan ahead to meet demand, or meet demand in emergency situations.

MCFB supports the portfolio approach as the best way to ensure that the Monterey Peninsula maintains an adequate and reliable water supply for decades to come. Detractors from this portfolio approach only seek to control growth and

[8] "MPWSP source water would include some brackish groundwater from the SVGB." Monterey Peninsula Water Supply Project FEIR/FEIS, Chapter 2.5.1 Salinas Valley Groundwater Basin Return Water, page 2-23.

FARM BUREAU
MONTEREY

1140 Abbott Street, Suite C, Salinas, CA 93901 • PO BOX 1449, Salinas, CA 93902
office (831) 751-3100 • www.montereycfb.com

development by using water as a weapon, condemning the Monterey Peninsula community to several more decades of intermittent water shortages and a lack of affordable and market rate housing development, lots of record, and change of use for economic expansion.

Environmental Concerns with the CEMEX Location

Our expressed concern is that CCC staff puts forward a logic that the CEMEX sand mining site, already *disturbed earth*, can be fully restored to its pristine condition prior to the advent of the mining facility, or presumably, European settlement of the Monterey coastal region. This rationalization continues to negate the development of many necessary coast public projects, whether roadway capacity expansion, facilities that enhance recreational use, or in this instance, the development of a reliable water supply resource.

The CEMEX site was the chosen location for this type of source water well facility as it is already disturbed earth with an established access road and other infrastructure in place. To put forward an ideal concept that the entire CEMEX site can be restored to pristine condition, mainly for recreation, fails to take advantage of the availability of current conditions.

We find it very incongruent that CCC staff would recommend denying the very type of source water well facility, on a plot of disturbed earth, when agency policy supports multiple public benefits. Recreational use and other restoration processes can certainly be worked around the small wellhead structures this Project would eventually install and utilize.

We urge consideration by CCC Commissioners that the CEMEX site is indeed the ideal location for this type of source water well facility, including the hydrologic features that lie directly beneath.

CPCN Issuance

In their decision to approve the Project and issue the CPCN, the CPUC Commissioners affirmed that the groundwater basin surrounding the source water intake wells would be adequately protected from harm; monitoring wells will ensure that early signs of any impacts will be detected. The FEIR/FEIS was exhaustive on this subject and represents a substantial amount of work involving historical data and modeling. The Return Water Flow Settlement ensures that any freshwater removed as a result of source water extractions will be returned to the Salinas Valley Groundwater Basin *in-lieu*. Moreover, the Project is drought-proof.

MCFB supported the issuance of the CPCN; our concerns have been satisfied to a positive outcome within that proceeding.

Conclusion

So, why does MCFB care so much if the permit for the source water well facility is issued or not? Being good neighbors and friends to those on the Monterey Peninsula who continue to argue over their water resources, our organization knows full well what a long-term, reliable water supply solution means to the community overall. Our experience with water supply development in the Salinas Valley stands in marked contrast to the acrimony that the Monterey Peninsula continues to retread each time a water supply project is proposed. Voting down a replacement dam and a prior desalination facility ensured that the acrimony would continue for many more decades and limit any development due to the cease-and-desist order in place.

FARM BUREAU
MONTEREY

1140 Abbott Street, Suite C, Salinas, CA 93901 • PO BOX 1449, Salinas, CA 93902
office (831) 751-3100 • www.montereycfb.com

The truth is that any delay in finding a long-term water supply solution for the Monterey Peninsula continues these arguments into the next generation; the greater economic vitality of the entire County is dependent on having adequate water supplies for both agricultural irrigation, tourism, economic growth, and housing development. A lack of a solution that provides these resources for the coming decades will only continue the infighting that has made the Monterey Peninsula the dysfunctional area of the Monterey County economy.

Salinas Valley landowners and water users have spent multiple decades and hundreds of millions of dollars developing their water resources, building two reservoirs (Nacimiento and San Antonio), the Salinas Valley Water Project, and the Castroville Seawater Intrusion Project. These projects have been constructed and financed by bringing together the greater community to manage water resources in a sustainable manner, allowing for a robust agricultural sector to flourish and expand. The Salinas Valley community has taken charge of their water resource destiny and successfully developed a reliable water supply system.

The Monterey Peninsula has continued to ignore potential projects as solutions to their water supply resources in these same intervening decades. Fighting over these projects has wasted hundreds of millions of dollars and forces the solution into the future where costs will certainly continue to escalate. Continued acrimony over various aspects of the Monterey Peninsula Water Supply Project only serve as delays to finding a solution. It's time that the Monterey Peninsula's water supply he made reliable by meeting current and future demand, and that Monterey County has significant and stable water resources for all regions of our County. Now is the time for a positive decision by the final State agency to support a reliable, well designed, and beneficial water supply project.

MCFB supports the issuance of the Coastal Development Permit for the source water intake wells of the Monterey Peninsula Water Supply Project in the coastal Sand Dune aquifer of Monterey County.

It's time to move this desalination Project across the finish line and ensure that the Monterey Peninsula has a long-term, reliable and redundant water supply for decades into the future. Reliance on a single water resource should be eliminated as a choice in such an important region for environmental, residential, commercial, and tourism sectors when a portfolio of projects can ensure that the community will not have to suffer through another period of water shortages and a continuing cease-and-desist order. This will then place the Monterey Peninsula on the same level of sustainable water supply that the Salinas Valley basin has invested in and assured for itself.

MCFB thanks the CCC Commissioners for their thoughtful consideration of this Coastal Development Permit; it's time to conclude the endless acrimony and move forward with a reliable water supply resource for the Monterey Peninsula.

Sincerely,

Norman C. Groot

Re: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Hon. Chair Padilla and Commissioners:

As a resident of the Monterey Peninsula I wish to express my strong support for the desalination plant that will be constructed by California American Water. Our Peninsula continues to suffer a water shortage, and a building moratorium for far too long. The key to affordable housing not only in our area but in our state is inventory. Each year we need to produce 300,000 units of new housing just to keep up with the population growth. Today we currently average under 100,000 statewide. The lack of water in our area keeps prices inflated and hurts the very people who service our economy by making them drive long distances for work.

The very fact that the Coastal Commission approved the test wells demonstrates the effort that California American Water has put into the project. Now with new data that suggests that Aquifer Storage and Recovery (ASR) may never produce more than the current five-year average of 1,164 acre feet or that the Pure Water Monterey main project is behind, over budget, and may never produce more that 2/3rds of the water projected, demonstrates the necessity and overwhelming need for an operating desalination project now, not ten years from now. Ten years from now will only increase costs and drive people away from our beautiful scenic coastline because they cannot afford to live here.

The desalination project is the only part of the portfolio that is drought resistant. The desal plant will make it possible for business to recover from the Covid-19 disaster, public officials to make smart land use decisions and communities to build the housing we need to support our firefighters, teachers, and other workers by lifting the moratorium we have been living under since 2010. Please support and approve California American Water's permit request that is before you.

Respectfully,

Kim DiBenedetto

Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Hon. Chair Padilla and Commissioners:

For the last 30 years struggle over growth and development has distorted the consideration of any new water supply project on the Monterey Peninsula. I've lived here since 1980 and each water supply project that might lift this community above virtual permanent drought has been fought by those who claim social justice while simultaneously working to keep "those people" from their neighborhoods.

In the early 1990's the Water Management District spent millions of dollars studying the water "situation" when obvious technical solutions were at hand. Instead, Water Management District in-fighting and lackluster leadership allowed the no-growthers in the community to kill two drought proof water supply projects – the desal project and the dam.

Now many of those same individuals and organizations who used social justice in the past are using it today as a weapon against the current desal project. These same entities and individuals would work to kill any project that might provide enough water to build both affordable housing and infill projects on lots that have been empty for the last 30 years.

Now even the Water Management District is getting into the no-growth act. They recently sent a letter to the commissioners saying that they no longer support the desal project. They have spent millions of our property tax and ratepayer dollars on unfulfilled water projects, but now in the eleventh hour they decide desal not needed?

In a recent poll 72% of respondents said that they supported the desal project and so the letter sent by the Water District certainly does not reflect the consensus of the community. Since there are several members of the District's board of directors who support the purchase of CalAm, it is all too apparent the goal is to kill the desal to reduce the purchase price. It's unconscionable that the desal would be used for this purpose.

It is especially egregious since the opponents to the desal project claim "social justice" as the reason for their opposition. The Coastal Commission must apply social justice concepts across all of the communities on the Monterey Peninsula including Carmel Valley, not only for the City of Marina.

Social justice demands that enough water is produced to enable the construction of sufficient housing units to provide homes for people employed on the Peninsula who are "those" people the desal opponents are trying keep out of their neighborhoods. Reject this approach and approve the desal permits.

Thank you,

Carmen Martin

Re: Support for Cal-Am's Monterey Peninsula Water Supply Project

Dear Chair Padilla and Commissioners:

As the former recent General Manager of Monterey County Water Resources Agency for 7 years, following 22-year career being in responsible charge of water utility systems across the United States, I am intimately familiar with the dire water situation on Monterey Peninsula and the options available for its resolution.

As a utility professional, I am convinced that the correct and most feasible solution for Monterey Peninsula's current water situation is construction and operation of the desalination project already approved by the California Public Utilities Commission. I've studied the numbers in the past; no amount of overstating supply by some and understating demand by others should be allowed to enter into your Commissions' approval process.

Accordingly, I strongly urge you to immediately approve the Coastal Development Permit for the Cal-Am Desalination Project.

Sincerely

David E. Chardavoyne

Re: Appeal No. A-3-MRA-19-0034; Approve Cal-Am Desal Project Permit

Honorable Chair Padilla and Commissioners:

Pebble Beach Company (PBC) would like to join with the broad coalition of governments, businesses, residents, and environmental organizations in support of the Monterey Peninsula Water Supply Project. We urge you to approve the required Coastal Development Permit for the project.

The Monterey Peninsula community has been at work for more than 40 years to develop a long-term, sustainable, drought resistant water supply for the Monterey Peninsula. The comprehensive, six-year environmental review for the Monterey Peninsula Water Supply Project was completed by state and federal agencies and unanimously approved by the California Public Utilities Commission in 2018. Objections raised by project opponents, including groundwater impacts, environmental justice, water rights, and project alternatives - to name a few - were all exhaustively analyzed, and ultimately dismissed. The question of how much water the Monterey Peninsula requires has also been carefully studied, deliberated, and ultimately settled by the California Public Utilities Commission in 2018. The decision before you today is the crucial, final step of approval needed to bring the Water Supply Project to fruition.

REAL ESTATE DIVISION
4005 Sunridge Road, Pebble Beach, California 93953

PBC has a long history of leading the golf industry and Monterey Peninsula with innovative and responsible water resource management. In the early 1990s, we financed and developed the $70M Pebble Beach water reclamation project – today this project supplies 100% of the water needed to irrigate all the golf courses in the Del Monte Forest. To date, we've saved more than 7.07 billion gallons of potable water for the Monterey Peninsula. Needless to say, we're staunch supporters of recycled water, and now have almost three decades of experience relying on recycled water. Importantly, we've learned that the supply of recycled water is extremely dependent upon the community's potable water use that, in turn, supplies the "raw product" for the reclamation process. As residents and businesses conserve more and more potable water, (as we have been doing on the Peninsula for years now), they, in turn, generate less and less waste water to be recycled. From our own 30-year experience, we know firsthand that the supply of recycled water is neither constant nor guaranteed over time. In addition to the long-term impact of conservation, the supply of recycled water also shrinks dramatically during times of drought. Neither of these issues afflicts the Cal-Am desalination project before you today: Unlike reclamation, it is entirely independent of the impacts of conservation and drought. For that reason, Cal-Am's project is essential. Recycled water alone simply cannot meet the Monterey Peninsula's water supply needs on a sustainable, long-term basis.

PBC would also like to call your attention to pages 115-132 of the Coastal Commission Staff Report. Collectively referred to as "Updates," the Staff Report relies on the incorrect, misleading findings of the Monterey Peninsula Water Management District's projections of future water supply and demand. Unfortunately, the Staff Report fails to consider numerous agency and public comments, including those of the State Water Resources Control Board, all of which discredit the Water Management District assumptions and findings. Specifically with respect to PBC, the Staff Report falsely assumes that we will not use our full water entitlement and, along with other questionable assumptions, erroneously calculates a reduced water demand for the greater Monterey Peninsula. PBC's vested right to use our water entitlement has been consistently upheld by every concerned agency, and we intend to fully utilize the entitlement. In fact, we've already used or allocated for use all but 60 acre-feet (out of our total 365 acre-foot entitlement). We bring this error to your attention for two reasons: (1) false assumptions call into question the overall credibility and integrity of the report, and (2) we sincerely hope that the Coastal Commission will not allow erroneous data and incorrect assumptions to influence your decision-making today. We believe the supply and demand numbers presented by MPWMD are erroneous and fail to take into account the complexity of water dynamics here and the long- and short-term needs of the community.

We also believe that the current MPWMD Board has an inherent conflict of interest because several if not a majority of board members have avowedly been pursuing a public buy-out of

Cal-Am. Torpedoing Cal-Am's desalination project will make that goal much more attainable. Instead of focusing on a hostile takeover of Cal-Am, the entire MPWMD Board should be laser-focused on the agency's primary mission: To create a reliable long-term water supply to meet the needs of the Monterey Peninsula. For that reason alone, we urge you to rely on the much more comprehensive and unbiased study of our water supply and demand approved by the California Public Utilities Commission with far more rigorous analysis and public review.

PBC strongly believes that we need both desalination and recycled water to provide our community with a long-term, adequate, secure, and flexible water supply. We are approaching the finish line to resolve our community's long-term water supply crisis, after 40 years in pursuit of that goal. We urge you to support the project to the fullest extent of your powers.

Sincerely,

PEBBLE BEACH COMPANY

Re: Approval of the Cal Am Desal Project Permit

Hon. Chair Padilla and Commissioners:

The Associated General Contractors of California represents approximately 1,000 general contractors, subcontractors, and suppliers who work on projects ranging from $100,000 to over $100 billion across the state. We believe the construction industry is vital to the success of the Monterey Peninsula. Together, our members actively create opportunities to build and strengthen our region. On behalf of AGC of CA, I am writing to express our continued support of the Monterey Peninsula Water Supply Project and the issuance of the Coastal Development Permit.

The Monterey Peninsula has faced drastic water conservation measures due to stringent constraints on water supply. While Monterey District customers have become leaders in the State regarding water conservation, the current shortfalls and demands on water supply cannot be met solely through conservation. A new supply of water must be provided to meet the current and future demands of the community. Moving forward with the desalination project will meet these demands and will protect and promote the overall livelihood of the region and its economy.

The approval of the project permit will also allow for compliance of the cease and desist order issued by the State Water Resources Board to halt the utilization of the Carmel River to serve the Peninsula. The project will not only ensure the protection of the Carmel River and its threatened species, but will also provide a sustainable, long term water supply that is built in an environmentally responsible manner which

AGC CALIFORNIA

incorporates state of the art design and desalination technology to reduce the impact to biological resources.

As the benefits of the Monterey Peninsula Water Supply Project are clear, AGC of California asks that the Commission move forward with the project and the proceed with the issuance of the Coastal Development Permit.

Sincerely,

Rosa Trevizo
Regional Government Affairs Manager
Associated General Contractors of California

Re: Support for California American Water's Monterey Peninsula Water Supply Project

Hon. Chair Padilla and Commissioners:

This letter conveys the comments of Trout Unlimited on the Coastal Development Permit for California American Water's Monterey Peninsula Water Supply Project.

Trout Unlimited (TU) is America's largest and oldest coldwater fish conservation group. Since 1959 TU has worked across the country to conserve, protect and restore native trout, salmon and steelhead, and their watersheds.

Specifically, on the Monterey Peninsula, our goal is to recover steelhead on the Carmel River.

In the 2013 *South-Central California Coast Steelhead Recovery Plan* prepared by the National Marine Fisheries Service, the Carmel River steelhead run is identified as a Core 1 population, which is the highest priority for recovery in the plan.

The Carmel River however, is dramatically impacted (impaired) by water diversions, primarily for domestic water use. The California State Water Resource Control Board has determined that until those diversions are abated, steelhead population in this river will have no chance to reach recovery numbers.

This proposed de-salinization facility is part of a portfolio of projects (including recycled water, strict conservation efforts and conjunctive use projects) which will allow the greater Monterey Bay area to abate river diversions and still provide adequate domestic water. It is the only component of this portfolio that is drought impervious and which can provide continuing sources of domestic water during periods of extended low rainfall and climate change.

In July 2020, responding to the Governor's Executive Order N-10-19, the State of California published the California Water Resilience Portfolio report. An excerpt from the Executive Summary includes:

> *Because no single solution can fully address the state's water challenges, the portfolio embraces a broad, diversified approach. Goals and actions are organized into four categories:*
>
> *Maintain and diversify water supplies*
> *Protect and enhance natural ecosystems*
> *Build connections*
> Be prepared

The Executive Summary of the Portfolio report ends with:

> *Carrying out this portfolio will require a new emphasis on cooperation across state agencies and with regional groups and leaders. Likewise, this portfolio will advance Newsom Administration priorities to build climate resilience across all sectors and make possible opportunity and prosperity for all Californians. This water resilience portfolio will serve as an important step toward achieving these ambitious goals.*

We believe that this project achieves the goal of diversifying water supplies, protects and enhances the Carmel River and helps this region prepare for drought and climate change for this coastal region of California.

This project will increase the quality, quantity, and stability the Carmel River streamflow and improve conditions for threatened steelhead and other species while sustaining the economic health and well-being of Monterey County's diverse residents, communities and businesses.

We strongly recommend that the Commission approve Cal Am's application for a Coastal Development Permit.

Sincerely,

Tim Frahm
California Central Coast Steelhead Coordinator

Cindy Merzon <cindy_merzon@calcoastal.org>

Fri 9/11/2020 11:29 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Good Afternoon,

On behalf of Monterey County businesses, I am writing to encourage you to support and approve the Cal Am Desal Project Permit. Jobs, economic recovery and affordable housing opportunities require an adequate, reliable water supply. It's time to stop delaying the only option on the table that is capable of meeting the terms of the Carmel River cutback order and supply our community with a long-term sustainable water source.

I urge you to support local business and economic needs for our community by approving the Project Permit for the Cal Am Desal Project.

Best,

Cindy Merzon, *Director*

September 11th, 2020

Chair Steve Padilla
California Coast Commission
45 Fremont St, Ste 2000
San Francisco, CA 94105

Dear Chair and Members of the Commission:

The people of the Monterey Peninsula need water. Yet we have been denied and delayed by many bureaus and lawyers for decades, blocking what we need.

Your staff has had input on this project for years. It was your staff that first recommended slant wells for our desalination plant. Yet now we are told by your staff they do not recommend the project.

I am concerned that water is used as a weapon in our area. There are voices calling for delay due to technical, cost and need reasons, when in fact, these voices do not want the people of the Monterey Peninsula to have ample water. Specifically, I call out the Public Water Now PAC as an operator in bad faith. Please do not let your agency or your staff be infected with their lies.

This project has faced a Byzantine history of permit processing. It is time for that process to end. Please do what you can to help the people of the Monterey Peninsula to obtain the water needed for our health, our hygiene, our gardens and our economy.

Please vote to approve the desalination project before your commission.

Sincerely,

Jeff Gorman, Candidate
United States Representative, CA 20

A-3-MRA-19-0034 Approve Cal Am Desal Project Permit

Smith, Joe <joe.smith@Sothebyshomes.com>

Fri 9/11/2020 11:23 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

To whom it may concern,

I have lived on the Monterey Peninsula all of my life. I remember when the Monterey Peninsula Water Management District was formed to get us more water. All they have done is get us less water. I urge to you approve a permit immediately for this project to move forward. The people of the Peninsula have waited too long for a water project to give us the water that is needed for the current population, business growth, and fill in development for lots of record. Without this project the main tax income from visitors will be affected in a negative way. That will affect all residents.

I urge your approval of the permit

Joseph B Smith
602 Congress Ave.
Pacific Grove, CA 93950

Re: Monterey Peninsula Water Supply Project

Dear Commissioners,

The Monterey County Water Resources Agency ("MCWRA") has a long-celebrated history utilizing recycled water. In collaboration with our sister agency, Monterey One Water ("M1W"), the Monterey County Water Recycling Projects ("MCWRP") have delivered over 250,000 ac-ft of recycled water to the agricultural lands around the town of Castroville over the past two decades. The implementation of the MCWRP has allowed MCWRA to reduce groundwater pumping in the area and slow seawater intrusion. However, seawater intrusion continues to progress and Castroville's municipal water supply is one of the most impacted. Without a reliable municipal supply, residents, businesses, and industries in the coastal communities of the northern Salinas Valley cannot thrive. The Monterey Peninsula Water Supply Project addresses the water supply needs of the Monterey Peninsula with the additional benefit of providing a long-term sustainable water supply for the severely disadvantaged community of Castroville. For the reasons discussed below, MCWRA reiterates its support for Cal-Am's Monterey Peninsula Water Supply Project.

The Monterey Peninsula Water Supply Project's Compliance with the Agency Act

In 2016, several parties (MCWRA, Cal-Am, Coalition of Peninsula Businesses, Landwatch Monterey County, Monterey County Farm Bureau, the Monterey Peninsula Regional Water Authority, Monterey Peninsula Water Management District, M1W, Planning and Conservation League Foundation, and the Salinas Valley Water Coalition) entered into a Return Water Settlement Agreement ("RSWA"), which addresses a concern raised early on about the location of the slant wells for the desalination plant, which overlay the western portion of the Salinas Valley Groundwater Basin ("SVGB"). Specifically, the issue was whether the production source water for the Monterey Peninsula Water Supply Project would conflict with the anti-export provision of the Monterey County Water Resources Agency Act ("Agency Act") and infringe upon the groundwater rights of those in the SVGB. Specifically, Section 52-21 of the Agency Act states that no SVGB groundwater may be exported for any use outside the SVGB.

In order to meet the requirements of the Agency Act, Cal-Am committed, through the RWSA, to make available for delivery "Return Water" equal to the percent of SVGB groundwater, as distinguished from seawater in the source water. The MCWRA Board of Supervisors approved the RWSA, thereby finding that the Monterey Peninsula Water Supply Project does not violate the Agency Act. MCWRA is entitled deference in its interpretation of the Agency Act. The California Public Utilities Commission agreed with MCWRA and approved the RWSA, finding it was reasonable, consistent with the law (including the Agency Act), in the public interest, and fully supported by the record. Coastal Commission staff failed to recognize the benefits of the RWSA solution, and MCWRA urges the Coastal Commission to consider the past findings that the Monterey Peninsula Water Supply Project is compliant with the Agency Act.

Pure Water Monterey Project and Expansion Project

When the MCWRP were designed over twenty years ago, it was assumed that the amount of wastewater flowing into the treatment plant would increase over time and provide additional recycled water for use in the region. This assumed increase in flows has not materialized and in fact has declined, mainly due to water conservation measures being implemented by residents, businesses, and the agricultural industry. The overall trend is for the use of water conservation measures to increase in the future, which will most likely further diminish inflows.

For the past five plus years, MCWRA has worked collaboratively with M1W on the establishment of new source waters for both the Castroville Seawater Intrusion Project growers and the Pure Water Monterey Project. However, MCWRA did not support certification of the Final Supplemental Environmental Impact Report ("FSEIR") on expansion to the Pure Water Monterey Project. The Expansion Project's new source waters have not been quantified sufficiently for MCWRA to agree that there is an adequate amount of treated wastewater to meet current contractual obligations, as well as additional demand. Furthermore, there are too many unanswered questions regarding the availability and rights to source waters, future operations, and the resulting adverse impacts for MCWRA and its stakeholders. The M1W Board of Directors recognized these constraints and chose to not certify the FSEIR. MCWRA strongly believes that the now tabled Expansion Project will not serve as a sustainable water supply for the Monterey Peninsula.

MCWRA is committed to assist in securing a long-term sustainable water supply for the Monterey Peninsula and Salinas Valley communities. In that regard it is the MCWRA's conclusion that currently the Monterey Peninsula Water Supply Project is the only project that addresses that interest. MCWRA urges the Coastal Commission to issue the Coastal Development Permit for the Monterey Peninsula Water Supply Project.

Sincerely,

Brent Buche

Re: Appeal No. A-3-MRA-19-0034

Honorable Chair Padilla & Commissioners,

" H2O – Our Future" is a grass roots organization which has sprung up over the last several months. Our current following is over 10,000 and growing daily. We are a group of concerned citizens, ratepayers, and organizations who live, work, and depend upon the economic vitality of the area covered by the Monterey Peninsula Water Management District and the Cal Am service area. Many of our members have been actively involved in one way or another with the ongoing water issues which plague the area of concern. We have come together because the government agency created to address and solve our water problems has failed us and our water purveyor has been subjected to numerous restrictions, regulations, and conditions, which if not met, will continue to and will increasingly have an adverse effect on our lives.

A committee of the group has read and analyzed the Staff report and we submit these comments for your consideration.

Sea Level Rise – We understand that sea level rise is a concern and needs constant monitoring and evaluation but during the life of the wells and the need for relocation in the future it is only speculation that the wells could be at increased risk from this issue. We must note that major infrastructure projects are always in need of periodic maintenance, upgrade, and possible relocation. If the Commission would consider direct ocean intake as approved in southern California this concern would be greatly reduced and in fact would eliminate some other issues.

Groundwater Resources – We believe the independent Hydrogeologist's report speaks for itself regarding the accusations that Marina's water would be at risk. This has been proven to not be the case. Therefore all the concern and testimony in the past and coming in the future regarding this issue is moot and should no longer be an issue.

Wetlands - This is of concern but believe monitoring after operation of the wells would be advisable. Staff seems to put a lot of emphasis on these wetland and vernal pools. With all the land to the north of the proposed site in dunes and crops we contest what wetlands? Same for all the lands to the east which are currently being converted to cropland we ask what wetlands? The only wetlands of concern are within the City limits of Marina which are relatively far from the well sites and according to the hydrology study are not connected to groundwater. We believe Staff needs to look at what is taking place in real time instead of trying to portray a situation which no longer exists. This will be a recurring theme in our letter.

Terrestrial ESHA - As stated above, things must be looked at in real time and in historical context. To portray something as being pristine and almost virgin like when it has been extremely impacted for over 100 years is heinous. The 35 acres of concern have been in a state of extensive use for over 100 years and are not the habitat of any of the listed species. Conditions change on a daily basis within the operations area of the sand plant and this is not conducive to providing habitat. To be slightly facetious we are sure some bird habitat will be disturbed when the sand plant buildings are removed. Are these to remain? Lastly, for all the time and effort spent on this element of the report does anyone realize that most if not all of the area to provide the well sites is currently under a new mound of sand approximately 30 feet in height? Yes, this area has been covered with a huge mound of sand for reclamation purposes when the plant is closed. The ground habitat that may have been there is gone.

Fill in Coastal Waters – In order for the project to move forward modifications to the existing outfall needs to be done. We believe this is minimal to its effects to the ocean and along with the placement of buoys be allowed.

Project Alternatives - Many of the group who reviewed the Staff report are longtime residents of the area with extensive experience and knowledge of what has taken place over the years regarding our water situation. In 1997 Assemblyman Keeley interfered with the legislated remedy to address our water problems, the creation of the MPWMD, by submitting AB 1182. This legislation was to direct the CPUC to study and provide an alternative to a Carmel River dam in case a dam project did not go forward. The dam was going to provide 24,000 acre feet of water to not only supply our communities with what they needed for present use but into the future. It also was going to provide water for habitat and restoration of the impacted Carmel River. Needless to say this threw the future of our community into the hands of State bureaucrats with no need of a solution and no sense of urgency. They finally came to a decision in 2018. Now we have an alternative to an alternative and the amount of water is being reduced at every turn.

The reason for Staff putting so much time and effort into this element is it is required but if was mainly a result of the unveiling of the Stoldt (GM MPWMD) Supply and Demand report. We can't make this any clearer; we don't want to live the next 20-30 years as we have the last 44. The PW expansion would be a great project to pursue once the Cal Am project is in place. This would provide redundant back up for any of the sources of water which may not be able to provide water as planned.

Stoldt's report and Staff's analysis does not take into account the effects of limited water over a 40 period of time on our communities and economic vitality. According to US Census figures there has been net zero population growth over the 40 years in the communities where the Census can accurately make a count. The unincorporated area of our area of concern is hard to determine but should follow the trend within the verifiable Census areas. We will pursue this theme in the next section.

Environmental Justice – What justice has there been over the last 40 years? **None**. Communities of concern are spread unevenly throughout the whole of the affected area we are discussing, not just the ones identified in the Staff report. The water inequity has caused housing prices to go up. Limited supply with great demand equals an increase in price. Our area is an economic hub which supplies jobs

Letter and Resolution supporting Cal Am desalination project approval

RESOLUTION NO. 1723

A RESOLUTION OF THE MONTEREY PENINSULA AIRPORT DISTRICT IN SUPPORT OF THE AMERICAN WATER WORKS COMPANY DESALINATION PROJECT

WHEREAS, water is a precious commodity necessary to sustain life, vegetation, and the lifestyle of the region; and

WHEREAS, the Monterey region has a history of chronic water shortage; and

WHEREAS, in 2006, a Court ruling ordered the reduction of water pumping from the Seaside Aquifer, and in 2009, the State of California issued a Cease and Desist Order imposing a great reduction of water withdrawals from the Carmel River; and

WHEREAS, the Monterey region must find an alternative water supply or face severe water rationing, which would have an extremely negative impact on the local economy and those living in the area; and

WHEREAS, the American Water Works Company ("Cal Am") has proposed a desalination project that would produce an estimated 6,900 acre feet of high quality potable water per year; and

WHEREAS, the proposed Cal Am desalination project will also support the regional Groundwater Replenishment Project, which would recharge the Seaside groundwater basin by injecting high quality purified water; and

WHEREAS, the proposed Cal Am desalination project is sustainable, drought-resistant and would improve and protect drinking water supplies, while also diversifying the community's water supply portfolio for a more secure water supply.

WHEREAS, the Board of Directors of the Monterey Peninsula Airport District believes that the Cal Am desalination project is one component of many which will help solve the regional water crisis, will have a positive effect on the local economy and those living in the area, and will produce economic viability and sustainability for the Monterey Regional Airport.

NOW, THEREFORE, BE IT RESOLVED BY THE BOARD OF DIRECTORS OF THE MONTEREY PENINSULA AIRPORT DISTRICT: the Board of Directors of the Monterey Peninsula Airport District supports the Cal Am desalination plant and believes that the proposed desalination project should be implemented as soon as possible to protect drinking water supplies, which will ultimately protect the region and its economy.

BE IT FURTHER RESOLVED that the Board of Directors of the Monterey Peninsula Airport District encourages the California Public Utilities Commission and all other regulatory agencies with jurisdiction over the proposed Cal Am desalination project to expedite its approvals for the desalination project to enable the local community to have a secure and diversified water supply portfolio.

PASSED AND ADOPTED BY THE BOARD OF DIRECTORS OF THE MONTEREY PENINSULA AIRPORT DISTRICT: This 15th day of August 2018, by the following roll call vote:

AYES:	**DIRECTORS:**	Cursio, Leffel, Nelson, Sabo, Chair Miller
NOES:	**DIRECTORS:**	None

RE: Proceeding # A. 12-04-019

Dear Ms. Stebbins:

On behalf of the Monterey Peninsula Airport District I am pleased to provide your organization with a Resolution of Support of the American Water Works Company Desalination Project. This Resolution was adopted unanimously by the Board of Directors at their August 15, 2018 Regular Board meeting.

The Monterey Peninsula Airport District is a Special District formed by the State of California in 1946. As owners and operators of the Monterey Regional Airport, the five-member Board of Directors is charged with managing the affairs of the Airport through its Executive Staff. As part of that effort, the Board and Staff have committed to the future development of the Airport to serve our region through the promotion of convenient air service and quality facilities. We believe that for the District to meet its goals, a viable and sustainable water supply must be available. The proposed desalination project in our view represents the best available option to ensure the creation of that supply. It is for that reason the Board of Directors chose to make its position known formally in the context of the resolution attached.

We would ask that our Resolution of Support be made part of the Record regarding this proceeding and strongly encourage a favorable decision on the part of the California Public Utilities Commission.

Cordially,

Monterey Regional Airport

Michael La Pier, A.A.E.
Executive Director

September 10, 2020 AGENDA ITEM #: Th3a & Th4a

California Coastal Commission
455 Market Street, Suite 228
San Francisco, CA 94105-2219

Dear Commissioners:

RE: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Submitted via e-mail to: CalAmMonterey@coastal.ca.gov

CalDesal is a non-profit association that educates and advocates for the increased use of brackish and seawater desalination along with salinity management as part of a diverse, secure, and high-quality supply to help meet California's water needs.

We were pleased to see the inclusion of desalination along with salinity management as proposed solutions in Governor Newsom's recently released Water Resilience Portfolio. Maintaining existing supplies and diversifying additional supplies is the first of four core goals of the Portfolio and desalination is identified as one piece to enhance regional water supply through diversification.

The Monterey Peninsula Water Supply Project would serve to diversify water supplies and help the region tackle challenges like the need for affordable housing. It would also meet the terms of the Carmel River cutback order. The Project would address the water supply crisis in the Monterey Peninsula, supplying the local community with a long-term reliable desalinated source of water supply.

Desal is a climate change-resilient, drought-proof, and pure water supply that can serve as part of a larger water supply portfolio based on a local area's specific challenges. The time is right for the Monterey Peninsula Water Supply Project to help meet those regional needs. We hope you will support it. Thank you for the opportunity to comment.

Sincerely,

Wendy Ridderbusch

Subject: Public Comment on September 2020 Agenda Item undefined 3a - Appeal No. A-3-MRA-19-0034 (California American Water Company, et. al., Monterey Co.)

Dear Commissioners,

Please consider this guest commentary that was printed in the Monterey Herald as my written comment for Appeal No. A-3-MRA-19-0034. The town of Castroville is a severely disadvantaged community, but we are willing to work with our neighbors to find a sustainable water solution for all our communities.

It is worth noting that the proposed alternative, the expansion of Pure Water Monterey, 1. would take water from Castroville, 2. is not funded, 3. had its draft EIR rejected by the Board of Monterey One Water, and 4. does not have a commitment for more source water from the Salinas Valley. The expansion of Pure Water Monterey is a paper alternative, not a real alternative.

Thank you,
Grant Leonard
Board Chair
North County Recreation and Park District

Desalination: The Castroville Connection

For people who do not spend their spare time following the Monterey Peninsula water saga, one of the more curious things about the CalAm Monterey Peninsula Water Supply Project is why Castroville has anything to do with the project. You'd be forgiven if you thought that the desalination project to bring water to the Monterey Peninsula only involved the CalAm, the Monterey Peninsula cities, and the Pacific Ocean.

However, Castroville, the Artichoke Center of the World, now finds itself at the center of the Desalination project. The reason is rather technical, but basically this is because the desalinated water will be pumped from the coastal dunes between the ocean and the farm fields north of Marina, and a certain percentage of the desalinated water is anticipated to come from the Salinas Valley groundwater basin. State law requires that water from the groundwater basin be used within the area of the groundwater basin, so that percentage of the desalinated water cannot go to the Monterey Peninsula.

Castroville, the small, agriculturally focused community in North County, is the logical recipient of the water from the groundwater basin. Castroville is within the groundwater basin, and Castroville suffers from water insecurity due to saltwater intrusion from the ocean. While the Monterey Peninsula is lacking water due to a state order to protect the Carmel River, Castroville faces a very real future of contaminated drinking water due to seawater intrusion.

The Monterey Peninsula Water Supply Project, as currently designed (and already approved by the California Public Utilities Commission) would answer the long standing water needs for both the Monterey Peninsula and Castroville. The Carmel River would no longer be over pumped, and the community of Castroville would no longer face the threat of salty drinking water in our homes.

But Castroville is not merely benefiting from this project, we are also helping to make it a reality by building the critical infrastructure to bring the desalinated water to Castroville. The Castroville Community Services District is a committed partner in the effort, agreeing to funding an approximately $3 million pipeline to Castroville from the desalination plant in Marina. This is no small effort for Castroville, which is determined to be either economically disadvantaged or severely economically disadvantaged depending on which State or Federal metric you use. The willingness to contribute millions of dollars to desalination speaks to the community's desire to be good partners on this water solution in spite of the community's economic challenges.

Castroville has a long history of partnering on innovative water solutions. The Castroville Seawater Intrusion Project(CSIP), has been providing recycled water for agricultural use since 1998. CSIP is supported by the Salinas Valley Water Project's rubber dam on the Salinas River, which provides seasonally stored water that is used with CSIP to reduce agricultural pumping, thereby delaying further seawater intrusion into our groundwater supply. Castroville knows the value of finding new, sustainable water sources because we've seen them work before.

The Monterey Water Supply Project offers yet another innovative approach to reduce seawater intrusion into Castroville's groundwater supply, while also meeting the water needs for residents of both the Monterey Peninsula and Castroville. That is why both the Castroville CSD and the North County Recreation and Park District submitted letters supporting the project to the California Coastal Commission. Our hard working, aspiring community is ready to partner on this project and see fresh water flow to homes from Carmel to Castroville.

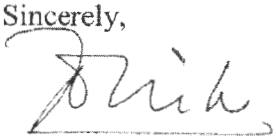
Re: Public Comment on September 2020 Agenda Item 4a - Application No. 9-19-0918

Dear Commissioners:

The Monterey Peninsula Chamber of Commerce has a vision that "champions Monterey County as an engine of innovation and prosperity." Restricted and inadequate water supply has compromised the economic and social well-being of the people of the Monterey Peninsula.



The California Coastal Act states the following:

> …existing developed uses, and future developments that are carefully planned and developed consistent with the policies of this division, are essential to the economic and social well-being of the people of this state and especially to working persons employed within the coastal zone.

This legislative intent is something the California Coastal Commission must address as it considers actions to permit a desalination plant to increase Monterey Peninsula water supply. The need for "water credits" from the Monterey Peninsula Water Management District (MPWMD) discourages private and public proposals and approvals for new residential units, including units that are affordable for teachers, nurses, and the households of service workers in the hospitality industry that dominates the local economy.

Attached are some findings that the California Coastal Commission should take into account as it considers the economic and social well-being of the people of the Monterey Peninsula and especially to working persons.

Sincerely,

Frank Geisler
CEO

MCAR

The Honorable Steve Padilla, Chair, and Members
California Coastal Commission
45 Fremont Street, Suite 2000
San Francisco, California 94105

September 15, 2020

Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Transmitted by e-mail to: CalAmMonterey@coastal.ca.gov

Dear Chair Padilla and Commissioners,

MCAR represents our 1,300 members who live and work in Monterey County. We consider the lack of available housing as the most important problem facing the citizens who live and work in Monterey County and on the Monterey Peninsula.

After a decade of support for the portfolio approach to water supply projects - Aquifer Storage and Recovery (ASR), Monterey 1 Ground Water Recharge (GWR) and the desalination project, the Monterey Peninsula Water Management District (MPWMD) decided in a 4-to-3 vote to no longer support the desalination project.

Making this worse is the data the MPWMD produced purportedly showed that the community does not need a drought proof water supply for the future. We have no idea how this conclusion was reached in that the data is not clear. With ASR producing a fraction of its projected output (1164 acre feet average over the last five years), and the new revelation that the Monterey 1 GWR project may never provide more than 2,200 acre feet per year; a denial of the desalination permits will create a serious water shortage even without a drought. Both of these projects were supposed to produce much more water. The Monterey 1 GWR expansion project is not viable – since there is no water source available for such a project.

The shortage of water continues to create a social justice issue in every community located on the Monterey Peninsula. High rents and long commute times are a fact of life for people of color who work on the Monterey Peninsula, but can't live here, because of the lack of available housing.

Denying the permits plays into the hands of the anti-housing special interest groups who are at the forefront of the effort to kill the current desalination project like the projects they defeated in 1993 and 1995.

The Coastal Commission could signal a real interest in social justice across all the communities located on the Monterey Peninsula by approving the permits which will provide just enough water to create affordable housing necessary for those engaged in industries such as medical, hospitality and agriculture.

The construction of the desalination plant will also allow for the recovery of businesses decimated by the Covid 19 recession and provide water for expanded and intensified business use which now banned by the State Water Resources Control Board.

Please approve the coastal development permits for the California American Water desalination project.
Sincerely,

Suzanne Menendez-Herbst
President

Alex W <alexander.charles.winkle@gmail.com>

Fri 9/11/2020 9:13 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Good afternoon,

This email is to support the Desal Project. Water is an ongoing concern for the development and economic growth/sustainability of the region. Without water we cannot properly address the ongoing housing issue which includes essential service employees who cannot find housing while they work in our community. Water also continues to be a barrier for small businesses who want to start or grow within our community.

Jobs, economic recovery and affordable housing opportunities require an adequate, reliable water supply. It's time to stop kicking the can down the road on the only option on the table that is capable of meeting the terms of the Carmel River cutback order and supplying our community with a long-term sustainable water source.

Re: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 (Monterey Peninsula Water Supply Project - MPWSP)

Honorable Chair Padilla and Commissioners:

When I moved to the Monterey Peninsula thirty years ago, in 1990, this region was suffering from a seven-year drought. I recall there was water rationing and punitive surcharges for the water needed to operate our hotels. Over the ensuing years, residents and businesses worked hard to conserve water, and now our community has the lowest per capita water use in the state.

However, this has not solved our water problem. With the cease-and-desist order placed on the Carmel River, there has been a unified effort over the past eleven years to create a long-term sustainable water supply. To date, the only plan that can meet the demand determined by the CPUC (14,000 afy) is the Monterey Peninsula Water Supply Project including the construction of a desalinization plant. I urge you to approve the permit that will allow this project to move forward.

Alternative projects that have been proposed are based on questionable claims that water demand for the district is some 40% less than what the CPUC has estimated. I believe these low estimates were manipulated in order to ensure the 2018 ballot Measure J succeeds in having the water district buy out Cal-Am. This measure would only be feasible if it resulted in cheaper water for the district's consumers, and proponents of the measure know the promise of cheaper water cannot be achieved if the desalinization plant is constructed. Unfortunately, the MPWMD has made a choice to pursue this political agenda - one that would leave residents and businesses critically short of our future water needs.

Water which costs a bit more is better than not enough. The Monterey Peninsula Water Supply Project is the only viable solution available to deliver enough water for the welfare of our residents and businesses and satisfy the need for affordable workforce housing. It is also the only sustainable water supply project that can protect us from the next seven-year drought.

Please grant the Coastal Development Permit necessary to allow us to solve our long-standing water problem here on the Monterey Peninsula.

Yours sincerely,

Mark Watson

Re: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 (Monterey Peninsula Water Supply Project - MPWSP)

Dear Chair Padilla, Honorable Coastal Commission Members, and Staff:

You all have a critical decision to make on September 17, 2020 and I encourage you to vote to approve the Coastal Development Permit for the Monterey Peninsula Water Supply Project!

I am very fortunate to be a third Generation native of the Monterey Peninsula; as such I have lived through our community's water problems for the past 50 years.

I literally grew up on and off water rationing. I remember when we didn't have a "Monterey Peninsula Water Management District." We put our faith in the State Legislature more than four decades ago to create that water district to help us address and solve our water problem.

As a community we still have not solved our water problem, but we are finally only one vote away from a solution, and that vote is yours.

The CPUC, the State Water Resources Control Board, The Supreme Court, and every previous regulatory permit has been obtained. Even your body in the past agreed that the Monterey Water Supply Project is the only viable solution to addresses the problem sufficiently.

No other alternative solves our water problem once and for all- regardless of what is being presented by the detractors of this project.

A little historical perspective: my community is notorious for getting very close to a solution/project and then pulling the plug, each time citing a myriad of reasons crafted solely to kill that solution/project. This occurred in the 1990's over a Carmel River Dam, and it happened again years later over two other desal projects. Ironically, one of the reasons the detractors gave to kill the Carmel River Dam, was to wait for desal, and of course once desal came, they found reasons to oppose those projects, and they are doing it again now, over the Monterey Water Supply Project.

Time after time as soon as we get close to a project, the "no growth" activists align themselves with any and all opposing groups in order to methodically kill the project. Yes, this is happening again right now over this project, they have aligned themselves with the community of Marina, and now they are fighting this project at every level, with the only goal of ensuring it doesn't get approved by you at the September 2020 hearing.

Some of the City of Marina residents are raising social justice concerns to explain why this project should not be built, while other communities like Castroville could raise social justice issues for not building it! Who are you to believe? In all sincerity, neither-- the problem we have is bigger than Marina or Castroville; it's the entire Monterey Peninsula, which includes both Marina and Castroville.

We need this project for many reasons, the State Cease and Desist Order being one. We want to address our water problems for the long-term and we want to avoid ever having to be in rationing again. We want to avoid ridiculous policies that involve having businesses truck in ice from outside the area, or not allowing restaurants to be located in buildings that are not already restaurants. Think about the irony in that, the only commercial buildings where we can locate a restaurant in our community are buildings where a restaurant had to fail before. Wow! So are we to assume that all restaurants close because of bad operators? Never due to a bad location? I have been in real estate my entire life, and we all know the adage, "location, location, location."But on the Monterey Peninsula we can only have a restaurant go into a place where a restaurant previously failed--not where a Blockbuster video closed up, or a Circuit City closed up. So those sites sat vacant for months in our community, while restaurant after restaurant opens up and fails time after time because the use, cannot change or be moved due to our local water credit system. Wow!

Some of the rules our community has constructed to restrict water are ludicrous, equally so are the clever ways we have found to try get around them and try to live a normal life as it relates to water. We are like no other community I know. When I tell visitors or prospective clients about our rules and restrictions, they cannot believe this is happening in a coastal community of California.

Our State and the Monterey Peninsula is facing a significant housing shortage because of decades of underbuilding and (extremely modest Monterey Peninsula) population growth. We have failed to address our needs locally and statewide, but here the difference is that other parts of the state have managed for the most part to address water, while the Monterey Peninsula cannot say that.

The Monterey Peninsula has spent the last four decades fighting about it. We need to join in our Governor's mandate to create more housing for the people who live in our communities. The only way to truly address the "housing issues" in our state is simply to build more of it. In our community we cannot provide housing without water, and we will not have water without the Monterey Peninsula Water Supply Project.

Do not be fooled by the statements that we have a recycled water project that we can use, or that can be expanded-- that is not enough water. Yes, we have a recycled project and it is currently running more than 40% under projections; its expansion EIR was never certified by its lead agency. The other project is the aquifer storage project -- that is also dramatically underperforming. We need desal to pick up the slack of these underperforming projects so we get out of water poverty.

Some solutions being talked about at the state level to address our housing shortage include allowing accessory dwelling units (ADU's) which are basically "granny units." Our community could do a lot to address our housing shortage just by adding Accessory Dwelling Units to existing homes, but we can't do that without water. The Monterey Peninsula Water Project will allow us to approve and create these sort of housing solutions that have been needed for years.

So I am asking --wait, not asking, begging you, just as I did in 2018 at the CPUC hearing in San Francisco, and last November at your hearing-- for this body to make the right decision for our community that has been unable to make the right decision for itself since the 1980's. Vote to approve the Coastal Development Permit for the Monterey Peninsula Water Supply Project once and for all!

Sincerely,

Jeff Davi,
Third Generation Monterey Peninsula Resident
Retired California Commissioner of Real Estate

RE: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Chair Padilla, Staff and Commissioners:

My name is John Phillips, and I am the Monterey County Supervisor for District 2, the Northern part of the County. I am also the sole County representative on the Monterey One Water (M1W) Board. My district, in the area I have lived for almost fifty years, includes the town of Castroville, an extremely disadvantaged community where the water supply is being severely negatively impacted by saltwater intrusion.

The desal project will provide much needed, reliable potable water to Castroville and surrounding areas, but that will not happen if Coastal Commission staff recommendation is followed.

The staff report concludes that based on this recent unverified and factually unsupported water demand analysis, that the expansion of the Pure Water Monterey Water recycling project will now provide sufficient water to meet the demand for the entire Monterey Peninsula. That just isn't so, and that isn't just my opinion. I refer you to the letter you received from the Monterey County Water Resources Agency which comes to the same conclusion.

The CPUC rejected expansion as an alternative-as did the M1W Board. The Pure Water Monterey project is not yet operational as we had hoped. There are significant and ongoing problems with the Pure Water treatment, including significant water chemistry issues. The injection wells for the treated water are not functioning properly and Pure Water Monterey is unable to deliver the originally projected water volumes. At this point, we do not know if Pure Water Monterey will ever function as designed, let alone be capable of delivering expanded volumes of water. We are now in the process of trying to rebuild two shallow wells that collapsed and are now

preparing to drill two additional deep wells at a considerable expense. A majority of our Board has concerns and questions about the viability of the expansion project including the availability of source water that have been contested by the Monterey County Water Resources Agency and the City of Salinas.

The M1W Board conducted a thorough examination of the EIR prepared for the Pure Water Monterey Expansion Project and found numerous deficiencies – namely that it failed to do a cumulative impacts analysis of the expansion project and the desalination project. Instead the EIR claimed that if the expansion project were built and the desal project came along subsequently, the expansion project would be mothballed. This is an absurd statement, particularly as the ratepayers of M1W would be on the hook for the capital expense of the project regardless.

Beyond the operational issues, Pure Water Monterey is simply not capable of becoming the water supply for the entire Monterey Peninsula. In addition to the inadequate environmental analysis, there is no agreed upon source water for the expansion of Pure Water Monterey and neither the Monterey County Water Resources Agency nor the City of Salinas have agreed to supply the water for the Pure Water Monterey expansion.

In my considered opinion, M1W is not legally, financially, or physically capable of becoming the sole water purveyor of the Monterey Peninsula. Please don't be misled by representations to the contrary.

Sincerely,

John Phillips
Supervisor, 2nd District
County of Monterey, Board of Supervisors

Re: Appeal No A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Hon. Chair Padilla and Commissioners:

Please approve California American Water's application for a Coastal Development Permit for the Monterey Peninsula Water Supply Project.

We have lived in Carmel for 30 years and were so frustrated to learn that the staff of the Coastal Commission is recommending denial of the project. We have watched the intensive EIR process and community outreach for the past 10 years – not to mention all the years before that watching project after project fail – cripple our community.

There is now a portfolio of projects that will provide water to allow us to meet the conditions of the CDO. These are desal, reclaimed water and ASR. Of these, the main component, the one that will provide a sustainable long-term water supply, is desal. Reclaimed water and ASR are both important but are dependent on rainwater and source water both of which are not guaranteed. Pure Water has yet to produce water and the expansion project doesn't have an approved EIR.

Without desal which offers a reliable water supply, there will be no workforce housing and a curtailed tourism industry which is already struggling from the pandemic devastating our local economies. We are looking at severe rationing if the milestones of the CDO are not met. Our community has already conserved beyond any other county in California. Additional rationing will affect our quality of life.

Please don't push this on to another generation to have to expend time and even more money examining unfounded alternatives. We are so tired of the long drawn out political battle. We are at the finish line. It is time for you to do the right thing and approve the Monterey Peninsula Water Supply Project on September 17th. Our community depends on it.

Sincerely,

Steve & Bonnie Adams

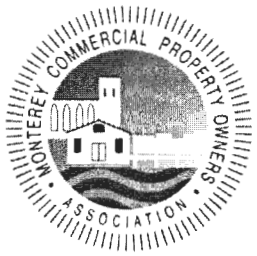
Subject: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit



Honorable Chair Padilla and Commissioners,

Greetings from Carmel Valley. My name is Sean Damery and I am the Regional Vice President for Ensemble Hotels and General Manager of Bernardus Lodge & Spa. This letter is to share with you my support of the Monterey Peninsula Water Supply Project. Water is a challenge on the peninsula that not only affects us as individual residents but as business owners and operators. Our vibrant hospitality industry brings revenue to the county – a benefit to all – resulting better schools, roads, and quality of life. To maintain and support these necessities, we have to allow our hospitality industry to grow. Currently, the hospitality industry is limited by an inability to expand or remodel. This is preventing not only job growth but limits our opportunity to bring more revenue to the county via transient occupancy tax and transient dollars that spread throughout small businesses in the community.

I appreciate your time and please approve the desalination plant project for the betterment of the community and to support successful growth.

Thank you,

Sean Damery
Regional Vice President and General Manager
Bernardus Lodge & Spa

Re: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034(Monterey Peninsula Water Supply Project - MPWSP)

Dear Chair Padilla, Honorable Coastal Commission Members,

The Monterey Commercial Property Owners Association was founded in the 1970's as a group of people who take a caring role in the city of Monterey to support the work done by the city and actively provide for communication between the City Government and the community at large.

In 2012 the community of the Monterey Peninsula proposed a water supply project to finally reduce the over-pumping of the Carmel River. The project had been negotiated and signed by an array of stakeholders including water related entities (MPWMD), municipalities, environmental organizations, local activist; an impressive list of signers demonstrating a broad consensus. For far too long the community had taken excess water from the river and now it was time to begin to produce the water by other means.

For a community that thrives on a stunning coastline, historic farming production from rich farm valley soil and mountain ranges carved by rivers of rainfall it is highly appropriate that the same community should stop harming the environment by damaging the Carmel River. That the project also allows the environmental devastation of the last sand-dredging operation on the West Coast to be repurposed as a component of the solution furthers the environmental goal of the community. Adding to the environmental goals of the project, recycled water would be a major component of the water supply. The anchor of the project was a desalination plant for those times when rainfall is

not sufficient, when river flow is not present and the community still requires water to meet the needs of the people. The cost of water was being shifted from the health of the Carmel River to the people who use water.

Subsequent to recently adopting a position that desal was not needed, the MPWMD has prepared to go back to the State Water Resources Control Board to ask to eliminate the conditions of the cease-and-desist order and continue over-pumping of the Carmel River setting a clear precedent of future expectations; when we need water we will turn to the Carmel River for supply. This points to the precise danger of not approving the desal wells. Recycled water alone fails to meet needs of this community.

The Monterey Peninsula does not exist in a bubble as evidenced by the vehicle, airplane and bicycle traffic coming and going constantly. Workers, students, leisure-seekers, tourists, many people from the region and beyond come and go every day. Having a reliable and sufficient water supply for the Monterey Peninsula is good for the entire region while having a failed system causes harm not just on the Peninsula but beyond to the surrounding communities as well. Some of these communities themselves are building new subdivisions as they pump water directly from the aquifers of the Salinas Valley. Meanwhile in Monterey building has come to a stop for years. Help the Monterey Peninsula reach a point where we are providing the housing supply needed by our community and doing so in an environmentally responsible manner. Please approve the desalination plant wells so we can do so.

John Steinbeck championed the everyday man and the beauty of this region when he wrote Cannery Row. *"The Carmel is a lovely little river. It isn't very long but in its course it has everything a river should have. It rises in the mountains, and tumbles down a while, runs through shallows, is damned to make a lake, spills over the dam, crackles among round boulders, wanders lazily under sycamores, spills into pools where trout live, drops in against banks where crayfish live. In the winter it becomes a torrent, a mean little fierce river, and in the summer it is a place for children to wade in and for fishermen to wander in. Frogs blink from its banks and the deep ferns grow beside it. It's everything a river should be."*

Please look beyond the Staff Report and allow the desalination plant to move forward. It is time for this community to live up to its responsibilities to respect the Carmel River as we have been asking to do for many years.

Sincerely,

John Tilley

Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Hon. Chair Padilla and Commissioners:

For the last 30 years struggle over growth and development has distorted the consideration of any new water supply project on the Monterey Peninsula. The drought in the 1970s exacerbated this conflict such that members of the California Legislature created the Monterey Peninsula Water Management District (District). The District's sole mission is to create, develop or purchase a sustainable, drought-proof water supply[1].

In the early 1990's the District studied and spent the funds necessary to move forward on a desalination plant. The need for a drought resistant water supply was acknowledged even before the State Water Resources Control Board (SWRCB) encumbered CalAm with the cease and desist order CDO 95-10.

However, the messages sent to the public by the District were confusing at best and disingenuous at worst. The resulting public sentiment created such a negative narrative that the 1993 election for funding the desalination plant failed mostly due to the resistance to the possibility of development.[2] Among the opponents of the desalination plant was the chair of the District who fought the desal plant in favor of the proposed Los Padres dam.

In 1995 the dam project was again fought by special interest groups opposed to growth. Their intentional strategy was outlined in a journal article published years later that labeled the dam as the "developers" dam. The intent was to marshal wide-spread opposition to its construction and this strategy was successful. In interviews conducted later, the leader of the opposition credited the defeat of the dam with the scare campaign that painted the project as the "developer's dam" which if constructed would create a future "San Jose by the Sea."[3]

It seems obvious that opposition to a sustainable and drought resistant water supply has always been based on opposition to growth. It seems to still be the case in 2020 as well.

After a decade of support for a portfolio of water supply projects – including desal, the District recently voted 4 to 3 to send a letter to the Coastal Commission staff removing that support based on a faulty supply and demand study created by the General Manager (GM) of the District who is neither an engineer or a hydrologist.

[3] Appendix E, pages 5 & 6, Extract from *Coalition building between Native American and environmental organizations in opposition to development, the case of the new Los Padres Dam project, Sep, 1998.*

One can only speculate why now after 10 years they would oppose the desalination plant. Perhaps it is either because they are invested in the purchase of California American Water and see the construction as a threat to that purchase.[4]

Or they oppose growth and a functioning water supply such as a desalination plant that would provide a path to growth. However, they seem to have forgotten that the purpose and only reason for the existence of the organization is to provide a viable and drought proof water supply project.

This is especially egregious since the opponents to the current desal project claim "social justice" as the reason for much of their opposition. The coastal commission must apply social justice concepts across all of the communities on the Monterey Peninsula, not just for the City of Marina.

Aggregate social justice across the Peninsula demands that enough water is produced by a portfolio of projects to enable the construction of sufficient housing units to provide homes for people employed in the hospitality, agricultural and medical services industries as well provide for the recovery of businesses shuttered or shattered due to the Covid-19 "recession."

The community has for almost 30 years suffered water poverty that has created ludicrous conditions for residents and businesses alike. For example, in early 2018 a business applied for a use permit to operate a juice bar in an empty storefront in Monterey. The applicants had to agree to such conditions as all the fruit used shall be washed and cut in their San Jose location and then transported to Monterey. They also had to agree that all ice required in the store would be trucked in from other locations.[5] In that case in February 2018, staff of the DISTRICT recommended against allowing "intensification of use" due to several arguments related to the lack of water. The staff report said:

> "…the ongoing lack of available water is a hardship experienced by many property owners and prospective businesses within the District." Also, …"The ongoing water supply shortage on the Peninsula has severely limited the ability of both property owners and potential tenants to find a location with enough available onsite water to conduct business…"[6]

Nothing has changed with the water supply from then to now. Apparently the staff in 2018 did not know that the GM of the DISTRICT decided the "ongoing lack of available water" was no longer a hardship. Does this mean the juice bar can make its own ice? Of course not, because the water referenced by the GM in his supply and demand analysis doesn't exist. New data on water production from both ASR and GWR shows the water produced will fall short of the supply projections by several thousand acre feet per year – even without a drought.

Now, is the time is to end both social justice inequities and what in essence are land use decisions by water strangulation. Please issue the permits necessary for the construction of the desalination plant.

Respectfully,

Scott Dick

Dr. Scott Dick

APPENDIX A

MONTEREY PENINSULA WATER MANAGEMENT DISTRICT

ISSUE

Does the Monterey Peninsula Water Management District contribute fair value to taxpayers for the taxes, fees, and charges it collects?

INVESTIGATION

The Monterey Peninsula Water Management District (MPWMD) was formed June 6, 1978 by enabling legislation in Statutes of 1977, Chapter 527, found in West's California Water Code Appendix Chapter 118.

For 20 years the MPWMD has been subject to pressure groups attempting to produce adequate water through studies, investigations, and regulations responding to the State Public Utilities Commission (PUC) and State Water Resources Control Board.

In the last ten years, despite having collected $34,065,000, of which $14,000,000 was for capital projects and methods to provide and improve adequate water supplies, MPWMD has made little progress based on the 1998 MPWMD Annual Report. This is an expenditure of $303 for every man, woman, and child in MPWMD.

MPWMD has imposed stringent regulations and rationing requirements on citizens; however, there is little reduction in water use, and its major proposals for a tax-supported dam and desalinization plant were defeated by the electorate.

Within the boundaries of MPWMD, there are private water companies which have provided, and continue to provide, water service to citizens and businesses.

Further, MPWMD overlaps a portion of the Monterey County Water Resources Agency (Agency) and has had to share responsibility for stream maintenance and aquifer control with both the Agency and private water purveyors.

The PUC requires that private water purveyors proceed to supply water at appropriate prices to residents by either building a dam, importing water, or developing additional legal supplies of water.

THE WEEKLY SUN Water - Issue | People - MPWMD JAN. 14, 1993, PAGE 5

Vote Planned in June

Heuer Will Campaign against Desal Project Approval

By Stan Hall

With the grand jury's criticism heavy in the air, directors of the water management district got ready Monday to ask citizens to approve a desalination plant on Monterey Bay although their senior member said he would actively oppose it.

"I will urge a no vote," Dick Heuer of Carmel Valley said during a board study session to provide the district's staff direction on how to proceed with the vote on June 8.

The key remaining step is to get the city councils of Carmel, Monterey, Pacific Grove, Seaside, Sand City and Del Rey Oaks to agree to be included in the water district's so-called improvement zone No. 5 by March 1.

Any city opting out would not receive any additional water from the desal plant, although its residents still would have to pay higher user fees, reflecting the 'drought protect" existing user would get because of it.

The proposed zone would cover the most heavily populated areas within the water management district's boundaries. Despite his personal opposition, Heuer said he would urge all cities to agree to be included so that their citizens could vote on the project and expressed confidence all would go along. As a general rule, anyone who pays water bills to Cal-Am, Water West or Seaside would be inside the zone boundaries.

After the meeting, Heuer, as he has before, said he would oppose desal's approval in June because he felt the district's first priority should be a new dam.

"I expect I will actively campaign against it," Heuer told the *Sun*. "If this vote is successful, I'm confident it will kill what I've worked for for nearly 10 years"—a new dam on the Carmel River.

As he has before, Heuer argued that approval and construction of a desal plant, which would provide 1,500-acre-feet of water a year for new growth and intensified use, would leave residents no reason to approve around $100 million for a new Los Padres dam. Water from the desal project will meet the demands from additional growth that will be permitted on the peninsula, but it will not provide the environmental benefits that a dam will, he said.

DICK HEUER

Chairman Dale Hekhuis and director Ken Long, who will succeed Hekhuis at the board's Jan. 28 meeting, in particular, challenged Heuer's opposition. They often cited the grand jury's recent criticism that the water district hasn't provided any new supplies in its 12 years of existence and recommendation that if it doesn't do so soon, it should be abolished.

Heuer argued that the district should know by 1994 whether it has a chance to win approval for a new day. "It's premature to make a choice between the two projects," he said.

"It's premature to say that we'll know about the dam in 1994," Long countered.

Noting that the district never had put a specific project before the voters for their approval before, Hekhuis said, "The grand jury report made it very clear that we need to do something to show people that we're able to produce a new project."

"It's not enough just do do something," Heuer said, "we need to do the right thing."

Mayor David Pendergrass of Del Rey Oaks, an appointed member of the board, sided with Long and Hekhuis. "The district has got to get off the dime," he said. "The public which lives here can't go on with moratoriums and more moratoriums." He referred to the water district's building moratorium which is beginning in its third year.

"We need to make sure this is a place to work, not just retire," Pendergrass said.

General Manager Jim Cofer said the district hoped to have selected a contractor for the desal plant in Seaside by the time the vote is held and "have real cost data for the public to see." He suggested the project will come in under $30 million, and Andy Bell, the district's engineering manager, agreed with him.

Bell said the district had been very conservative in its cost estimates and also included contingencies which would likely not be a part of the final contract.

Cofer said whether the plant would be privately financed or financed with public bonds still had not been determined, but he suggested bond financing would prove to be cheapest.

Officials from the water district are scheduled to visit each of the six city councils within the next month to explain the need to form improvement zone 5. While the cities have the option of agreeing to go along with it or not, the unincorporated parts of Monterey County which lie within the proposed boundaries can be included solely on a vote of the district's directors, Counsel David Laredo said.

Sun 9/30/93 Water - Desal

Desal Advocate Not Giving Up Hope; Says Dam's Cost Could be Too High

By Stan Hall

One of the peninsula's leading advocates of using desalinated sea water said he doesn't think the idea is dead despite voter rejection of a proposed plant on Monterey Bay in June.

Director Dale Hekhuis of the Monterey Peninsula Water Management District (MPWMD) suggested that residents might look at desalination differently after final cost figures are available for a proposed new Los Padres Dam.

Hekhuis, who championed desal personally while he was chairman of the water management district in 1992, noted that estimates of the cost of a new dam ranged from $100 million to $125 million.

"I think the cost of the dam will become a very serious question," Hekhuis told The Sun. He also suggested that the water management district might not be able to win the approvals it needs to build the proposed 24,000 acre-foot reservoir on the Carmel River or could face longer delays in winning approval than it now anticipates.

In a telephone interview, Hekhuis made it clear he was not giving up support for the proposed new dam, but wanted to see better cost figures "so we can make a true comparison between the dam and desal."

He noted that at $42 million, construction of the proposed Hatton Canyon Freeway would be one of the most expensive, if not the most expensive, projects ever undertaken on the peninsula.

"The dam could cost two to three times as much," he said. "I think we must look at how much paying power we, as a people, have. There's an upper limit to what we can afford, and it hasn't been fully discussed yet.

"When it comes to the dam, we need an informed dabate about what proportion of our financial capability we want to devote to one project," added Hekhuis, a retired financial executive with General Electric.

Hekhuis' fellow water board director, Dick Heuer, who led the fight against approval of desal, said he thought Hekhuis was wrong if he was suggesting that desal could substitue for a dam.

"Desal doesn't solve all our problems," he said. "It has no environmental benefits.

"Why would people vote for desal if they didn't get any additional water to use from it—if it had to be used to reduce pumping from the Carmel River?" Heuer asked. He was referring to a possible ruling by the State Water Resources Control Board in response to complaints that the river aquifer has been overpumped causing environmental damage. The board has heard testimony on the complaints, but there's no indication when it might rule.

"I think it will be approved," Heuer said of a vote on the dam. Then he added a moment later, "Nobody knows how the people are going to vote."

He said if voters should reject a proposal to finance the dam, the community then could turn to an alternative like desal.

Hekhuis said a committee formed to promote desal, the Committee for a Secure Water Supply, still is active. Hekhuis and Bob Franco, former mayor of Del Rey Oaks who served on the water board as the mayors' representative, head the group.

"We're going to hold off (any action) until the EIR goes through the process and the cost is better known," Hekhuis said.

By a 14,258-12,481 margin, voters turned down a proposed $22 million plant in Sand City which could produce up to 3 million gallons of drinking water a day. The water management district had proposed the desal plant as a part of a two-pronged strategy that called for additional water from desal in the short run and a longer-term increase from a new dam.

APPENDIX C

MEETING WITH PUC STAFF

APRIL 23, 1996

SWRCB Order No. WR 95-10 (JULY 6, 1995)

Replace 10,730 AFA (69% of supply)
Borrowed water (11,285 AFA) ends October 1, 1997
Only 1137 AFA in pre-1914 water rights available for use outside Carmel Valley plus 4000 AFA from Seaside. Additional 2179 AFA from Los Padres for use in Carmel Valley only

Water for Lots of Record and Intensification

New Los Padres Project Permits

Issued and in public domain
Any change can endanger permit viability and add time
CEQA compliance with MPWMD and PUC as co-lead agencies

Financing Project

Need for independent analysis to determine most cost effective method. Selection of consultant by PUC with evaluation/comments from MPWMD and Cal-Am

Public Opinion

Belief that small projects can solve water problems
Fear of growth
Disinformation campaigns
POWR Initiative

Recycled Paper

that. The prophecies tell us that the Red, Black, Yellow, and White nations will come together" (T.L.B. Nason, personal communication, December 29, 1995). In central coast of California cultural renewal activities and in the struggle against the New Los Padres Dam project, a strategy of deliberately reaching out to non-natives is being followed. Anne Marie Sayers (personal communication, November 3, 1995), prominent Costanoan/Mutsun tribal leader, stated at a Native American organized anti-dam gathering, "We are allowing people to become aware of our existence. We educate people of our existence. We are all Native Americans, now let us unite and become one earth and one people."

Esselen groups, with their non-native supporters and environmental and neighbourhood organizations, formed an effective coalition that defeated the proposed New Los Padres Dam. However, the arguments of the predominantly environmentalist groups and the Native American groups differed in important respects. Whereas the Esselen were opposed to building a dam in this particular place because of the threat to their sacred sites, the environmental groups were opposed to any dam, on the grounds that increasing the water supply would lead to more development and growth on the Monterey Peninsula. What were some of the pivotal issues in the struggle against the New Los Padres Dam Project? One of the most fundamental disputes was the issue of growth.

KEY ISSUES FOR THE NEW LOS PADRES DAM OPPOSITION MOVEMENT

Environmental Dam or Developers' Dam?

The water district, following the voters' rejection of the desalination plant in 1993, concluded that there was no alternative solution to the peninsula's water problems other than the construction of the dam. The features of the dam that they chose to emphasize in public meetings and communications to the media were that it would provide a secure water supply in times of drought and that it would be environmentally beneficial. When I met with Henrietta Stern, senior planner for the water district, she emphasized to me a number of times that it was an environmental dam. "The key is restoring stream flow in the Carmel River," she told me (H. Stern, personal communication, January 18, 1995). In an article published in a local newspaper, Stern (1994) made this argument about the benefits of the dam:

> How will the dam affect the environment? The NLP project would provide year-round stream flow to the Carmel River Lagoon [at the mouth of the river] in 75 percent of water years. It would benefit about 24 miles of riverbank vegetation and wildlife, steelhead habitat, recreational and aesthetic resources, and the Carmel River Lagoon in nearly all years. (p. 6)

However, the environmental benefits of the dam were simply not believed by the Sierra Club and Citizens for Alternative Waters Solutions (CAWS) activists, and they sought to publicly discredit them. In an interview with Gruber, chair of the Sierra Club's New Los Padres Dam subcommittee, he told me: "We're calling it the *developers' dam*. It'll lead to 14,000 new homes being built. In the drought years, they'll suck up the extra water that is supposed to restore the river. Every development around here is called an environmental development" (D. Gruber, personal communication, October 12, 1995). This last comment referred to the fact that in the Monterey Bay area, controlled-growth advocates and elected repre-

sentatives had been so successful in restricting development projects that such projects needed to be packaged in ways that made them more palatable to the public. Presenting them as environmental was one strategy; a similar manoeuvre, used elsewhere, was presenting them as promoting the performing arts (see Whitt, 1987). Richard Gendron (1996) has explored this approach in neighboring Santa Cruz County, which he described as "the developer's canny tactic of using an arts-based growth strategy as a means of . . . driving a wedge into a progressive coalition that has successfully opposed every large-scale development in the previous 20 years" (p. 551). The Sierra Club and CAWS activists were not deceived by such canny tactics and focused on the growth potential of the dam. For them, it was unquestionably not an environmental dam. One of the Sierra Club campaigners, Arthur Mitteldorf (1995), wrote in the club's local magazine:

> Environmentally, the worst solution to the water shortage problem on the Monterey Peninsula is the proposed 24,000 acre feet New Los Padres Dam. It would provide excess water, that essential missing ingredient for sprawling growth. You can safely bet that it would not rescue the almost depleted steelhead population. (p. 7)

Gruber (1995a) wrote in the Sierra Club's local newsletter, "We disbelieve the arguments that the flow from the dam would restore damage to the lower river" (p. 28), whereas another activist in the Sierra Club, Mark Langner (1995a), concluded, "The Water District's interest in the environment is sudden and questionable. The proposed dam is definitely not an environmentally friendly project" (p. 4). Sierra Club and CAWS campaigners emphasized that the water district's own Environmental Impact Report made clear the dam's potential for growth. In that report, it states, "If the long-term water supply project is not built, growth that is now planned for the peninsula would be constrained . . . it is clear that expansion of the water supply system would remove one obstacle to district growth" (Monterey Peninsula Water Management District, 1994a, chap. 19, p. 1). The additional water supply would make possible "roughly a 20 percent increase in housing, population and water demand" (Monterey Peninsula Water Management District, 1994a, chap. 19, p. 5). It is not that the Sierra Club was against any development. Gruber told me, "Most everybody agrees we can't just chop off and say nobody can come in, but we should have moderate, thoughtful development" (D. Gruber, personal communication, February 16, 1996). Their opposition to the dam was based on the belief that it would not result in thoughtful development and that, in Gruber's words: "The first order of benefit was not to the river; the first order of benefit was to development" (D. Gruber, personal communication, February 16, 1996). On the basis of this analysis, the Sierra Club strategy in mobilizing opposition to the project was to emphasize the growth potential of the dam. The success of this strategy is illustrated by the fact that the latest dam proposal for the Carmel River (following the rejection of the New Los Padres Dam by voters) is being presented by the water district as the no-growth dam.

The Annual Death of the Carmel River

A second major dispute concerned the fact that the lower course of the Carmel River dries up every year, causing damage to vegetation and wildlife, including the steelhead fish run. For the Esselen, this was a desecration of the river, and it was also the reason for lawsuits complaints from both the Sierra Club and the California

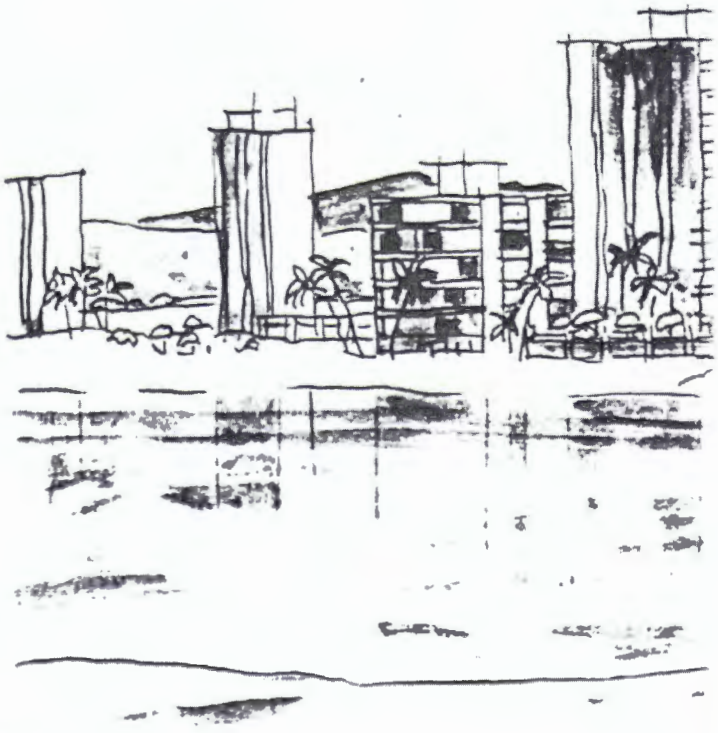
- *Increased River Damage*
- *Worse Water Rationing*
- *50% Higher Water Bills*
- *San Jose-by-the-Sea*

Questions? Look Inside! →

THE DAM

The dam is first and foremost a development project, enabling growth for tourism, golf courses and housing. In moderation, that would be acceptable. As proposed, the changes imposed upon the region would be spectacular.

What will the dam do?



- **Allow at least 20% new growth,** the equivalent of adding a city the size of Seaside.
- **Destroy 3 1/2 miles of river bank habitat.**
- **Cost $350 million dollars;** if you pay $60 now, you will pay at least $90 in the year 2000.

Will it solve environmental problems?

- **In a word, NO.** In fact, in spite of the claims of the Water District, evidence indicates that the dam would worsen environmental problems.
- 3 1/2 miles of **pristine river would be drowned.**
- **The banks of the lower river,** damaged by overpumping, would be exposed to worse conditions than now, because the dam allows 14,000 new users of the system. This means that in extended drought years when the dam is empty (known as "revert" conditions), 14,000 new users would be using the same water supply we have now. This also applies to drought reserve: many more users, but no new water during extended droughts.
- **More traffic.** More people will be attracted here to live and to use the new tourist facilities; therefore, more traffic.
- **Degraded air.** This would be one result of the increased population and traffic.
- **Faulty data.** Estimated flows in the river were based on faulty hydrological data. Dry year flows are wrong, and overestimate the amount of water available. The river banks will suffer for this.
- **Fish harmed.** Steelhead trout would be trapped and trucked around the dam. Experts say this is not likely to work well. The natural spawning beds of the fish would be destroyed, and genetic diversity weakened.

What about Growth?

- There is provision in the project for **3,380 acre feet of new growth.** That could translate into 14,000 new homes, based upon typical water usage, or the equivalent combination of apartments, houses and commercial uses.
- It is probable that **even more water** from the dam would go to growth after the rules are forgotten.
- Growth is the **reason for the dam;** it doesn't solve any long-term environmental problems, and fails to supply drought reserve.

Are there alternatives?

There are. No one of those alternatives alone will supply the water necessary to repair the river and allow for moderate growth, but a *palette* of them, a combination, would. Among those alternatives are:

- **Desalination**
- **Retrofitting current plumbing**
- **Reducing water pressure**
- **Dual plumbing systems**
- **Storm water collection systems**

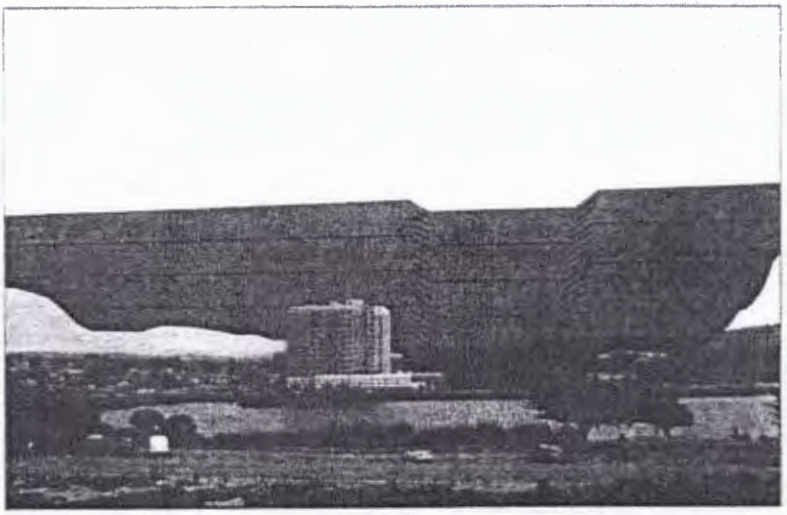
Water Board Chair Fran Farina said in her 1991 ballot statement, *"I believe desalination could meet the needs of this community if a dam were not approved by the permitting agencies."*

Would the dam provide flood protection?

No. The Water District says as much. Moreover, the dam would even worsen flood conditions in some circumstances, according to the environmental report.

Why It's Called "The Developer's Dam"

Development interests which made large contributions (as of Sept. 93) to the committee supporting the Dam:



Paul Davis (Architect)	$20,000 (Loan)
Monterey Marriott Hotel	$1,000
Mahoney-Tancredi (Realtors)	$1,000
Inns By the Sea	$1,000
Pebble Beach Company	$1,000
MPBXPAC (Builder's Exchange)	$1,000
Rancho Cañada Golf Club	$1,000
Quail Lodge, Inc.	$1,000
Cannery Row Co.	$1,000

"Environmental Dam," or a dam for developers, golf courses and growth? We suggest you read the list and decide for yourself.

There are better alternatives for our water supply than a dam. I'm voting "NO" to save our quality of life—Clyde Roberson, Former Mayor, City of Monterey

Would Cal-Am build the dam?

Would Cal-Am build the dam if the voters turned it down? **No.** Cal-Am answers to the PUC, a political body. Water board member and dam proponent Jim Hughes said, *"I think the dam is dead if there is a no vote. The PUC is a political animal and won't cram a dam down the throats of residents."*

TO HELP GET AN IDEA OF THE SIZE OF THIS PROJECT, VISUALIZE THE DAM BEHIND THE NEW EMBASSY SUITES HOTEL. IT WOULD BE MORE THAN TWICE AS TALL AS THE HOTEL, 282 FEET, AND A QUARTER OF A MILE LONG.

Would you buy a pig in a poke?

The wording of the ballot measure limits the cap amount of the bond measure, but it leaves the method of financing up to the Water District. Basically, you would be giving them power of attorney to charge you whatever is necessary. Do you trust them this much? What happens if the project costs more than 116.5 million dollars? Do we stop building mid-way through? Listen to the words of Mark Riesner, author of *Cadillac Desert*:

> *Dams are less safe than they say, cost more than they say, and produce less than they say.*

"They," of course, are the developers and special interests who actually benefit from such projects.

DON'T ALLOW AN UNNECESSARY AND GROWTH-INDUCING DAM;

VOTE NO ON MEASURE "C"

THE DAM

Monterey County, Calif.-Area Water Chairman Keeps Focus, Favors Slow Growth

Monterey County Herald

Byline: By Dennis Moran

Body

No one can say for sure that the Monterey Peninsula's water district will exist a year from now -- but its new board chairman intends to keep it focused on a new water supply.

Alexander Henson, elected board chairman last month, wants to see the Monterey Peninsula Water Management District put a seawater-desalination project up to a public vote in March 2004. The proposed plant would be built in Sand City and would provide only enough water to meet a state order to drastically reduce draws from the ***Carmel River***.

In other words, it's a no-growth project. That would naturally suit Henson, an environmental attorney who heads what he terms a slow-growth majority on the water board. And he believes the fastest way to get a water project approved and built is to take the explosive growth issue out of the equation. The pro-growth crowd can get more water later from another desalination plant proposed by the state for Moss Landing, Henson says.

First things first, he says, and that means satisfying the 7-year-old state order to leave more water in the ***river***.

"History has shown that if a water supply project has a growth component, the majority of people on the Peninsula won't vote for it," Henson says. Voters in 1995 turned down a proposal for a new ***dam*** on the ***Carmel River*** because it would have provided water for more housing, Henson and others believe.

The California-American Water Co., the Peninsula's provider, has since come back with a no-growth ***dam*** proposal, but many believe it's a dead issue due to opposition from state and federal agencies charged with protecting two threatened species that live in the ***river***, the steelhead and red-legged frog.

For a March 2004 vote on a water project to be binding, district consultants would have to finish an exhaustive environmental review of the desal proposal by September, district officials say. The project also will need cost and financing figures for voters to mull. Board members will find out Thursday if it's a doable timeline.

Meanwhile another clock may be ticking. Voters in November overwhelmingly recommended that the water district be dissolved, and backers of the measure have been lobbying state Sen. Bruce McPherson to introduce legislation to replace the water board with a joint-powers authority of mayors.

Those who want the district dissolved fault it for failing to develop a new water source in its 24 years of existence. Ironically, Henson says that getting rid of the district now would further delay a water project by negating the district's ongoing preparatory work.

For that reason he doesn't think it will happen.

The vote "reflected the electorate's unhappiness that the district has been unable, to date, to accomplish a major water-source project," Henson said. "My answer to that vote is to get a water-supply project online. Should we just fold up our tent and wait two to four years for a joint-powers authority to get back to where we are now?"

To get one water project the district is required to study several alternatives. It's a cycle of costly and lengthy engineering studies, environmental reviews and cost analyses the district has trod before, only to have proposals stymied by environmental roadblocks, voted down by the public or, many observers swear, boondoggled by shifting water-board politics.

This time around, Henson believes the slow-growth water board majority has its hands firmly on a divining rod pointing to new water.

Board member Alvin Edwards, not a member of that majority, believes more public input is needed on the various options before one is selected for a binding public vote. Instead of a binding ballot measure in March 2004, Edwards wants an advisory public vote in November of this year on all the alternatives, along with a ballot question on whether the district should seek enough water to provide for growth.

"I just want to know which way the people want to go," Edwards says.

"Do they want desal or do they want a ***dam***? I know they want to solve the problem, but how much are they willing to pay? Let the people answer some of the questions we've been fighting with on the board."

The ***dam*** still has passionate adherents who note how much cheaper it would be than desalination and who say it would enhance, and not harm, ***river*** habitats. In 1998, the last time the district had detailed cost-comparison figures, it was estimated that the ***dam*** would increase an average monthly water bill by $ 18.64, compared to $ 43.50 for a desalination plant.

But improving technology has been driving down cost estimates for desal in recent years, and several proposed plants are under consideration in California.

If the water board survives efforts this year to do away with it, it could be subject to another policy shift in November -- the terms of environmentalists Henson, Molly Erickson and Kris Lindstrom are up for election then. Edwards believes those three have been too uncompromising on such issues as water-credit transfers to be re-elected. "I don't think they'll be there," he says.

Henson generated controversy during the board's first meeting after the public no-confidence vote when he proposed that the district look into taking over Cal-Am's local operation.

That could be done by a process of eminent domain, by which a public agency can condemn and appropriate private property deemed to be in the public interest. Other communities in California and other states are looking into doing that with Cal-Am or its parent company, American Water Works.

Henson believes it could result in fewer rate increases for customers, since the water district does not have stock shareholders for whom profits are needed. Also, Henson is rankled by what he terms uncooperation from Cal-Am, particularly on what action the company will take on the state's desalination proposal for Moss Landing. Taking over the company would eliminate uncooperation, Henson notes.

The state Public Utilities Commission last summer released a report recommending a $ 100 million desalination plant for Moss Landing.

Water board members generally admired the proposal but some said that another agency, possibly the state itself, should take the lead in shepherding it through. Board members also waited to see whether Cal-Am would support the project and withdraw its application for a ***dam***, and meanwhile the board put on hold certain elements of its own water-source process.

Cal-Am hasn't made that decision yet, and Henson believes the company is stalling.

FINDINGS

1. MPWMD income has totaled $34,065,000 for the last ten years.

2. MPWMD has collected the following fees, connection charges, and property taxes in the last ten years:

Property Taxes	-	$ 6,050,000
Connection Fees	-	$10,020,000
User Fees (Water)	-	$12,221,000
Miscellaneous Fees	-	$ 5,774,000

3. MPWMD has spent the following in the last ten years:

Studies, Services, and Supplies	-	$15,084,000
Personnel (Regulations/Planning)	-	$14,272,000
Related Projects	-	$ 1,636,000

4. MPWMD staff has grown to 25 people.

5. Through recent legislation involving MPWMD, its water users are about to pay for a new study, costing up to $700,000, reviewing all previous studies. Additionally, there are costs associated with involving the staffs of MPWMD, PUC, and State Water Resources Control Board.

RECOMMENDATIONS

The 1999 Monterey County Civil Grand Jury recommends:

1. In conjunction with the Monterey County Local Agency Formation Commission, the Board of Supervisors (BOS) initiate efforts to:

a. comply with the requirements of State of California Government Code Section 56000-56780 (Cortese-Knox Act of 1985);

b. seek consensus of Cities within the boundary of MPWMD;

c. encourage repeal of MPWMD enabling legislation by the California Legislature, if deemed necessary; and

d. take steps necessary to dissolve and liquidate MPWMD.

2. Upon dissolution of MPWMD, the BOS turn over the responsibilities to the Monterey County Water Resources Agency.

3. Upon dissolution of MPWMD, the BOS designate the County Planning and Building Inspection Department, and the respective Cities designate their City Building Departments to enforce necessary water management regulations.

4. Consider the possibility of buying water from the State Water Project at San Luis Reservoir and pumping to the Monterey Peninsula.

ITEM: **PUBLIC HEARING** **APPENDIX H (and CONT. ON PAGE 17)**

11. CONSIDER APPLICATION FOR VARIANCE TO ALLOW NON-RESIDENTIAL GROUP II WATER USE CAPACITY AT 458-460 ALVARADO STREET, MONTEREY (APN: 001-572-029)

Meeting Date:	**February 22, 2018**	**Budgeted:**	**N/A**
From:	**Dave Stoldt, General Manager**	**Program/ Line Item No.:**	**N/A**
Prepared By:	**Stephanie Locke**	**Cost Estimate:**	**N/A**

General Counsel Approval: N/A
Committee Recommendation: N/A
CEQA Compliance: This action does not constitute a project as defined by the California Environmental Quality Act Guidelines section 15378.

SUMMARY: Anthony G. Davi, Sr. is requesting Board approval of a variance from Rule 24-B to allow commercial Group II water use in a Group I space at 458-460 Alvarado Street (Site) in Monterey without requiring water from the City of Monterey's Allocation (**Exhibit 11-A**). The Site currently consists of two retail spaces. Non-Residential Group I uses include retail, office, warehouse, gym, bank, etc. Mr. Davi states that he has been unable to rent either of his spaces in the last 14 months to a business that qualifies for the District's Group I Water Use Factor and now faces potential loss of insurance. All inquiries have been food-related Group II businesses. Mr. Davi is requesting that the Board allow him to rent both spaces as Group II, because Group II is more desirable for the downtown Alvarado Street location. District research shows that Group II businesses use more water than Group I and includes uses such as coffee shops, bakeries, ice cream shops, delis and pizzerias. Presently, no additional water is available on Site or approved from the City of Monterey to allow this Intensification in Use.

District Rule 90 allows for consideration of a variance from the Rules and Regulations when there are Special Circumstances[1] or Undue Hardship[2]. The Board may, after holding a public hearing, in specific cases, grant a variance from any provision of the standards incorporated into the Rules and Regulations whenever it finds: (a) that Special Circumstances exist in a particular case, and (b) that practical difficulties or Undue Hardship would result from the strict interpretation and enforcement of any such standard, and (c) that the granting of such a variance would not tend to defeat the purposes of these Rules and Regulations. The Board may place conditions upon such variances.

RECOMMENDATION: Staff recommends the Board deny the variance and adopt the Findings of Denial (**Exhibit 11-B**). District Rule 20, Permits Required (**Exhibit 11-C**), requires a Water Permit for any Change of Use or any expansion of a Non-Residential use to a more intensive use as determined by Rule 24, Table 2, Non-Residential Water Use Factors (**Exhibit 11-D**). Rule 23-A-1-g (**Exhibit 11-E**) states that when an application involves an Intensification of Use, the increase in Capacity shall deducted from a Jurisdiction's Allocation or a Water Entitlement as indicated on the Water Release Form. The City of Monterey has not authorized additional water to the Site. When the Jurisdiction is opposed to assigning water to a property, the business cannot obtain a Water Permit. Further, the ongoing lack of available water is a hardship experienced by many property owners and prospective businesses within the District. Finally, staff believes granting a variance would create an unfair precedent and would be in violation of District Rules 20, 23, and 24.

DISCUSSION: Mr. Davi approached the District in December 2016 regarding a proposed tenant "Tea Zone & Fruit Bar" for his Group I space. The business was described as a juice bar with smoothies and tea. After reviewing information about other Tea Zone locations, including a visit to a Tea Zone & Fruit Bar location in the San Jose area, staff determined use was Group II and would require water from the City of Monterey's Allocation before a Water Permit could be issued.

The difficulty in finding tenants for Group I commercial space is not unique to 458-460 Alvarado Street. It's a problem pervasive due to the area's lack of water, the Cease and Desist Order against California-American Water Company, and store-based retailers versus e-commerce, etc. This situation is commonplace among property owners and potential tenants, especially in the Cities of Monterey and Pacific Grove where there is no water available from Water Entitlements or Allocations. The problem is so significant that the Monterey County Weekly published an article on January 11, 2018, highlighting the lack of available Group II spaces, with as many as 17 businesses applying for one vacant Group II location (**Exhibit 11-F**).

The ongoing water supply shortage on the Peninsula has severely limited the ability of both property owners and potential tenants to find a location with enough available onsite water to conduct business. In adopting Option V of the Water Allocation Program EIR in 1991, the Board made a finding to allocate only water that presently exists. Most Jurisdictions have previously allocated their water, leaving little for potential development. A small quantity of water remains in the City of Monterey's Allocation and is distributed periodically at its discretion.

[1] "Special Circumstances" are defined as unusual, uncommon, peculiar, unique or rare situations that require Board consideration.
[2] "Undue Hardship" is a condition that exists when compliance with a rule, regulation or condition poses significant difficulty when considered in light of unique circumstances related to the application.

September 11, 2020

The Honorable Steve Padilla, Chair, and Members
John Ainsworth, Executive Director
Tom Luster, Senior Environmental Scientist
California Coastal Commission
45 Fremont Street, Ste. 2000
San Francisco, California 94105

Dear Chair Padilla, and Honorable Coastal Commissioners,

Since 1978, The Cannery Row Company has promoted and encouraged visitation to and appreciation of the California coastline. For approximately the same amount of time, futile endeavors to solve our water supply problem have prolonged the disruption of the Carmel River and now the impending breach the CDO.

The community came together to adopt a three prong approach in creating a resilient and environmentally sensitive solution to our water needs. Desal is a critical component of that solution and ensuring continued compliance with the State Water Resources Control Agency's Cease and Desist Order. Approval of Monterey Peninsula Water Supply Project will protect and promote the Monterey Peninsula's economy by providing a path for lifting the moratorium on new service connections for the first time since 2010, benefiting the economy and recovery of the tourism industry, the main economic driver for the Monterey area, providing an opportunity for new housing and to pursue the State's goals of shared prosperity and economic inclusion that cannot be achieved otherwise.

The draconian measures that would be triggered by a violation of the CDO will severely impact the Monterey Peninsula's economic future and all efforts of moving California forward for all.

We strongly encourage you to grant the coastal development permit and allow the Monterey Peninsula Water Supply Project to proceed and ensure economic vitality and equitable opportunities for all community members on the Monterey Peninsula.

Sincerely yours,

Theodore Balestreri II
VP Hospitality Operations

Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Jerry Edelen <jeryedel71@gmail.com>

Fri 9/11/2020 8:20 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Honorable Chair Padilla and Commissioners,

I am Jerry Edelen, one of the Founding Mayors of the Monterey Peninsula Regional Water Authority.

The Authority was formed 7 years ago by the 5 mayors of the Monterey Peninsula to secure a permanent source of water for the Monterey Peninsula by building a Desalination Plant which would be our last chance to avoid a water catastrophe.

CAL AM was chosen to build the Desal Plant; and the Authority and Cal-Am asked the State Water Resources Control Board for permission to use open water intakes. The Board ruled that we could not and that instead, we had to try slant wells, even though these wells:

Had never been done before,

Were more expensive,

And by their very nature, processed brackish water rather than fresh sea water.

Despite all odds, CAL-AM was successful in building a slant well. However, now, because brackish water rather than sea water is being processed, there is a movement to shut this program down.

This is patently unfair. Millions of dollars and years have been spent being forced to comply with the orders of one State Board, only to have the possibility of another State Commission destroy all that effort.

Please allow the Monterey Peninsula to solve its water shortage once and for all by approving this project. It is our last chance.

Thank you for your consideration.

Re: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Honorable Chair Padilla and Commissioners:

As a resident of the Monterey Peninsula I want to express my strong support for the California American Water desalination plant. It seems we have been living with a severely strained water supply forever.

There have been numerous attempts to provide our Peninsula with a new water supply and for one reason or another they all were stopped. Cal Am's desalination plant is long term answer to a water supply we so desperately need.

It is my understanding that the State is promoting water supply solutions that use what I believe is called a portfolio approach to a sustainable long-term water supply. It seems to me the Monterey Peninsula could be the perfect example of supporting our States goal.

With the Desalination plant we will have three separate sources of water including; 1) Aquifer Storage and Recovery; 2) Pure Water Monterey's re-cycled water project; 3) Cal Am's desalination plant. This is the time to finally let our Peninsula take control of it's water future and give us a diverse water supply we can depend on.

Please support California American Water's permit request that is before you.

Respectfully,

Elizabeth P. Williams

Re: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034(Monterey Peninsula Water Supply Project - MPWSP)

Dear Chair Padilla, Honorable Coastal Commission Members, and gentlemen:

The Coalition of Peninsula Businesses shares the Commission's goal of bringing the public to the Monterey Peninsula to enjoy the ocean and the beautiful coast. This depends on sufficient water for coastal accommodations and workforce housing.

The Coalition of Peninsula Businesses (CPB) urges you to consider the following facts and evidence in making your decision. We urge you to allow the Monterey Peninsula Water Supply Project - a much-needed sufficient water supply project - to go forward.

Only six years ago, you unanimously approved a permit for a test well for this project in order to judge whether slant wells – requested by you – would be feasible. The Coalition and many others – including, importantly, Marina Mayor Bruce Delgado - wrote you in support of the test well.

Pure Water Monterey Expansion (PWME) is not likely ever to be built – there is a serious dispute about whether there is source water for processing and the Monterey One Water (M1W) Board has declined to certify the project Supplemental Environmental Impact Report. Even if it is constructed, there is no reason to believe it will produce water at the level expected or whether the water production, even if consistently achieved, would be sufficient to satisfy demand. PWME is not a feasible alternative to desal.

The water supply/water demand numbers in the Monterey Peninsula Water Management District (MPWMD) report (*Supply and Demand for Water on the Monterey Peninsula*) have been questioned and contradicted by the California Public Utilities Commission (CPUC) and State Water Resources Control Board (SWRCB), two agencies with the expertise and the authority to judge those numbers. The Coalition's analysis shared with you on June 17th and June 19th demonstrates that the MPWMD report numbers themselves indicate that without desal there is not sufficient water to meet Peninsula demand.

- All water supply sources in the report are assumed to operate at maximum capacity, 100% of the time, which is extremely unlikely.

- Aquifer Storage Recovery (ASR) has only reached the capacity anticipated twice in the past 15 years. There is no reason to believe that it will ever reach that production figure year-in and year-out. Its average production is half of the max amount assumed in the MPWMD report.

- Pure Water Monterey (PWM) is underperforming and over a year behind schedule. Its current production is less than two thirds of what was anticipated. (3500afa committed v current production of 2300afa). It's extremely risky to assume its longer-term performance will be trouble free, as is assumed in the report.

If the community is to go forward without desal and the alternative projects favored in the staff report continue to falter, Cal Am will be left with no option but to violate the CDO by exceeding pumping limits on the Carmel River and to over-pump the Seaside Basin. Without desal, there is no assurance as to short or long-term water supply sustainability or sufficiency.

It's important for the Commission to also understand some of the local political backdrop that in our assessment has influenced the position of those who claim a desal solution isn't needed:

- ✓ A ballot measure - Measure J - passed in 2018, required MPWMD to analyze the 'feasibility' of buying all of Cal Am assets (i.e. buying out Cal Am). Measure J passed with the campaign promise that buying out Cal Am would make water cheaper.

- ✓ Unfortunately, Measure J created a mandate for MPWMD to make the purchase price of Cal Am as low as possible, which means eliminating a desal plant from the price. It's our belief that the scenario presented to you in which the Peninsula's water supply would be adequate for years without desal – is designed to further this goal.

The widely supported three-legged stool (a portfolio of projects) approach to our water supply problem would provide critically needed redundancy and sufficiency and there is no reason to abandon these sound principals now. The fact that PWM combined with PWME does not provide sufficient water is reason enough to reject PWME as a substitute for desal.

The staff report expresses concern about litigation - but not does not disclose that almost all the litigation was filed by one entity – Marina Coast Water District (MCWD) - that lost every single case that has been decided.

Claims of harm to Marina drinking water and the Marina aquifer ignore all the evidence, including the Coastal Commission's own study, that show no harm occurs (the Commission's report indicates the desal project would have 'limited to negligible effects' - see report summary at page 4).

Marina and Marina Coast Water District were offered numerous opportunities to participate in crafting the project, including the return water agreement, and consistently refused to engage. The damage done to Castroville if the desal plant and the return water agreement are not realized will be enormous.

For all the reasons outlined above, please grant the Coastal Development Permit necessary to allow this water supply project to proceed. Please allow this closure to the Monterey Peninsula's four decades of agonizing attempts to solve its water supply problem and four decades-long attempt to stop the environmental damage to the Carmel River.

Sincerely,

Jeff Davi, Co-chair

Re: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Hon. Chair Padilla and Commissioners:

As a lifelong resident of the Monterey Peninsula I wish to express my **strong support** for the desalination plant that will be constructed by California American Water. Our Peninsula continues to suffer a water shortage, and a building moratorium for far too long. I have lived through many cycles of drought on this Peninsula, including the cycle that forced us to go into water rationing in the 70's. This desal plant is the opportunity to give our Peninsula a consistent water supply that we can rely on.

The desalination plant along with Pure Water Monterey's recycled water project, and aquifer storage and recovery will give us a drought resistant, sustainable water supply. From what I read the state strongly supports this approach and that is exactly what should happen.

The desalination project is the only part of the portfolio that is drought resistant. The desal plant will perhaps make it possible to finally build the housing we need to support our firefighters, teachers, and other workers by lifting the moratorium we have been living under since 2010.

There is no doubt that our weather patterns are only going to become dryer and warmer. This causes great concern with the sustainability of the new recycled water project. If our global warming conditions continue to accelerate at the rapid pace we've been seeing, Pure Water Monterey may not have a water source to recycle from in a few years.

Please support California American Water's permit request that is before you. It is the ONLY RIGHT thing to do for the Monterey Peninsula communities that have been working towards this goal for the last 10 years. **Vote yes – in support of the Desal project**.

Respectfully,

Arleen Hardenstein

Honorable Chair Padilla and Commissioners,

Please support and approve California American Water's permit request that is before you.

The desalination project is the only part of the Monterey Peninsula water portfolio that is drought resistant. The desal plant will make it possible for business to recover from the Covid-19 disaster, public officials to make smart land use decisions and communities to build the housing we need to support our firefighters, teachers, and other workers by lifting the moratorium we have been living under since 2010.

New data suggests that Aquifer Storage and Recovery (ASR) may never produce more than the current five-year average of 1,164 acre feet or that the Pure Water Monterey main project is behind, over budget, and may never produce more that 2/3rds of the water projected, demonstrates the necessity and overwhelming need for an operating desalination project now, not ten years from now.

I am asking as a mother of young children, so their future may be free from the water rationing that took place on the Monterey Peninsula in the 1970's. I am asking as a peer of other young adults who are effortlessly trying to gain economic opportunity in the region that currently has no drought resistant and sustainable water source, stretched thin workforce and no path forward for affordable housing.

Please do what is best for the next generation and approve the California American Water permit request.

Respectfully,

Shanee Barker

Re: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Honorable Chair Padilla and Commissioners,

I am writing to you as a former City Councilmember of the City of Pacific Grove, former boardmember of the Monterey Peninsula Water Management District and a local resident and business owner.

As a member of this community both personally and professionally, I can attest from personal experience that our community needs a new and RELIABLE water source. In order to fulfill the State Order to stop taking water from the Carmel River and in order to address other environmental concerns, a well thought out desal project that is designed to be as environmentally sensitive as possible is the best solution for our region.

Do not be swayed by a very vocal but *small* portion of our community who wish to use access to water as a means of preventing growth or other development. We have our local governments and agencies to control the direction of our development. We need access to water for our basic needs and for our community's ability to support jobs, housing and economic recovery. This is the project that a majority of our community supports.

Please approve the Cal Am Desal Project Permit. WE NEED A LOCAL, RELIABLE, DROUGHT-PROOF WATER SUPPLY. Our recycled water project is an important addition to our "suite of solutions" but is it NOT a permanent replacement source for river water.

The Monterey Peninsula Water Supply Project is the only project that will solve the decades long water shortage for our local community

Please approve the Cal-Am Desal Permit.

Sincerely,
Michelle Knight, PhD.

California Coastal Commission

Re: Appeal No. A-3MRA-19-0034; Approve Cal Am Desal Permit

Honorable Chair Padilla and Commissioners,

I was disappointed to read Coastal Commission staff's claims regarding Environmental Justice and the desal project's disproportionate impacts on lower income communities. The reality is lower income families are unable to access water to add bathrooms, ADU's, develop their vacant properties, develop businesses within their communities and are too often hindered or prevented from development due to lack of available water supplies. Affordable housing, student housing and the like are also unable to develop due to a lack of water supply, which limits our housing supply and in turn forces higher rents regionally.

On the other hand, the wealthy in our communities benefit from being able to purchase water (Malposo and Orosco water) for expanding or developing their properties and in many instances have adequate land to drill wells or find other means to source water. There already is inequities in the way the water is distributed in our region. Development of a sustainable water supply is the solution to better balance these inequities.

After decades of proposals, research, reports, studies it is now time to get serious about solving our water problems for everyone. The only viable, reliable and ready to go project is the Cal Am desal project. Please approve this project so that we can begin providing water to everyone.

Sincerely,
Wald, Ruhnke & Dost Architects, LLP

Re: Support for California American Water's Monterey Peninsula Water Supply Project

Hon. Chair Bochco and Commissioners:

I am writing to urge you to approve the Coastal Development Permit for California American Water's Monterey Peninsula Water Supply Project (MPWSP) that is desperately needed to provide a long term solution to the Monterey peninsula. As a former member of the Monterey Peninsula Water Management District, I am very well aware of the water issues facing our community and what we need to do to get that resolve those issues.

The MPWSP is a critical part of the solution needed to answer to the State Water Resources Control Board's (SWRCB) 2009 Cease and Desist Order, which limits pumping from the Monterey Peninsula's primary water source, the Carmel River. This water project, in conjunction with the continued water conservation efforts of the Monterey peninsula will help us meet the SWRCB's requirement for a replacement water source to be on-line by December 31, 2021.

A lot of attention has been given to an alternate project, "Pure Water Monterey" which recently came on line with a limited replacement supply. As with any projects, the design production can vary widely from the actual capacity. The current design for the Pure Water Monterey project is that it can produce up to 3,500 acre feet of water per year. However, a number of technical issues have been encountered with the project and it is expected to only produce about 2,000 acre feet of water this year. A little over half of the design capacity. This project, as well as the proposed expansion, rely heavily on runoff capture to meet the design capacity. As we are all aware, when it does not rain, water does not flow and this will not meet the needs of our community.

Your approval of this project will help protect the Carmel River and will allow the Monterey Peninsula community to comply with state regulations. The community has come together to bring the Carmel River back to its former glory and protect all of the plants and animals that rely on that environment.

The project has been the subject of an extensive environmental review by state and federal agencies and was unanimously approved by the California Public Utilities Commission (CPUC) in

Andrew Clarke
926 Angelus Way
Del Rey Oaks, CA 93940

2018. This project is not without its opponents but has been exhaustively reviewed in the 13,000-page EIR/EIS and found to be in compliance with all laws and regulations. In fact, the California Supreme Court recently denied a parties petitions for writ of review of the CPUC's approval, upholding the EIR and the CPUC's decision.

The project has been designed in an environmentally-responsible manner. It utilizes a state-of-the-art subsurface intake well system and a commingled brine/wastewater discharge, a desalination technology that minimizes marine impacts and is preferred by the SWRCB, Monterey Bay National Marine Sanctuary and your agency. The project's subsurface intake wells will also be located on a disturbed former industrial site, reducing impacts to biological resources.

Without the approval of this Coastal Development permit, our community may face severe water restrictions, including possible water rationing, unless a long-term permanent replacement source is put in place. Our communities other water potential water supply projects, including the expansion of Pure Water Monterey, have not completed the required environmental review and has not been approved by the CPUC which is required for California American to integrate it into its water supply.

The timing of this approval is critical as failure to complete the project in timely manner would be harmful for the Monterey Peninsula community and the environment. The construction schedule for the project requires work begin as soon as possible in order to meet the Cease and Desist Order deadlines. Your review of this important project cannot be delayed.

My time serving on the MPWMD I worked very hard to get a new water supply online but was not successful. Approval of this project will help our community have the necessary water we need to provide economic opportunities that we have been held back from for the past 25 years. Our community has become the gold standard in the state in water conservation. However, given the already low water usage rate, conservation alone cannot replace the shortfall between California American's water supplies and anticipated future demands.

The benefits of the Project are clear. I ask that the you approve California American's application for a Coastal Development Permit at the earliest opportunity.

Sincerely,

Andrew Clarke

Walt Duflock
PO Box 82
San Ardo, CA 93450

Dear Honorable Chair Padilla and Commissioners,

My name is Walter Duflock and I am a fifth-generation family farmer from the Salinas Valley.

I am writing to urge you to support and approve the required Coastal Development Permit for California American Water's Monterey Peninsula Water Supply Project.

The Monterey Peninsula Water Supply Project is California American Water's answer to the State Water Resources Control Board's 2009 Cease and Desist Order, which limits pumping from the Monterey Peninsula's primary water source, the Carmel River, and requires a replacement water source be on-line by December 31, 2021.

Approval of this project will protect the Carmel River and its threatened species; and by providing a sustainable long-term water supply and alternative source to the river, will allow the Monterey Peninsula community to comply with state regulations.

The project has been the subject of an extensive, six-year environmental review by state and federal agencies and was unanimously approved by the California Public Utilities Commission (CPUC) in 2018. The objections you will hear raised by opponents, including water rights, groundwater impacts, environmental justice, community values and review of alternative projects were exhaustively reviewed in the 13,000-page EIR/EIS and ultimately dismissed. The California Supreme Court recently denied Marina's and Marina Coast Water District's petitions for writ of review of the CPUC's approval, upholding the EIR and the CPUC's decision.

The project has been designed in an environmentally-responsible manner. It utilizes a state-of-the-art subsurface intake well system and a commingled brine/wastewater discharge, a desalination technology that minimizes marine impacts and is preferred by the State Water Board, Monterey Bay National Marine Sanctuary and your agency. The project's subsurface intake wells will also be located on an already disturbed former industrial site, reducing impacts to biological resources.

Under the State Water Board's order to cease diversions from the Carmel River, Cal Am must ramp down its withdrawals from the River, which would result in severe water restrictions, including possible water rationing, unless a long-term permanent replacement source is put in place. The expansion of Pure Water Monterey has not completed CEQA review and was determined by the CPUC in its decision to approve the Monterey Peninsula Water Supply Project to be of inadequate size to meet the terms of the Cease and Desist Order and the long-term water demands of the Monterey Peninsula.

Failure to complete the project in timely manner would be harmful for the Monterey Peninsula community and the environment. The construction schedule for the project requires work begin as soon as possible in order to meet the Cease and Desist Order deadlines. Your review of this important project cannot be delayed.

Monterey County's future depends on additional investment in our water, transportation and housing infrastructure. Our community has faced stringent water supply restrictions that have necessitated drastic water conservation measures, prohibited new service connections and increases in existing water use, limited economic growth and severely limited opportunities for affordable housing in the region. We've seen a housing crisis emerge locally as students, workers and families struggle to find any housing, affordable or not. We understand that access to water is becoming more challenging and valuable, and this source would give us a new supply source that provides predictable and continuous access. This plant provides the best long-term solution to the Peninsula's water supply developing a stable, consistent and readily available water source.

Our water needs on the Monterey Peninsula will continue to grow regardless of housing development, business growth and hospitality demands. This last year has shown the instability that a changing climate adds to an already stressed amount of resources. We are not drought ready. We are not prepared with the proper degree of water storage. We do not have a modern water management plan. We are losing access to water and it is time to take a step in the correct direction towards a solution.

We need to find a solution to this problem. While some in our communities are staunch water conservationists, Monterey County's demand for water will only continue to rise. However, given the already low water usage rate, conservation alone cannot replace the shortfall between Cal Am's water supplies and anticipated future demands.

The benefits of the Project are clear. We ask that the Commission approve Cal Am's application for a Coastal Development Permit as soon as possible.

Sincerely,

Walter Duflock

San Bernardo Rancho

SAGE
150 Main St #130
Salinas, CA 93901
September 11, 2020

Dear Honorable Chair Padilla and Commissioners,

I am writing to urge you to support and approve the required Coastal Development Permit for California American Water's Monterey Peninsula Water Supply Project.

The Monterey Peninsula Water Supply Project is California American Water's answer to the State Water Resources Control Board's 2009 Cease and Desist Order, which limits pumping from the Monterey Peninsula's primary water source, the Carmel River, and requires a replacement water source be on-line by December 31, 2021.

Our Peninsula has struggled for decades to supply its constituents with desperately needed water. This Project is a key pillar of the Monterey Peninsula Water Supply Project and without it we have at the very best a tenuous solution. This is the only Project that creates a reliable water source regardless of drought, limited wastewater flows and agricultural drain flows.

In the Salinas Valley, our wastewater flow is a potential water source for the future. Relying upon a solution which is predicated on the same or more wastewater being available in the future is a flawed and harmful perspective. At present, there is little to no chance that our flow will increase and a much stronger chance that in the future our farmers will need more of their wastewater.

Climate change and an evolving series of challenges to our ecosystem and society are more prevalent than ever. From the perspective of our Governor's office, the only option is to begin baking climate resiliency into our infrastructure planning. Climate Resiliency is shaping our state's infrastructure investment and planning. This is showcased by Governor Newsom's Water Resilience portfolio and its subsequent guidance. We support initiatives that help our communities respond to change. The State's guidance includes 'maintain and diversify water supplies,' 'build connections' and 'be prepared.' Setting a one project solution to the Peninsula's needs does not fulfill these suggestions. Further the document recommends the need to plan for prolonged droughts and "develop strategies to protect communities and fish and wildlife in the event of a drought lasting at least six years."

Approval of this project will protect the Carmel River and its threatened species; and by providing a sustainable long-term water supply and alternative source to the river, will allow the Monterey Peninsula community to comply with state regulations.

In addition to the environmental impact the Project would have, the social justice impact will potentially be even greater. As stated in the findings and reported on by the

Monterey Herald, "there's a consensus among housing advocates and city housing staff that the moratorium on new water hookups is a significant factor in preventing more affordable housing to be built." We understand that the expansion's current supply and demand expectations for the needs of the Peninsula take into account the current number of hookups, not new hookups. We believe that our communities in Monterey County should and need to have the opportunity to live where they work.

Monterey County's future depends on additional investment in our water, transportation and housing infrastructure. This future has only become more complicated as our industries, municipalities and constituents struggle from the COVID pandemic's economic impact.

Our community has faced stringent water supply restrictions that have necessitated drastic water conservation measures, prohibited new service connections and increases in existing water use, limited economic growth and severely limited opportunities for affordable housing in the region. We've seen a housing crisis emerge locally as students, workers and families struggle to find any housing, affordable or not. We understand that access to water is becoming more challenging and valuable, yet this source would give us continuous access. This plant provides the best long-term solution to the Peninsula's water supply developing a stable, consistent and readily available water source.

Failure to complete the project in timely manner would be harmful for the Monterey Peninsula community and the environment. The construction schedule for the project requires work begin as soon as possible in order to meet the Cease and Desist Order deadlines. Your review of this important project cannot be delayed.

We need to find a solution to this problem. While our communities have become staunch water conservationists, our needs will only continue to rise. However, given the already low water usage rate, conservation alone cannot replace the shortfall between Cal Am's water supplies and anticipated future demands.

The benefits of the Project are clear. We ask that the Commission approve Cal Am's application for a Coastal Development Permit at the earliest opportunity.

Sincerely,

Appeal No. A-3-MRA-19-0034; APPROVE CAL AM DESAL PROJECT PERMIT (submitted Sep 10, 2020)

Tom Rowley <TomR2004@hotmail.com>

Fri 9/11/2020 6:12 AM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>
Cc: Tom Rowley <TomR2004@hotmail.com>

TO: Honorable Chair Padilla & Commissioners,

INTRODUCTION: The Staff Report relies on inaccurate data and baseless propaganda for its analysis and conclusions. The permit request from CAW should be approved and construction of the critically needed desalination plant allowed to move forward ASAP based on the FACTS I've listed below:

(1) Proposed Expansion of Pure Water Monterey (PWM EXP) is NOT feasible because reliable source waters for recycling are not currently available. NOTE: The Supplementary EIR for the PWM EXP was NOT approved by Monterey One Water ("Sewer Board") for sound environmental reasons, and furthermore comments submitted for the Sup EIR during its review reveal that an EIS is likely to be required under Federal Law (NEPA) to address discharge of harmful brine into the Monterey Bay National Marine Sanctuary rom the proposed PWM EXP.

(2) Existing Production of Recycled Water from Pure Water Monterey (PWM) is NOT reliable and cannot be counted on for annual MP water needs. NOTE: Currently a request is out for Contractor bids for an additional 1,000-foot injection well; please refer to Monterey County Herald legal notices 9/08/2020. Also, repeated under-estimation of true costs of the PWM project have been sounded by officials at the Sewer Board and MPWMD "since day one" of the Groundwater Recycling (GWR) proposal.

(3) The MPWMD was created by a vote of Monterey Peninsula (MP) citizens in 1978, and by law -- it is only a water "management" agency -- it is NOT a land use authority like a City and County! NOTE: Under its current GM David Stoldt, the WMD has issued multiple "phony" water demand studies for the MP land use jurisdictions (Unincorporated areas of the MP + the Six Cities: Monterey, Pacific Grove, Carmel, Del Rey Oaks, Seaside, & Sand City) -- Please observe that All of these areas contain large groups of citizens from ALL socio-economic groups, but not one of these land use jurisdictions has approved the data in those studies; please refer to the water demand data contained in the EIR for the Monterey Peninsula Water Supply Project (MPWSP), which was approved unanimously by the CPUC in September 2018 after 6 + years of analysis by hydrological experts, including multiple years of production from a test slant well authorized by the CCC -- your Agency.

(4) Aquifer Storage & Recovery (ASR) is NOT a guaranteed annual supply of potable water because it relies on injection of water from "excess" winter flows from the Carmel River. NOTE: Rainfall data from the 1840s to today reveals that "dry" years (less than 18 to 20 inches rainfall) occur in the Carmel Valley watershed in 7 of 10 years! (ASR is the second limited source of potable water in addition to the PWM discussed above.)

(5) Alleged or Claimed Damage to the Water Supply of Marina is NOT based on facts, as proven per the exhaustive and comprehensive EIR/EIS for the MPWSP. NOTE: Repeated and blatant "propaganda" by groups like Public Water Now (PWN) and the MCWD claiming social injustice and alleged harm to MP citizens should be totally rejected by the Commission -- it is obvious to all MP citizens (& me) that have been monitoring the much delayed progress toward completion of all 3 components of the MPWSP that

this propaganda is totally bogus and that the CCC staff was "suckered" into believing harm when in fact the MPWSP will benefit ALL socio-economic groups on the MP!

(6) The ONLY WATER SUPPLY PROJECT that can provide a "long-term sustainable annual water supply" of potable water for all citizens and land use jurisdictions on the MP is from the proposed desalination plant. NOTE: ALL three components of the MPWSP (3-legged stool) are needed for back-up and to meet the annual water needs of the MP, including vital allocations to effect a recovery form the ongoing pandemic recession -- to include water for new / expanded small businesses (the back-bone of jobs on the MP separate from the hospitality industry) PLUS for all types of housing -- especially affordable low income housing and work force housing.

Finally, "Thank You" to all the Commissioners for your impartial and fair consideration of the facts I've stated above -- my statements are based on my personal observations during thousands of hours attending MPWMD and water-related meetings at the various Cities and Monterey County during my over 45 years residency on the MP. These statements do not necessarily reflect the comments or the opinions of the organizations I've listed below.

Re: Support for California American Water's Monterey Peninsula Water Supply Project

Hon. Chair Bochco and Commissioners

Ensuring a long-term sustainable water supply has been the single most significant issue on the Monterey Peninsula for decades. I support the Monterey Peninsula Water Supply Project that will be before you in September, 2020.

As one who was born on the Peninsula and has lived most of my life here, I have experienced this first hand, through droughts and water rationing. My family was among the tens of thousands of local residents who experienced mandatory water rationing as far back to the mid-1970's through early 1978 and again from 1989 to 1991. There have been many other limitations on water usage that adversely affect our community.

After a long career in law enforcement, I was elected to the Monterey City Council in 2014 and again last year I was re-elected by my community. As I walked throughout Monterey's neighborhoods during campaigns I spoke with residents and businesspeople alike, and a constant theme about long-term water solutions registered with me. There is widespread unhappiness about water restrictions that impact my residents and we, as the Monterey Community need a reasonable Desal solution which has been studied to death and past the highest environmental hurdles. I still hear about how my community is desperate for a sustainable solution that can be counted on to improve lives and help support jobs. This is the closest we've come and this is the best opportunity to bring a reasonable solution , please don't disappoint us. We need housing and without the desal supply we fail further behind.

As a five-year member of the Monterey City Council, I serve on various regional boards and hear countless times from residents – those from cities and from unincorporated areas – that their inability to obtain a new water meter or a permit for a change or business improvement has been far more than an inconvenience. It has handicapped people in their day-to-day lives and prevented them from improving their homes or employ more people and improve our community. For many, it has meant being unable for decades to add a bathroom for a growing family, expand a business and make it more viable, or create more much needed housing and jobs.

Commercial buildings, which formerly housed vibrant businesses, stand vacant because through the years adaptation of commercial locations is necessary and expected. Without the desal component of the Monterey Water Project there is no long-term improvement that is guaranteed to be sustainable. A reasonably sized Desal supply from the Pacific Ocean provides what my community needs. Some buildings have been vacant for many years, and empty lots remain that way because water meter permits cannot be obtained.

There have been countless studies and investigations concerning water usage and how to achieve the best solution, but no community consensus has ever been reached; there are too many opinions. There have been many divergent proposals by well-meaning and dedicated people and you'll hear of some that have already been considered and deemed not sustainable. Doesn't the examination and carefully evaluated project, through the California Water Resources count for something after all these years of study. The only agreement is that a remedy is needed, now more than ever.

What you now have before you, I believe, is the best opportunity to resolve this vital matter through the Monterey Peninsula Water Supply Project, which offers a three-pronged portfolio:

- Desalination, using subsurface technology as directed by the California Coastal Commission
- Aquifer Storage and Recovery (ASR), which is when "excess" Carmel River winter flows, under state and federal oversight, are treated and transmitted to wells in the Seaside Groundwater Basin.
- Sewage Treatment, another part of the solution.

The Monterey Water Project would ensure a strong, viable, and, more importantly, much-needed source of new water. But, without an approved desalination plant the statement of long-term sustainability rings hollow. Desalination coupled with the other design elements is essential to the Monterey region's long-term water needs. With a three-pronged portfolio our total system would truly be sustainable! Rain, ASR and the Carmel Valley River can not bring us to a complete and sustainable supply system.

This project has been carefully scrutinized and studied in a six-year environmental review conducted by state and federal agencies. The California Public Utilities Commission has approved it unanimously. Mitigation measures were imposed to reduce the project's environmental impacts as much as possible. The Monterey Water Project is environmentally responsible and includes leaving additional water in the Carmel River to protect and preserve fish, a longstanding issue. It would abide by the State Water Resources Board's order to halt diversions from the Carmel River and it would replace water supplies in the Monterey District which includes many of our neighboring cities.

If we don't allow this much-needed water supply project the greater Monterey Peninsula and the environment will suffer. Those who live within the Monterey District have been diligent in reducing their water usage. However, more is needed than these self-imposed

restrictions. History has taught us rain is infrequent and storage is limited. The desal aspect enables the region to create the storage solution through the ASR system to enable a healthier Seaside Aquifer under appropriate scrutiny. Without the desal project the water supply will fall very much short of the water demand. The Monterey Water Project would allow for the lifting of the moratorium, in effect for the past nine years, and a moderate amount of new service connections. Our economy would be bolstered, additional jobs created, and a path would be established for new and much-needed housing, including low-cost housing and Accessory Dwelling Units, (ADU's). All of these require more water.

As an elected official, I have a duty to seek more affordable housing for the residents of Monterey and the greater Peninsula. Without the Monterey Water Project this is impossible. Give us the ability to start saying YES to smart and reasonable projects for our community. The City of Monterey's General Plan calls for additional housing, and state-mandated Regional Housing Needs Allocation, (RHNA) require it. Without new meters and water supplied by the three-prong portfolio approach new housing here is illusive.

I ask that the members of the Coastal Commission approve California American Water's application for a Coastal Development Permit in a timely fashion.

In *East of Eden*, John Steinbeck, writes about the neighboring Salinas Valley, which has had its own water concerns, penned these words:

And it never failed that during the dry years the people forgot about the rich years, and during the wet years they lost all memory of the dry years. It was always that way.

Through the Monterey Peninsula Water Supply Project that is before you, it no longer has to be that way.

Please know that this is exceedingly critical for the City of Monterey and the entire Peninsula and I ask that you approve the Monterey Peninsula Water Project.

Thank you for your consideration.

Re: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Hon. Chair Padilla and Commissioners:

As a resident of the Monterey Peninsula I wish to express my strong support for the desalination plant that will be constructed by California American Water. Our Peninsula continues to suffer a water shortage, and a building moratorium for far too long. For generations, we have kicked the can down the road, only increasing costs to the community. Now the California state mandate to add ADU's is not possible with no new water available, businesses struggle to find spaces with adequate water, homeowners are unable to remodel or update, and vacant lots sit unimproved when there is dire need for more housing.

The desal plant will make it possible for business to recover from the Covid-19 disaster, public officials to make smart land use decisions and communities to build the housing we need to support our firefighters, teachers, and other workers by lifting the moratorium we have been living under since 2010.

Please support and approve California American Water's permit request that is before you.

Respectfully,

Carol Duncan

Re: Monterey Peninsula Water Supply Project

Chair Padilla and Members of the Commission,

I am once againg writing in support of Cal-Am's proposed desalination plant in Marina. The completion of this water supply project is very important for our community.

I serve as a Director of the Del Monte Forest Property Owners Association (DMFPOA) and as a member of Land Use Advisory Committee for the Pebble Beach area. I serve on the Pebble Beach Architectural Review Board and on the DMFPOA's Equestrian & Hiking Trails and the Roads & Traffic committees. Professionally, I am a registered Civil Engineer.

My volunteer involvement in the community makes me keenly aware of the issues surrounding our community's water supply. Without exaggeration, I can say that every facet of life on the Monterey Peninsula is affected by our limited water supply. It should not be this way. The time has come to fully address this basic resource need for current and future generations.

There is a critical need for workforce housing in our community. The lack of workforce housing and traffic congestion is intertwined. It is impossible to address this need without an adequate water supply. Completion of the proposed desalination plant will finally allow the peninsula to begin to address these problems. Pebble Beach was able to complete a much needed workforce housing project but only because it had an independent water source. That sort of opportunity is not available to other communities on the peninsula because of the lack of water supply.

We need the desalination plant that is being proposed. Some are saying that it is too big. Nonsense. To argue that other projects could address our needs is shortsighted. These alternatives will not produce enough water to address both current and future demand. We have to look beyond today.

Please approve the coastal development permit so that the building of the desalination plant can proceed.

Sincerely,

Bart J. Bruno

Subject: Appeal No. A-3-MRA-19-0034, Approve Cal Am Desal Project Permit

Dear Chair Padilla & Commissioners:

The Monterey Peninsula Taxpayers Association was formed in 1965 to advocate for the interests of taxpayers on the Monterey Peninsula in combating an attempt to purchase the local water agency. We have remained active in water issues to this day, we are not a *johnny come lately*.

We read with dismay the staff report. They are recommending denial based on what they claim is an environmentally superior alternative. Their analysis is fundamentally flawed. The staff chose to ignore multiple sister agencies as well as the agency who is responsible for that alternative. They ignored:

California Public Utilities Commission – They reviewed all viable alternatives and certified the EIR/EIS for the Monterey Water Project. After exhaustive hearings they set the amount of required to satisfy the Cease and Desist Order and have ruled that the proposed Pure Water Monterey Expansion does not provide enough water.

State Water Resources Control Board – Their order reducing pumping from the Carmel River demands construction of Cal Am's desal plant and they have stated that the demand analysis and information provided on the potential to expand Pure Water Monterey does nothing to change that.

Cal EPA – Jared Blumenfeld the Secretary for Environmental Protection recently addressed the Commission and indicated that the Monterey Water Project is the only project which will rejuvenate the Carmel River.

Monterey One Water – They are the body running the Pure Water Monterey project, they declined to certify the Pure Water Monterey Expansion project in large part due to the lack of water for the project. All water proposed for the project comes from outside

the Monterey Peninsula from the Salinas Valley which has its own major water problems and will need this water. Needless to say, the Salinas Valley is adamantly against this water coming to the Peninsula.

Instead of listening to the above agencies, the Coastal Commission Staff based their recommendation on comments made from two agencies whose credibility is suspect at best.

City of Marina & Marina Coast Water District – Marina was offered a seat at the table to receive the return water from the project early on but declined. They have done everything in their power to try to kill the project. They have filed 10 lawsuits questioning the legality of a multitude of issues and have **lost every one** of those that have been decided.

Monterey Peninsula Water Management District – Up until about a month ago they had been officially on record as supporting the Desal Project. They were active participants before the CPUC and SWRCB in determining the mix of projects as well as the water needs. Now for political reasons they have abandoned their mission of augmenting the water supply and have decided to become a land use agency. They have no legal basis for involvement in land use issues. Determining water demand is the purview of the Cities and County. The City Managers of all Peninsula Cities do not agree with the District's water demand numbers and the Districts numbers do not take into account State ADU mandates or water for affordable housing.

In short, the only project which provides for a sustainable long-term water supply for the Monterey Peninsula is the Desal project.

The Desal project is the only project which will satisfy the terms of the Cease and Desist Order.

The Pure Water Monterey project (original phase) is woefully behind schedule and grossly over budget and has not been proven to be viable yet staff suggests expansion of this project is a better alternative.

If the Desal project is not approved, the Monterey Peninsula will run foul of the Cease and Desist Order in Fall of 2021 which will result in a 40% cut back in water use and there are not currently any viable alternatives.

We urge you to APPROVE the Cal Am Desal Project Permit.

Sincerely,

Rick Heuer

Re: Support for Cal-Am's Monterey Peninsula Water Supply Project

Chair Padilla and Commissioners,

I am writing in support of the desalination plant in Marina and ask that you approve the Coastal Development Permit. It is a much needed solution that will benefit the community beyond just providing water.

Almost daily, the issue of affordable housing is in the news. Governor Gavin Newsom has been very vocal about this and has signed bills that will help to compel the cities to tackle the lack of affordable housing. The issue of water and housing go hand-in-hand on the Monterey Peninsula. Lack of a water supply has exasperated the housing supply shortage.

For nearly 20 years, Cypress Pacific Investors, LLC, has developed in-fill housing units in the City of Marina and on the Monterey Peninsula. Many of our units are affordable by design. We have built homes with accessory dwelling units (ADU's) long before it became the "innovative" option to add much needed housing in California. Developing affordable workforce housing is something we know a lot about.

The Monterey Peninsula has fallen behind on meeting their state mandated housing goals. Even small infill projects cannot proceed due to the lack of water. The need for more workforce housing is very apparent every morning as the highway is clogged with people trying to commute to work on the peninsula. Other nearby cities, especially Marina, should not have to make up the peninsula's shortfall. Approval of the desalination plant will put us on a path towards solving this problem.

Please don't be distracted by those who point to an expansion of the recycled water project as an adequate solution. To try to make their argument work, they claim that the demand for water has been overstated. It has not. In fact, the current demand figures do not take into account the demand that will be created by the trend towards developing ADU's. We probably will need more water; definitely not less.

Please approve the coastal development permit so that the building of the desalination plant can proceed.

Sincerely,

Peter J. Taormina

Re: Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Hon. Chair Padilla and Commissioners:

I am writing on behalf of 400 Pacific Grove Chamber of Commerce Members and our Board of Directors to urge you to support and approve the required Coastal Development Permit for California American Water's Monterey Peninsula Water Supply Project.

The Monterey Peninsula Water Supply Project is our community's desperately needed solution to the State Water Resources Control Board's 2009 Cease and Desist Order, which strongly limits pumping from the Monterey Peninsula's primary water source, the Carmel River. Under the order, Cal Am must ramp down its withdrawals from the River to no more than 3,376 AF annually.

In their review of the project, the California Public Utilities Commission noted that average water demand for our community is 12,270 AF annually, without considering the need for extra water to facilitate economic growth, municipal general plan buildouts and development of vacant legal lots of record, among other needs. Hence the project application sized the project at 14,275 AF per year, to allow room to meet anticipated future water demand. Without approval of this project, at 14,275 AF, our community would be subject to severe water restrictions and strangled economic growth, including possible water rationing, unless a long-term permanent replacement supply begins delivering by December 31, 2021 under the timeline imposed by the State's Cease and Desist order.

A Pure Water Monterey Expansion Project that excludes a desal plant leaves our community with insufficient water, providing little over 11,000 acre feet per year, right at the edge of Staff's projected demand. But Staff's supply numbers assume that 1,300 acre feet will always be available from Aquifer Storage and Recovery. In the past 15 years, that full amount has been available only twice. The average is less than 700 acre feet annually, and in years of drought, zero water from ASR has been available. If ASR

supplies are reduced in times of drought, which is inevitable given historical trends and the increasingly relevant effects of climate change regionally, the Peninsula will not have enough water to meet demand. The Pure Water Monterey Expansion Project therefore leaves us in our current situation, and will only exacerbate conditions of highly suppressed demand, a moratorium on all new water connections, no new development, and the possibility of continued illegal diversions in times of drought, or if any existing water supply, such as ASR, falls short. We cannot afford continued uncertainty over our water supply.

Furthermore, the ongoing coronavirus pandemic has made our business community and many of our residents severely economically vulnerable. The economic damage of the current crisis may persist for years, having a certain and reliable water supply will allow our business community to stabilize itself economically, both now and long after the current crisis is over. Finally, at a time when all ratepayers must pay for water using increasingly smaller budgets due to drops in business and operating income, a long-term reliable supply that our community can depend on is needed now more than ever. The objections you will hear raised by opponents, including water rights, groundwater impacts, environmental justice, community values and review of alternative projects were exhaustively reviewed in their 13,000-page EIR/EIS and ultimately dismissed.

For years, our community has faced stringent water supply restrictions that have necessitated drastic water conservation measures, prohibited new service connections and increases in existing water use, limited economic growth and severely limited opportunities for affordable housing in the region. Faced with these constraints, local businesses and residents have become leaders in the state in water conservation. However, given the already low water usage rate, conservation alone cannot replace the shortfall between Cal Am's water supplies and anticipated future demands. The benefits of the Project are clear. We ask that the Commission approve Cal Am's application for a Coastal Development Permit. After decades of struggle over water, our community needs to be able to put this issue behind us for the long-term.

Sincerely,

Moe Ammar
President, Pacific Grove Chamber of Commerce

We are also owners of a rental property:
23435 Telerana Way
Carmel, CA 93923

We would like to **strenuously** object to the Coastal Commission staff's recommendation to deny the CalAm permit application for the proposed desal plant.

Local leaders and CalAm have worked for decades to ensure a reliable source of water for the Monterey Peninsula and its associated communities. The proposed desal plant does exactly that, even in years of extreme drought, which climate change makes more likely moving forward. While we are no fans of CalAm, we genuinely believe that the Peninsula needs this desal project and that CalAm has done everything conceivable to demonstrate the project's justification and environmental sustainability, demonstrated yet again with the slant-well test results.

This has led to approvals and up to and including the CPUC, and success prevailing against numerous and ill-considered lawsuits. Now, at the 11th hour, will the CCC staff really derail this critical project over illusory environmental concerns? Will not a desal plant be better than the existing cement plant? How many times do we really need to question previous environmental studies and re-litigate old lawsuits?

And should not property values and the continued economic vitality of the Monterey Peninsula region be part of the decision making process? We believe that is certainly the case and that Commission staff has ignored this consideration and therefore failed to make a prudent and balanced decision.

Please vote to approve this desperately needed project.

Respectfully,

-- Alexander and Patricia Gray

Appeal No. A-3-MRA-19-0034; Approval of Cal-Am Desal Project Permit

Fred Meurer <meurer@meurermuni.com>

Thu 9/10/2020 8:53 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Honorable Steve Padilla, Chair and Commissioners
California Coastal Commission
Attn: Tom Luster
455 Market Street, Suite 300
San Francisco, Ca. 94105

Subject: Appeal No. A-3-MRA-19-0034; Approval of Cal-Am Desal Project Permit

Honorable Chair Padilla and Commissioners,

I am writing to urge you to reject the staff recommendation and APPROVE the coastal development permit for California American Water's Monterey Peninsula Supply Project

My name is Mary Ann Carbone. I am the Mayor of Sand City and have City Council authority to speak in favor of the Cal Am coastal permit application. The desalination plant is essential to the Peninsula developing a portfolio of water supply projects that offer a mix of sources and capacities that would be resilient to drought, mechanical failure and necessary maintenance. The portfolio consists of our small Sand City desalination plant, Carmel River Groundwater; Aquifer Storage and Recovery; the Pure Water Monterey sewage reclamation; and, the key Cal Am desalination plant. This portfolio would be cost effective and would be adequate for meeting the member agencies' general plans and housing needs.

The portfolio concept was developed by the Monterey Peninsula Water Authority made up of the Mayors of the 6 Peninsula Cities. This Agency was created by the Mayors after the Monterey Peninsula Water Management District failed to develop a water supply system to meet the regions needs and after the desalination project development that was put together with Marina Coast Water District (MCWD) failed. This failure occurred after Marina Coast could not meet its contractual requirements. The portfolio concept was developed through extensive public outreach and public hearings held by the Authority, technical analysis and rigorous review by all of the Federal and State Agencies with oversight.

If you follow your staff's recommendation, the Peninsula will be sentenced to another decade of water poverty. Our region has failed to agree on a water supply to replace our draw on the Carmel River watershed since 1977. Sand City built its own desalination plant to be sure we could serve the needs of our community, but the whole Peninsula must be

economically vibrant if any of us are going to have successful communities. We are all tied together.

The lack of adequate water has deprived our region of an adequate supply of housing for all but the rich. This is the ultimate **social injustice** to the poor, the working poor and the middle class. The result of not having enough water and adequate affordable housing can be seen in the number of schools on the Peninsula that have been shuttered. This has happened due to the lack of housing being developed to meet the needs of our workforce in hospitality, education and public agencies.

Your staff is also justifying denial of desalination in favor of a potential project called Pure Water Monterey Expansion that does NOT have an approved environmental document. I am a member of the Monterey1Water Board. I voted with the Board majority to deny certification of the Expansion Project environmental document because it did not adequately address issues raised by NOAA, the City of Salinas, and the Monterey County Water Resource Agency. Even if certified and built, the proposed project would provide adequate water and would discontinue the Peninsula's water poverty and the injustice that goes with it. Also, it relies on a source water supply that the Salinas Valley needs for meeting its requirements under the State Groundwater Sustainability Act and fails to provide the overall drought protection and reliability the portfolio concept offers.

I am also a member of the Seaside Basin Water Master Board. Our Chairman has outlined the damage that would be done to the Seaside Aquifer if the desalination project is denied. We cannot afford to risk seawater intrusion into the Seaside Basin due to a lack of supply.

Marina's claims of damage to their water supply has been shown to be unfounded by your analysis as well as all of the previous hydrogeology work done by the other State and Federal Agencies. The staff report does not mention that Marina was offered the opportunity to participate in the project and potentially be the recipient of the basin water produced by the desalination plant. They declined to participate and that resulted in the basin water being provided to Castroville, a disadvantaged community. Castroville will suffer considerable damage and social injustices if this water supply is denied through Commission denial of the Cal Am application.

The desalination project and water portfolio are part of providing a balance between cost, environmental impacts, and the human need for a reliable water supply. Please reject the staff recommendation and **APPROVE** the project application. The future of the Monterey Peninsula is absolutely dependent on a water supply that allows us to meet the current affordable housing needs and the future housing needs of the working class. As a retired construction laborer, I know from firsthand knowledge the negative impact the

water shortage has had on the working people that provide the essential services so necessary for a successful community.

Respectfully Submitted,

Mary Ann Carbone
Mayor of Sand City

Appeal No.A-3-MRA-19-0034 : Approval Cal Am Desal Project Permit

Fred Meurer <meurer@meurermuni.com>

Thu 9/10/2020 8:39 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Honorable Steve Padilla, Chair and Commissioners
California Coastal Commission
Attn: Tom Luster
455 Market Street, Suite 300
San Francisco, Ca. 94105

Subject: Appeal No. A-3-MRA-19-0034 : Approval Cal Am Desal Project Permit

Honorable Chair Padilla and Commissioners,

I am writing to urge you to deny the staff recommendation and APPROVE the coastal development permit for California American Water's Monterey Peninsula Supply Project

My name is Chuck Della Sala. I have been involved in the Peninsula's search for a new water supply as a property owner, city planning commissioner, City Council member and Mayor of Monterey. As mayor, I helped form the Peninsula Water Authority with the other 5 Peninsula cities' mayors. I was the initial chairman of the public process that led to the concept of a water supply portfolio of: Carmel River Groundwater; Aquifer Storage and Recovery; the Pure Water Monterey sewage reclamation; and, the anchor project of a desalination plant. The portfolio offered a mix of sources and capacities that would be resilient to drought, mechanical failure and planned maintenance. The portfolio would be cost effective and adequate for the member agencies' general plans and housing needs. This portfolio concept was developed as a result of extensive public outreach and public hearings, technical analysis and rigorous review by all of the federal and state agencies with oversight.

Our region has been searching for the "perfect" water supply to replace our draw on the Carmel River Watershed since 1977. The Monterey Peninsula Water Management District has chased dams, water hyacinths, conservation, aquifer storage, treated sewage and multiple attempts at desalination. They have spent hundreds of millions of rate payer dollars in pursuit of the ephemeral perfect project. Just as they would get close to success, they would reach for an even more "perfect", potentially less expensive project. The result this search has been years of failure to find the more "perfect" water project. This has resulted in water poverty for the region, and a crushing shortage of housing for the poor, the working poor and the middle class. Even new doctors and lawyers cannot find quality "affordable" housing. Young families cannot afford to live here, our schools are closing for lack of students and the teachers that we do have, cannot find a home near where they work. It is getting harder and harder for businesses, universities, and the military to do business on the Peninsula due to a lack of workforce housing.

We are on the cusp of having a project portfolio approved that is drought proof and that makes the State Water Resource Control Board happy because of the benefits to the Carmel River. The CPUC is happy as it has issued a Certificate of Public Convenience and Necessity and the challenge to that decision was denied hearing by the Supreme Court.

The project is now before you for issuance of a coastal permit for a slant well field for the desalination plant feed water. Your commission required that slant wells be tested. The tests showed that the wells work without negative impact to others. Now your staff is recommending denial of the slant wells because of the potential impacts that 1/4 acre of well heads might have on environmentally sensitive

habitat in the 400 acre CEMEX industrial sand mine site and potential drawdown of vernal ponds that no one has proven are fed by groundwater.

Your staff is also recommending denial of desal in favor of a potential project called Pure Water Monterey Expansion. After supporting desal through most of the public process, political winds and board membership changes have caused the Water Management District to once again, look for a "more perfect" project by a potential expanded Pure Water Monterey component of the portfolio and removal of the desal plant.

This potential project SFEIR was not certified by the Monterey1 Water Board because it did not adequately address issues raised by NOAA, City of Salinas and the Monterey County Water Resource Agency. Even if certified and built, it would yield a water supply system that maintains water poverty on the peninsula, is not drought proof and relies on a source water supply that the Salinas Valley needs for meeting its requirements under the State Sustainable Groundwater Management Act.

Additionally, the coastal impacts of the well field are inconsequential when compared to the impacts of the Peninsula once again being denied an adequate and resilient water supply. Such a supply is offered by the portfolio of desal, aquifer storage and Pure Water that has been developed through years of public hearings, technical analysis, federal and state environmental analysis and regulatory oversite and approval by all federal agencies through NOAA and every state agency but yours.

Please deny the staff recommendation and approve the project application.

Chuck Della Sala
Former Mayor of Monterey

Appeal No.A-3-MRA-19-0034 : Approval Cal Am Desal Project Permit

Fred Meurer <meurer@meurermuni.com>

Thu 9/10/2020 8:28 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Honorable Steve Padilla, Chair and Commissioners
California Coastal Commission
Attn: Tom Luster
455 Market Street, Suite 300
San Francisco, Ca. 94105

Subject: Appeal No. A-3-MRA-19-0034 : Approval Cal Am Desal Project Permit

Honorable Chair Padilla and Commissioners,

I am writing to urge you to reject the staff recommendation and APPROVE the coastal development permit for California American Water's Monterey Peninsula Supply Project

My name is Sam Farr. I was a member of the election Team along with Peter Douglas and Bill Press that passed Proposition 20 in 1973. I organized and led the campaign bike ride from Lands' End in San Francisco to Balboa Park in San Diego to bring attention to the lack of "coast access". Later, as a Monterey County Supervisor, I served on the Central Coast Regional Commission where I initiated the LCP's for Big Sur, Carmel Highlands, Pebble Beach and the rest of unincorporated Monterey County. This was done in 1976, the year of the drought.

I went on to serve 6 years as a Monterey County Supervisor, 13 years in the California Assembly and 24 years as the Congressman representing the Central Coast of California. During my 50+ years of public service, I have been a staunch advocate for the protection of the environment, environmental laws and regulations and the creation of multiple National Monuments and Parks. I have been an equally staunch advocate for the creation of adequate housing for our poor, our working poor and our working middle class.

My bottom line up front- In this case, I weigh the greatest good as being the creation of a water supply portfolio that is anchored with a desalination plant to provide a water supply with drought protection, a production capability that can respond to the critical workforce housing needs of the Monterey Peninsula, and that has to date been approved by all reviewing Federal and State Agencies in their technical studies and environmental documents and found to be the superior environmental option.

of water and it had to tear down the dam-all to be paid for by the company and passed on to rate payers.

After examining all alternatives for new sources of water and in consultation with the State and Federal agencies, including the Coastal Commission, it was decided that salt water desalination was the best alternative. The process was started and terms were set by the regulators. Legal setbacks occurred and lawsuits were filed, long delays followed.

As water rates increased, the economic viability of alternatives became possibilities. Politics also started changing with new pressures on MPWMD to examine buying out Cal Am. The desalination project was held hostage, because its operation would drive up the cost of buying out the company.

Even though the Cal Am test wells met or exceeded every condition placed on it and is ready to be put into production, every possible way is being used to stop it, mostly to make Cal Am cheaper for buy out-ignoring the real need for that desalinated water.

I urge you to reject your staff recommendation, as our Regional Coastal Commission did several times when I was on it back in the 1970's, for the following reasons:

1. To meet affordable housing goals and needs. The alternatives will not produce enough water to meet housing goals or housing needs. Not a single entity has committed any new water to affordable housing construction. Without the desalination wells project, water will continue to be scarce and only the rich will benefit.

2. Negative environmental impacts. The Monterey Bay brine disposal issues have been addressed to the satisfaction of the Marine Sanctuary. In this case dilution is the solution.

On shore the desalination plant wellhead site is located on the most disturbed shoreline spot on Monterey Bay-the longest running sand mining site in California. Sand mining has stopped, but left behind an industrial waste site. No activity can make it worse.

3. Economics. Yes it costs money, so did tearing down the San Clemente dam even with help from the Coastal Conservancy, NOAA (for fish protection) and the Carmel River reparations fund. Rate payers paid as well. The question commissioners ought to ask is what will be the cost of having no affordable workforce housing in the area that is totally dependent on the tourism industry?

Back to where I started, working to enact new ideas to make the Coast accessible, with passage of the Coastal Act in 1972. Accessibility to our beautiful coast now depends on a service industry that can live near their jobsite. Interpretation of the Coast-like the Aquarium; marine education instruction, like Hopkins Marine Station employees; Coastal

Dunes State Park employees; the BLM's Rocks and Island Monument (that I created while in Congress) employees. The list goes on especially for lower income staff and employees.

The point is that we have a critical housing shortage on the Monterey Peninsula for all but the wealthy. We know it, but cannot do anything about without new water supplies. So far all the recent small increases in water have not produced any affordable housing. No jurisdiction is willing to commit new water to affordable housing if it's a scarce amount of water. Without enough water to build affordable housing, the entities that we rely on for coastal access and interpretation are not going to have the people to do the work. Further traffic gridlock is also going to be a detriment to visitor servicing entities and coastal access.

We need enough water to meet legal obligations and to support sound public policy- the ONLY guarantee for that water is with the Cal Am Desalination Project. It is time to approve the project and move forward.

Sincerely,

Congressman Sam Farr (Retired)

Re: Support for California American Water's Monterey Peninsula Water Supply Project

Hon. Chair Padilla and Commissioners:

I am writing to you as a resident of Salinas, California and I wish to express my total support for the California American Water desalination plant. I spend hours during the week tied up on Highway 68 and Highway 1 with my car idling in traffic.

There are many causes, but the biggest one is the lack of available housing on the Peninsula. We need more housing everywhere, however whenever a housing unit is proposed on the Peninsula, the first question asked; is where is the water going to come from. The pollution from the commute, the waste of hours and the lack of workforce housing is an environmental and economic disaster.

The desalination plant is the key part of the three-pronged approach to solving our water needs, because it is the only drought resistant water supply in the portfolio.

It is easy to just focus on the needs of citizens on the Peninsula, but it's worth repeating that it is a county-wide issue and lack of water on the Peninsula affects all of us here in Monterey County.

I ask that you please issue the California American Water permit for the slant wells for the desalination plant.

Respectfully,

Renee Garner

Appeal No. A-3-MRA-19-0034 : Approval Cal Am Desal Project Permit

Fred Meurer <meurer@meurermuni.com>

Thu 9/10/2020 8:05 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Honorable Chair Padilla and Commissioners,

I am writing to urge you to reject the staff recommendation and APPROVE the coastal development permit for California American Water's Monterey Peninsula Supply Project

My name is Fred Meurer. I am the Chairman of the Monterey Bay Defense Alliance (MBDA). We are a nonprofit 501 c (3) whose mission is to protect and grow the national security and defense organizations stationed in the Monterey Bay Region.

I served 20+ years in the Army as a Corps of Engineer officer, with my final tour as the Director of Public Works and Housing. My very first meeting as the Director in September of 1981 was to discuss a permanent water supply for the Army assets on the Monterey Peninsula. After retiring from the Army, I went to work for the City of Monterey. I served as Director of Engineering and Maintenance for 5 years and as City Manager for over 22 years. 32 years after that first meeting on water, my last meeting as City Manager in December of 2013 was still on the same subject- a sufficient water supply for the Monterey Peninsula. Since my retirement, I have been consulting with the Military Services on the issues of critical infrastructure and partnerships with local agencies.

The major national security activities on the Monterey Peninsula are the Naval Postgraduate School (NPS), the Defense Language Institute (DLI), Fleet Numerical Meteorology and Oceanography Center (FNMOC), the Navy Research Lab (NRL), the Defense Manpower Data Center (DMDC), the Center for Homeland Security and Defense and the US Coast Guard Station Monterey.

These activities play a critical role in the Nation's national security, homeland security and economic security capabilities. It is essential that we do everything we can to make these activities as mission effective, cost effective and mission resilient as we can. These missions are critical to our defense, but they also infuse billions of dollars of economic activity into our local and state economy. It is also important to know that they have been reviewed for closure or realignment in each of the six base closure rounds since 1988. In 1991, Ft Ord was selected for closure.

All of our national security activities are totally mission dependent on large numbers of civilian instructors, professors, analysts, engineers, scientists and other professional support personnel who are almost all government employees. The defense activity employment issues involved with recruiting and retaining a highly qualified military and civilian workforce are not unlike the private sector and other public sector employers-quality schools, quality and affordable housing and a quality living and working environment. The lack of an adequate water supply to build meaningful numbers of workforce housing units makes it increasingly difficult to recruit and retain the talent necessary to accomplish these military missions.

The military missions change and grow as they respond to international threats. The installations that support these missions must have the infrastructure needed to support and grow these ever changing missions. Specifically, they must have a water supply that is reliable, responsive to mission growth needs and resilient to drought and other potential interruptions. The current water supply system does not meet these needs and neither does a water supply with only a Pure Water Expansion and not a desalination component.

The staff recommendation to deny a permit for the desal plant's slant wells would perpetuate this unacceptable situation. The staff proposed a water solution, whose sponsor refused to certify its EIR, provides no flexibility for future mission growth and does not meet Defense Department expectations for infrastructure resilience.

I encourage you to approve the Cal Am Coastal Development application.

Regards,

Fred Meurer
Chair, Monterey Bay Defense Alliance

Jim Wagoner <wagoner66gt@sbcglobal.net>

Thu 9/10/2020 6:52 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

Hi,

My name is Jim Wagoner and my family and I live here in Pacific Grove. I grew up in this area, attended High School in Salinas, and have been involved in the communities as both a "local" and as a "visitor".

I'm an Engineer by profession. The situation of a limited resource requires focused problem-solving. The lack of a guaranteed supply of water has put so many restrictions onto the multiple communities, both residential and commercial it is difficult to see why people don't understand an obvious problem as well as the limited options. For those of us who believe the global impact on our environment is real, we need to be putting our resources into solid solutions that can be counted upon.

The Carmel River is not a guaranteed supply and has many other challenges. The technology of desalination is well proven and can be done in a way to both solve the problem and do so in a way to protect the environment.

Please approve the desal project.

Thank you,
Jim Wagoner

Re: Appeal No. A-3-MRA-19-0034; Approve Cal-Am Desal Project Permit

Honorable Chair Padilla and Commissioners:

Pebble Beach Company (PBC) would like to join with the broad coalition of governments, businesses, residents, and environmental organizations in support of the Monterey Peninsula Water Supply Project. We urge you to approve the required Coastal Development Permit for the project.

The Monterey Peninsula community has been at work for more than 40 years to develop a long-term, sustainable, drought resistant water supply for the Monterey Peninsula. The comprehensive, six-year environmental review for the Monterey Peninsula Water Supply Project was completed by state and federal agencies and unanimously approved by the California Public Utilities Commission in 2018. Objections raised by project opponents, including groundwater impacts, environmental justice, water rights, and project alternatives - to name a few - were all exhaustively analyzed, and ultimately dismissed. The question of how much water the Monterey Peninsula requires has also been carefully studied, deliberated, and ultimately settled by the California Public Utilities Commission in 2018. The decision before you today is the crucial, final step of approval needed to bring the Water Supply Project to fruition.

REAL ESTATE DIVISION

4005 Sunridge Road, Pebble Beach, California 93953

PBC has a long history of leading the golf industry and Monterey Peninsula with innovative and responsible water resource management. In the early 1990s, we financed and developed the $70M Pebble Beach water reclamation project – today this project supplies 100% of the water needed to irrigate all the golf courses in the Del Monte Forest. To date, we've saved more than 7.07 billion gallons of potable water for the Monterey Peninsula. Needless to say, we're staunch supporters of recycled water, and now have almost three decades of experience relying on recycled water. Importantly, we've learned that the supply of recycled water is extremely dependent upon the community's potable water use that, in turn, supplies the "raw product" for the reclamation process. As residents and businesses conserve more and more potable water, (as we have been doing on the Peninsula for years now), they, in turn, generate less and less waste water to be recycled. From our own 30-year experience, we know firsthand that the supply of recycled water is neither constant nor guaranteed over time. In addition to the long-term impact of conservation, the supply of recycled water also shrinks dramatically during times of drought. Neither of these issues afflicts the Cal-Am desalination project before you today: Unlike reclamation, it is entirely independent of the impacts of conservation and drought. For that reason, Cal-Am's project is essential. Recycled water alone simply cannot meet the Monterey Peninsula's water supply needs on a sustainable, long-term basis.

PBC would also like to call your attention to pages 115-132 of the Coastal Commission Staff Report. Collectively referred to as "Updates," the Staff Report relies on the incorrect, misleading findings of the Monterey Peninsula Water Management District's projections of future water supply and demand. Unfortunately, the Staff Report fails to consider numerous agency and public comments, including those of the State Water Resources Control Board, all of which discredit the Water Management District assumptions and findings. Specifically with respect to PBC, the Staff Report falsely assumes that we will not use our full water entitlement and, along with other questionable assumptions, erroneously calculates a reduced water demand for the greater Monterey Peninsula. PBC's vested right to use our water entitlement has been consistently upheld by every concerned agency, and we intend to fully utilize the entitlement. In fact, we've already used or allocated for use all but 60 acre-feet (out of our total 365 acre-foot entitlement). We bring this error to your attention for two reasons: (1) false assumptions call into question the overall credibility and integrity of the report, and (2) we sincerely hope that the Coastal Commission will not allow erroneous data and incorrect assumptions to influence your decision-making today. We believe the supply and demand numbers presented by MPWMD are erroneous and fail to take into account the complexity of water dynamics here and the long- and short-term needs of the community.

We also believe that the current MPWMD Board has an inherent conflict of interest because several if not a majority of board members have avowedly been pursuing a public buy-out of

Cal-Am. Torpedoing Cal-Am's desalination project will make that goal much more attainable. Instead of focusing on a hostile takeover of Cal-Am, the entire MPWMD Board should be laser-focused on the agency's primary mission: To create a reliable long-term water supply to meet the needs of the Monterey Peninsula. For that reason alone, we urge you to rely on the much more comprehensive and unbiased study of our water supply and demand approved by the California Public Utilities Commission with far more rigorous analysis and public review.

PBC strongly believes that we need both desalination and recycled water to provide our community with a long-term, adequate, secure, and flexible water supply. We are approaching the finish line to resolve our community's long-term water supply crisis, after 40 years in pursuit of that goal. We urge you to support the project to the fullest extent of your powers.

Sincerely,

PEBBLE BEACH COMPANY

Appeal No. A-3-MRA-19-0034; Approve Cal Am Desal Project Permit

Timothy Errington <erringtonimages@gmail.com>

Thu 9/10/2020 5:16 PM

To: CalAmMonterey@coastal <CalAmMonterey@coastal.ca.gov>

California Coastal Commission
Honorable Chair Padilla and Commissioners

Honorable Chair Padilla and Commissioners,

I am writing to urge you to approve the Coastal Development Permit sought by California American Water to build the proposed desalination plant.

While I believe the Pure Water Monterey recycling project is an important step, it is unclear that it will provide a sufficient supply in order to reduce the pumping of the Carmel River to legal limits.
Without the desalination plant we have no back-up to the Pure Water Monterey project.

I understand Coastal Commission staff concluded there would be less overall environmental impact from Pure Water Monterey, however their assessment did not include the environmental impact to the Salinas River Lagoon or the harm to the Carmel River if the Pure Water Monterey project cannot produce sufficient supply.

I believe both projects are vital to the Monterey Peninsula and should be permitted.
We should not become complacent since we are not currently in drought conditions but longer more severe droughts are on the horizon. Having both the desalination plant and Pure Water recycling should provide enough water to our area for decades.

It is important for the California Coastal Commission to recognize and ensure we are prepared for the future.

Thank you,
Timothy M. Errington

The Honorable Steve Padilla, Chair and Commissioners
California Coastal Commission
Attn: Mr. Tom Luster
455 Market Street
San Francisco, CA 94105

RE: APPEAL NO. A-3-MRA-19-0034; APPROVE CAL AM DESAL PROJECT PERMIT

Honorable Chair Padilla, Commissioners and Staff:

On behalf of the Utility Workers Union of America Monterey Local, I write to encourage the Coastal Commission to grant California-American Water's (Cal-Am) application for a Coastal Development Permit for the Monterey Peninsula Water Supply Project.

Water supply is an important issue to the Monterey Peninsula, especially to our members who live and work here. This new plant would create new jobs for highly skilled union workers. This project would help local water users, help the Carmel River, and help working families.

Following the failure of multiple other proposals for creating a new water supply, in 2012, California American Water submitted an application to the California Public Utilities Commission (CPUC) for the Monterey Peninsula Water Supply Project. The CPUC and Monterey Bay National Marine Sanctuary subsequently spent 6 ½ years reviewing potential environmental impacts. A joint Environmental Impact Report/Environmental Impact Statement was certified by the CPUC in September 2018.

The deadline for California American Water to cease unauthorized diversions from the Carmel River is December 31, 2021. We believe your approval of this project is the best chance the community has for solving its decades-long water supply issues and improving habitat for endangered and threatened species.

Our members urge the Commission to reject staff's recommendation and allow development of this project to proceed to create new job opportunities for working families and restore the Carmel River.

Sincerely,

Andrew Kolonics
President, Local 511

Re: Letter in Support of the Monterey Peninsula Water Supply Project

Dear Chair Padilla and Commissioners,

The along awaiting long term Water Supply (desalination) project is now in your hands. You hold the future of either a prosperous community or a community in decline, it is up to you. I strongly encourage the Commission to approve Cal Am's application for the Coastal Development Permit. Completion of this desalination plant, in conjunction with other water sources, will help our community meet its current and future water supply needs, and protect the natural resources that we all cherish.

Scudder Roofing and Scudder Solar have been a family-owned business located in Marina for over 37 years, we employ over 80 people. Our workforce lives in Marina, Monterey, Salinas, and the surrounding communities. The residents and businesses in Marina, and the other Monterey Peninsula cities and towns, as well as the Salinas and South County, are all interconnected. The lack of a reliable water supply is not only devastating to the future or our communities (families) and the environment, the lack of a reliable water source adversely impacts the economic stability of all the communities. The success of the peninsula directly impacts all these other communities. We cannot fall victim to the naysayers. We cannot allow further degradation to our rivers beds, our water table, and our resources that inadequate water supply creates.

The time is now. Completion of the proposed desalination plant is key to solving the local water supply problem. For too many years our community has lived with the threat of droughts, water shortfalls, moratoriums, and devastating fires. Lack of water is bad for the environment and adversely affects the overall quality of life of the people who call this region home.

Some have recently pointed to an expansion of the Monterey One recycled water project as an alternate solution. This is not a solution it is only a distraction and an expensive Band-Aid to an already overwhelmed water system. Our community has talked about having an adequate water supply project for over 45 years and over this time the environment has suffered as well as the quality of life in our communities. Citizens have suffered long enough. The Coastal Commission has a great opportunity to take the lead on this and make something positive happen. Now is the time for leadership. You have a great opportunity to solve one of our major challenges the water shortage. Please take charge and do the right thing for the community and the future.

Please approve Cal Am's request for a coastal development permit and let's get this project underway.

Sincerely, Peter H Scudder

San Francisco, California, 94105

Dear Honorable Chair and Commissioners of the California Coastal Commission,

I write to you today on behalf of Monterey/Santa Cruz Counties Building Construction and Trades Council, regarding the Cal-Am desalinization plant project in Marina, California. It is extremely important that this project gets your blessing and approval to move forward as all our affiliates in the Building Trades are awaiting your great decision.

I personally have lived in Monterey County for 58 years. My first 28 years I lived in Pacific Grove, CA and 16 years in Seaside, CA. So, my first 44 years of my life has been with Cal-Am Water as our water supplies. I recall vividly in 1977, we customers were restricted to 50 gallons of water per day, per person. We need a water supply today and the customers of Cal-Am water are concerned thinking "Do we go back to 1977?" If you could imagine yourself as these customers and think about the challenges they've had to face without a proper water supply and no desalinization plant. You are hindering economic growth for the youth in Cal-Am's jurisdiction. The youth's future can come to a stand still to the point where a business or residence is not able to add (one) single bathroom to their establishment.

For the last sixteen years my family and I have lived in Marina, California. I consider myself domicile to the Monterey Peninsula. It is crucial and important that on September 17, 2020, that this project gets your blessing and gets approved.

Fraternally Yours, In Solidarity,

Manuel R. Pinheiro

September 11, 2020

To: California Coastal Commission
From: Abbie Beane, CRWC Executive Director
Re: Support for the Monterey Peninsula Desalination Project

Honorable Chair Padilla and Commissioners,

The Carmel River Watershed Conservancy (CRWC) was created in 2000 to advance the restoration of the Carmel River Watershed and the recovery of the threatened South Central Coast Steelhead. We led the development of a Watershed-wide Assessment and Action Plan, and we now chair the Carmel River Task Force comprising all the federal, state, and local government agencies and non-profits with an interest in the restoration of the Carmel River and its threatened species. We are uniquely situated to represent the interests of our watershed and its threatened species.

That restoration and the steelhead recovery plan will not succeed unless there is more water in the Carmel River and its aquifer that have been over-pumped for decades. This Desalination Project is critically needed to increase in-stream flows and to meet the Peninsula's long-term water supply needs. It provides a new local, reliable, drought-proof water supply. Being drought-proof is critically important as the Monterey Peninsula has periodically suffered many years of drought that would nullify the use of aquifer storage and recovery (ASR) and storm water recycling as alternative water supply sources. These sources should be supplemental to the desalination plant. CRWC argues that the Peninsula will need at least 14,000 acre feet of water annually, as the CPUC has calculated, to meet future water demand. This number is almost 3,000 acre feet higher than the amount of water that would be provided under a best-case scenario without desal and only an expanded recycled water project and ASR. The Pure Water Monterey (PWM) project also recently claimed to have rights to new wastewater sources. Both the Monterey County Water Resources Agency and City of Salinas, however, have argued that these sources may lead to seawater intrusion in the Salinas Valley or may be claimed for agricultural uses. These entities have therefore asked Monterey One Water to deny certification of PWM's supplemental EIR.

The Desalination Project has been designed in an environmentally-responsible manner, has been the subject of a seven-year review and incorporated all feasible mitigation measures, and was approved by the CPUC. It utilizes a state-of-the-art subsurface intake well system and a commingled brine/wastewater district, a desalination technology that minimizes marine impacts, and it is preferred by the State Water Board and the Monterey Bay National Marine Sanctuary. The Project's subsurface intake wells will also be located on a disturbed former

Carmel River Watershed Conservancy
PO Box 223833, Carmel, CA 93922

Paul Bruno, Vice President
Abbie Beane, Executive Director
Andy Magnasco, Treasurer
Jennifer Duggan, Secretary
Catherine Stedman
Scott Hennessy
Jen Hunter

industrial site, reducing biological impacts. Coastal Commission staff has found that this project will cause adverse wetland impacts and construction impacts on Environmentally Sensitive Habitat Area, however, Cal-Am has prepared findings to mitigate these impacts.

Failure to complete the Project to provide an alternative water supply for the region in a timely manner would be harmful for Cal-Am's customers, the Monterey community, and especially the Carmel River and its aquifer.

For years, the Monterey community that Cal-Am serves has faced stringent constraints on water supply that have necessitated drastic water conservation measures and have limited economic growth in the region. Faced with these constraints, Monterey District customers have become leaders in the State in water conservation. However, given the already low water usage rate, conservation alone cannot replace the shortfall between Cal Am's water supplies and anticipated future demands. A new supply, like this Project, is needed.

Finally, the staff recommendation contends that the desalination plant presents environmental justice concerns. Risking a lack of water for the Peninsula and in the Carmel River watershed presents its own set of environmental justice concerns. There are many low-income populations in East Carmel Valley that rely on wells and on a healthy watershed to prevent destructive wildfires. Furthermore, there are residents who are new to the area and must rely on some development, through renovations or rental income, in order to afford the area's high cost of living. Currently these residents are not allowed to develop without available water credits.

Both the desalination plant and ASR will face hurdles, so we feel it is irresponsible to pursue only one option for meeting Peninsula water supply demands and cessation of pumping on the Carmel River.

The benefits of the Project to the Carmel River Watershed are clear. We ask that the Commission reject staff's recommendation and approve Cal Am's application for a coastal development permit at the earliest opportunity.

Sincerely,

Abbie Beane

San Francisco, CA 94105- 2219

Re: Support for California American Water's Monterey Peninsula Water Supply Project

Hon. Chair Bochco and Commissioners:

Please approve California American Water's application for a Coastal Development Permit for the Monterey Peninsula Water Supply Project.

I have lived on the Monterey Peninsula for 18 years. Being totally dependent on local rainfall and receiving the majority of our water from the Carmel River whose resources are over-strained, we have been under strict conservation measures for literally decades.

Our community has fought and fought over the best way to solve our water problems. Half the community wants no solution because they are afraid it will lead to growth and the other half wants a right-sized, long-term legal water supply. The voices that truly care about the health of the river also support a solution.

In 2009, the State Water Resources Control Board stepped in and put us under a Cease and Desist Order because we can't agree. They believed the added pressure and threat of devastating consequences would push us to complete a project.

We need your help to resolve our water issues. Cal Am's desal project is environmentally friendly. It won't harm Marina. This is a red-herring designed to stop the project. Recycled water is not drought proof. We don't need to put another generation through the time and expense of examining unfounded alternatives. Please approve this project – our community depends on it.

Sincerely,

Gary & Doreen Cursio

Comment in Support of the Monterey Peninsula Water Supply Project
Case Number: 9-19-0918

Dear Commissioners,

I support the Monterey Water Supply Project to create a desalination plant as a clean, sustainable solution to the water supply crisis in the Monterey Peninsula.

This desalination project is the only viable option to supply our community with a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and restoring the Carmel River and the Seaside basin.

The Monterey Peninsula is a leader in conservation, and for 25 years has been working with federal, state and local agencies to develop an alternate water supply for our community. It is imperative that the water supply needs of the Monterey Peninsula and the environmental issues facing the Carmel River are resolved as quickly as possible.

Please support this desalination project to ensure our water future. Thank you for your consideration.

Sincerely,

john derrick

RE: Application No. 9-19-0918 and Appeal No. A-3-MRA-19-0034 (California American Water Company)

Dear Mr. Ainsworth:

On behalf of the Castroville Community Services District, we are writing to encourage the California Coastal Commission to support the Coastal Development Permit for California American Water Company's proposed desalination facility for the following reasons:

- Pure Water Monterey expansion (PWMx) is not a feasible alternative to the MPWSP desalination facility. The initial Pure Water Monterey (PWM) recycle water facility is already facing major cost and performance delays including two shallow wells failing and the two remaining deep wells pumping a fraction of projected injection rates. The PWMx cannot be constructed in 20 months as claimed by those opposing the MPWSP due to fatal flaws in water rights, water quality, existing plant performance, in addition to required Monterey Bay National Marine Sanctuary's permits and Federal NEPA permits from NOAH.

- PWMx will have a greater adverse environmental impact than the proposed desalination facility; due to increased concentrate from the expansion project and adverse effects on the Salinas Ag community, Castroville and others which need the proposed PWMx source water to offset sea water intrusion in North Monterey County's 180'-400' aquifer.

- PWMx will not be enough to lift the Cease and Desist Order (CDO) on the Peninsula. Based on the current Pure Water Monterey (PWM) project, which is experiencing extensive problems with injection, treatment, financing and cost escalation. It is highly speculative to put faith in an expansion of a project, that to date, has failed to show it is a reliable, long-term water supply.

- The report titled "*Supply and Demand for Water on the Monterey Peninsula*" adopted by the MPWMD on May 18, 2020, which claims the PWM expansion could provide a new water supply sufficient to meet the future needs of the Peninsula for the next 20 to 30 years defies common sense and multiple peer reviews by the CPUC. SWRCB and others. This claim by the MPWMD that both proposed water supply projects meet the current and future needs of the Peninsula is highly suspect. While the CPUC has already issued a CPCN permit for the MPWSP, the PWMx has not secured financing, a water purchase agreement or even a certified Environmental Impact Report

- Based on the performance and cost increases incurred by the current PWM project, any expansion will result in more delays in meeting the CDO. These delays mean it will not be on-line until years after the already permitted MPWSP. Meanwhile, these delays will result in M1W and CalAm rate payers suffering severe financial hardship when the water purchase agreement and CDO are not met.

- Castroville is a 100% severely disadvantaged community that provides labor for many businesses and residences on the Peninsula. Due to the severe restrictions on water supply, affordable housing cannot be built on the Peninsula, instead it is being disproportionately developed in Castroville. The result is that water restrictions prevent building affordable housing near where these folks work. This lack of water for affordable housing results in more traffic, air pollution, water pollution and overall environmental degradation to our environment

- This Water poverty is caused in large part, by some paid "Intervenors", creating water scarcity to limit growth and deny low-income affordable housing

- In addition, only the MPWSP helps stop seawater intrusion by intercepting the seawater at the coast, drawing brackish water back and allowing wells to be turned off directly in front of the intrusion. PWMx does not provide any of these benefits. In fact, it exacerbates sea water intrusion in the 180'- 400' pressure aquifer by taking water that should be sent to the existing Castroville Sea Water Intrusion Project

- Finally, MPWSP (desal), PWM (recycle) and ASR (aquifer storage and recovery) represent the original "three- legged stool" approach that has been determined, after years of study, community input and millions of dollars to be the only secure, reliable, drought proof and long-term water supply for the Peninsula

Thank you for your consideration of the Castroville Community Services District's concerns.

Sincerely,

Adriana Melgoza, President
Castroville Community Services District

RE: Staff report regarding permit for the Proposed Monterey Peninsula Water Supply Project

Dear Commissioners:

On behalf of the North County Recreation and Park District, I write to express our support for Monterey Peninsula Water Supply Project.

The North County Recreation and Park District (NCRPD) is approximately 46 square miles, serving the communities of Castroville, Elkhorn, Moss Landing, Oak Hills and Rancho Moro Cojo, as well as unincorporated areas within Northern Monterey County. We currently operate the North County Recreation Center, Cato-Phillips Park, Crane Street Park, Japanese School Park, Rancho Moro Cojo Park, and the Moro Cojo Nature Trails.

We are also the primary provider of youth, adult, and senior programs for North County. Each year we serve over a thousand youth, and hundreds of adults and seniors, many of whom are low income. Our parks provide open, green spaces for our community to walk, run, and play, and community center hosts dozens of community events and private parties annually.

The NCRPD's vision is to build community through people, parks and programs. Our mission is to:

- Strengthen community image and sense of place
- Support economic development
- Strengthen safety and security
- Promote health and wellness
- Foster human development
- Increase cultural unity
- Protect environmental resources
- Provide recreational experiences
- Facilitate community problem solving

The NCRPD Board of Directors is writing to offer our support for the Monterey Peninsula Water Supply Project. In addition to meeting the Monterey Peninsula's water needs, this project will benefit Castroville by providing additional water to the community, thereby reducing Castroville's dependency on well water from the critically over drafted Salinas Groundwater Basin, which in turn will help reduce the rate of seawater intrusion into the groundwater of Castroville.

North County Recreation & Park District
We create community through people, parks, and programs

Castroville is a disadvantaged community, as defined by the California Environmental Protection Agency's CalEnviroScreen 3.0 analysis tool, which analyzes socioeconomic and pollution burden data for community census tracts statewide. Continued contamination of our groundwater by seawater intrusion is a very real danger, and one that will only exacerbate the economic and environmental challenges we face.

We are encouraged by actions of our partner agency, the Castroville Community Service District (Castroville CSD) to ensure that any amount of fresh water incidentally captured in the desalination process will be retained in Salinas basin. This requires a significant investment from the Castroville CSD, including a $2.8 million pipeline to bring the water to Castroville. However, benefits are well worth the investment because this project will:

- Provide a long term, drought proof water supply to the peninsula, allowing compliance with the Cease and Desist Order,
- Allow wells directly in the path of the seawater intrusion to reduce or completely stop pumping, thus preventing the advancement of seawater further into our common basin,
- Provide Castroville, CSIP and possibly others a secure long term, drought proof water supply,
- Intercept the incoming seawater before it can further intrude our water supply and even help draw back some of the seawater already in the basin.

The NCRPD Board believes in working collaboratively to solve local and regional problems, which is why we support the Monterey Peninsula Water Supply Project. The project offers clear environmental benefits to the Monterey Peninsula and the Salinas Valley groundwater basin, and it will ensure a safe and sustainable water source for the disadvantaged community of Castroville.

We encourage the Coastal Commission to approve any required permits for this needed project.

Sincerely,

Grant Leonard
Board President

FAX: (831) 796-3022

September 11, 2020

Chair Padilla, Staff and Commissioners:

I am writing you today as an individual who spends his days problem solving on behalf of his community. I am proud to be the current Chair of the Monterey County Board of Supervisors, and even more so to have been born and raised in the district I am lucky enough to represent. This district and its people, are the reason I wake up every morning and go to work, knowing my constituents need someone looking out for their interests.

The water woes of the Peninsula are not new by any stretch of definition. The impact of the lack of meaningful action to create a new and sustainable water source on the other hand has been significant in the areas I represent. Due to the lack of a water supply on the Coast, the Salinas Valley is tapped for the vast majority of future growth of housing in our region. That pushes up the cost of housing for our skilled farmworkers who work extremely hard to put food on our nations table. This leads to increased traffic, and dense housing situations that have helped fuel the Covid19 pandemic in my communities. The numbers of cases in my community paint this picture much more clearly than any other statistic available. Latinos make up nearly 80% of all the Covid19 cases in my community and the industry hardest hit has been agriculture, with nearly 23% of the cases in Monterey County self-identifying as working in the industry.

I share these numbers in hopes that you will look at our larger picture issues in Monterey County to inform the decision you make about the future of the Cal Am Desal Project. Moving forward with the project today means more housing, and especially affordable housing, which can be built near the coast where our tourism industry thrives. Approval of this project will allow hospitality employees to live near work, reduce congestion and pollution, and safeguard ag land. All of this can be accomplished while not threatening or relying on the water we need to grow the crops that feed our nation, or subjecting our farmworkers to even further concentration into current limited housing. All of this can help reduce pandemics like Covid-19.

Using the Pure Water Monterey project as a justifiable alternative is unrealistic and puts the long-term burden of expectation of water delivery on the Salinas Valley. I question whether this violates other non-export policies from our basin and puts at risk the nation's food supply.

Please look beyond the local NIMBY politics and flip flopping from local agencies. Make a decision that solves a problem, rather than kicking it down the road. Don't put a band aid on a problem that will continue to lead to legal battles down the road. The long-term threat of this decision to my community and the work we do to feed the world is real. We, and our forefathers, have made significant decisions to create the water source we depend on today, dating as far back as seventy years ago when we created

our two water dams (Nacimiento and Lake San Antonio). We continue to tax ourselves to maintain and upkeep the system that makes our entire region an agricultural powerhouse, but also creates sustainable drinking water replenishment in the Salinas Valley while battling saltwater intrusion.

Don't kick this can down the road, solve the problem by allowing the creation of a new water source. Don't create a band-aid that is put on the backs of my communities, threatening their most critical resource, causing continued competition for housing resources, as they work to feed the nation.

Sincerely,

Chris Lopez
Monterey County Supervisor
Third District

Re: Monterey Peninsula Water Supply Project – Support

Dear Mr. Ainsworth:

The Seaside Groundwater Basin Watermaster is tasked by the Court to administer the Seaside Basin. Our board is comprised of elected officials and others who each have a role in the protection and management of the basin.

Today I once again write to urge your approval of Coastal Development Permit (CDP) for California American Water Company's (CAW) Monterey Peninsula Water Supply Project (MPWSP). In October of 2019, our board approved a resolution in support of the MPWSP. That resolution was presented to the Coastal Commission at its prior hearing on the project.

As the Coastal Commission is well aware, the MPWSP is necessary to meet the long-term water demands of the Monterey Peninsula. No other project has been identified to reliably meet the communities' water needs sufficiently to get the community out from under the State Water Board's Cease and Desist Order. The MPWSP also will provide much needed protections to one of the Peninsula's other critical water supply sources, the Seaside Groundwater Basin.

- Without the quantities of supplemental supplies from the MPWSP, CAW and other Seaside Basin pumpers may not be able to meet the pumping reductions called for in the Seaside Basin Decision.
- The MPWSP supply is necessary to meet the replenishment obligations required in the Seaside Basin Decision, and to avoid the undesirable consequences of overdraft, and seawater intrusion.
- Without the quantity of supplemental supplies provided by the MPWSP, the Seaside Basin Watermaster cannot achieve the protective water levels (PWL) for the Basin that have been identified as necessary to avoid seawater intrusion and irreversible loss of Basin storage.
- If Seaside Basin storage is lost or reduced as a result of seawater intrusion, other existing water supplies - such as native groundwater, Aquifer Storage and Recovery, and Pure Water Monterey – are in serious jeopardy, as seawater intruded aquifers cannot be used for groundwater storage.
- The MPWSP is necessary to provide the Seaside Basin with the replenishment needed for reliable protection against seawater intrusion.

It is imperative that the Coastal Commission and other stakeholders understand what is truly at stake for the Seaside Basin and the water supplies that are dependent on the health and security of the Basin. The Seaside Basin is perhaps the most critical water supply resource for the Monterey Peninsula. The Basin provides more than 3,000-acre feet of native groundwater annually for

municipal uses in CAW's Monterey and Laguna Seca Districts and to the Cities of Seaside and Sand City, and also is used for other beneficial uses in the Basin. The Basin also provides critical groundwater storage for CAW's Aquifer Storage and Recovery (ASR) diversions from the Carmel River, and provides storage and treatment of recycled water for Monterey One Water's Pure Water Monterey (PWM) Project. The loss of Seaside Basin storage as a result of overdraft and seawater intrusion would have a catastrophic impact on these crucial existing water supplies, not only for CAW's customers on the Monterey Peninsula, but for the other municipal and irrigation users in Monterey County.

The Seaside Basin Decision, as amended in February 2007, allocates the yield of the Seaside Basin to municipal and overlying groundwater users according a formula and schedule set forth in the Decision. The Decision requires gradual reduction in total Basin production in order to reduce Basin pumping to Natural Safe Yield, which was determined to be approximately 2,900 acre-feet in 2007. Municipal pumpers that exceed their Natural Safe Yield allocations are required to replenish the Basin for such overproduction, even if that overproduction is authorized under the Decision. The Decision also obligates Watermaster to study and manage conditions in the Basin and, to the extent Watermaster finds that pumping may result in Material Injury to the Basin, and to request relief from the Court to avoid or mitigate Material Injury to the Basin and its users. The Decision defines Material Injury to include impacts such as seawater intrusion, water quality degradation and subsidence.

Under the Decision, CAW currently is obligated to replenish approximately 700-acre feet per year (afy) over a 25-year period in order to offset its overproduction. This replenishment will be accomplished by "in lieu recharge" of the Basin, i.e., CAW reducing its authorized pumping by 700 afy and allowing that unpumped groundwater to remain in groundwater storage. For planning purposes, Watermaster has assumed that the MPWSP will deliver approximately 700 afy to satisfy CAW's replenishment obligation, in-lieu of exercising its pumping rights. The Commission's evaluation of water supply and demand cannot merely assume CAW's yield allocation under the Decision (approximately 1,800 afy, reduced to 1,500 afy in 2021), but must also consider an additional 700 afy necessary to satisfy replenishment obligations under the Decision. Water supply and demand analyses that do not consider this replenishment obligation as a water demand (or as a reduction in the available Seaside Basin native groundwater supply) are ignoring potential Material Injury to the Seaside Basin.

In addition to administering the Natural Safe Yield of the Seaside Basin Decision, Watermaster has been carefully studying and evaluating seawater intrusion risks and potential management actions to avoid the disastrous consequences of seawater intrusion into the Seaside Basin. As described in the attached memorandum from Watermaster's Technical Program Manager, Robert Jaques, increasing groundwater elevations in the Seaside Basin aquifers across the coastal front has been identified by Watermaster's technical experts as a prudent and necessary action to prevent seawater intrusion into the Basin's aquifers. Based on our analysis of water elevations in several key coastal wells, Watermaster has found that higher groundwater elevations are needed in both the Paso Robles (shallow) and Santa Margarita (deep) aquifers to reduce the risk of seawater intrusion. To achieve these protective water levels (PWL), Watermaster has found that approximately 1,000 afy of additional replenishment is required over a 25-year period. The MPWSP is the only possible supplemental water project before us that is capable of supplying the additional water needed to allow Watermaster to sustain PWL in the Basin.

Sincerely,

Paul B. Bruno, Chairman

Seaside Basin Watermaster
P.O. Box 51502
Pacific Grove, CA 93950
(831) 641-0113

MEMORANDUM

TO: Chairman of the Board of Directors of the Seaside Groundwater Basin Watermaster

FROM: Robert Jaques, Technical Program Manager

DATE: August 11 , 2020

SUBJECT: Recharge Water Is Needed to Protect the Seaside Groundwater Basin Against Seawater Intrusion

---

To our Technical Advisory Committee, I recently presented an analysis of groundwater modeling work and other reports pertaining to proposed projects that would supply water to help stabilize groundwater levels in the Basin. The Committee unanimously approved the analysis and recommended that it be presented to the Board of Directors.

Background & Discussion

The Seaside Groundwater Basin Adjudication Decision, which established the Watermaster in 2006, had as its primary purpose reducing pumping from the Basin in order to stabilize groundwater levels to prevent seawater intrusion. The Seaside Basin is a critical source of water supply for the Monterey Peninsula. The management actions in the Decision reflect the fact that the Basin had been over-pumped for many years prior to the issuance of the Decision, but does not contain express requirements for water levels to be raised. It only required that pumping be reduced to keep groundwater levels from continuing to fall. We now know that groundwater levels in the Basin have continued to fall in some areas despite implementation of the Decision-required pumping reductions, and that even if they stabilized at current levels they would be well below sea level in some parts of the Basin.

Protective Water Levels (PWLs) were developed for four wells located near the coast in the Coastal Subarea of the Basin. If the groundwater level is at or above the PWL at a given location, it means that seawater cannot intrude into that area because the groundwater level is sufficiently above sea level to prevent that from happening. Currently, groundwater levels at all of the wells in the deep (Santa Margarita) aquifer are below their respective PWLs, and only one of the groundwater levels is above its PWL in the shallow (Paso Robles) aquifer. Our hydrogeologic consultants have told us with

certainty that persistence of groundwater levels below PWLs will lead to seawater intrusion into the Basin. Loss of groundwater storage to seawater intrusion will be very difficult, if not impossible, to reverse. While it is not possible at this time to accurately predict when that could occur, groundwater levels need to rise above PWLs to ensure protection of the aquifers.

The only way to achieve PWLs is to inject more water into the Basin than is taken out, so that the Basin is permanently recharged and not just used as a temporary storage vessel (which is the case with the existing Pure Water Monterey Project and the proposed Pure Water Monterey Expansion Project).

Principle Conclusions from the Analysis

If the Desalination Plant is Not Constructed and There is No Expansion of the Pure Water Monterey Project (Under this scenario the only project constructed is the original 3,500 AFY PWM Project)

- There is negligible net change in groundwater levels because on average the amount of water that is replenished is quickly extracted and not left in the Basin.
- PWLs will not be achieved.
- The Basin will not be protected against seawater intrusion.

If the Desalination Plant is Not Constructed and the Pure Water Monterey Expansion Project is Constructed (Under this scenario both the original PWM Project and the PWM Expansion Project would be in operation)

- The groundwater modeling for the original PWM Project used the same Cal Am water demand figures that were used in the EIR/EIS for the MPWSP. The groundwater modeling performed for the PWM Expansion Project used water demand figures developed by MPWMD that are several thousand AFY lower than the demand figures that were used when the modeling was done for the original PWM Project.
- Even using the lower water demand figures mentioned above, PWLs will not be achieved and the Basin will not be protected against seawater intrusion with the Expanded Pure Water Monterey Project because additional replenishment water will not be available for the Seaside Basin.
- If the higher and more conservative original water demand values were used in the PWM Expansion Project modeling, that modeling would show an even greater threat of seawater intrusion because additional replenishment water will not be available for the Seaside Basin and pumping from the Basin would need to be greater to meet the higher demands.

Additional Replenishment Water Will be Needed to Achieve Protective Elevations

- Previous modeling indicates injecting on the order of 1,000 AFY of additional water into the Seaside Basin for 25 years, along with the existing Cal Am replenishment obligations and the original PWM Project and either the desalination plant or the PWM Expansion Project, may be necessary to achieve protective elevations at all Basin locations within 25 years.

- Groundwater modeling that incorporates the actual projects that are to be constructed, i.e. either the desalination plant or the PWM Expansion Project, would need to be performed to refine the amount of additional injection water that would be needed.
- In its initial years of operation the desalination plant will have unused capacity that could potentially provide some of this replenishment water.
- If the desalination plant is constructed, a smaller PWM Expansion Project could likely provide the additional water needed to achieve protective elevations.

Comment in Support of the Monterey Peninsula Water Supply Project Case Number: 9-19-0918

Dear Commissioners,

I support the Monterey Water Supply Project to create a desalination plant as a clean, sustainable solution to the water supply crisis in the Monterey Peninsula.

This desalination project is the only viable option to supply our community with a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and restoring the Carmel River and the Seaside basin.

The Monterey Peninsula is a leader in conservation, and for 25 years has been working with federal, state and local agencies to develop an alternate water supply for our community. It is imperative that the water supply needs of the Monterey Peninsula and the environmental issues facing the Carmel River are resolved as quickly as possible.

Please support this desalination project to ensure our water future. Thank you for your consideration.

Sincerely,

Sam Teel

Comment in Support of the Monterey Peninsula Water Supply Project
Case Number: 9-19-0918

Dear Commissioners,

I support the Monterey Water Supply Project to create a desalination plant as a clean, sustainable solution to the water supply crisis in the Monterey Peninsula.

This desalination project is the only viable option to supply our community with a long-term sustainable water source that is capable of supporting affordable housing, economic recovery and restoring the Carmel River and the Seaside basin.

The Monterey Peninsula is a leader in conservation, and for 25 years has been working with federal, state and local agencies to develop an alternate water supply for our community. It is imperative that the water supply needs of the Monterey Peninsula and the environmental issues facing the Carmel River are resolved as quickly as possible.

Please support this desalination project to ensure our water future. Thank you for your consideration.

Sincerely,

cornelius wigg

Comment in Support of the Monterey Peninsula Water Supply Project Case Number: 9-19-0918

Dear Commissioners,

I support the Monterey Water Supply Project to create a desalination plant as a clean, sustainable solution to the water supply crisis in the Monterey Peninsula.

This desalination project is the only viable option to supply our community with a long-term sustainable water source that is capable of supporting

affordable housing, economic recovery and restoring the Carmel River and the Seaside basin.

The Monterey Peninsula is a leader in conservation, and for 25 years has been working with federal, state and local agencies to develop an alternate water supply for our community. It is imperative that the water supply needs of the Monterey Peninsula and the environmental issues facing the Carmel River are resolved as quickly as possible.

Please support this desalination project to ensure our water future. Thank you for your consideration.

Sincerely,

lauren ARMSTRONG

Comment in Support of the Monterey Peninsula Water Supply Project Case Number: 9-19-0918

Dear Commissioners,

I support the Monterey Water Supply Project to create a desalination plant as a clean, sustainable solution to the water supply crisis in the Monterey Peninsula.

This desalination project is the only viable option to supply our community with a long-term sustainable water source that is capable of supporting

affordable housing, economic recovery and restoring the Carmel River and the Seaside basin.

The Monterey Peninsula is a leader in conservation, and for 25 years has been working with federal, state and local agencies to develop an alternate water supply for our community. It is imperative that the water supply needs of the Monterey Peninsula and the environmental issues facing the Carmel River are resolved as quickly as possible.

Please support this desalination project to ensure our water future. Thank you for your consideration.

Sincerely,

George Hoffman

Comment in Support of the Monterey Peninsula Water Supply Project Case Number: 9-19-0918

Dear Commissioners,

I support the Monterey Water Supply Project to create a desalination plant as a clean, sustainable solution to the water supply crisis in the Monterey Peninsula.

This desalination project is the only viable option to supply our community with a long-term sustainable water source that is capable of supporting

affordable housing, economic recovery and restoring the Carmel River and the Seaside basin.

The Monterey Peninsula is a leader in conservation, and for 25 years has been working with federal, state and local agencies to develop an alternate water supply for our community. It is imperative that the water supply needs of the Monterey Peninsula and the environmental issues facing the Carmel River are resolved as quickly as possible.

Please support this desalination project to ensure our water future. Thank you for your consideration.

Sincerely,

Leanne Leonard

Comment in Support of the Monterey Peninsula Water Supply Project Case Number: 9-19-0918

Dear Commissioners,

I support the Monterey Water Supply Project to create a desalination plant as a clean, sustainable solution to the water supply crisis in the Monterey Peninsula.

This desalination project is the only viable option to supply our community with a long-term sustainable water source that is capable of supporting

affordable housing, economic recovery and restoring the Carmel River and the Seaside basin.

The Monterey Peninsula is a leader in conservation, and for 25 years has been working with federal, state and local agencies to develop an alternate water supply for our community. It is imperative that the water supply needs of the Monterey Peninsula and the environmental issues facing the Carmel River are resolved as quickly as possible.

Please support this desalination project to ensure our water future. Thank you for your consideration.

Sincerely,

Kaitlin Ford

Comment in Support of the Monterey Peninsula Water Supply Project Case Number: 9-19-0918

Dear Commissioners,

I support the Monterey Water Supply Project to create a desalination plant as a clean, sustainable solution to the water supply crisis in the Monterey Peninsula.

This desalination project is the only viable option to supply our community with a long-term sustainable water source that is capable of supporting

affordable housing, economic recovery and restoring the Carmel River and the Seaside basin.

The Monterey Peninsula is a leader in conservation, and for 25 years has been working with federal, state and local agencies to develop an alternate water supply for our community. It is imperative that the water supply needs of the Monterey Peninsula and the environmental issues facing the Carmel River are resolved as quickly as possible.

Please support this desalination project to ensure our water future. Thank you for your consideration.

Sincerely,

Nikki Kendall

Comment in Support of the Monterey Peninsula Water Supply Project Case Number: 9-19-0918

Dear Commissioners,

I support the Monterey Water Supply Project to create a desalination plant as a clean, sustainable solution to the water supply crisis in the Monterey Peninsula.

This desalination project is the only viable option to supply our community with a long-term sustainable water source that is capable of supporting

affordable housing, economic recovery and restoring the Carmel River and the Seaside basin.

The Monterey Peninsula is a leader in conservation, and for 25 years has been working with federal, state and local agencies to develop an alternate water supply for our community. It is imperative that the water supply needs of the Monterey Peninsula and the environmental issues facing the Carmel River are resolved as quickly as possible.

Please support this desalination project to ensure our water future. Thank you for your consideration.

Sincerely,

mark mahaney
