Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like "Regenerative" and "carbon farming" techniques.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
David Boyer

**Date:** Tuesday, March 29, 2022 2:33:11 PM

---

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

There has been much talk in the animal ag industry lately about "carbon farming" and "sustainable" or "regenerative ranching." The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a "solution" to the real negative impacts caused by factory farms, and even so-called "family farms," when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don't be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Nicole BONGIOVANNI-Lewis

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

US Methane emissions from livestock and natural gas are nearly equal.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Alan Kiviat

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

Cows produce 150 billion gallons of methane per day.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Kelly Henderson

**Date:** Tuesday, March 29, 2022 2:25:13 PM

---

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extend and expand the destructive cattle operations in PRNS.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Julija Merljak

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
thalia lubin

**Date:** Tuesday, March 29, 2022 2:23:24 PM

---

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Amy McManus

---

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like “Regenerative” and “carbon farming” techniques.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS’ plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS’ plan.

Sincerely,  
Glenn Hufnagel

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Glenn Hufnagel

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Jacqueline Wolfe

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Richard Kite

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

The United Nations states, “The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures.” During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

**Date:** Tuesday, March 29, 2022 1:57:15 PM

---

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
josh loria  
[joshloria@gmail.com](mailto:joshloria@gmail.com)

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

**Date:** Tuesday, March 29, 2022 1:32:07 PM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Krin Asselta

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

There has been much talk in the animal ag industry lately about “carbon farming” and “sustainable” or “regenerative ranching.” The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a “solution” to the real negative impacts caused by factory farms, and even so-called “family farms,” when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don't be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

**Date:** Tuesday, March 29, 2022 1:25:35 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Cynthia Powell

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johnes disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Kathie Kingett

---

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Camilo Echavarria Uribe

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Ann Tagawa

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Barbara Hanson

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Carol Leuenberger

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Carol Leuenberger

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extends and expands the destructive cattle operations in PRNS.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

Please protect the native tule elk from being culled in our National Seashore.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Sincerely,  
Norma Wallace

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS’ own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Ken Martin

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Valerie Coshnear

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Jeff Thayer

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest "the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available." And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,

**Date:** Tuesday, March 29, 2022 12:34:53 PM

---

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as "regenerative ranching," "carbon farming," etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Melvin D. Cheitlin

**Date:** Tuesday, March 29, 2022 12:33:24 PM

---

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Freddy Rohlen

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
ilene gudelsky

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

Kindly act in the best interest of the public good.

Sincerely,  
Elisa Townshend

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

I am offended by the idea that native tule elk must be “culled” because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Lisa Salazar

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Sandy Kavoyianni

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

The Voeller paper (2021) states 'fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.' The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

Please protect the native tule elk from being culled in our National Seashore.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Lori Beth Kidd

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Barbara Kuecker

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Dairy farms and cattle ranching don’t belong in a national park. They contribute to climate change. Don’t be fooled by false “greenwashing” claims, about “regenerative grazing” or “carbon farming.” Those concepts are promoted by big money interests, but their overly optimistic claims aren’t published in referenced journals.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS’s extensive past history, the Commission can expect more of the same. It’s important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,

**Date:** Tuesday, March 29, 2022 11:48:11 AM

---

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Elizabeth Scherbak

**Date:** Tuesday, March 29, 2022 11:40:54 AM

---

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Astrid van der Geest

**Date:** Tuesday, March 29, 2022 11:39:24 AM

---

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,

**From:** [Silvana Borrelli](#)

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 11:38:05 AM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Silvana Borrelli

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8’ fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS’ plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS’ plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Kenneth Lapointe

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
ADRIANA TRASNEA

**Date:** Tuesday, March 29, 2022 11:28:12 AM

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Andrea Rohr

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Carolyn Borg

**From:** [Lorenz Steininger](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 11:27:15 AM

---

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Lorenz Steininger

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (*Enterococcus* is another large genus of bacteria)."

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Jennifer Schally

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

US Methane emissions from livestock and natural gas are nearly equal.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Suehan Estrada

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Judith S Anderson

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Victor Carmichael

**Date:** Tuesday, March 29, 2022 11:07:35 AM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Takeo Tabuchi

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Merz Peggy

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary. and caution that these approaches are greenwashing attempts, like "Clean Coal."

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let's use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS' Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
Keli Hendricks

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO<sub>2</sub>/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO<sub>2</sub>/year in PRNS is to remove all cattle ranching from these public lands.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Elisa kleven

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, “The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention.” This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Sheri Cardo

**Date:** Tuesday, March 29, 2022 10:50:21 AM

---

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Marce Walsh

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

**Date:** Tuesday, March 29, 2022 10:42:28 AM

---

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive “methane digesters” have limited effectiveness, and only mitigate a problem which shouldn’t even exist at a national park.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Sheila Ward

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Diana Duffy

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.’s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of “Clean Coal.” I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let’s restore our National Seashore

Sincerely,

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Holly Rose

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Anthony Donnici

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Sincerely,  
Michael Ballin

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don’t resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn’t enable natural composting, and results in water pollution.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

I am offended by the idea that native tule elk must be “culled” because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

The impacts of ranching in PRNS is well documented in the NPS’ own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
s.smith

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
cara lou wicks

**Date:** Tuesday, March 29, 2022 10:05:10 AM

---

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest "the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available." And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
amy trusso

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
dorothy blake

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (Enterococcus is another large genus of bacteria)."

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Silvia Bertano

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of “greenwashing” by vested agricultural interests with buzz words like “regenerative” or “carbon” farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like “Clean Coal.”

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Kate Llewellyn

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Tracey Kleber

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Louis Rhodes  
an\_doc@yahoo.com [your location will go here]

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Jon Charles Falk

**From:** [Judy Moran](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 9:28:08 AM

---

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Judy Moran

---

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

Please protect the native tule elk from being culled in our National Seashore.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
LESLIE Krygier

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

US Methane emissions from livestock and natural gas are nearly equal.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Sincerely,  
Parrie Henderson

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Annette Varady

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

I urge the Commission to not support the NPS’ plan to cull native Tule elk in PRNS.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Laetitia Amadei

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Tracey Mangus

**Date:** Tuesday, March 29, 2022 9:05:10 AM

---

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Roy Falk

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (*E. coli*) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded *E. coli* limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (*Enterococcus* is another large genus of bacteria)."

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

Cows produce 150 billion gallons of methane per day.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Ragen Serra

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on "best management practices", but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
T Sherrill

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

Please protect the native tule elk from being culled in our National Seashore.

Kindly act in the best interest of the public good.

Sincerely,  
Don Faia  
[dfaia@cruzio.com](mailto:dfaia@cruzio.com) [your location will go here]

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures." During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,

**Date:** Tuesday, March 29, 2022 8:45:10 AM

---

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

The Voeller paper (2021) states 'fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.' The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures." During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let's use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS' Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
Brent Durand

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Quida Jacobs

**Date:** Tuesday, March 29, 2022 8:29:18 AM

---

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher’s plan.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Joseph Vincent

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
M Rute Correia

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 8:25:07 AM

---

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
PAMELA LICHTENWALNER

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

Because of livestock at PRNS, the free roaming tule elk have been infected with Johnes's disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

There has been much talk in the animal ag industry lately about “carbon farming” and “sustainable” or “regenerative ranching.” The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a “solution” to the real negative impacts caused by factory farms, and even so-called “family farms,” when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don't be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Heidi ahlstrand

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Denise Frullo

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Sincerely,  
Tanya Glasser

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Amy Cyr

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Vic Bostock

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Jamie Johnson

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

**Date:** Tuesday, March 29, 2022 7:47:06 AM

---

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

It’s disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future “potential” water quality improvements. This “see no evil” attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore’s GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an ‘off-set’.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS’ plan. The impacts of ranching in PRNS is well documented in the NPS’ own EIS - ranching must end in PRNS.

Sincerely,  
Scott Webb

**Date:** Tuesday, March 29, 2022 7:43:10 AM

---

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johnne's disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Maggie Kalabakas

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extend and expand the destructive cattle operations in PRNS.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Veronica Bourassa

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Noble Woodward

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

US Methane emissions from livestock and natural gas are nearly equal.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Roxanne Christie

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels of E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact on marine life in the ocean.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

---

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

Because of livestock at PRNS, the free roaming tule elk have been infected with John's disease, and therefore can't be relocated.  
Commercial operations that harm wildlife do not belong in a public park.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
gina sanfilippo

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Michael Weaver

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don’t resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn’t enable natural composting, and results in water pollution.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Cheryl Reynolds

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Kathy Mason  
kmason633@yahoo.com [your location will go here]

**Date:** Tuesday, March 29, 2022 7:21:18 AM

---

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest "the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available." And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Barb Tokunaga

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Kathleen Mireault

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures." During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Charles SMITH

**Date:** Tuesday, March 29, 2022 7:16:15 AM

---

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Tiffany Nicol

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Sincerely,  
Deborah Perry

**Date:** Tuesday, March 29, 2022 7:08:20 AM

---

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement “best practices,” water quality at PRNS remains poor.

Assuming the NPS’ strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg “The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock “does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate.” The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS’ strategy.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Jessica Heiden

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Anne Barker

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 7:05:12 AM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Adriana Nunez

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Mari Elvi

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like "Regenerative" and "carbon farming" techniques.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

---

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

US Methane emissions from livestock and natural gas are nearly equal.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Shari Iacone

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

Please protect the native tule elk from being culled in our National Seashore.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Rhonda Johnson

**Date:** Tuesday, March 29, 2022 6:58:16 AM

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher's plan.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Susan M Ponchot

**Date:** Tuesday, March 29, 2022 6:58:12 AM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Jean Riehl

**Date:** Tuesday, March 29, 2022 6:56:06 AM

---

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
kathy beeney  
kat\_beeney@yahoo.com [your location will go here]

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Michael White

**Date:** Tuesday, March 29, 2022 6:52:11 AM

---

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 6:52:05 AM

---

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive “methane digesters” have limited effectiveness, and only mitigate a problem which shouldn’t even exist at a national park.

The NPS’ plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public’s vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don’t miss this opportunity. Do what’s right and rescind Consistency Determination CD-0006-20. I thank you.

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Steve Overton

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO<sub>2</sub>/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO<sub>2</sub>/year in PRNS is to remove all cattle ranching from these public lands.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Kay Tsenin

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The NPS’ plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Mark Klugiewicz

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Charles Hammock

**Date:** Tuesday, March 29, 2022 6:28:13 AM

---

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Justin KREISER

---

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Brittney Hammock

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
KELLY KREISER

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Claude Robert

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Tammy King

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johnes disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Jane Broendel

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

Please protect the native tule elk from being culled in our National Seashore.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn’t just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn’t remove the cows from Pt. Reyes.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The CCC’s mission is to protect and enhance the California coast. It reads “The Commission is committed to protecting and enhancing California’s coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination.”

Per the CCC’s mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

**Date:** Tuesday, March 29, 2022 6:11:08 AM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Sonia Romero Villanueva

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Eric Wollscheid  
ewoll8@hotmail.com [your location will go here]

**Date:** Tuesday, March 29, 2022 6:09:20 AM

---

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

Due to the NPS’ plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS’ plan (CD-0006-02).

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS’ plan and help us save our Seashore.

Sincerely,  
Christina Lee

**Date:** Tuesday, March 29, 2022 6:09:12 AM

---

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

The United Nations states, “The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures.” During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Melissa Gaskins  
gaskinshockey@gmail.com [your location will go here]

**Date:** Tuesday, March 29, 2022 6:09:09 AM

---

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Jennifer Parks

**Date:** Tuesday, March 29, 2022 6:05:13 AM

---

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

Because of livestock at PRNS, the free roaming tule elk have been infected with John's disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Richard Johnson

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Rickey Buttery

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,

**Date:** Tuesday, March 29, 2022 5:58:07 AM

---

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

Kindly act in the best interest of the public good.

Sincerely,  
Sarah Hamilton  
bigguy287@twcnr.com [your location will go here]

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 5:57:09 AM

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Martha Burton

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures." During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Rickey Buttery

**Date:** Tuesday, March 29, 2022 5:55:11 AM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Nikki Wojtalik

**Date:** Tuesday, March 29, 2022 5:54:09 AM

---

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

US Methane emissions from livestock and natural gas are nearly equal.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Bettina Lorenz

**Date:** Tuesday, March 29, 2022 5:54:08 AM

---

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Francesca Bortoli

---

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures."  
During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Steve S

**Date:** Tuesday, March 29, 2022 5:49:10 AM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
RICHARD BAKER

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO<sub>2</sub>) per year, or 51% of all worldwide greenhouse gas emissions.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Suzanne Butler

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

Cows produce 150 billion gallons of methane per day.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Sylvana Arguello

**Date:** Tuesday, March 29, 2022 5:20:11 AM

---

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Alexandria Hendrix

**Date:** Tuesday, March 29, 2022 5:20:10 AM

---

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

Please protect the native tule elk from being culled in our National Seashore.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Deborah Dahlgren

**Date:** Tuesday, March 29, 2022 5:16:07 AM

---

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Maria Rua

**Date:** Tuesday, March 29, 2022 5:05:12 AM

---

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

I am offended by the idea that native tule elk must be “culled” because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Adam DOnofrio

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Lorri Sawyer

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Vasileios Grigoriou

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8’ fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS’ plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS’ plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS’ plan and help us save our Seashore.

Sincerely,  
Yee Yean Lim

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
francis mastri

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extend and expand the destructive cattle operations in PRNS.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Russelle Morrison

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

I urge the Commission to not support the NPS’ plan to cull native Tule elk in PRNS.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Michael Rynes

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

The NPS noted in their March 4, 2022 letter – "At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals." This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Lisa Collon

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

Due to the NPS’ plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS’ plan (CD-0006-02).

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let’s restore our National Seashore

Sincerely,  
Elizabeth Casanova

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called “carbon farms”?

The NPS’ plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS’ plan.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Phillippa Hilsden

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Carolyn Marion

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement "best practices," water quality at PRNS remains poor.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

US Methane emissions from livestock and natural gas are nearly equal.

Because of livestock at PRNS, the free roaming tule elk have been infected with John's disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let's use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS' Plan B as it is not consistent with the Coastal policies in California

Sincerely,

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

Voeller, et. al, “Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations” argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don’t work in the rain noting: “Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events.” He suggests smoothing the data to examine overall declines. Unfortunately, one can’t simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

US Methane emissions from livestock and natural gas are nearly equal.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
ahmed Hadidi

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as "regenerative ranching," "carbon farming," etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

Kindly act in the best interest of the public good.

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated "The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels..." (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Peggy Powell Morgan

---

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.’s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of “Clean Coal.” I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Marina Sagardua

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

I am offended by the idea that native tule elk must be "culled" because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Arifa Isabel

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO<sub>2</sub>/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO<sub>2</sub>/year in PRNS is to remove all cattle ranching from these public lands.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Krisanne Baker

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest "the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available." And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Mitzi Frank

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

Please protect the native tule elk from being culled in our National Seashore.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Mark Hirshfeld

---

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Mitzi Frank

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 2:56:09 AM

---

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Lisa Koehl

**Date:** Tuesday, March 29, 2022 2:53:07 AM

---

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Diane Eisenhower

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Sarah Gould

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 2:45:09 AM

---

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Joseph Quirk  
jqurk66@gmail.com [your location will go here]

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Rayline Dean  
RaylineDean@gmail.com [your location will go here]

**Date:** Tuesday, March 29, 2022 2:42:10 AM

---

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8’ fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS’ plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS’ plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Gustavo Gomes

---

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term ‘clean coal’ used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let’s restore our National Seashore

**Date:** Tuesday, March 29, 2022 2:03:09 AM

---

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Eunice Sousa

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 1:53:07 AM

---

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

Kindly act in the best interest of the public good.

Sincerely,  
Vivienne Ben-Shir

**Date:** Tuesday, March 29, 2022 1:52:06 AM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of “regenerative ranching” or “carbon farming” cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
carol-alida pennington

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Michaela Reisser

**Date:** Tuesday, March 29, 2022 1:29:07 AM

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Olimpia Storoni

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

I am offended by the idea that native tule elk must be "culled" because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Kerstin Selhausen

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Steve Vicuna

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
maurizia burlando

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 1:21:07 AM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

Kindly act in the best interest of the public good.

Sincerely,  
Sija Sur  
sija1810@gmail.com [your location will go here]

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Cynthia Lewis

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures." During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher's plan.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Sincerely,  
robert micth

**Date:** Tuesday, March 29, 2022 1:09:06 AM

---

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
David Brodnax

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

**Date:** Tuesday, March 29, 2022 12:47:17 AM

---

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
MariaGrazia Sanguin  
p168@libero.it [your location will go here]

Dear California Coastal Commission ,

The overall health of our National Park and the Pacific coastline is far more important than a handful of cattle ranching tenants making money off of public lands while impacting our landscape, our waterways, our native wildlife. I urge the Commission to revoke your conditional approval of the National Park Service's CD-0006-02.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
caroline themm  
ninacw@aol.vom [your location will go here]

Dear California Coastal Commission ,

The overall health of our National Park and the Pacific coastline is far more important than a handful of cattle ranching tenants making money off of public lands while impacting our landscape, our waterways, our native wildlife. I urge the Commission to revoke your conditional approval of the National Park Service's CD-0006-02.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

US Methane emissions from livestock and natural gas are nearly equal.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Carrie Bezler

**Date:** Tuesday, March 29, 2022 12:46:08 AM

---

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
The Rev Dr Edward Kern

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
Ken Wu

---

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

Because of livestock at PRNS, the free roaming tule elk have been infected with Johne's disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Thomas Talbot

---

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Thomas Talbot

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS’ plan (CD-0006-02)

Sincerely,

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
serena ruffilli

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Cows produce 150 billion gallons of methane per day.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Debra Cameron

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The letter from the NPS to the Commission said, “Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions.” Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

Cows produce 150 billion gallons of methane per day.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

The impacts of ranching in PRNS is well documented in the NPS’ own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Elisabeth Bechmann

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of "best management practices" (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park's waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Tuesday, March 29, 2022 12:13:07 AM

---

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
lois harris  
msclois@aol.com [your location will go here]

**Date:** Tuesday, March 29, 2022 12:10:08 AM

---

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

Kindly act in the best interest of the public good.

Sincerely,  
Jeff Hoffman

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Dan O'Toole

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary. and caution that these approaches are greenwashing attempts, like "Clean Coal."

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Javier Tavora

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Jim Chisholm

**Date:** Monday, March 28, 2022 11:52:06 PM

---

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Amy Harlib

**Date:** Monday, March 28, 2022 11:42:09 PM

---

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Mrs. Frankie Harris

**Date:** Monday, March 28, 2022 11:42:08 PM

---

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures." During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Ira Gerard-DiBenedetto  
iragerard@hotmail.com [your location will go here]

**Date:** Monday, March 28, 2022 11:41:06 PM

---

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
cara artman

**Date:** Monday, March 28, 2022 11:38:07 PM

---

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Bea Prinz

**Date:** Monday, March 28, 2022 11:36:07 PM

---

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Chris Dennis

**Date:** Monday, March 28, 2022 11:33:09 PM

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

**Date:** Monday, March 28, 2022 11:33:06 PM

---

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on "best management practices", but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Jennifer Kopczynski  
adivachanna@aol.com [your location will go here]

**Date:** Monday, March 28, 2022 11:30:13 PM

---

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Thomas Scott

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of “greenwashing” by vested agricultural interests with buzz words like “regenerative” or “carbon” farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary.and caution that these approaches are greenwashing attempts, like “Clean Coal.”

Due to the NPS’ plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS’ plan (CD-0006-02).

The NPS is being sued because the NPS’ Plan is violating the NPS’ own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS’ plan inconsistent with the Coastal Act.

Sincerely,  
Susan Delles

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

**Date:** Monday, March 28, 2022 11:11:05 PM

---

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Candace LaPorte

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

Cows produce 150 billion gallons of methane per day.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Jason Fish

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

Please provide our native Tule Elk from the NPS’ and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC’s efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission’s CD requirements, the issue of NPS reliability still justifies the CCC’s withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Myriam Martinez

---

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Meg Paton

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

US Methane emissions from livestock and natural gas are nearly equal.

Please protect the native tule elk from being culled in our National Seashore.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Kaayla Roth

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Meg Paton  
spay\_your\_pet@yahoo.com [your location will go here]

**Date:** Monday, March 28, 2022 10:44:08 PM

---

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Cathy 2813984883

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Teseo Staffilani

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS’ purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California’s endemic Tule elk.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Ken Wilson

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Jörg Gaiser

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Fredrik Larsson

**Date:** Monday, March 28, 2022 10:29:08 PM

---

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

Please protect the native tule elk from being culled in our National Seashore.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Jennifer Kelly

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

The letter from the NPS to the Commission said, “Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions.” Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement "best practices," water quality at PRNS remains poor.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as "regenerative ranching," "carbon farming," etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Joan Wager

---

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (*Enterococcus* is another large genus of bacteria)."

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest "the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available." And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

I hope that the CCC will do whatever it can to remedy the situation.

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
SIGRID RAMOS

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Sincerely,  
Molly Huddleston

**Date:** Monday, March 28, 2022 10:12:06 PM

---

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

The letter from the NPS to the Commission said, “Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions.” Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it’s time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It’s past time for the cows to be removed from the seashore.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne’s disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS’s extensive past history, the Commission can expect more of the same. It’s important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Leslie Burpo

**Date:** Monday, March 28, 2022 10:08:08 PM

---

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS’ plan, as it is time to end these unnecessary impacts.

Sincerely,  
Annette Vargas

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Daniel Brower

---

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Mercedes Benet

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Joan Keijer  
[joankeijer@yahoo.com](mailto:joankeijer@yahoo.com) [your location will go here]

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures." During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The NPS noted in their March 4, 2022 letter – "At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals." This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
John Malloy

---

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Lois nottingham

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Nina Gondos

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Ibrahim rexhepi

**Date:** Monday, March 28, 2022 9:56:08 PM

---

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Nathalie Guyonvarch

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement “best practices,” water quality at PRNS remains poor.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of “greenwashing” by vested agricultural interests with buzz words like “regenerative” or “carbon” farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary. and caution that these approaches are greenwashing attempts, like “Clean Coal.”

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Dee Green

---

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Enid Cardinal

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Michelle Krueger

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Kostas Korovilas

---

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS’ purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California’s endemic Tule elk.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Elaine Fischer

**Date:** Monday, March 28, 2022 9:41:08 PM

---

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Emily Willoughby

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause of the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Elaine Becker

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 9:37:05 PM

---

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated "The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels..." (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johne's disease, and therefore can't be relocated.  
Commercial operations that harm wildlife do not belong in a public park.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
John Doucette

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Gayle Janzen

---

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

The NPS noted in their March 4, 2022 letter – "At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals." This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Debra Rehn

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Candy Bowman

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Edie Bruce

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Dianne Matheny

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Joan Milford

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Cara Barnhill

**Date:** Monday, March 28, 2022 9:18:12 PM

---

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

Because of livestock at PRNS, the free roaming tule elk have been infected with John's disease, and therefore can't be relocated.  
Commercial operations that harm wildlife do not belong in a public park.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
Jill Kennedy

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Rub Good

**Date:** Monday, March 28, 2022 9:17:09 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

Voeller, et. al, “Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations” argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don’t work in the rain noting: “Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events.” He suggests smoothing the data to examine overall declines. Unfortunately, one can’t simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

The NPS is being sued because the NPS’ Plan is violating the NPS’ own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS’ plan inconsistent with the Coastal Act.

Sincerely,  
Dede Dresser

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Katha Kerr  
[kathakerr@telus.net](mailto:kathakerr@telus.net) [your location will go here]

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Angela Gantos

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore’s GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an ‘off-set’.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS’ plan

Sincerely,

**Date:** Monday, March 28, 2022 9:12:12 PM

---

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Zoe Harris

**Date:** Monday, March 28, 2022 9:12:06 PM

---

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

US Methane emissions from livestock and natural gas are nearly equal.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Suzanne Becket

---

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of “regenerative grazing” (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Beti Webb Trauth

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

No amount of “best practices” will ever stop beef and dairy operations from being a villain in the struggle against climate change.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Michelle Hayward

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Jim Wilson

**Date:** Monday, March 28, 2022 8:59:06 PM

---

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures."  
During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Marcia Flannery

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement “best practices,” water quality at PRNS remains poor.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS’ plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extend and expand the destructive cattle operations in PRNS.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Margo Lovejoy

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Stephen Donnelly

**Date:** Monday, March 28, 2022 8:47:06 PM

---

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Lynette McLamb

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are "technically or financially infeasible" and "in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS"

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Davis Everett

---

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Kaatje Adams

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 8:40:09 PM

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures."  
During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Jennifer Schmitz

**Date:** Monday, March 28, 2022 8:38:11 PM

---

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as "regenerative ranching," "carbon farming," etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Linda Carroll

---

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called “carbon farms”?

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Jimmie Lunsford

**Date:** Monday, March 28, 2022 8:37:08 PM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne’s disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Victor Escobar

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Russell Weisz

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Liana Lang

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Patricia Purdy

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Candice Johnson

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (Enterococcus is another large genus of bacteria)."

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

---

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Lexie Cataldo

---

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,

**Date:** Monday, March 28, 2022 8:27:24 PM

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures."  
During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

Because of livestock at PRNS, the free roaming tule elk have been infected with John's disease, and therefore can't be relocated.  
Commercial operations that harm wildlife do not belong in a public park.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Charlie Burns

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

Kindly act in the best interest of the public good.

Sincerely,  
kajsa engelsson

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn’t just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn’t remove the cows from Pt. Reyes.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Jon Anderholm  
xunbio@hotmail.com [your location will go here]

**Date:** Monday, March 28, 2022 8:27:11 PM

---

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

Kindly act in the best interest of the public good.

Sincerely,  
Jon Anderholm

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

No amount of “best practices” will ever stop beef and dairy operations from being a villain in the struggle against climate change.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Sincerely,  
janet oconnor

**Date:** Monday, March 28, 2022 8:25:10 PM

---

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

There has been much talk in the animal ag industry lately about "carbon farming" and "sustainable" or "regenerative ranching." The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a "solution" to the real negative impacts caused by factory farms, and even so-called "family farms," when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don't be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher's plan.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to

the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Matt Maguire

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Harriet McCleary

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Elaine Woodruff

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
David Burtis

**Date:** Monday, March 28, 2022 8:21:07 PM

---

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extend and expand the destructive cattle operations in PRNS.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Louise Butler

**Date:** Monday, March 28, 2022 8:18:14 PM

---

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS’ own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johnne's disease, and therefore can't be relocated.  
Commercial operations that harm wildlife do not belong in a public park.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS’ plan and help us save our Seashore.

Sincerely,  
Denise Brennan

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Joyce Grajczyk

---

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

Kindly act in the best interest of the public good.

Sincerely,  
Debbie Friesen

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Nina Monasevitch

**Date:** Monday, March 28, 2022 8:14:07 PM

---

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Joanna Martin

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive “methane digesters” have limited effectiveness, and only mitigate a problem which shouldn’t even exist at a national park.

The NPS’ plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS’ plan.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS’ plan and help us save our Seashore.

Sincerely,

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 8:11:06 PM

---

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians. It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let's use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS' Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
Jennifer Scott

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Leslie Richardson

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
regula hess

**Date:** Monday, March 28, 2022 8:07:08 PM

---

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
John Hoffman

**Date:** Monday, March 28, 2022 8:06:17 PM

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Christina Viljoen  
viljo3059@gmail.com [your location will go here]

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

Please protect the native tule elk from being culled in our National Seashore.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
linda petrulias

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Amber Gill

**Date:** Monday, March 28, 2022 8:05:09 PM

---

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Pamela Green

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

Cows produce 150 billion gallons of methane per day.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Peter Kahigian  
p\_kahigian@hotmail.com [your location will go here]

**Date:** Monday, March 28, 2022 8:02:07 PM

---

Dear California Coastal Commission ,

The overall health of our National Park and the Pacific coastline is far more important than a handful of cattle ranching tenants making money off of public lands while impacting our landscape, our waterways, our native wildlife. I urge the Commission to revoke your conditional approval of the National Park Service's CD-0006-02.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Francesca Reitano  
[freitano@gmail.com](mailto:freitano@gmail.com) [your location will go here]

**Date:** Monday, March 28, 2022 8:01:12 PM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Gwen Nolte

**Date:** Monday, March 28, 2022 7:58:11 PM

---

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
George Craciun

---

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Jamie Fairchild

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS’ plan (CD-0006-02 ).

Sincerely,  
Lynn Wilbur

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

The letter from the NPS to the Commission said, “Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions.” Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let’s restore our National Seashore

Sincerely,  
Stephanie Kob

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Katherine Hinson

Dear California Coastal Commission ,

The overall health of our National Park and the Pacific coastline is far more important than a handful of cattle ranching tenants making money off of public lands while impacting our landscape, our waterways, our native wildlife. I urge the Commission to revoke your conditional approval of the National Park Service's CD-0006-02.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Donna Gensler

---

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Scott Species

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let's use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS' Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
robert dowling

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated "The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels..." (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
robert dowling

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Rudy Zeller

Dear California Coastal Commission ,

The overall health of our National Park and the Pacific coastline is far more important than a handful of cattle ranching tenants making money off of public lands while impacting our landscape, our waterways, our native wildlife. I urge the Commission to revoke your conditional approval of the National Park Service's CD-0006-02.

The Voeller paper (2021) states 'fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.' The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO<sub>2</sub>/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO<sub>2</sub>/year in PRNS is to remove all cattle ranching from these public lands.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Maureen O'Neal

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Freddy Rohlen

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
Carl Oerke Jr

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

Assuming the NPS’ strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg “The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock “does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate.” The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS’ strategy.

I am offended by the idea that native tule elk must be “culled” because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Diane Gentile

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Frances Dunham

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of "best management practices" (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park's waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as "regenerative ranching," "carbon farming," etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Gina LoBiondo

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

California’s highest E.Coli level was recorded on a Point Reyes ranch. Park service’s 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johne's disease, and therefore can't be relocated.  
Commercial operations that harm wildlife do not belong in a public park.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Cinzia B.  
picchina@ymail.com [your location will go here]

**Date:** Monday, March 28, 2022 7:28:20 PM

---

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called “carbon farms”?

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC’s requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS’s General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Krista Dana

---

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive “methane digesters” have limited effectiveness, and only mitigate a problem which shouldn’t even exist at a national park.

Due to the NPS’ plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS’ plan (CD-0006-02).

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Reesa St George

**Date:** Monday, March 28, 2022 7:27:07 PM

---

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Kim O'Connor

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Malva McIntosh

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called “carbon farms”?

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS’ plan.

Sincerely,  
Jenna Fallaw

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Clau Pen

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

US Methane emissions from livestock and natural gas are nearly equal.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Linda Bellavia

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Cindy Page  
clpage235@gmail.com [your location will go here]

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Sarah Lincoln

**Date:** Monday, March 28, 2022 7:19:08 PM

---

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (*Enterococcus* is another large genus of bacteria)."

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures." During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Deborah Mastrandrea

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

There has been much talk in the animal ag industry lately about “carbon farming” and “sustainable” or “regenerative ranching.” The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a “solution” to the real negative impacts caused by factory farms, and even so-called “family farms,” when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don’t be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

Kindly act in the best interest of the public good.

Sincerely,  
Paul Kalka

**Date:** Monday, March 28, 2022 7:15:11 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Jan Jones

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Yazmin Gonzalez

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called “carbon farms”?

Please withdraw your conditional approval of the NPS’ plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Raymond Arent

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Linda E Peveto

Dear California Coastal Commission ,

The overall health of our National Park and the Pacific coastline is far more important than a handful of cattle ranching tenants making money off of public lands while impacting our landscape, our waterways, our native wildlife. I urge the Commission to revoke your conditional approval of the National Park Service's CD-0006-02.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on "best management practices", but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Kayla Stephens

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Margaret Ribeiro

Dear California Coastal Commission ,

The overall health of our National Park and the Pacific coastline is far more important than a handful of cattle ranching tenants making money off of public lands while impacting our landscape, our waterways, our native wildlife. I urge the Commission to revoke your conditional approval of the National Park Service's CD-0006-02.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Lauren Murdock

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Sarah Kimber

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Dana A Shields

**Date:** Monday, March 28, 2022 7:04:06 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

US Methane emissions from livestock and natural gas are nearly equal.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Mark Feldman

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Dana A Shields  
[danashields@mac.com](mailto:danashields@mac.com) [your location will go here]

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (Enterococcus is another large genus of bacteria)."

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like "Regenerative" and "carbon farming" techniques.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,

**From:** [Abigail Howes](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Karin Rettig

**Date:** Monday, March 28, 2022 6:58:24 PM

---

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Carol Stevens

**Date:** Monday, March 28, 2022 6:58:15 PM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Susan Heath

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Nancy McMahon

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

Please protect the native tule elk from being culled in our National Seashore.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Noreen Lassandrello

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Evelyn Coltman

**Date:** Monday, March 28, 2022 6:56:11 PM

---

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Dr. Theresa Scherf

**Date:** Monday, March 28, 2022 6:55:08 PM

---

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
C M

**Date:** Monday, March 28, 2022 6:53:09 PM

---

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Susan Foley  
susietwin001@aol.com [your location will go here]

**Date:** Monday, March 28, 2022 6:52:06 PM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Shakayla Thomas

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 6:49:14 PM

---

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Karen Anderson

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
James Stanton

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
K Krupinski

**Date:** Monday, March 28, 2022 6:47:07 PM

---

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Radhika Srinivasan

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
jesse williams

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johnes disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Crystal Rector

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary. and caution that these approaches are greenwashing attempts, like "Clean Coal."

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Ellen Franzen

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extend and expand the destructive cattle operations in PRNS.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Carol Chappell  
ccngbrazil@hughes.net [your location will go here]

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

US Methane emissions from livestock and natural gas are nearly equal.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS’ plan.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public’s vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don’t miss this opportunity. Do what’s right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Lisa Kipen-Hershenson

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO<sub>2</sub>/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO<sub>2</sub>/year in PRNS is to remove all cattle ranching from these public lands.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Bobbi Lempert

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Sincerely,  
Barbara Whyman

---

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS’ plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

Kindly act in the best interest of the public good.

Sincerely,  
renee vesely

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Maureen Porcelli

---

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Maureen Porcelli  
[am.curious.sometimes@gmail.com](mailto:am.curious.sometimes@gmail.com) [your location will go here]

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Saran K.  
sarank@mac.com [your location will go here]

**Date:** Monday, March 28, 2022 6:34:12 PM

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Francie Salle  
fgsalle@gmail.com [your location will go here]

**From:** [Shani Schulman](#)

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 6:33:11 PM

---

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of “greenwashing” by vested agricultural interests with buzz words like “regenerative” or “carbon” farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like “Clean Coal.”

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Shani Schulman  
HvnlyAngel777@hotmail.com [your location will go here]

**From:** [Michelle Palladine](#)

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 6:32:12 PM

---

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Michelle Palladine

**Date:** Monday, March 28, 2022 6:30:30 PM

---

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
A. Mervyn & Marilyn Carse

**Date:** Monday, March 28, 2022 6:30:21 PM

---

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher's plan.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Patricia Browne

**From:** [JEDD PARKER](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 6:30:20 PM

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
JEDD PARKER

**Date:** Monday, March 28, 2022 6:29:21 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher's plan.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,

---

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

No amount of “best practices” will ever stop beef and dairy operations from being a villain in the struggle against climate change.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
c abbot

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Sincerely,  
Derek Gendvil

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

The Park Service’s own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there’s not much else that can be gained beyond what’s been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Pat Copenhaver

**Date:** Monday, March 28, 2022 6:27:08 PM

---

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on "best management practices", but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures." During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Pat Copenhaver

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Leo Kucewicz

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO<sub>2</sub>) per year, or 51% of all worldwide greenhouse gas emissions.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Margaret Silver

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
James Gifford

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are "technically or financially infeasible" and "in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS"

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary.and caution that these approaches are greenwashing attempts, like "Clean Coal."

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Ron Silver  
rhinopias@comcast.net [your location will go here]

**Date:** Monday, March 28, 2022 6:17:13 PM

---

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
Waltraud Buckland

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Jan Bird

Dear California Coastal Commission ,

The overall health of our National Park and the Pacific coastline is far more important than a handful of cattle ranching tenants making money off of public lands while impacting our landscape, our waterways, our native wildlife. I urge the Commission to revoke your conditional approval of the National Park Service's CD-0006-02.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public’s vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don’t miss this opportunity. Do what’s right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
KENDRA WILSON

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. “Carbon farms” are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a ‘management threshold.’ Please note there is no science behind the NPS’ number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS’ and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS’ plan, and find the plan not consistent.

Sincerely,  
Kellie Smith

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 6:14:08 PM

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

Kindly act in the best interest of the public good.

Sincerely,  
Shelley Cerasaro

**Date:** Monday, March 28, 2022 6:11:15 PM

---

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Carly Clements Owens

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO<sub>2</sub>) per year, or 51% of all worldwide greenhouse gas emissions.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Paula Morgan

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like "Regenerative" and "carbon farming" techniques.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
John Burridge

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Tarzan Mangili

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
joyce kolasa

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
James Cronin

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
David Sawcer

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

I am offended by the idea that native tule elk must be “culled” because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS’ plan.

Sincerely,  
Diane Marcotte

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Steve Aydelott

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 6:07:06 PM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of "best management practices" (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park's waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Kay Fife

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Carol Sears

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 6:05:11 PM

---

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Sincerely,  
Laura D.

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

The NPS noted in their March 4, 2022 letter – "At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals." This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Mason Griffith  
magbaron@msn.com [your location will go here]

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Margaret Walden

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest "the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available." And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

Please protect the native tule elk from being culled in our National Seashore.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,

**Date:** Monday, March 28, 2022 6:03:13 PM

---

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher's plan.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Sincerely,  
Barbara Becker

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of "best management practices" (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park's waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
roth woods

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johnes disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Chris Guillory

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

The United Nations states, “The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures.” During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC’s efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission’s CD requirements, the issue of NPS reliability still justifies the CCC’s withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Sandra Holland

**Date:** Monday, March 28, 2022 5:58:07 PM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Heather Cross

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Chris Bowman

**Date:** Monday, March 28, 2022 5:57:08 PM

---

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

There has been much talk in the animal ag industry lately about "carbon farming" and "sustainable" or "regenerative ranching." The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a "solution" to the real negative impacts caused by factory farms, and even so-called "family farms," when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don't be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

**From:** [Teri Sigler](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 5:55:14 PM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Teri Sigler

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Soumya Naidu

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Mackenzie Evans

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Ruth Boice  
rlboice2@yahoo.com [your location will go here]

**Date:** Monday, March 28, 2022 5:53:12 PM

---

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Nandita Shah

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The Voeller paper (2021) states 'fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.' The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher's plan.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
christine wisniewski  
c.wish@att.net [your location will go here]

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

The Voeller paper (2021) states 'fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.' The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

There has been much talk in the animal ag industry lately about "carbon farming" and "sustainable" or "regenerative ranching." The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a "solution" to the real negative impacts caused by factory farms, and even so-called "family farms," when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don't be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
audrey chun

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Pamela Wood

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The letter from the NPS to the Commission said, “Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions.” Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Sincerely,  
Kathleen Kaiser

---

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC’s efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission’s CD requirements, the issue of NPS reliability still justifies the CCC’s withdrawal of its Consistency Determination. We ask that you do that.

---

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Sandra Walker

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

Kindly act in the best interest of the public good.

Sincerely,  
Hank Ramírez

**Date:** Monday, March 28, 2022 5:46:06 PM

---

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Richard Barker

**Date:** Monday, March 28, 2022 5:45:19 PM

---

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull

our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Sandi Aden  
ibshrt@aol.com [your location will go here]

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The NPS’ Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

No amount of “best practices” will ever stop beef and dairy operations from being a villain in the struggle against climate change.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Blake Wu

**Date:** Monday, March 28, 2022 5:45:11 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Dianne Douglas

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC’s requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS’s General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Gail MacMillan

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as "regenerative ranching," "carbon farming," etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Sherrill Futrell

**Date:** Monday, March 28, 2022 5:44:16 PM

---

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Susan Campbell

**Date:** Monday, March 28, 2022 5:44:12 PM

---

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

The NPS noted in their March 4, 2022 letter – "At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals." This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Maryellen Redish

**Date:** Monday, March 28, 2022 5:42:16 PM

---

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Marie Elaina Rago

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Lynne Holt

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Cindy Risvold

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

The CCC should not approve of a Climate Action Strategy from the NPS that can’t prove demonstrable positive results. Claims of “regenerative ranching” or “carbon farming” cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Colleen Lobel

---

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Robyn Deveney  
wheelercamps@gmail.com [your location will go here]

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Regan Ebert

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
MArgaret Vernon

**Date:** Monday, March 28, 2022 5:39:12 PM

---

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

**Date:** Monday, March 28, 2022 5:37:15 PM

---

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Nancy Thelot

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Nancy Thelot

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8’ fence. In addition, the NPS’ plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC’s efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission’s CD requirements, the issue of NPS reliability still justifies the CCC’s withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,

**Date:** Monday, March 28, 2022 5:36:11 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive “methane digesters” have limited effectiveness, and only mitigate a problem which shouldn’t even exist at a national park.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS’ plan

Sincerely,  
Tajeer Robinson

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

The Voeller paper (2021) states 'fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.' The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

Please protect the native tule elk from being culled in our National Seashore.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
chuck levin  
[chucklevin81@gmail.com](mailto:chucklevin81@gmail.com) [your location will go here]

**Date:** Monday, March 28, 2022 5:35:08 PM

---

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

There has been much talk in the animal ag industry lately about “carbon farming” and “sustainable” or “regenerative ranching.” The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a “solution” to the real negative impacts caused by factory farms, and even so-called “family farms,” when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don’t be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
C Grimes

**Date:** Monday, March 28, 2022 5:34:12 PM

---

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

**From:** [William Foreman](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 5:34:10 PM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
William Foreman  
WilliamForeman91@yahoo.com [your location will go here]

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 5:32:19 PM

---

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Robert Wisniewski

**From:** [Tina Zenko](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 5:31:10 PM

---

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Tina Zenko

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 5:30:17 PM

---

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

The NPS’ plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Lacey Hicks

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement "best practices," water quality at PRNS remains poor.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Sincerely,  
Denise Lenardson

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

Cows produce 150 billion gallons of methane per day.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Craig Zimmerman

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS’ plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Joanne Anderson

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Anne Hamre

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest "the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available." And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Dori Cole

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement “best practices,” water quality at PRNS remains poor.

US Methane emissions from livestock and natural gas are nearly equal.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Helen Schafer

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

---

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,

**From:** [Steve Prince](#)

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 5:27:11 PM

---

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

Cows produce 150 billion gallons of methane per day.

Due to the NPS’ plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS’ plan (CD-0006-02).

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Steve Prince  
cands78@comcast.net [your location will go here]

**Date:** Monday, March 28, 2022 5:26:15 PM

---

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (*Enterococcus* is another large genus of bacteria)."

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Annamaria Laverty

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

California’s highest E.Coli level was recorded on a Point Reyes ranch. Park service’s 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn’t just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn’t remove the cows from Pt. Reyes.

I urge the Commission to not support the NPS’ plan to cull native Tule elk in PRNS.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Jami Dougan

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Jeanine Weber  
weberjea@aquinas.edu [your location will go here]

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

Please protect the native tule elk from being culled in our National Seashore.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Dawn Hendry

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Peter Ayres

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Dawn Hendry

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Cows produce 150 billion gallons of methane per day.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
David Stear

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Frances Mackiewicz

---

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Sincerely,  
Janet Ginepro

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like “Regenerative” and “carbon farming” techniques.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Lynn Costa

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS’ plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS’ plan.

Sincerely,  
Robert Ferrara

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Michael Braude

---

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Melissa Polick

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
D Garratt

**Date:** Monday, March 28, 2022 5:18:07 PM

---

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Liz Erpelding-Garratt

**Date:** Monday, March 28, 2022 5:17:06 PM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Jean Le Marquand

**Date:** Monday, March 28, 2022 5:14:13 PM

---

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Colleen K  
dudette53147@yahoo.com [your location will go here]

**Date:** Monday, March 28, 2022 5:14:09 PM

---

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Colleen K

**Date:** Monday, March 28, 2022 5:12:14 PM

---

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Robyn Reichert

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

**Date:** Monday, March 28, 2022 5:11:16 PM

---

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called “carbon farms”?

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne’s disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS’ plan

Sincerely,  
Marie Dickenson

**Date:** Monday, March 28, 2022 5:11:13 PM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Barbara Harper

**Date:** Monday, March 28, 2022 5:09:24 PM

---

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Eric Edwards

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive “methane digesters” have limited effectiveness, and only mitigate a problem which shouldn’t even exist at a national park.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

The NPS is being sued because the NPS’ Plan is violating the NPS’ own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS’ plan inconsistent with the Coastal Act.

Sincerely,  
Richard Spotts

---

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Cows produce 150 billion gallons of methane per day.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
lin hemme

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like "Regenerative" and "carbon farming" techniques.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Susan Dannelly

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extend and expand the destructive cattle operations in PRNS.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
ALISON DICE

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Ray Martinez

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Tharukee Amaya

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don’t even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public’s vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don’t miss this opportunity. Do what’s right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Mrs. P. D. Waterworth

---

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Bernadette Belcastro

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Ellen Homsey

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Carol Thornton

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Sara Gernsbacher  
sgernsbacher@gmail.com [your location will go here]

**From:** [Bronwen Evans](#)

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 4:55:17 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

I am offended by the idea that native tule elk must be "culled" because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Bronwen Evans

**Date:** Monday, March 28, 2022 4:55:11 PM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

Please protect the native tule elk from being culled in our National Seashore.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Dawn Cumings  
dmcumings@hotmail.com [your location will go here]

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Susan O'Rourke

**Date:** Monday, March 28, 2022 4:54:07 PM

---

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Janet Robinson

**Date:** Monday, March 28, 2022 4:51:16 PM

---

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Alan Wojtalik

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The Voeller paper (2021) states 'fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.' The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let's use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS' Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
Missy Kendrick

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

There has been much talk in the animal ag industry lately about “carbon farming” and “sustainable” or “regenerative ranching.” The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a “solution” to the real negative impacts caused by factory farms, and even so-called “family farms,” when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don’t be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Thomas Boswell

**Date:** Monday, March 28, 2022 4:49:11 PM

---

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Deepa Gopal

**Date:** Monday, March 28, 2022 4:49:10 PM

---

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as "regenerative ranching," "carbon farming," etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

**Date:** Monday, March 28, 2022 4:48:25 PM

---

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Rachel Wolf

**Date:** Monday, March 28, 2022 4:48:20 PM

---

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
John Rhoades

---

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Laura Campbell

**Date:** Monday, March 28, 2022 4:47:16 PM

---

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Kenneth Green  
jascaain@aol.com [your location will go here]

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Devin Royer

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS’ plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Liz Field  
ejefield16@comcast.net [your location will go here]

---

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
karen kindel  
k.kindel@att.net [your location will go here]

**Date:** Monday, March 28, 2022 4:45:17 PM

---

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Dean Halpern

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

I am offended by the idea that native tule elk must be "culled" because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,

**Date:** Monday, March 28, 2022 4:45:08 PM

---

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

---

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Hilarie Ericson

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are "technically or financially infeasible" and "in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS"

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Dominique Hecker

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary. and caution that these approaches are greenwashing attempts, like "Clean Coal."

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
Anne Kobayashi

---

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
patricia perron

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Edward Rengers  
[edreng@gmail.com](mailto:edreng@gmail.com) [your location will go here]

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 4:35:16 PM

---

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

No amount of “best practices” will ever stop beef and dairy operations from being a villain in the struggle against climate change.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS’ plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS’ plan.

Sincerely,  
Brandie Deal

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Grace Gutierrez  
kittyoliver@yahoo.com [your location will go here]

**Date:** Monday, March 28, 2022 4:34:31 PM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

Please protect the native tule elk from being culled in our National Seashore.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Paula Cano

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 4:33:07 PM

---

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Bill Both  
saulpaulus@aol.com [your location will go here]

**From:** [Carol Fletcher](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 4:32:08 PM

---

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Carol Fletcher  
cefletch@umich.edu [your location will go here]

---

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Sincerely,  
Desiree Nagyfy

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

Cows produce 150 billion gallons of methane per day.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Mia Moss

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Sincerely,  
Cindy Moczarney

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Linda Black

---

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on "best management practices", but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Jennifer Brooks

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Francine Lipka

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 4:28:20 PM

---

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Michael Rosa

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

Voeller, et. al, “Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations” argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don’t work in the rain noting: “Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events.” He suggests smoothing the data to examine overall declines. Unfortunately, one can’t simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore’s GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an ‘off-set’.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC’s requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS’s General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Wallace Rhine

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

Cows produce 150 billion gallons of methane per day.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Nicole Heslip

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8’ fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS’ plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS’ plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

The impacts of ranching in PRNS is well documented in the NPS’ own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Ro Vansrien

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Sandra Dal Cais

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extends and expands the destructive cattle operations in PRNS.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term ‘clean coal’ used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Please protect the native tule elk from being culled in our National Seashore.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
brigitte Tawa

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Nora Coyle  
[lcs89@yahoo.com](mailto:lcs89@yahoo.com) [your location will go here]

**Date:** Monday, March 28, 2022 4:24:06 PM

---

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Sincerely,  
Nora Coyle  
lcs89@yahoo.com [your location will go here]

**From:** [Nora Coyle](#)

**Date:** Monday, March 28, 2022 4:23:17 PM

---

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated "The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels..." (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Nora Coyle  
[lcs89@yahoo.com](mailto:lcs89@yahoo.com) [your location will go here]

**Date:** Monday, March 28, 2022 4:23:09 PM

---

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Nora Coyle  
lcs89@yahoo.com [your location will go here]

**Date:** Monday, March 28, 2022 4:22:14 PM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures."  
During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

It’s disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future “potential” water quality improvements. This “see no evil” attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS’ plan (CD-0006-02)

Sincerely,

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Teresa Audesirk

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Sincerely,  
Steven Vollibs

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO<sub>2</sub>) per year, or 51% of all worldwide greenhouse gas emissions.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Marie Wakefield

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Takako Ishii kiefer

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Julie Beer

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Sheila Kelley

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement “best practices,” water quality at PRNS remains poor.

US Methane emissions from livestock and natural gas are nearly equal.

The NPS’ plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Zach Ferrara  
[zachferrara@gmail.com](mailto:zachferrara@gmail.com) [your location will go here]

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

There has been much talk in the animal ag industry lately about "carbon farming" and "sustainable" or "regenerative ranching." The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a "solution" to the real negative impacts caused by factory farms, and even so-called "family farms," when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don't be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

The NPS noted in their March 4, 2022 letter – "At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals." This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will

of the ranching tenants.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Zach Ferrara

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Ian Shelley

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

Kindly act in the best interest of the public good.

Sincerely,  
Michael Lerner

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Alice Jena

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (*Enterococcus* is another large genus of bacteria)."

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Sally Hinshaw

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Reetta Raag

---

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Gary F Gilardi

---

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Liz Sanders

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Sincerely,  
Elizabeth Jache  
quinsy\_balky\_0r@icloud.com [your location will go here]

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Elizabeth Jache  
quinsy\_balky\_0r@icloud.com [your location will go here]

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 4:08:19 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Diane Soddy

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium Escherichia coli (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (Enterococcus is another large genus of bacteria)."

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

**Date:** Monday, March 28, 2022 4:07:15 PM

---

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

The CCC should not approve of a Climate Action Strategy from the NPS that can’t prove demonstrable positive results. Claims of “regenerative ranching” or “carbon farming” cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

Kindly act in the best interest of the public good.

Sincerely,  
allie palmer

**Date:** Monday, March 28, 2022 4:07:09 PM

---

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8’ fence. In addition, the NPS’ plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
El Pe

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 4:04:10 PM

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Ann DeBolt

---

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Suzanne Connors

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Ruth Ann Wiesenthal-Gold

**Date:** Monday, March 28, 2022 4:03:09 PM

---

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Robert Blumenthal  
[rblument@comcast.net](mailto:rblument@comcast.net) [your location will go here]

**Date:** Monday, March 28, 2022 4:02:16 PM

---

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
An Feig  
aafeig57@gmail.com [your location will go here]

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

US Methane emissions from livestock and natural gas are nearly equal.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Sincerely,  
Rita Jaros

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS’ plan. The impacts of ranching in PRNS is well documented in the NPS’ own EIS - ranching must end in PRNS.

Sincerely,  
Susan Fischer

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Jodi Rodar

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significantly polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of “greenwashing” by vested agricultural interests with buzz words like “regenerative” or “carbon” farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like “Clean Coal.”

Due to the NPS’ plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS’ plan (CD-0006-02).

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS’s extensive past history, the Commission can expect more of the same. It’s important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Mary Dickson

**Date:** Monday, March 28, 2022 3:59:07 PM

---

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated "The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels..." (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

Please protect the native tule elk from being culled in our National Seashore.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
nathan schaefer  
natgumpa@yahoo.com [your location will go here]

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Carrie Swank

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO<sub>2</sub>) per year, or 51% of all worldwide greenhouse gas emissions.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Jennifer Lessard

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures." During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Tracey Bonner

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive “methane digesters” have limited effectiveness, and only mitigate a problem which shouldn’t even exist at a national park.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public’s vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don’t miss this opportunity. Do what’s right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Eleanor Navarro

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Joyce Overton

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

Cows produce 150 billion gallons of methane per day.

I am offended by the idea that native tule elk must be "culled" because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Patricia Dangle

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Kimberly Short

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Sincerely,  
Bernadette Andoloro

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Priscilla Martinez

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Alan P Socol

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let's use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS' Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
Rene Voss

---

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Cindy M. Dutka  
mdmsass@aol.com [your location will go here]

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement “best practices,” water quality at PRNS remains poor.

The CCC should not approve of a Climate Action Strategy from the NPS that can’t prove demonstrable positive results. Claims of “regenerative ranching” or “carbon farming” cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS’ plan (CD-0006-02)

Sincerely,  
Maggie Topalian

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are "technically or financially infeasible" and "in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS"

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,

**Date:** Monday, March 28, 2022 3:50:21 PM

---

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest "the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available." And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Jane Clark

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
thomas moore

**Date:** Monday, March 28, 2022 3:50:14 PM

---

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Elliott Sernel

---

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Susan Bortolussi

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS’ plan.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Marianne Garau

**Date:** Monday, March 28, 2022 3:48:22 PM

---

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Kathryn Fox

**Date:** Monday, March 28, 2022 3:48:21 PM

---

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures." During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

Cows produce 150 billion gallons of methane per day.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Daniel OBrien

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Janelle George

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Jody Gibson

**Date:** Monday, March 28, 2022 3:46:12 PM

---

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
A Martin

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
David Ross

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Ms Lilith

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Janell Curtis

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Kindly act in the best interest of the public good.

Sincerely,  
Walter Bishop  
orindawood@gmail.com [your location will go here]

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,

---

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called “carbon farms”?

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Carolyn Bishop

**Date:** Monday, March 28, 2022 3:41:04 PM

---

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Miriam Kurland

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

Methane has a global warming potential 86 times that of CO<sub>2</sub> on a 20-year time frame.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Sam Matthews

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Laura Herndon

---

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement "best practices," water quality at PRNS remains poor.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as "regenerative ranching," "carbon farming," etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Arnie Schildhaus

**Date:** Monday, March 28, 2022 3:38:29 PM

---

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Mary Morse

**Date:** Monday, March 28, 2022 3:38:09 PM

---

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

The NPS noted in their March 4, 2022 letter – "At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals." This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Iris Patty Yermak

**Date:** Monday, March 28, 2022 3:38:07 PM

---

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Laura Rice

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as "regenerative ranching," "carbon farming," etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
William Mittig

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Marie DAnna

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

**Date:** Monday, March 28, 2022 3:36:17 PM

---

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 3:35:16 PM

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of "best management practices" (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park's waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
David Meade

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Jim Brunton

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

Please protect the native tule elk from being culled in our National Seashore.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Rhonda Anderson

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

**Date:** Monday, March 28, 2022 3:32:15 PM

---

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Helen LaDeau

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher’s plan.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let’s restore our National Seashore

Sincerely,  
Pamela Slater Price

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

US Methane emissions from livestock and natural gas are nearly equal.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS’ plan.

Sincerely,

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of “greenwashing” by vested agricultural interests with buzz words like “regenerative” or “carbon” farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like “Clean Coal.”

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8’ fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS’ plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS’ plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
ann malyon

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO<sub>2</sub>/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO<sub>2</sub>/year in PRNS is to remove all cattle ranching from these public lands.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
KENDRICK MILLER

**Date:** Monday, March 28, 2022 3:30:16 PM

---

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Kristin Campbell

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Sincerely,  
Sue Velez

**Date:** Monday, March 28, 2022 3:28:11 PM

---

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

The CCC should not approve of a Climate Action Strategy from the NPS that can’t prove demonstrable positive results. Claims of “regenerative ranching” or “carbon farming” cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The NPS’ plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS’ plan.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS’ plan, as it is time to end these unnecessary impacts.

Sincerely,  
Robin Peterson

---

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

Cows produce 150 billion gallons of methane per day.

Please protect the native tule elk from being culled in our National Seashore.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Christina Williams  
clmw67@gmail.com [your location will go here]

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 3:27:13 PM

---

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Ernie Walters

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

**Date:** Monday, March 28, 2022 3:26:14 PM

---

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Beef and dairy operations are well known to be leading causes of climate change, so they don’t belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of “regenerative grazing” (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let’s restore our National Seashore

Sincerely,  
James Mulcare

**Date:** Monday, March 28, 2022 3:26:13 PM

---

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significantly polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Christina Williams

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
JOHN P.

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Jessica Cresseveur

**Date:** Monday, March 28, 2022 3:25:13 PM

---

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.’s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of “Clean Coal.” I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Mari Dominguez

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Robert Posch

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as “regenerative ranching,” “carbon farming,” etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

The tule elk naturally belong in the coastal prairie of Point Reyes. Unlike cows, who greatly outnumber the elk.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Danielle Jesensky

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

The final Point Reyes General Management Plan Amendment EIS presents fecal bacteria data from fourteen PRNS surface water locations between 1999 and 2013. Safe levels were exceeded at all sampling locations, ranging as high as 1.6 million MPN/100 ml. Compare that to the water quality standard of 240 MPN/100 ml for water contact recreation, which after all is what we come to our National Seashore for.

The United Nations states, “The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures.” During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Theodore King

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Cows produce 150 billion gallons of methane per day.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
R.A.L. West

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it’s time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It’s past time for the cows to be removed from the seashore.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS’ purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California’s endemic Tule elk.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Dana Bleckinger

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johnes disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Deidra Lunn  
nobodybutus2@comcast.net [your location will go here]

**Date:** Monday, March 28, 2022 3:23:11 PM

---

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Cheryl Eames

**Date:** Monday, March 28, 2022 3:22:37 PM

---

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Kathleen McHendry

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
ALESSANDRO GANGEMI

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Pamela Olsen

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like "Regenerative" and "carbon farming" techniques.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Andrew Hinz

**Date:** Monday, March 28, 2022 3:21:10 PM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,

**Date:** Monday, March 28, 2022 3:20:15 PM

---

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Heather Buchanan

---

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Brian Field

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Cows produce 150 billion gallons of methane per day.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Lisa Zales

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of “greenwashing” by vested agricultural interests with buzz words like “regenerative” or “carbon” farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like “Clean Coal.”

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Skot McDaniel

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Janet Thew

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Lisa Mazzola

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Meagan Fastuca

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

There has been much talk in the animal ag industry lately about "carbon farming" and "sustainable" or "regenerative ranching." The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a "solution" to the real negative impacts caused by factory farms, and even so-called "family farms," when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don't be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,

**Date:** Monday, March 28, 2022 3:15:26 PM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Linda Pemberton

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Judith Smith

**Date:** Monday, March 28, 2022 3:15:21 PM

---

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher's plan.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

**Date:** Monday, March 28, 2022 3:15:12 PM

---

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

Cows produce 150 billion gallons of methane per day.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Ainslie Gilligan

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 3:15:10 PM

---

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Doris Potter

**Date:** Monday, March 28, 2022 3:15:09 PM

---

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Robert Jardine

**Date:** Monday, March 28, 2022 3:14:08 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Michelle Setaro

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Heidi Steinert-Bresilge

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Michelle Setaro

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Kathy Simington

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS’ plan (CD-0006-02)

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

It is of great concern politicians at the local and federal level support the NPS’s actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS’ plan (CD-0006-02)

Sincerely,  
Lois White

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS’ own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne’s disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS’ plan

Sincerely,  
Karen Jacques

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher's plan.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
AIXA FIELDER

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Margaret DeMott

**Date:** Monday, March 28, 2022 3:10:29 PM

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Doris Alpern

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Ashok and Kiran Bajaj

**Date:** Monday, March 28, 2022 3:10:11 PM

---

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Cows produce 150 billion gallons of methane per day.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Claire Perricelli

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Anne Kaufmann

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are "technically or financially infeasible" and "in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS"

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Valerie Sotere

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement “best practices,” water quality at PRNS remains poor.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

It is of great concern politicians at the local and federal level support the NPS’s actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,

We are counting on you to help us keep the park service accountable.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term ‘clean coal’ used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

It is of great concern politicians at the local and federal level support the NPS’s actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

The CCC’s mission is to protect and enhance the California coast. It reads “The Commission is committed to protecting and enhancing California’s coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination.”

Per the CCC’s mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Cindy and Christine Guarnieri

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Cows produce 150 billion gallons of methane per day.

I am offended by the idea that native tule elk must be “culled” because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Robert Badcock

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

Kindly act in the best interest of the public good.

Sincerely,  
Diane-Michele Petrillo

**Date:** Monday, March 28, 2022 3:08:18 PM

---

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Cindy and Christine Guarnieri

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Stefan Taylor

**Date:** Monday, March 28, 2022 3:08:10 PM

---

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Bruce and Maureen DeNunzio

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Kristina Wunder

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of "best management practices" (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park's waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

Kindly act in the best interest of the public good.

Sincerely,  
Mark Koritz  
mkoritz2002@yahoo.com [your location will go here]

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Ellen McCann

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like “Regenerative” and “carbon farming” techniques.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

The NPS is being sued because the NPS’ Plan is violating the NPS’ own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS’ plan inconsistent with the Coastal Act.

Sincerely,  
Janet Delaney

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS’ plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC’s efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission’s CD requirements, the issue of NPS reliability still justifies the CCC’s withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Deborah Santone

**Date:** Monday, March 28, 2022 3:05:13 PM

---

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Kelly Berry  
[kellyberr@hotmail.com](mailto:kellyberr@hotmail.com) [your location will go here]

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Donna Hamilton

**Date:** Monday, March 28, 2022 3:04:25 PM

---

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Mary Thornton  
marybrabson01@gmail.com [your location will go here]

**Date:** Monday, March 28, 2022 3:04:24 PM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
B G  
barbaran2323@gmail.com [your location will go here]

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 3:04:20 PM

---

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Sabina Sonneman

---

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Denise Snyder

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures."  
During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Ann Sandritter

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let’s use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS’ Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
Gerald Hallam

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Thomas Ervin

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore’s GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an ‘off-set’.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Deb Castellana

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Sandra BonSell

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Lisa Reich

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

No amount of “best practices” will ever stop beef and dairy operations from being a villain in the struggle against climate change.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Gerald Hallam

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

No amount of “best practices” will ever stop beef and dairy operations from being a villain in the struggle against climate change.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
David Burns

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

Please protect the native tule elk from being culled in our National Seashore.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Jane Drews  
jcd907@gmail.com [your location will go here]

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Mary Franklin

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don’t resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn’t enable natural composting, and results in water pollution.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne’s disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Gay Goden

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Denise Martini

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Cows produce 150 billion gallons of methane per day.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are "technically or financially infeasible" and "in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS"

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Marya Zanders

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The letter from the NPS to the Commission said, “Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions.” Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS’ purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California’s endemic Tule elk.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Robert Gartner

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Laura Ricci

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Natalie Alexander

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Peter Broderson

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let's use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS' Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
Kathleen Grossman

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Deidre and Ronald Brown

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
David Bruce Anderson

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Amy Iagrone

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Teresa Silver

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The Commission’s post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore’s waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC’s deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Assuming the NPS’ strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg “The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock “does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate.” The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS’ strategy.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

Kindly act in the best interest of the public good.

Sincerely,  
Sophia Vassilakidis

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Thom Peters

**Date:** Monday, March 28, 2022 2:58:10 PM

---

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Mel Apodaca  
dsgmel@msn.com [your location will go here]

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Gretchen Wagner

**Date:** Monday, March 28, 2022 2:57:24 PM

---

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
sheila larkin

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Sincerely,  
Terry Tedesco

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Robert Wohlberg

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Tracey katsouros

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO<sub>2</sub>) per year, or 51% of all worldwide greenhouse gas emissions.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Sincerely,  
Susan Sloan

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Robert Bruce Anderson

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement “best practices,” water quality at PRNS remains poor.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Andarin Arvola

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Cora Luce

**Date:** Monday, March 28, 2022 2:56:06 PM

---

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Tracy Ouellette

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Sincerely,

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement “best practices,” water quality at PRNS remains poor.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please do not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let's use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS' Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
Vittorio Ricci

**Date:** Monday, March 28, 2022 2:55:14 PM

---

Dear California Coastal Commission ,

The overall health of our National Park and the Pacific coastline is far more important than a handful of cattle ranching tenants making money off of public lands while impacting our landscape, our waterways, our native wildlife. I urge the Commission to revoke your conditional approval of the National Park Service's CD-0006-02.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Peter Wood  
nativeofny1@yahoo.com [your location will go here]

**Date:** Monday, March 28, 2022 2:55:10 PM

---

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

There has been much talk in the animal ag industry lately about "carbon farming" and "sustainable" or "regenerative ranching." The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a "solution" to the real negative impacts caused by factory farms, and even so-called "family farms," when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don't be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

**From:** [Gregory Freeman](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:55:09 PM

---

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Gregory Freeman

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO<sub>2</sub>) per year, or 51% of all worldwide greenhouse gas emissions.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,

**Date:** Monday, March 28, 2022 2:54:08 PM

---

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures."  
During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS' purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California's endemic Tule elk.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

**Date:** Monday, March 28, 2022 2:54:06 PM

---

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (*Enterococcus* is another large genus of bacteria)."

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

Please protect the native tule elk from being culled in our National Seashore.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Scott Vayo  
svayo@nbbj.com [your location will go here]

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

The NPS’ Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of “greenwashing” by vested agricultural interests with buzz words like “regenerative” or “carbon” farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary, and caution that these approaches are greenwashing attempts, like “Clean Coal.”

Please protect the native tule elk from being culled in our National Seashore.

The CCC’s mission is to protect and enhance the California coast. It reads “The Commission is committed to protecting and enhancing California’s coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination.”

Per the CCC’s mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Gloria Shen

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Tony Gray

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

No amount of “best practices” will ever stop beef and dairy operations from being a villain in the struggle against climate change.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Karen L Pecsok

**Date:** Monday, March 28, 2022 2:53:06 PM

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

Comments on the draft GMPA and draft EIS from the San Francisco Regional Water Quality Control Board to NPS regarding the GMP echo the concern of over-optimistic expectations for ongoing improvements. It is asked of the Commission to assess independently whether or not the best management practices for keeping cattle manure out of our waterways, based on the topography of the landscape, can truly occur.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Sincerely,  
Jerri Berg

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Chen Sapirstein

**Date:** Monday, March 28, 2022 2:52:36 PM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

The United Nations states, "The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures."  
During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Ken Kipen

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Rocio Luparello

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

Please protect the native tule elk from being culled in our National Seashore.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Anthony Montapert

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

There has been much talk in the animal ag industry lately about "carbon farming" and "sustainable" or "regenerative ranching." The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a "solution" to the real negative impacts caused by factory farms, and even so-called "family farms," when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don't be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

---

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Suneet Srivastava

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johnes disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Matt Brzezinski

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

Voeller, et. al, “Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations” argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don’t work in the rain noting: “Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events.” He suggests smoothing the data to examine overall declines. Unfortunately, one can’t simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS’ plan and help us save our Seashore.

Sincerely,

**From:** [Kristi Meyer](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:51:20 PM

---

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Kristi Meyer

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

US Methane emissions from livestock and natural gas are nearly equal.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
April Eversole

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

It is of great concern politicians at the local and federal level support the NPS's actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Mary Ann McFarland

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Chris Carpenter

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Rob Seltzer

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Richard Sanders

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
DALE STEICHEN

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

---

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
gary parlette

**Date:** Monday, March 28, 2022 2:47:47 PM

---

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Lindsay JOhnson

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

I am offended by the idea that native tule elk must be “culled” because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

US Methane emissions from livestock and natural gas are nearly equal.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Anita Scheunemann

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extend and expand the destructive cattle operations in PRNS.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels of E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact on marine life in the ocean.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

Please protect the native tule elk from being culled in our National Seashore.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Georgia Braithwaite

**Date:** Monday, March 28, 2022 2:45:09 PM

---

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

**Date:** Monday, March 28, 2022 2:44:28 PM

---

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Ted Fishman

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:44:27 PM

---

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called “carbon farms”?

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Elise McCoubrie

**Date:** Monday, March 28, 2022 2:44:21 PM

---

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

The NPS' General Management Plan Amendment (GMPA) for PRNS legally must not impair any park resources, including water. However water quality data provided to the Commission to date clearly documents impairment to water quality continues. It is time to end tenant cattle ranching in our National Seashore, the only National Seashore on the Pacific Coast.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Diane Zinni  
[mtnbliss@gmail.com](mailto:mtnbliss@gmail.com) [your location will go here]

**From:** [Roger Hollander](#)  
**To:** [Coastal Point Reyes Management Plan](#)

**Date:** Monday, March 28, 2022 2:44:17 PM

---

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Roger Hollander

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Diane Kastel  
classylady1@comcast.net [your location will go here]

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore’s GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an ‘off-set’.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Jennifer Edelen  
elvenmommy3@yahoo.com [your location will go here]

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:44:05 PM

---

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Robert Brown

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The letter from the NPS to the Commission said, “Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions.” Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

No amount of “best practices” will ever stop beef and dairy operations from being a villain in the struggle against climate change.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, “The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention.” This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS’s extensive past history, the Commission can expect more of the same. It’s important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Mary Walls

**Date:** Monday, March 28, 2022 2:43:12 PM

---

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

No amount of “best practices” will ever stop beef and dairy operations from being a villain in the struggle against climate change.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Kimberly Allen

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS’ own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

Please provide our native Tule Elk from the NPS’ and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Edna Mullen

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Karen Matkovic

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Virgene Link-New

**Date:** Monday, March 28, 2022 2:42:05 PM

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (Enterococcus is another large genus of bacteria)."

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
THERESA EVERETT

---

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive “methane digesters” have limited effectiveness, and only mitigate a problem which shouldn’t even exist at a national park.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let’s restore our National Seashore

Sincerely,  
Diane Kastel

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Mary Wylie

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Judith Anshin

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Julie Block

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

There has been much talk in the animal ag industry lately about “carbon farming” and “sustainable” or “regenerative ranching.” The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a “solution” to the real negative impacts caused by factory farms, and even so-called “family farms,” when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don’t be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let’s use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS’ Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
Lyn du Mont

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS’ own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS’ plan.

Sincerely,  
Linda Gazzola

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:41:08 PM

---

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
David Brooks

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
joan johnston

---

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement “best practices,” water quality at PRNS remains poor.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called “carbon farms”?

Due to the NPS’ plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS’ plan (CD-0006-02).

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
John Dale Kennedy  
tandoorii@comcast.net [your location will go here]

---

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive “methane digesters” have limited effectiveness, and only mitigate a problem which shouldn’t even exist at a national park.

I am offended by the idea that native tule elk must be “culled” because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Stephen House

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,

**From:** [Lacey Levitt](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:40:19 PM

---

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

Please protect the native tule elk from being culled in our National Seashore.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Lacey Levitt

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Susan Krause  
skrause442@yahoo.com [your location will go here]

**From:** [Wendy Honold](#)

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Sincerely,  
Wendy Honold

**Date:** Monday, March 28, 2022 2:39:24 PM

---

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

As decision makers in this very consequential time your decisions will have historic impact. Please beware of “greenwashing” by vested agricultural interests with buzz words like “regenerative” or “carbon” farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary.and caution that these approaches are greenwashing attempts, like “Clean Coal.”

I urge the Commission to not support the NPS’ plan to cull native Tule elk in PRNS.

The impacts of ranching in PRNS is well documented in the NPS’ own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
p Nunez

---

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Susan Dubovsky

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC’s efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission’s CD requirements, the issue of NPS reliability still justifies the CCC’s withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

The United Nations states, “The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures.” During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Mari Mennel-Bell  
mari471@aol.com [your location will go here]

**Date:** Monday, March 28, 2022 2:39:08 PM

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Michelle Blackley

**Date:** Monday, March 28, 2022 2:39:06 PM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (*Enterococcus* is another large genus of bacteria)."

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

Kindly act in the best interest of the public good.

Sincerely,  
Jonathan Mitchell

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

The NPS posted a water quality monitoring plan from 2001. Therefore the reluctance of the NPS to propose an updated Water Quality Strategy to the Commission, per mutual agreement, at the April 2022 meeting, is telling. The NPS are aware of the ongoing high levels of pollution occurring in PRNS, caused by tenant ranchers. It is imperative for the health of our environment, our ocean and aquatic life, that the Commission rescind their conditional approval on CD-0006-02, and partner with the public who are against the continual destruction in PRNS caused by private cattle ranching.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

Please protect the native tule elk from being culled in our National Seashore.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Nora Lewis

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Diane Kastel

**Date:** Monday, March 28, 2022 2:38:12 PM

---

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Charlene Kerchevall

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Antje Fray

---

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS’ plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Claudia Wornum

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let's use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS' Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
julie Rose

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

Beef cattle and dairy cows are not naturally suited to the Western coastal prairie. They graze in such a way that destroys the root system of native plants, which causes erosion. And their excess manure isn't completely composted, which is why surface water at PRNS has such high levels of contamination.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Joanne DeHart

**Date:** Monday, March 28, 2022 2:37:14 PM

---

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Cows produce 150 billion gallons of methane per day.

I am offended by the idea that native tule elk must be "culled" because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Arielle Schechter

**Date:** Monday, March 28, 2022 2:37:12 PM

---

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
William Nichols

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Sincerely,  
Mark Reback

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.’s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of “Clean Coal.” I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS’ plan and help us save our Seashore.

Sincerely,  
Nicholas Prychodko

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:35:33 PM

---

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don’t capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden’s desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS’ plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS’ plan.

Sincerely,  
Judith S Anderson

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Jared Brenner

**Date:** Monday, March 28, 2022 2:35:25 PM

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement "best practices," water quality at PRNS remains poor.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

US Methane emissions from livestock and natural gas are nearly equal.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Michael DiDiego

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

---

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
joan silaco

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The letter from the NPS to the Commission said, "Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions." Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

It is time to end the extractive ranching industry in the only National Seashore on the California Coast. Please reconsider your conditional approval.

Sincerely,  
Jennifer Valentine

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Kindly act in the best interest of the public good.

Sincerely,

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission’s concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS’s refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public’s outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public’s resources.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS’ plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS’ and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS’ plan, and find the plan not consistent.

Sincerely,  
Bruce Hlodnicki

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Michael DiDiego

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Timothy Dunn

---

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

The Voeller paper (2021) states ‘fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.’ The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Carol Hoke

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

There has been much talk in the animal ag industry lately about “carbon farming” and “sustainable” or “regenerative ranching.” The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a “solution” to the real negative impacts caused by factory farms, and even so-called “family farms,” when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don’t be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS’ plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Josefine Singh

**Date:** Monday, March 28, 2022 2:33:30 PM

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (*Enterococcus* is another large genus of bacteria)."

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,

**Date:** Monday, March 28, 2022 2:33:27 PM

---

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Dale Sorensen

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called “carbon farms”?

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Burkhard Broecker

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extend and expand the destructive cattle operations in PRNS.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

As decision makers in this very consequential time your decisions will have historic impact. Please beware of "greenwashing" by vested agricultural interests with buzz words like "regenerative" or "carbon" farming. Agencies such as the U.N Intergovernmental Panel on Climate Change are realistic and deflationary and caution that these approaches are greenwashing attempts, like "Clean Coal."

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Judy Schriebman

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

The NPS noted in their March 4, 2022 letter – "At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals." This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Deborah Segnan

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Dona LaSchiava

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Judith Tanur

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Agnetha Broecker  
[agnethabroecker@yahoo.de](mailto:agnethabroecker@yahoo.de) [your location will go here]

**From:** [Diane Sullivan](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:33:14 PM

---

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Diane Sullivan

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO<sub>2</sub>) per year, or 51% of all worldwide greenhouse gas emissions.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Robert Gerosa

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

Please protect the native tule elk from being culled in our National Seashore.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
AnaLisa Crandall

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Ingrid Broecker

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
PAUL BABBINI  
PEBABBINI@AOL.COM [your location will go here]

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
Timothy Duda

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Barbara Greenwood

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
mary more

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Walter Erhorn

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

Please help us protect our public land and coastline in PRNS. Please revoke your conditional approval, and help us end private ranching in PRNS.

Sincerely,  
Jim Steitz

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Sincerely,  
Jeanne Held-Warmkessel

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

Voeller, et. al, “Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations” argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don’t work in the rain noting: “Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events.” He suggests smoothing the data to examine overall declines. Unfortunately, one can’t simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive “methane digesters” have limited effectiveness, and only mitigate a problem which shouldn’t even exist at a national park.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Sincerely,  
Kelly Connolly

**Date:** Monday, March 28, 2022 2:31:15 PM

---

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Stefan Petersen

---

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Anna Drummond  
pal\_95945@yahoo.com [your location will go here]

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public’s vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don’t miss this opportunity. Do what’s right and rescind Consistency Determination CD-0006-20. I thank you.

**Date:** Monday, March 28, 2022 2:31:08 PM

---

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO<sub>2</sub>) per year, or 51% of all worldwide greenhouse gas emissions.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Susan Watts

**Date:** Monday, March 28, 2022 2:31:05 PM

---

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

Voeller, et. al, "Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations" argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don't work in the rain noting: "Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events." He suggests smoothing the data to examine overall declines. Unfortunately, one can't simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

It is unthinkable to have the most feces-contaminated location in America in a National Park. This level of pollution cannot be mitigated - it needs to be eliminated.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Sincerely,  
janet forman

**Date:** Monday, March 28, 2022 2:30:22 PM

---

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The NPS noted in their March 4, 2022 letter – "At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals." This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Gary Beckerman

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

Please protect the native tule elk from being culled in our National Seashore.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Mary Workman

**Date:** Monday, March 28, 2022 2:30:16 PM

---

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Gail Roberts

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like "Regenerative" and "carbon farming" techniques.

Please withdraw your conditional approval of the NPS' plan. The public wants to see Tule Elk in our National Park, not domestic cattle.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Joanie Steinhaus

**Date:** Monday, March 28, 2022 2:30:11 PM

---

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO<sub>2</sub> deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO<sub>2</sub>. Most of this comes from manure.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Robin Bressler

**Date:** Monday, March 28, 2022 2:30:10 PM

---

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

On multiple levels, the NPS has proven to be unable to effectively manage the native Tule Elk in PRNS, as they have not made appropriate choices to date, with their prioritization of cattle and tenant ranchers, over our elk and our environment. Please do not allow the NPS to cull more Tule Elk in our National Seashore, located on the coast of California.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Teresia LaFleur

**Date:** Monday, March 28, 2022 2:30:06 PM

---

Dear California Coastal Commission ,

The overall health of our National Park and the Pacific coastline is far more important than a handful of cattle ranching tenants making money off of public lands while impacting our landscape, our waterways, our native wildlife. I urge the Commission to revoke your conditional approval of the National Park Service's CD-0006-02.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Martin Reifinger

**Date:** Monday, March 28, 2022 2:29:28 PM

---

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

Methane has a global warming potential 86 times that of CO2 on a 20-year time frame.

The recent NPS survey indicates that in 2021 the Drakes Beach Tule elk herd grew to 151 individuals, placing it above the 140-individual threshold for lethal removal set forth in the Record of Decision. Lethal removal of endemic Tule elk in the free-ranging herds while half of the Tule elk in the Preserve die of dehydration and malnutrition is a violation of the public trust.

The CCC’s mission is to protect and enhance the California coast. It reads “The Commission is committed to protecting and enhancing California’s coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination.”

Per the CCC’s mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Karen Slote

**Date:** Monday, March 28, 2022 2:29:25 PM

---

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significantly polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

Because of livestock at PRNS, the free roaming tule elk have been infected with John's disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Teri Shore

**Date:** Monday, March 28, 2022 2:29:20 PM

---

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are “technically or financially infeasible” and “in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS”

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

The current status of Consistency Determination (CD-0006-20) is an appeasement to grandfathered landholders and industrial practices. By contract to the intent of the original legislation for design and development of the PRNS, the scope and magnitude of these activities should be removed.

Sincerely,  
Jennifer Scull

**Date:** Monday, March 28, 2022 2:29:19 PM

---

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

Methane and GHG release from cattle operations is a leading cause of our climate crisis. I ask the Commission to not condone the impact of this destructive industry in our coastal zone, as it is time to do everything we can to fight climate change.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Marie Young

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

I respectfully request the Commission to do the right thing, and withdraw your approval of CD-0006-20.

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
D Schoech  
[dschoech@sbcglobal.net](mailto:dschoech@sbcglobal.net) [your location will go here]

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
David Lowe

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Summer Kozisek

Dear California Coastal Commission ,

It is imperative that we fight to protect our waterways that drain into the bays and beaches of the Pacific Ocean, to protect the air quality that is along our Coastal zone, and the native wildlife that should be able to live without the risk of being killed by the NPS. Please help the public protect our natural resources in PRNS by voting against the NPS' plan B.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Kindly act in the best interest of the public good.

Sincerely,  
Tracey Aquino

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

Since the Commission came within one vote of rejecting the NPS's request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS's track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO<sub>2</sub>/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO<sub>2</sub>/year in PRNS is to remove all cattle ranching from these public lands.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
Carter Neal

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest "the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available." And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Carlene Visperas

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

The CCC should not approve of a Climate Action Strategy from the NPS that can’t prove demonstrable positive results. Claims of “regenerative ranching” or “carbon farming” cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

It is of great concern politicians at the local and federal level support the NPS’s actions to cull free-ranging Tule elk in PRNS. I visit PRNS for the sole reason to see Tule Elk, and not domestic cattle. Please prioritize native Tule Elk over private ranching operations in our National Park on the California coast.

The CCC’s mission is to protect and enhance the California coast. It reads “The Commission is committed to protecting and enhancing California’s coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination.”

Per the CCC’s mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,

**Date:** Monday, March 28, 2022 2:28:17 PM

---

Dear California Coastal Commission ,

I am writing to request the CCC to withdraw their conditional approval of the environmentally destructive plan, CD-0006-20. The significant impact to water quality, air quality and our native Tule Elk, caused by ranching operations, should not be condoned nor allowed to continue.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

In this time of extreme climate disruption, we all need to do everything we can to stop global warming. Livestock emissions – from manure and gastroenteric releases – account for roughly 32 per cent of human-caused methane emissions. Over a 20-year period, it is 80 times more potent at warming than carbon dioxide. The cows in PRNS produce over 6 ½ times the GHGs what all the 2 million plus visitors and their cars do. Any rational climate action strategy – that isn't just a greenwashing vehicle – will require the elimination of cows from the seashore. No plan or strategy should be accepted by the CCC as viable that doesn't remove the cows from Pt. Reyes.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

Please consider these matters, and act accordingly, and in the best interest of our environment and future generations to come.

Sincerely,  
Vesna Glavina

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

Re-wilding Point Reyes is the best climate action plan. Why do we need to replace coastal prairies and wilderness that are proven to be the most effective carbon sinks with experimental unproven so-called "carbon farms"?

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The Commission has the opportunity to oppose what is essentially a foregone conclusion arranged at the federal level, in which the people and the environment suffer for the benefit of industry. I urge the Commission to withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

The Voeller paper (2021) states 'fecal indicator bacteria concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in the study watersheds.' The Voeller paper also states that adding subsequent BMPs do not benefit water quality. Therefore, it is clear, from current water quality data from concerned citizens, that water quality in PRNS will not meet necessary standards until tenant cattle operations are removed from our National Park.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let's restore our National Seashore

Sincerely,  
Claire Bush

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

There has been much talk in the animal ag industry lately about “carbon farming” and “sustainable” or “regenerative ranching.” The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a “solution” to the real negative impacts caused by factory farms, and even so-called “family farms,” when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don’t be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Linda Bescrypt

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Sincerely,  
Kate Kenner

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

The CCC should not approve of a Climate Action Strategy from the NPS that can’t prove demonstrable positive results. Claims of “regenerative ranching” or “carbon farming” cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

Kindly act in the best interest of the public good.

Sincerely,  
Julie Harris

---

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

There has been much talk in the animal ag industry lately about “carbon farming” and “sustainable” or “regenerative ranching.” The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a “solution” to the real negative impacts caused by factory farms, and even so-called “family farms,” when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don’t be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Nicolas Dunn  
nduong1@irf.com [your location will go here]

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Holly Crawford

**Date:** Monday, March 28, 2022 2:26:48 PM

---

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true

regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Sally Sheck

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

Please protect the native tule elk from being culled in our National Seashore.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Leslie Lazzo

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement "best practices," water quality at PRNS remains poor.

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO2/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO2/year in PRNS is to remove all cattle ranching from these public lands.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Sean Harper

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

Kindly act in the best interest of the public good.

Sincerely,  
Margaret Petkiewicz

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Sandra Couch

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

The NPS' plan allows the slaughter of our free-ranging native Tule Elk in PRNS. This is not ethical, nor legal, as this endemic species is protected in California. Tule Elk must be prioritized over commercial cattle operations in our National Seashore.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Marilyn Martin

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Denise Sammartano

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Anna Givens

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:26:28 PM

---

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,  
Louise Slattery

**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:26:27 PM

---

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

ING STATEMENT (50):

In the past 12 months, a number of large trash dumps which have existed in the park for years, hidden bulldozing of an anadromous fish streambank by a rancher, leaky or failed ranch septic systems and numerous instances of ranchers violating the terms of their leases with impunity all point to willful neglect, if not downright abrogation of duty, by the NPS. Based on the NPS's extensive past history, the Commission can expect more of the same. It's important that the Commission recognize the entrenched pattern and rescind the finding of Consistency Determination CD-0006-20.

Sincerely,  
Sue Hall

**Date:** Monday, March 28, 2022 2:26:25 PM

---

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

US Methane emissions from livestock and natural gas are nearly equal.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Sincerely,  
Kellen Dunn  
snobunnie1992@yahoo.com [your location will go here]

**Date:** Monday, March 28, 2022 2:26:21 PM

---

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Cows produce 150 billion gallons of methane per day.

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

Please act boldly to revoke the conditional concurrence. Despite overwhelming evidence of water pollution, bulldozing of natural habitat, toxic dumps from ranches threatening marine sanctuaries, the NPS continues to neglect its duty to preserve and protect a National park. We are counting on you to hold them accountable.

Sincerely,  
russ ziegler

**Date:** Monday, March 28, 2022 2:26:19 PM

---

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

The cattle in PRNS produce six and half times the greenhouse gases that the two million-plus visitors and their cars do each year. As our world is being consumed by mega-fires, extreme drought and vanishing water supplies, it's time to phase out the largest air pollution source in our seashore: cattle ranches and dairies. No climate action plan or strategy can alter this reality. It's past time for the cows to be removed from the seashore.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
Sharon Longyear

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:26:18 PM

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

The extreme and dangerous levels of water pollution cannot be mitigated with best management practices (BMPs). The SF water quality board has determined that some of the mitigation measures are "technically or financially infeasible" and "in the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS"

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,

**From:** [Carol Collins](#)

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:26:17 PM

---

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC’s requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS’s General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Carol Collins

**Date:** Monday, March 28, 2022 2:26:14 PM

---

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

Cattle manure from both beef and dairy operation, has significant impact on the multiple waterways in the watersheds in PRNS. Even if cattle are fenced out of waterways and riparian areas, during the rainy season, the precipitation moves the manure downhill, and into our waterways. No best management practices can stop this from occurring.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

I hope that the CCC will do whatever it can to remedy the situation.

Sincerely,  
Kathy Kelly

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term ‘clean coal’ used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS’ purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California’s endemic Tule elk.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS’ plan

Sincerely,  
Fred Granlund

**Date:** Monday, March 28, 2022 2:25:10 PM

---

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

Due to the NPS' plan to cull free-ranging Tule Elk and the significant die-offs of Tule Elk held captive behind an eight foot fence without sufficient water and forage, I urge the Commission to withdraw your conditional approval provided to the NPS' plan (CD-0006-02).

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
Linda Berger

**Date:** Monday, March 28, 2022 2:25:08 PM

---

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Caroline Boston

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

The free-ranging Drakes Beach Tule elk herd at least have access to water, as they are located in an area of the National Park with a few watersheds. However, the watersheds in PRNS are polluted with high levels of bacteria from cattle manure, which will cause Johne's disease in our Tule Elk. Please end ranching in PRNS, in order for our Tule Elk, other wildlife and aquatic life, to have access to clean water.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Betty Kissilove

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

I urge the Commission to do the right thing. Please protect our National Seashore, and revoke your conditional concurrence.

Sincerely,  
Jim Petkiewicz

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

Kindly act in the best interest of the public good.

Sincerely,  
Kenneth Gibson

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
Laurel Collins

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

“Livestock are one of the most significant contributors to today’s most serious environmental problems,” senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. “Urgent action is required to remedy the situation.”

Our free-ranging elk are being managed by the NPS through culling. And the free-ranging elk have to learn to survive in PRNS by eating non-native annual grasses planted by the tenant ranchers, vs the elk having native vegetation which they evolved with. It is time to remove the cattle to give our Tule elk the freedom to roam without the risk of being killed, and to restore the native vegetation which is what the Elk should have access to.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS’ plan (CD-0006-02 ).

Sincerely,

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

The NPS noted in their March 4, 2022 letter – “At this time, the NPS does not intend to initiate reduction of the Drakes Beach herd to a population threshold of 140 individuals.” This is an atrocious statement on many levels. The NPS threw out an arbitrary number of 140 (was 120), and there is no biological, ecological rationale for this number. NPS personnel should be focused on science to support the natural resources on public lands, and not focus on the will of the ranching tenants.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

Upon close reading of the EIS for the GMPA, it's clear that ranch operations cannot continue if clean waters are to be achieved in the park. For a ranch to be economically functional requires a minimum number of cows, and that number will produce so much manure, it will have to be spread on the land, where it will inevitably run off into the local waterways. That runoff has been shown to contaminate the waterways with levels of e. coli, enterococcus and other bacteria far beyond safe levels, despite the applications of BMPs. For clean water, private cattle operations must be removed from PRNS.

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Jennifer Kelly

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

Even if the NPS presents an action plan at the upcoming hearing to address the Commission's concerns regarding water pollution, air quality issues and appropriate tule elk management, it cannot be trusted to actually implement it. The perfect example of this is NPS's refusal to monitor known polluted waterways since 2013. It was private citizens, concerned about excessive and dangerous bacterial levels in Kehoe Lagoon, Abbotts Lagoon and other locations that tested the waters in 2021, at their own expense. As expected, contamination rates significant and harmful to public health and aquatic health. Did the NPS restart testing then? No, they did not. They have consistently ignored the public's outcries demanding they take action. NPS cannot be trusted to fulfill its duties to protect our park and the public's resources.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:24:42 PM

---

Dear California Coastal Commission ,

California has always been a leader in passing regulations for environmental standards that are resisted by private interests. Within the Point Reyes coastal zone you have the power to enforce the state water quality standards to protect a natural resource from private ranching interests and hold a federal agency accountable. I urge the Commission to revoke your conditional approval of CD-0006-02.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Per the NPS’ own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO<sub>2</sub>/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO<sub>2</sub>/year in PRNS is to remove all cattle ranching from these public lands.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
Maggie Frazier

Dear California Coastal Commission ,

In the midst of a pandemic when the general public needs to have the ability to enjoy clean air, clean water, and enjoy watching the iconic Tule Elk, I urge the Commission to not support the NPS plan which will extend and expand the destructive cattle operations in PRNS.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels of E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact on marine life in the ocean.

Cattle ranching generates high levels of methane – independent scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS' plan (CD-0006-02 ).

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like “Regenerative” and “carbon farming” techniques.

Over the last decade, California has lost a significant percentage of the remaining Tule Elk due to the NPS’ purposeful culling of free-ranging herds in PRNS, and the horrific deaths of the Tule elk held captive in the Elk Preserve due to lack of sufficient water and forage. This is wrong, as the sole cause on the loss of Tule elk in PRNS is the prioritization of tenant cattle ranching over California’s endemic Tule elk.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS’ plan.

Sincerely,  
Jennifer Kelly

**Date:** Monday, March 28, 2022 2:24:31 PM

---

Dear California Coastal Commission ,

Kindly consider the problems with how our National Park Service is operating Point Reyes National Seashore.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

"Livestock are one of the most significant contributors to today's most serious environmental problems," senior UN Food and Agriculture Organization (FAO) official Henning Steinfeld said. "Urgent action is required to remedy the situation."

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Armando A. Garcia

Dear California Coastal Commission ,

Having read that the National Park Service wanted more time to come up with the simple mitigation plans the Commission required as a condition of approval for Consistency Determination CD-0006-20, it seems to me that the NPS's priorities continue to be misplaced. The NPS should be focused on the significant air and water pollution caused by tenant cattle ranchers, as well as protecting our native Tule Elk.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

Tule elk naturally roam and graze lightly, which allows them to coexist with the native plants at Point Reyes. But the cows move less and eat everything down to the ground, which kills the native plants and causes erosion and other ecological problems. Cattle are impacting our Tule elk, the quality of air, and quality of water in PRNS.

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Timothy Mullen

**Date:** Monday, March 28, 2022 2:24:20 PM

---

Dear California Coastal Commission ,

I urge the Commission to withdraw the conditional approval of the NPS' plan as we must end the constant environmental damage occurring in our National Seashore caused by private cattle operations.

In their letter dated March 4, 2022 the NPS says a delay in submitting plans to the CCC is necessary because they have delayed issuance of leases. Issuing leases has no bearing on preparing a water quality sampling plan but by falsely linking these two issues the National Park Service seeks to control the schedule.

I urge the Commission to perform due diligence on the Climate action plan to be submitted by the NPS. Regenerative ranching and carbon sequestration are new terms utilized by the Ag industry that is equivalent to the term 'clean coal' used by the coal industry. Cattle operations are destructive to the land, and air on many levels, and are a major cause of our climate crisis.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Lynette Ridder

Dear California Coastal Commission ,

Regarding the Coastal Commission's upcoming hearing on Agenda Item 18a, conditional Consistency Determination CD-0006-20 for the National Park Service's General Management Plan Amendment, I find it galling the claim the NPS cannot provide a water pollution control plan, an air pollution control plan, and a report on free-roaming tule elk herds management, as required by the CCC, because they are being sued. The lawsuit challenges the basis for their Record of Decision to make permanent the private, for-profit ranches that despoil our park. It does nothing to prevent them from doing what they should have been doing all along: testing the park's waters for cattle-caused fecal and other pollution, reducing or removing cattle where such pollution cannot be abated, and making ranchers who harm the public's resources fix the problems they've caused.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on "best management practices", but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Sylvia Vairo

Dear California Coastal Commission ,

I am writing the Commission to request to do whatever it can to protect and restore wilderness at Point Reyes National Seashore.

CCC staff has already determined that the GMPA is not consistent with the coastal act policies related to protecting marine resources (Section 30230) and water quality (Section 30231). You have the statutory mechanisms to object to this concurrence. Please do not settle for anything less than holding concurrence until adherence to state standards of water quality is achieved.

The United Nations states, “The sustainable use of land, soil, water and energy for food contributes to greenhouse gas emissions that cause rising temperatures.” During the April 2021 CCC meeting, the NPS stated they will partner with Marin County initiatives to address the climate impact caused by cattle ranching operations in our National Park.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Jennifer Kelly

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

The NPS has not performed surface water quality testing since 2013, even though prior NPS data, and data from concerned citizens and environmental organizations have documented the significant levels of pollution in drainages in PRNS that flow into the Pacific Ocean. The high levels are E.coli and Enterococcus not only are a public health issue, but also detrimental to aquatic life in the waterways and will have an impact to marine life in the ocean.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

The NPS is being sued because the NPS' Plan is violating the NPS' own Organic Act, the Clean Water Act, the Point Reyes Act, and NEPA policy. I urge the Commission to remove your conditional approval, and find the NPS' plan inconsistent with the Coastal Act.

Sincerely,  
Phillip Mitchell

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

Native Tule Elk are a protected species in California, and domestic cattle raised for private, for-profit endeavors are not.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Lily Lau-Enright

---

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Javier Rivera-Diaz

Dear California Coastal Commission ,

The National Park Service (NPS) was to provide a water quality strategy, a climate action strategy, and an update on the free-ranging Tule Elk to the Coastal Commission within 12 months of April 2021, however the NPS staff at Point Reyes National Seashore requested to extend their commitment. The NPS inaction on ongoing critical issues in our National Park on the California coast is unacceptable. I urge the Commission to withdraw your conditional approval for CD-0006-02.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

The McClure Dairy, on the I Ranch parcel, ended their dairy operations in the summer of 2021, for multiple reasons: there is an organic milk glut, the natural spring on the leased parcel ran dry, and the rancher wants to retire. However, even with the removal of approximately 600 dairy cows, 150 heifer remain as the rancher wants to keep the lease, but the water quality continues to be impacted from the cattle manure on the land.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
Glenda Corning

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

NPS has not done water quality tests there since 2013, for reasons withheld, even though there were significant bacteria and other issues found at that time. The results, published March 3, 2021, show 5X the safe human limit of coliform bacteria, 40X the safe limit for E. coli, and 300X the safe limit of enterococci. Please note this level of pollution, caused by cattle manure, occurs even after the NPS and ranchers implemented over 30 best management practices and 170 management activities over the last 20 years to improve water quality in Point Reyes National Seashore.

Beef and dairy operations are well known to be leading causes of climate change, so they don't belong in a national park. At PRNS, overgrazing has removed the natural root system of the coastal prairie plants, which was a natural carbon sink. No amount of "regenerative grazing" (a debunked concept) will ever bring that root system back. Only the removal of cattle will restore carbon into the earth.

I am offended by the idea that native tule elk must be "culled" because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Lisa Jacobson

---

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Kevin Davis

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

No climate action strategy will address the horrific air pollution that is caused by private cattle ranching in PRNS. Per the NPS' own EIS, 24,000 metric tons of GHG are released into the air because of cattle operations. This is not acceptable in the midst of climate change, and in a National Park.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

California is running out of water, extractive industries are impacting the quality of air, and we are losing wildlife on a daily basis. Let's use Point Reyes National Seashore as a model for 30 x 30 and remove destructive ranching from our public land. Please revoke your conditional approval, and vote No to the NPS' Plan B as it is not consistent with the Coastal policies in California

Sincerely,  
V Robert Wallace

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

As a frequent visitor to Point Reyes National Seashore I am appalled that our National Park Service allows ranchers to use the creeks and streams as open sewers for their cow manure. The disease-causing bacteria in cow feces and human feces are the same. Should we allow humans to defecate in Drakes Estero and Abbots Lagoon?

Grazing, is analogous to mining, logging, or drilling on public land, in that these processes can only degrade and deplete not protect. Before committing your key decision on unproven methods proposed by vested interest, please consider that the simplest, proven and cost-effective way to address climate change is to just let Point Reyes be a National Park.

The National Park Service (NPS) continues to fail the public, our environment and our native wildlife, especially our Tule Elk. Our Drakes Beach herd is now at 151 free-ranging animals, and the NPS has the ability to kill the Tule elk to reduce an arbitrary number of 140 – there is absolutely no science behind this number.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

I want to thank the Commission for the opportunity to provide public comments. I no longer want to see nor hear of the continual impact of ranching on my public land. Please hold the NPS accountable, and vote against the NPS' plan. The impacts of ranching in PRNS is well documented in the NPS' own EIS - ranching must end in PRNS.

Sincerely,  
Samuel Durkin

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

No amount of "best practices" will ever stop beef and dairy operations from being a villain in the struggle against climate change.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Dear California Coastal Commission ,

Point Reyes National Seashore (PRNS) needs more agencies to help save and protect our public land from the constant impact caused by tenant cattle operations on 1/3 of our Park. Please partner with me and other environmental organizations, and withdraw your support from the NPS Plan.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johnes disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

Please withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,

Dear California Coastal Commission ,

Our environment and wildlife in PRNS is worth saving, therefore I kindly ask the Commission to prioritize our National Park over tenant cattle ranching, and revoke your conditional approval of the NPS' plan.

NPS had decades to fix the water quality issue and their solution was to stop testing. They are still not serious about solving this issue since they are asking for an extension to provide a water monitoring strategy. With the federal consistency review the California Coastal Commission has an important responsibility to bring adherence to state water quality standards. CCC should hold the concurrence till NPS has fixed this issue.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

Tule elk are native to this region, but domestic cattle are not. It is unfathomable the NPS' plan will allow culling of our native species to benefit a handful of highly subsidized ranchers that are running their commercial businesses in a National Park. This is not appropriate.

As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I truly thank the CCC for holding the NPS accountable, and respectfully ask the Commission to withdraw your conditional approval of the NPS plan, as the plan will continue to impact our waterways, our air quality, our native wildlife and native vegetation.

Sincerely,  
Judy Sylvester

**Date:** Monday, March 28, 2022 2:23:30 PM

---

Dear California Coastal Commission ,

As a citizen who enjoys public parks, I want commercial ranching at Point Reyes National Seashore to be discontinued, therefore I urge the Commissioners to withdraw their conditional approval of the NPS' plan CD-0006-20

A 36,000 sq foot loafing barn, a massive concrete structure, was allowed to be built on I Ranch in 2004 on the hills along the Pacific coast, to reduce the high level of bacteria in Abbotts Lagoon located downhill from a dairy operation. However, data from January 2021, notes water flowing downhill from the McClure dairy and into Abbotts Lagoon, exceeded E. coli limits by a factor of 20 and enterococci limits by a factor of 60. Loafing barns are considered a best management practice (BMP) to address water pollution in PRNS, however this is a prime example noting loafing barns are not improving water quality to meet the safe criteria.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS' and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS' plan, and find the plan not consistent.

Sincerely,  
Nancy PEARLMAN

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

The Commission's post-hearing letter of May 10th, 2021, to Supt. Kenkel gave clear and specific direction to the NPS on how to structure a water quality monitoring program designed to address the degraded and polluted condition of the seashore's waters, as well as a Climate Action Plan and to report on the status of the tule elk herds. For Supt. Kenkel to request an extension to the CC's deadline smacks of bureaucratic foot dragging. The Commission must not budge on its NPS performance requirements.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

It is distressing to know the National Park Service (NPS) has the ability to cull free-ranging Tule Elk in a National Park to support the demands of cattle ranching tenants.

The CCC's mission is to protect and enhance the California coast. It reads "The Commission is committed to protecting and enhancing California's coast and ocean for present and future generations. It does so through careful planning and regulation of environmentally-sustainable development, rigorous use of science, strong public participation, education, and effective intergovernmental coordination."

Per the CCC's mission statement and the data available to the CCC documenting the significant environmental impact to our waterways in PRNS, including the NPS intent to cull our wildlife for private commercial ranching, I request the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) in order to protect the natural resources on our public lands.

Sincerely,  
Joseph Boone

Dear California Coastal Commission ,

Private cattle operations on 1/3 of our public land in PRNS, is not an appropriate use of land in a coastal zone for multiple reasons. For the April 7 CCC meeting, I urge the Commission to revoke the conditional approval of the NPS plan, on the basis of ongoing pollution of our waterways, significant levels of methane released into the atmosphere on a daily basis, and the culling of elk.

Despite finding very high fecal bacteria levels at Point Reyes National Seashore, the NPS decided to stop monitoring surface water in 2013. The NPS justifies this neglect by saying they would rather spend our tax dollars on “best management practices”, but water sampling conducted after these BMPs were constructed show continued risk to human health and wildlife from bacteria and excessive nutrient and sediment loading.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

I urge the Commission to not support the NPS’ plan to cull native Tule elk in PRNS.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS’ plan

Sincerely,  
Tressa Reisberg

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

The successful rescue of the tule elk species from the brink of extinction is a signal achievement of the National Park Service. Elk in Point Reyes provide a significant tourist attraction and natural feature in the park. Confining, hazing, and culling these animals for the sake of private commerce on public land is antithetical to the intent of National Parks.

The impacts of ranching in PRNS is well documented in the NPS’ own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Kevin Vaught

**Date:** Monday, March 28, 2022 2:23:20 PM

---

Dear California Coastal Commission ,

As a concerned citizen over the environmental health of our National Park in Marin County, I urge the Commission to withdraw your conditional approval for CD-0006-02.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

Thank you for the opportunity to provide the public to share our concern. Based on continual delays by the NPS to appropriately manage our National Seashore, the public urges the Commission to withdraw your conditional approval of CD-0006-02.

Sincerely,  
Susan Berzac

**Date:** Monday, March 28, 2022 2:23:16 PM

---

Dear California Coastal Commission ,

For the sake of the health of the ecosystems in PRNS, I urge the Commission to rescind your conditional approval of CD-0006-20, and find the NPS' plan inconsistent with the Coastal Act.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

Regarding regenerative ranching and carbon farming, if you research these topics, you see two basic sets of results: industry results (including certain universities with industry funding) which emphasize high-end potential benefits but without peer-reviewed, repeatable, convincing science, and independent bodies such as the U.N.'s Intergovernmental Panel on Climate Change which are more realistic and deflationary. These approaches are more and more recognized as a green-washing attempt, along the lines of "Clean Coal." I ask the Commission to perform research on the published articles available many of which documents the lack of benefit to address the climate crisis.

Tule elk have a remarkable history, having been brought back from the brink of extinction. Their presence at Point Reyes is proof that positive change is possible. NPS policy, which favors commercial livestock over wildlife, doesn't reflect the values of those who created the park.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Anne Parzick

Dear California Coastal Commission ,

I have been a long-time advocate for removing the private, for-profit ranches from our National Seashore. Regarding Agenda Item 18a (CD-0006-20), it's no surprise the National Park Service is trying to weasel out of their responsibilities to ensure those ranches stop damaging what should be a pristine environment held in trust for all people today - as well as future generations - to enjoy and cherish. The NPS has acted mostly as the agents and advocates for cattle ranchers who, having been paid fair market value for the land, should have departed the park decades ago. It's my sincere hope that the Commission will hold the NPS to its commitments – or reverse Consistency Determination CD-0006-20.

Water quality data shared for public review, and local, state and federal review, clearly documents significant levels of pollution in our waterways that flow into the Pacific Ocean, all caused by commercial cattle ranching operations that lease parcels in PRNS. It is unclear why this level of pollution continues to be condoned. As a visitor to PRNS, this is unacceptable.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

I urge the Commission to not support the NPS' plan to cull native Tule elk in PRNS.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Yves Decargouet

---

Dear California Coastal Commission ,

As one who is proud and awestruck by the unique California coastline and biodiversity, especially in Point Reyes, I would like to thank you for your efforts to protect the only National seashore on the West coast.

People who visit the beaches and bays of Point Reyes National Seashore may already be getting sick from the fecal bacteria in the water they swim, wade, and kayak in but have no way of knowing the source. The National Park Service knows this, so not only do they not monitor water quality, they don't even put up warning signs when they know contamination from cattle waste is likely during periods of rain.

PRNS beef and dairy operations cause climate change, both through the consumption of living plant matter (carbon) and through the emission of methane. Methane emission in particular has increased during the past few decades, because cow manure in their modernized operations is stored, rather than aerobically composted.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Heather Walker-Dale  
arydonis@hotmail.com [your location will go here]

Dear California Coastal Commission ,

I ask the Commission to no longer support the NPS' plan to expand and extent destruction cattle operations on our California coast in PRNS. Nothing in this plan will provide the protection of water, air and native wildlife on our public land. It is time to end the leasing of 1/3 of our National Park to commercial ranching operations, and return it to the public and all wildlife to enjoy.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive "methane digesters" have limited effectiveness, and only mitigate a problem which shouldn't even exist at a national park.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,  
Marjorie Angelo

**Date:** Monday, March 28, 2022 2:23:06 PM

---

Dear California Coastal Commission ,

I am urging the Commissions to rescind their conditional approval of the environmentally destructive NPS plan CD-0006-02. Our National Seashore, located on the California coast line, deserves to be without commercial ranching operations that impact our public land.

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

Assuming the NPS' strategy on Climate Action includes regenerative ranching and carbon sequestering as a means to combat climate change the California Coastal Commission should be aware that the claims of regenerative ranching and carbon sequestering are far from proven. In an article by J. Dutkiewicz and G.N. Rosenberg "The Myth of Regenerative Ranching (Sep. 23, 2021) the authors debunk the notion that regenerative ranching can hold answers to limiting the impact of dairy and cattle on climate change. They note a study done by Oxford scholars in 2017 found that grass-fed livestock "does not offer a significant solution to climate change as only under very specific conditions can they help sequester carbon. This sequestering of carbon is even then small, time-limited, reversible and substantially outweighed by the greenhouse gas emissions these grazing animals generate." The California Coastal Commission should be fully informed of all of the arguments, both for and against these practices before agreeing to NPS' strategy.

It is the native Tule Elk that bring people from all over the Bay Area, and the US to see these majestic animals in our National Park. Please help protect them from the culling by the NPS.

The impacts of ranching in PRNS is well documented in the NPS' own EIS therefore we must end commercial ranching in PRNS. Please withdraw your conditional approval.

Sincerely,  
Amy Dozier

Dear California Coastal Commission ,

On April 22, 2021, the Commission conditionally concurred in a vote of 5-4 with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA). For the upcoming meeting on April 7, I respectfully request the Commission to revoke your conditional approval.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

Please rescind your conditional concurrence, and help us protect our native Tule Elk, our landscape, our waterways in PRNS.

Sincerely,  
Alexandria Luostari  
[Alexandria.luostari@gmail.com](mailto:Alexandria.luostari@gmail.com) [your location will go here]

**Date:** Monday, March 28, 2022 2:22:13 PM

---

Dear California Coastal Commission ,

I am passionate about protecting our National Parks and coastal zones for public use. Therefore I am writing to request the California Coastal Commission to reassess and revoke your conditional approval of the NPS plan, based on water quality data available documenting the significant pollution occurring in the watersheds that drain into the Pacific Ocean, the constant impact of methane released into the atmosphere by private cattle operations, and the culling of native Tule elk in PRNS.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

The NPS says it will develop a plan to address the methane pollution caused by the cattle in PRNS, but there is no plan that can effectively do that, other than removal of virtually all the cows. Even methane digesters don't capture the belches and farts cows emit, so there will continue to be excessive damaging air pollution in PRNS as long as there are more than just a very few cows there. When one thinks about how PRNS could be the shining example of President Biden's desperately needed 30 X 30 rewilding program, it becomes clear that continued destructive ranching is the last activity that should be allowed in the park.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

We need to keep methane out of the air, manage our limited water supply and protect our wildlife, in the midst of climate change and a biodiversity crisis. I urge the Commission to revoke your conditional approval on the NPS' plan and help us save our Seashore.

Sincerely,  
John Beck

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 2:22:06 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
elizabeth mostov  
li\_dode@yahoo.com [your location will go here]

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

The NPS’ plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS’ plan.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS’ plan (CD-0006-02)

Sincerely,  
H. Lehman Holder

**Date:** Monday, March 28, 2022 2:21:55 PM

---

Dear California Coastal Commission ,

I am writing to urge the California Coastal Commission to reconsider its finding of the Point Reyes National Seashore General Management Plan Amendment as conditionally compliant with the Coastal Act.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Per the NPS' own Environmental Impact Statement, it notes that ranching in the park generates the equivalent of 24,000 metric tons of CO<sub>2</sub>/year, six-and-a-half times the amount generated by all the car traffic of the over two million annual visitors to PRNS. These emissions are over 60% of overall park emissions, and 21% of countywide agriculture emissions. The only way to effectively end the 24,000 metric tons of CO<sub>2</sub>/year in PRNS is to remove all cattle ranching from these public lands.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public's vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don't miss this opportunity. Do what's right and rescind Consistency Determination CD-0006-20. I thank you.

Sincerely,  
Rohana Wolf

Dear California Coastal Commission ,

I request the Coastal Commission to revoke their Conditional Concurrence it issued in April 2021 for CD-0006-20 due to lack of management of the National Park Service of the documented, and ongoing issues on water quality, climate impact, and culling of free-ranging Tule Elk.

Despite efforts by National Park Service (NPS) to implement best practices (specifically over 170 of them- reference NPS's :General Management Plan Amendment Record of Decision, pg. 97) water quality remains to be a high concern. Western Watershed press released noted that "water sampling from Kehoe Creek and Abbotts Lagoon on January 27 and 28, 2021, showed that bacteria contamination of surface water dramatically exceeded acceptable water quality standards despite the reported implementation by the park service of waste management actions in drainages impacted by dairy and beef ranches... Bacteria results for the South Fork of Kehoe Creek were 30 times the allowable limit for applicable water quality standards for the bacterium *Escherichia coli* (E. coli) on January 27, and 20 times the limit on January 28. Kehoe Creek drains to Kehoe Lagoon at Kehoe Beach and, with heavy rains, the lagoon flows to the ocean. The Lagoon and the ocean are popular recreational spots with direct human contact, which triggers more stringent water quality criteria. A sample was taken from the Lagoon on January 28 and it exceeded E. coli limits by a factor of 40, and exceeded enterococci limits by a factor of 300 (Enterococcus is another large genus of bacteria)."

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Given the above facts, and the history of the PRNS management catering to the needs of the ranchers over those of the public, it is entirely appropriate for the Commission to revoke its finding of a Consistency Determination. I hope that will be the outcome of the April 7th hearing. Thank you for your consideration.

Sincerely,

**From:** [Patricia Poock](#)

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

It's disingenuous of the NPS to extrapolate ongoing benefits without documented evidence, which is lacking. The lack of water testing by the NPS provides a convenient fig leaf for them to make spurious claims about future "potential" water quality improvements. This "see no evil" attitude may be one reason why the Park Service is failing to provide the Commission with the water and air pollution strategies the CCC has required for its Consistency Determination (CD): no testing = no pollution = no problem to address.

When emissions from land use and land use change are included, the livestock sector accounts for 9 per cent of CO2 deriving from human-related activities, but produces a much larger share of even more harmful greenhouse gases. It generates 65 per cent of human-related nitrous oxide, which has 296 times the Global Warming Potential (GWP) of CO2. Most of this comes from manure.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

Please repeal your conditional approval. It is time for our National Seashore, the only Seashore on the California coast, to be given the opportunity to be restored to a healthy environment by removal of all cattle operations in our public land.

Sincerely,  
Janet Heinle

---

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

Commercial operations, such as the PRNS dairy and beef ranches, must push for maximum output from within their allotted space, in order to be profitable in a modern competitive market. This explains why those ranches have increased the magnitude and mechanization of their operations, ever since the PRNS was established many decades ago. Excess manure causes surface water contamination, and also problems with runoff into the seashore.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Jared Cornelia

---

Dear California Coastal Commission ,

We are in the midst of both a significant climate crisis and biodiversity crisis. One way to help address these catastrophic events is to end the destructive, private ranching in PRNS by withdrawing the conditional approval of the NPS' plan B.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

In conclusion, it is abundantly clear that if allowed, the NPS will continue in its historic pattern and avoid as much as possible holding the ranchers responsible for the damages their operations cause in PRNS. It is only due to the CCC's efforts to protect our environment and hold fast to the California Coastal Act that the public can have any assurances that decades of fecal coliform, enterococcus and other bacterial pollution, excess nutrients, and other forms of water pollution might be reduced or eliminated, that some measures to reduce GHGs in the park might be addressed, and that the native tule elk might not be shot for the benefit of profit-seeking, environmentally-destructive ranchers. Even if the NPS presents belated plans to address the Commission's CD requirements, the issue of NPS reliability still justifies the CCC's withdrawal of its Consistency Determination. We ask that you do that.

Sincerely,  
Amber Sumrall

**Date:** Monday, March 28, 2022 2:21:34 PM

---

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

I urge the Commission to perform your own research reading independent and scientific articles documenting that regenerative ranching and carbon sequestration will have no to minimal benefit on our public land in PRNS.

PRNS is the only national park with tule elk. Currently there are approximately 500 elk in total (with a die-off in progress as of this writing) in the Seashore and about 5,500 cows, and there are about as many cows in the Seashore as there are tule elk in existence.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Dr Kristi Dunn

Dear California Coastal Commission ,

As an independent quasi-judicial state agency with federal consistency review authority you have the power to hold the park service accountable to the statute of the enabling legislation of Point Reyes act for the “maximum protection, restoration and preservation of the natural environment of the area”. We are counting on you to help us keep the park service accountable.

The National Park Service has not tested the waters of Pt. Reyes National Seashore since 2013, but they claim implementation of “best management practices” (BMPs) have and will continue to reduce water pollution caused by massive amounts of cow manure draining into the park’s waterways and the Pacific Ocean. Please note the high level of pollution in our waterways per the water quality data provided to date. BMPs are not the answer to protect the public, and to protect aquatic and marine life in this coastal zone.

The Climate Crisis is real. Per data provided by the IPCC, we are at the tipping point to address this issue for future generations. Therefore, it is unclear why a highly impactful industry which releases tons of methane into the atmosphere, continues to be allowed in a National Park, when PRNS, located in coastal zone, should be some of the most protected lands. No activity will stop the continual release of methane into our air in PRNS, unless private cattle operations are required to end.

I am opposed to any policy that kills tule elk in favor of private business operations in a public park.

Please stand with the people of the state of California and not private interests. Public opinion is being disregarded, we need your help in getting heard.

Sincerely,  
Arlene Zuckerman

Dear California Coastal Commission ,

I am concerned about the ongoing mismanagement of Point Reyes National Seashore, which is detrimental to the public good.

In their letter dated March 4, 2022 requesting a delay in submitting water quality monitoring and climate strategy plans, the National Park Service claimed they have not prepared a water quality monitoring plan because they were busy contracting with laboratories, training staff, and procuring equipment. Not only do these activities not preclude preparation of a monitoring plan, they are usually done after a plan is approved so the number and types of analyses and equipment are known.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

It is negligent and irresponsible to cull a native species, whose population is on the decline in a National Park. Private, for-private cattle ranching operations in PRNS should not be prioritized over native Tule Elk.

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Stephanie Trasoff

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

The Voeller paper states 30 best management practices (BMPs) were implemented during from 2000-2013, however per water quality data reported and submitted to the Commission over the last year, it is evident BMPs do not work, as the watersheds in PRNS continue to be significantly polluted.

Beef and dairy cows at PRNS emit methane, a highly potent greenhouse gas, via burping and manure. There is no practical way to stop this process, except by removing the cows. Expensive “methane digesters” have limited effectiveness, and only mitigate a problem which shouldn’t even exist at a national park.

Tule elk exist only in California, and their numbers still are much lower than they were in the nineteenth century. There is no good reason that cattle in a national park should outnumber the tule elk by a factor of ten.

California is usually the leader in environmental safeguards, and Point Reyes National Seashore another opportunity on how to address climate crisis and the ongoing drought in this state. The public asks the CCC to vote against the NPS’ plan (CD-0006-02 ).

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

The NPS' Voeller paper states early BMPs implemented have a large effect of improving water quality however subsequent BMPs implemented do not. The NPS implemented over 30 BMPs, and 170 management activities to improve water quality, therefore it is doubtful any additional BMPs will ensure our water in PRNS will improve.

US Methane emissions from livestock and natural gas are nearly equal.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8' fence. In addition, the NPS' plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Tracy Drake  
tld1218@hotmail.com [your location will go here]

**From:** [Jess Taylor](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 1:40:10 PM

---

Dear California Coastal Commission ,

I am writing the California Coastal Commissioners requesting to withdraw your conditional approval from the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

The culling of Tule Elk is not consistent with the Coastal Act as it is not protecting natural resources in PRNS. Please to not support, nor find consistent any plan by the NPS that allows the killing of a protected, native species.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
Jess Taylor  
citta\_alta@yahoo.com [your location will go here]

**From:** [Nick Tucker](#)  
**To:** [Coastal Point Reyes Management Plan](#)  
**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 1:38:15 PM

---

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

During the rainy season from 2021-2022, it was shared the Sonoma County Dairy Association were sampling surface waters in PRNS on behalf of the tenant beef and dairy ranchers. These water quality data should be made public, and submitted to the Commission, the San Francisco RWQCD, as the NPS has failed to provide any water quality data since 2013.

Animal agriculture is responsible for 18 percent of greenhouse gas emissions, more than the combined exhaust from all transportation, while transportation exhaust is responsible for 13% of all greenhouse gas emissions.

In just two years (2020-2021) over half of the Tule elk in the Elk Preserve died and the herd decreased from 445 individuals to just 221 surviving elk. The free-ranging herds are now at risk of culling, based on the NPS' plan.

Kindly act in the best interest of the public good.

Sincerely,  
Nick Tucker  
NicolasAnthony.Tucker@gmail.com [your location will go here]

Dear California Coastal Commission ,

Point Reyes National Seashore is a gem located along the Pacific Coast, and millions of people visit it each year to see the majestic Tule Elk, the elephant seals along the coastline, including the avian species which utilize PRNS as it is in the Pacific Flyway. For these reasons and more, I am writing to ask the Commission to help protect PRNS from cattle ranching, and revoke your conditional approval of CD-0006-20.

In 2017, a published report documented a leased parcel operating a cattle ranch in PRNS had the state's highest reported E.coli level. In 2021, data from a water quality study conducted in PRNS by an expert and downstream from leased parcels that operate polluting dairy and beef operations, confirmed bacteria levels exceeding water quality criteria in public waterways at Kehoe Creek and Abbotts Lagoon. These results were consistent with the NPS' results from 1999-2013, and once again, shows harmful bacteria levels in waterways in our National Park, even after best management practices were installed over a decade ago in these watersheds.

I caution the Commission of green-washing by the NPS, PRNS tenant ranchers, pro-ranching organizations and pro-ranching Board of Supervisors, and regional politicians, It is important for the Commission to read and reference independent, scientific, published articles on the lack of significant and long-term benefit regenerative ranching and carbon farming to address the climate crisis.

The public comes to PRNS to enjoy the natural resources, including the iconic Tule Elk. The NPS should not cull Tule Elk to support private cattle ranching in PRNS

These ranchers that lease parcels in PRNS, can move their commercial businesses outside of the park to the lands they own in Marin and Sonoma Counties, or lease land from other cattle ranchers. Removal of all ranching operations in PRNS will save and restore on our public land. I urge the Commission to withdraw your conditional approval as this plan is not consistent with the Coastal Act.

Sincerely,  
Rachel Taylor

**Subject:** Public Comment on April 2022 Agenda Item Thursday 18a - CD-0006-  
**Date:** Monday, March 28, 2022 1:05:15 PM

---

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

Data available indicate that even after implementing significant numbers of best management practices (BMPs), water quality samples in Point Reyes were generally very poor and exceed bacteria limits for recreational contact more often than not. Testing by NPS in certain watersheds in Point Reyes ended in 2013, however recent testing done by concerned citizens in January 2021, shows that water quality remains extremely poor and that improvement trends implied by the NPS as of the end of their testing in 2013 are in fact not occurring.

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

Please do not allow the NPS to kill our free-ranging Tule elk. Our elk should be given the freedom to roam, especially in the only National Seashore on the West Coast.

Again, for the sake of water quality, the climate and biodiversity crisis, I urge the Commission to withdraw your conditional approval of the NPS' plan (CD-0006-02)

Sincerely,  
Scott Webb

Dear California Coastal Commission ,

On Earth Day 2021, the CCC narrowly voted in favor of extending commercial operations with conditions to submit a water quality strategy and climate action plan. While it was discouraging the commission would vote in favor of continuation and extension of commercial operations that are degrading a precious natural resource, we would like to thank the commission for setting conditions on concurrence and enforcing compliance standards that are long overdue.

The NPS and tenant cattle ranchers are aware of extremely high levels of pollution occurring in our streams, lagoons, waterways in PRNS, many that drain into Drakes Estero and the Pacific Ocean. It is unclear why the NPS and tenant ranchers have failed to do the right thing, by testing water quality over the last several years, while knowing of the high level of pollution that directly impacts public health and aquatic health.

Livestock is responsible for 65% of all human-related emissions of nitrous oxide – a greenhouse gas with 296 times the global warming potential of carbon dioxide, and which stays in the atmosphere for 150 years.

Please provide our native Tule Elk from the NPS' and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

Your strong position on this federal consistency determination will send a powerful message that preserving a natural resource matters.

Sincerely,  
Woody Elliott

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

Proposed water quality improvements by the NPS at this stage should not be the continuation of current versions which have shown to fail to meet established water quality standards.

Over 5000 cattle are in the Seashore and use up to 78 million gallons of water per year, for drinking, and cleaning manure out of dairy barns. This is allowed to occur at a time of recurring drought in California, driven by the climate change which is exacerbated by the other impacts of those same cattle in PRNS. This is not right, to continue to lease parcels for cattle ranching activities, while the area is in a drought period, and the public is being asked to decrease their water usage. The right step for our National Park and the climate crisis, is to remove all cattle operations immediately.

Tule elk are endemic to California, and PRNS is the only National park with Tule elk. We just lost approximately half of the elk herd held captive behind the 8' fence over the last 2 years, due to lack of sufficient water and forage – the NPS were aware of this because concerned citizens made them aware. And now, the NPS' plan allows for the culling of the free-ranging elk. Please withdraw your conditional approval of the NPS' plan as the public wants to see Tule Elk in our National Park, not domestic cattle.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Amy Allen

**Date:** Monday, March 28, 2022 12:29:18 PM

---

Dear California Coastal Commission ,

I am writing to respectfully request the CCC to help us protect our natural resources in PRNS, as it deserves to be saved and restored for the general public and future generations to come.

Voeller, et. al, “Rangeland 2021 Improved Microbial Water Quality Associated with Best Practices on Coastal Dairies and Livestock Operations” argue that agricultural best management practices (BMPs), such as fencing, manure management, development of off-stream water sources, and other means of separating cattle and their waste from surface waters, are effective at reducing fecal indicator bacteria (FIB). However, even Voeller admits that these practices don’t work in the rain noting: “Despite dramatic reductions, FIB concentrations still periodically exceed regulatory objectives and microbial pollutants remain that may introduce human, ecosystem, and other risks in our study watersheds...FIB levels increased across all stations during rainfall events.” He suggests smoothing the data to examine overall declines. Unfortunately, one can’t simply smooth the data when their child goes into the water and becomes ill. One, also, doubts species struggling to survive can ignore large spikes in pollutants during and after rains.

Removing cattle from the seashore and restoring native, perennial prairies and woody vegetation, which have been shown to sequester more carbon than the European grasses, would be an effective way to decrease carbon emissions.

Please provide our native Tule Elk from the NPS’ and cattle ranchers plan. No endemic species, that is protected by a federal conservation law, should be allowed to be culled.

Taking constructive action to eliminate or vastly reduce the methane pollution from too many cows, and allowing the native tule elk to live in peace in their natural environment are what the public wants from the Park Service, not excuses and more catering to the needs of the ranchers at the expense of the public. I urge the Commission to rescind the conditional approval of CD-0006-20, as it is time for the destructive cattle operations to end along our California coast in PRNS.

Sincerely,  
Walker Laughlin  
[walker@wellkind.org](mailto:walker@wellkind.org) 94930

Dear California Coastal Commission ,

It is time for the right step to occur in our National Park on the coastline of California, Point Reyes National Seashore (PRNS). I respectfully request the Commission to withdraw your conditional approval of CD-0006-02.

The letter from the NPS to the Commission said, “Since the release of the ROD, the NPS has met with ranchers to begin identifying operational and infrastructure needs to further improve resource conditions.” Besides being a conflict of interest, it is precisely this approach that has led to the current violations of standard. CCC should add the condition that independent conservation, ecological and public environment organizations provide oversight over water quality rectification.

Regenerative ranching and carbon farming have minimal short term benefit. Methane released continuously from cattle exceeds any possible benefit. We and future generations need this National Park to be restored to native coastal prairie landscapes, including native trees – this is what will help with soil and vegetation health which in turn will benefit reducing CO2 from the atmosphere.

The NPS is being sued by Harvard Animal Clinic, due to the preventable and horrific slow death caused by starvation and lack of water of the Tule Elk herd confined behind the 8’ fence. In addition, the NPS’ plan allows the culling of the free-ranging elk, to keep the native species from competing with cattle for forage and water. Why is this allowed and supported in a National Park ?

With an objection to the federal consistency determination you will send a strong statement that the best climate action plan is to prioritize environment over private interests especially in a National Park.

Dear California Coastal Commission ,

On March 4, 2022, Point Reyes National Seashore (PRNS) Superintendent Kenkel requested an extension on the agreed upon conditions, however the California Coastal Commission (CCC) denied the extension. I would like to thank the members of the CCC for holding the National Park Service accountable to address the agreed upon conditions from the April 2021 meeting.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

With respect to the Climate Action Strategy, when the Park Service does revert with a plan, the Commission can expect to hear an impressive group of buzz words such as "regenerative ranching," "carbon farming," etc. I urge the Commission to consider the source and do independent research regarding this unproven and self-interested set of speculations.

The Tule elk population were at approximately 500,000 in California until European settlers hunted them almost to extinction. Today there are as many cattle in PRNS as there are Tule Elk in California.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Daniel Dietrich

**Date:** Monday, March 28, 2022 12:03:08 PM

---

Dear California Coastal Commission ,

Given the lack of conclusive scientific studies and data that clearly demonstrate the NPS can meet regulatory standards on a consistent basis by means of best practices in regards to: water quality, reducing the impact of climate change, and improving the well-being of the elk without the full removal of dairy and cattle ranches, I urge the California Coastal Commission (CCC) to withdraw their conditional approval of the National Park Service's (NPS) General Management Plan Amendment (GMPA) for Point Reyes National Seashore.

The NPS' Record of Decision notes 170 management activities were implemented to improve water quality in PRNS, however data on water quality available over the last year clearly notes that these management activities are not beneficial to improve water. It is time for tenant cattle ranching to end in PRNS.

A question: why should the NPS continue to financially support a polluting industry on our public land and in a coastal zone, that clearly is impacting our air quality with high levels of methane and green-house gases into our atmosphere ?

The NPS now has the ability to cull up some of the Drakes Beach herd from 151 to reduce to 140, based on their plan, and based on what they think is a 'management threshold.' Please note there is no science behind the NPS' number of 140. To date, it is uncertain the size of the other free-ranging herd (Limantour herd), as the NPS has not shared this information. Please help protect our Tule Elk.

The impacts of the beef and dairy ranches in PRNS can stop now, so that we can have clean water, clean air, and free-ranging elk. Please withdraw your conditional approval of the tenant ranchers and NPS' plan, as it is time to end these unnecessary impacts.

Sincerely,  
Tyler Petersen

Dear California Coastal Commission ,

We face a key turning point in the fate of Point Reyes National Seashore. Will it be a National Park where nature and biodiversity thrive or degraded grazed lands where California endemic species are killed? Your decision on federal consistency can prevent an ominous fate of the only National seashore on the West coast.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

There has been much talk in the animal ag industry lately about “carbon farming” and “sustainable” or “regenerative ranching.” The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a “solution” to the real negative impacts caused by factory farms, and even so-called “family farms,” when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don’t be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

The NPS is engaged with FIGR on the horrific culling of our native Tule Elk. FIGR have not been involved in the protection of this native species so it is unclear why this is being allowed. Our native Tule Elk should not be killed for any reason, and the elk should be prioritized over tenant-owned domestic cattle in PRNS.

The public has made it abundantly clear in past hearings that it wishes ranching to cease in PRNS. The NPS does not have the credibility to enforce environmental protection of our precious seashore even if it comes up with plans to do so, and people are tired of being told that ranching was meant to continue indefinitely when the record and the public’s vision say otherwise. Our coast and its attendant wildlife cannot thrive while ranching persists, and it is time for it to end. The Commission is in the position to uphold the Coastal Act, put an end to the pollution and degradation caused by ranching operations, and open the door to true regeneration of native plant and animal life. Please don’t miss this opportunity. Do what’s right and rescind Consistency Determination CD-0006-20. I thank you.

Dear California Coastal Commission ,

One of the most significant provisions of the federal CZMA gives state coastal management agencies federal consistency review authority over all federal activities. With the extent of documented inconsistencies and decades of inaction by the NPS to protect coastal watersheds and marine resources, the CCC staff has found that the GMPA is not “consistent to the maximum extent practicable” with the enforcement policies of the California Coastal Management program.

Since the Commission came within one vote of rejecting the NPS’s request for a Consistency Determination (CD) that their General Management Plan Amendment comports with the California Coastal Act, one would think the NPS would work diligently to perform the tasks it agreed to, to attain that CD. That is, until one looks at the NPS’s track record as the enforcing agency responsible for making sure that the private, for-profit ranches that are degrading our park are held accountable and made to remediate the damages they inflict. Therefore, it would be appropriate for the Commission to find that the GMPA is not consistent with the California Coastal Act at this time.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

It is unacceptable endemic Tule Elk in PRNS are second tier to domestic cattle raised by ranching tenants. Tule Elk should not be culled over cattle.

Impacts to water quality and air quality are unavoidable in PRNS while the cattle industry is allowed to continue – just follow the science. The culling of native Tule elk is avoidable, but the NPS’ and ranchers believe it is appropriate to do so, but the public does not. It is asked the Commission no longer support the NPS’ plan, and find the plan not consistent.

Sincerely,  
Kathy Cullen

Dear California Coastal Commission ,

More than ever, the population is in need of outdoor places to go that provide a healthy and safe ecosystem with clean air and clean water, and abundant wildlife. I kindly request the Commission to reassess the conditional approval, as it is imperative to remove the commercial ranching operations from Point Reyes National Seashore, so that our waterways are no longer polluted with cattle manure, methane is no longer released into the air, and Tule elk can roam freely without the risk of being killed by the NPS.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

The CCC should not approve of a Climate Action Strategy from the NPS that can't prove demonstrable positive results. Claims of "regenerative ranching" or "carbon farming" cannot be accepted at face value. Such claims must be backed up by independent studies not funded by private or commercial interests. There is a lot of pseudo-science being tossed around, but when one looks under the surface, most of it is worthless. Commissioners owe it to themselves and the public to vet any such claims before allowing a climate plan to be based on them.

The agriculture lobbyists and unfortunately some of our local, state and congressional politicians support the culling and confining of our Tule Elk in PRNS. This is not acceptable. Please help protect the Tule elk from the poor decisions being made by the NPS, and the politicians who are financially benefitting from the ranching industry.

Thank you for your time, and please help us protect our National Seashore, the only National Seashore on the West Coast.

Sincerely,  
Michelle Waters

Dear California Coastal Commission ,

I want to recognize the critical step that the California Coastal Commission (CCC) has taken to make the National Park Service (NPS) bring forth their Water Quality and Climate Change strategies, along with the well-being of the free-ranging elk herd to supplement the General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the Golden Gate National Recreation Area before the CCC signs off.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO<sub>2</sub>) per year, or 51% of all worldwide greenhouse gas emissions.

Please protect the native tule elk from being culled in our National Seashore.

California is in the midst of a significant drought. Why do we continue to allow a private industry pollute our limited surface waters, and use significant amounts of water from our natural springs causing them to run dry, in a National Park? Time to end this extractive industry in our public land. Please change your conditional approval, and vote No on the NPS' plan.

Sincerely,  
Wendy Dreskin

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

Surface water at Point Reyes has been contaminated by E. coli, which originates from commercial beef and dairy ranching. Concerned citizens, with no financial interest at stake, have documented this over many years. Despite promises to implement “best practices,” water quality at PRNS remains poor.

The promise of ranching that offsets methane by storing carbon in the soil would be a blessing. However, there is not enough evidence that regenerative ranching works. First there is a problem with defining it. Regenerative ranching could be about processes (how you farm) or outcomes (what you achieve). Second there is a problem with measuring the impact. There is widespread scientific debate about how much carbon agricultural lands can actually sequester in the soil. Experts suggest “the potential carbon benefit can vary from region to region, farm to farm, even from parcel to parcel within a single farm. It can change based on soil composition. It can change based on the level of nitrogen available.” And it is suggested that some agricultural lands max out their carbon sequestration potential over time. The CCC should have more evidence of sound working practices before signing off on a strategy.

A Tule elk cow weighs on average 341 pounds, while a Holstein dairy cow weighs 1500 pounds. An elk cow consumes 6.8 pounds of dry weight forage a day while a Holstein dairy cow consumes 6.7 times more food than the average elk cow – a whopping 45.6 pounds of dry weight forage a day.

I urge the committee to be sensitive to overly-optimistic predictions without sufficient enforcement budget and governance, and with insufficient penalties for the seemingly inevitable violations of whatever the new terms of ranch operations may be.

Sincerely,  
William Teufel MD

Dear California Coastal Commission ,

I am writing the Commission to share my concern that no amount of water quality strategies and climate action plans will stop the significant impact of cattle ranching in PRNS. For this reason, I kindly request the Commission to vote against Plan B, by withdrawing your conditional approval.

This not the first time the National Park Service at Point Reyes National seashore has snubbed the California Coastal Commission. According to the National Park Service General Management Plan Amendment EIS, a loafing barn was constructed at the McClure dairy between 2004 to 2006. The National Park Service stated “The McClure dairy plans to construct a loafing barn ...The California Coastal Commission has requested that water quality improvements are quantified. The Seashore staff will assist with monitoring to quantify pollutant levels...” (National Park Service report by Ketcham, November, 2001). However, water quality standard exceedances continued after the barn was constructed and no reports to the Coastal Commission are in evidence in the extensive references cited in the EIS.

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like “Regenerative” and “carbon farming” techniques.

People who enjoy the outdoors like to marvel at the wonderful creatures of nature, such as the tule elk. The elk can thrive in a coastal prairie that is free from barbed wire and restrictive fences

It is time to prioritize the environmental health and the love of our wildlife in PRNS. Please rescind your conditional approval, and let’s restore our National Seashore

Sincerely,  
Sara Jara

Dear California Coastal Commission ,

The overall health of our National Park and the Pacific coastline is far more important than a handful of cattle ranching tenants making money off of public lands while impacting our landscape, our waterways, our native wildlife. I urge the Commission to revoke your conditional approval of the National Park Service's CD-0006-02.

The Park Service's own Environmental Impact Statement (EIS) notes BMPs as fencing cattle out of waterways can only go so far, and there's not much else that can be gained beyond what's been achieved to date. In addition, BMPs have been employed since the last tests performed by the NPS, and if NPS is to be believed, pollutant levels would show a reduction by now. However, testing by concerned citizens show consistent excess unsafe bacterial and coliform levels.

There has been much talk in the animal ag industry lately about "carbon farming" and "sustainable" or "regenerative ranching." The Commission should be abundantly aware that this is almost exclusively greenwashing. Such efforts have minimal and short-lived benefits, as soil carbon absorption quickly reaches a saturation point, it requires way more land and labor to rotate grazing than is either available or economically feasible, and it is being promoted as a "solution" to the real negative impacts caused by factory farms, and even so-called "family farms," when in reality it is a distraction from actually addressing the problems. In fact, these techniques are meant to address excess manure, but the methane produced by cattle exceeds any small benefit gained. Sadly, a number of pseudo-environmental groups such as the Marin Conservation League, Marin Resource Conservation District, the Environmental Forum of Marin and others have given cover to these efforts with their not-disinterested support, but don't be fooled – the science says such approaches barely work, and definitely are not an answer to the harms caused by concentrated animal operations. Any partnership between NPS and these or other promoters of false science should not be acceptable to the CCC.

In 1993, the Report of the Scientific Advisory Panel on Control of Tule Elk on Point Reyes National Seashore concluded, "The long-range goal of elk management at PRNS should be the re-establishment of free-ranging elk throughout the seashore and associated public lands. This would involve ... removal of the fence across Tomales Point. [The National Park Service] and [California Department of Fish and Game] should develop a long-range management plan with the goal of achieving a large, healthy, free-ranging elk population subjected to a minimum of management intervention." This report is in the NPS Elk Management Plan, therefore what does the NPS continue to prioritize destructive cattle ranching over our native Tule Elk ?

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

The only certain and effective way to address water quality pollution, such as the dangerous levels of E-Coli, in watersheds containing dairies and ranches is to remove the domestic animals. Impacts of cattle defecating in streams cannot be mitigated - it should never have been allowed to occur.

The only sound and definitive Climate Action strategy pertinent to the Point Reyes National Seashore's GMPA is to rid the area of dairy and cattle ranches and their immediate and related residue - not a proposal for an 'off-set'.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

The National Park Service is obviously enduring significant political pressure to continue ranching in the park, regardless of the consequences to the environment and the public. Representative Huffman, Senator Feinstein, and others, have explicitly directed NPS to continue ranching, before the EIS was published. NPS is not free to act on science and data, and is in fact under great pressure to misrepresent the situation to justify a predetermined outcome of the entire process.

Sincerely,  
Kathleen Ames

**Date:** Monday, March 28, 2022 10:39:31 AM

---

Dear California Coastal Commission ,

In April 2021, the Commission conditionally concurred with the consistency determination (CD-0006-20) submitted by the National Park Service's (NPS) General Management Plan Amendment (GMPA) for PRNS/GGNRA giving NPS a full year to present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging elk herd. NPS made this information public on March 25, 2022 thus allowing little time for review and rebuttal. As a concerned citizen I urge the CCC to allow more time for thorough review and vetting of these strategies before approving the GMPA

The industrial ranching operations at PRNS, which include massive (30,000 sq. ft.) modern loafing barns, don't resemble the small traditional historic ranches of six decades ago, from before the formation of the PRNS. Tons of feed are brought in, and excess manure is stored in poop lagoons and later sprayed onto fields. This crude practice doesn't enable natural composting, and results in water pollution.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

Tule elk help make Point Reyes National Seashore a desirable place to visit. NPS policy should protect them better.

The Park is along the Pacific Flyway and almost half of all North American bird species, nearly 500 in all, are recorded there. There are over 50 species registered as threatened, rare, or endangered at the state or federal level. It is imperative we keep our Park clean and unimpaired for bird species, and protect what is far more important than an extractive cattle industry on public lands. Please vote against Plan B, as we must do everything we can to protect our environment, especially on public lands.

Sincerely,  
Kathleen Ames  
[kateames@hotmail.com](mailto:kateames@hotmail.com) 94960

**Date:** Monday, March 28, 2022 10:34:15 AM

---

Dear California Coastal Commission ,

We must protect and preserve our coastal zones in Point Reyes National Seashore, from the destructive cattle operations on our public lands. Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

Reinstatement of water testing shouldn't take more than a year to set up, and would have been restarted by any responsible agency immediately after the CCC's prior hearing on this issue. This arrogant lack of responsiveness by the NPS is reason enough for the Commission to rescind CD-0006-20. If the Park Service can't even say how they're going to mitigate the damages caused by their GMPA, how can they be expected to actually implement any planned action?

Dairy farms and cattle ranching don't belong in a national park. They contribute to climate change. Don't be fooled by false "greenwashing" claims, about "regenerative grazing" or "carbon farming." Those concepts are promoted by big money interests, but their overly optimistic claims aren't published in referenced journals.

Because of livestock at PRNS, the free roaming tule elk have been infected with Johne's disease, and therefore can't be relocated. Commercial operations that harm wildlife do not belong in a public park.

The ecological richness and value of Point Reyes needs to be reiterated. It contains a mosaic of habitats in all areas except on 28,000 acres where ranching operations is allowed. It supports diverse wildlife including our endemic Tule elk, however ranching operations impact our wildlife through culling of the elk, hazing and silage mowing. We must restore the areas destroyed by ranching, by ending private cattle ranching in PRNS. Please withdraw your conditional approval and vote against the Plan, as the Plan has no ability to protect our water, air and wildlife.

Sincerely,  
Clay Bell

Dear California Coastal Commission ,

The impact of cattle operations on our water, air and Tule elk should not be allowed on public land, therefore please reassess your conditional approval on CD-0006-20.

The NPS states their plan does not impair any resource, and claims water quality in the Seashore will improve in line with two cited studies (Voeller 2021; Lewis 2019). However, the NPS has not shared water quality data since 2013, therefore the NPS cannot state water quality will improve. Water quality data from 2021 provided by concerns citizens state the opposite – water quality is impaired to a level that it is a high risk to humans, as well as aquatic life.

Instead of offering a strategy to reduce air emissions, the National Park Service points to the closure of one of the dairies at the park. However, the NPS offers no guarantee that the lease will not be taken over by another rancher who will bring in more cattle in the future. Indeed, their Succession Policy dictates that surrendered leases will be preferentially offered to other ranchers, their families, even their employees. If the National Park Service wants to demonstrate a sincere desire for lasting improvement in the quality of water and air at Point Reyes National Seashore they can start by rewriting their succession policy to permanently retire leases when ranchers do not wish to renew them, thereby allowing the land to return to an ecologically sustainable state that would benefit wildlife and improve the enjoyment of visitors.

The tule elk at PRNS are restricted, both by the barbed wire fences and by the 8-foot tall fence at Tomales Point. The fences should be removed, for the sake of these native animals, and no wildlife in PRNS should be culled for private financial benefit of domestic cattle.

The mere fact that the NPS has asked for this delay demonstrates a failure to meet the CCC's requirements for a CD. This should be taken as proof that the NPS does not intend to fulfill its responsibilities. Therefore, I ask that the Commission rescind its conditional concurrence and declare the NPS's General Management Plan Amendment inconsistent with the California Coastal Act. Thank you for your consideration of these matters, and I respectfully request the Commission revoke their conditional approval.

Sincerely,  
beverly petersen

Dear California Coastal Commission ,

I would like to thank the California Coastal Commission (CCC) for denying an extension to the National Park Service (NPS), and requiring the NPS to return to the April 2022 meeting and present a Water Quality Strategy, Climate Action Strategy, and an update on the well-being of the free-ranging herd, per the agreement reached after the April 2021 meeting. As an individual concerned with the continual and significant impact occurring in a National Park and caused by private ranching operations, I want to thank the Commission for holding the NPS accountable.

The McClure Dairy built a 36,000 square foot loafing barn on the rolling hills near the Pacific Coast in 2004, to help the dairy financially and to reduce the significant impact on water quality from the cattle operations. Please note the high levels of water pollution in this watershed which drains into Abbotts Lagoon, a waterway enjoyed by aquatic life, including river otters, and the public. This is a prime example that a loafing barn, a best management practice (BMP) has no benefit in protecting our water from cattle manure in PRNS.

Approximately 20% of the greenhouse gas (GHG) emissions from the Marin agriculture operations comes from the tenant cattle ranching operations in PRNS. That is a significant amount of GHGs coming out of public lands, caused by a polluting industry, and is not acceptable.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

Kindly act in the best interest of the public good.

Sincerely,  
William Parrinello

Dear California Coastal Commission ,

Thank you, Commissioners, for refusing to let the National Park Service delay reporting back to you with their plans to address water pollution, air pollution and tule elk management as agreed to by the NPS. Those of us who have witnessed the NPS's mismanagement of Pt. Reyes National Seashore over the years will be surprised if they actually come back with plans for CCC review, and even more so should they be meaningful. Should any such plans surface, it will bear close ongoing scrutiny to see if plans are ever implemented.

According to the NPS' own EIS, "Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, Manure and Nutrient Management, and water consumption related to ranching activities." If ranching were removed from PRNS, the EIS states "...impacts on water quality would be noticeable, long-term, and beneficial because ranching activities would be phased out across the entire planning area." Therefore why does the NPS have the option to continue to allow destructive ranching operations in PRNS when it continues to impact our water?

Our best defense for the climate crisis is to preserve wilderness, especially in a National park, not try to solve a problem created by grazed lands with experimental unproven techniques like "Regenerative" and "carbon farming" techniques.

Domestic cattle raised for private, financial benefit on public lands should not be prioritized over endemic Tule Elk. This is another reason why I urge the Commission to revoke your conditional approval.

The ongoing impact to our water, air, land, vegetation and native wildlife in our National Park is inappropriate. It is time to end the polluting and extractive ranching industry on our public land. The NPS' plan is not consistent with the Clean Water Act, Clean Air Act, nor does it protect our wildlife. Please vote against the NPS' plan.

Sincerely,  
Audrey Fusco

Dear California Coastal Commission ,

I am writing to request the CCC to help us protect coastal and marine resources in PRNS.

The NPS documented that over 170 management activities have been implemented to improve water quality, however per data provided by concerned citizens, clearly notes that these 170 management activities have had no to minimal benefit, as our waterways in the coastal areas continue to be significant polluted, and at levels that are unsafe for public use, and also unsafe for fresh water aquatic life, including marine life.

Rearing cattle produces more greenhouse gases than driving cars, UN report warns.

It is tragic that a National Park that should consider killing Tule Elk, a species endemic to California and introduced to Point Reyes to be protected. Please do not allow park service to kill Tule Elk to protect private interests.

In the midst of a climate crisis and biodiversity crisis, we can utilize our public land in PRNS to help slow or stop each. There are private land owners trying to create native habitats in their yards to help with climate change and the biodiversity crisis. We should do the same on our public land in PRNS. Please say No to the NPS' plan

Sincerely,  
Kelli Petersen

Dear California Coastal Commission ,

The NPS' plan CD-0006-20 should be unacceptable to all. The plan impacts the quality of water, air and soil, impacts our native wildlife and native vegetation. I urge the Commission to withdraw your conditional approval of the NPS' plan, for the sake of our environmental and for future generations.

California's highest E.Coli level was recorded on a Point Reyes ranch. Park service's 2013 water quality study determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts areas with high concentrations of fecal coliform. As a regulatory body with jurisdiction and mission to protect the California Coast these findings should be unacceptable. When will it be enough for your decisive action?

Cattle ranching generates high levels of methane – independent and scientific data document this, and methane release is a leading cause of the climate crisis. The public should subsidize nor support any activities of the NPS nor the tenant ranchers in PRNS to help reduce their polluting industry.

I am offended by the idea that native tule elk must be “culled” because they are supposedly interfering with commercial beef and dairy operations in a national park. Native Tule Elk should be given priority over the tenant ranching operations.

The public has spoken, and the data continues to document the egregious and unethical impacts to our natural resources on our public land in PRNS. Please withdraw your conditional approval of the Consistency Determination (CD-0006-20)

Our water is being polluted, our air is being polluted, and our endemic wildlife are being culled, under the NPS' Plan. Please help us protect our National Seashore by revoking your conditional approval.

Commercial ranching operations take up about one third of the total land area at PRNS, and they use almost all available fresh water on the peninsula. For example, the big McClure (I Ranch) and Kehoe (J Ranch) operations are strategically situated in valleys where they take water from a natural spring and from Abbotts Lagoon. Removing this water harms the ecosystem.

Coastal prairies sequester carbon better than annual cheatgrass in grazed land which is also a fire hazard. "Carbon farms" are experimental and not proven to scale. Methane digesters are not cost-effective. We do not have too much time to respond to the climate crisis. We should not deflect from reality to suit private interests using catchphrases to confound the reality of claims.

The health of the free range elk herds must be recognized as an immediate issue. Proposed climate action strategies may or may not come to fruition to aid them and cannot be used as a proxy for addressing current needs.

In light of non-adherence to proper testing regime and evaluation it would be prudent for the CCC to withdraw your conditional approval of the Consistency Determination (CD-0006-20) to properly comply with your fiduciary responsibilities and to be evaluated, again, when the interests of all effected parties are properly addressed.

Sincerely,

Dear California Coastal Commission ,

I am writing to ask the Commission to rescind your conditional approval on CD-0006-02, and vote against this NPS plan, as we must address the ongoing issue of destructive cattle ranching in PRNS that continues to degrade water and air quality, and impacts the lives of the native Tule Elk.

The NPS had 12 months to create a surface water quality plan, and also had plenty of opportunities to collect water samples during the several rain events that occurred between in the PRNS/GGNRA area between October 2021 and early 2022. These data could have been shared with the Commission and the concerned public, however the NPS requested an extension, therefore it is assumed the NPS did not follow through with the agreed upon condition.

Methane is 25-100 times more destructive than CO2 on a 20-year time frame.

Native Tule elk were reintroduced into PRNS in 1978, to help restore the herd that was once over 500,000 in population, and now the herd is down to 5000. Please do not support the culling of this endemic species, and withdraw your conditional approval of CD-0006-20, and vote against the NP and rancher's plan.

Thank you for your time in reading this letter. Again, I request the Commission to rescind your conditional approval, and help save our native wildlife, and help save PRNS.

Sincerely,  
lonna richmond

Dear California Coastal Commission ,

I am calling on the Commission to help protect the unique landscape and wildlife in Point Reyes National Park. The air, the water, and the wildlife all deserve protection, and this can occur with the support of the California Coastal Commission.

Decades of inaction and lack of enforcement by NPS has eroded public trust and the latest request by NPS to request an extension to present the water quality strategy is another example of the park service lack of interest in addressing the serious situation. When will it be enough for the CCC to take a stronger position to preserve the California coast?

Livestock and their byproducts account for at least 32,000 million tons of carbon dioxide (CO2) per year, or 51% of all worldwide greenhouse gas emissions.

The NPS' plan allows for the culling of the free-ranging elk, to benefit ranchers who rent parcels on our public land. This is not appropriate. Please reconsider your conditional approval of the NPS' plan.

Your decision to revoke the concurrence will send an unequivocal and strong message that it is important to protect the diminishing natural and biodiverse ecosystems against private interests.

Sincerely,  
Chris Jones

**Subject:** Reject the Conditional Compliance to Point Reyes GLMPA  
**Date:** Monday, March 28, 2022 12:21:27 PM

---

Dear Executive Director John Ainsworth,

As someone who is concerned about wild animals and wildlands, and one of over 250,000 In Defense of Animals supporters, I urge you to vote against the staff-recommended conditional compliance to the Point Reyes General Land Management Plan Amendment (GLMPA), and object to the National Park Service's consistency determination, which is not consistent with the California Coastal Management Plan.

The CCC received over 20,000 comments opposing the park's plan to continue ranching leases within the national park. We applaud the Commission for postponing the public hearing, which will allow enough time to adequately review and analyze comments with scientific and technical data.

The staff report focused on water quality, yet the last tests were documented in 2013. In Defense of Animals recently performed professional scientific water quality tests from key collection points at Point Reyes National Seashore. Now the Commission has ample opportunity to review these new findings.

The report also did not address other spillover effects from the Point Reyes GLMPA, including air quality and climate impacts from grazing cows, water quantity, and the loss of coastal public access.

Please vote against the conditional compliance to protect our waterways and the Pacific Ocean from harmful spillover impacts. Thank you for your consideration of this important and timely matter.

Sincerely,  
Mr. Mikie carroll  
225 W Cypress Ave Kingsland, GA 31548-4269
